The first law of motion is, "that a body always perseveres in its state of rest or of uniform motion in a right line, till by some external influence it be made to change its state." That a body of itself perseveres in its state of *rest*, is matter of most common and general observation, and is what suggests to us the passive nature of body; but that it likewise of itself perseveres in its state of *motion* as well as of rest, is not altogether so obvious, and was not understood for some time by philosophers themselves, when they demanded the cause of the continuance of motion. It is easy, however, to see that this last is as general and constant a law of nature as the first. Any motions we produce here on the earth soon languish, and at length vanish; whence it is a vulgar notion that in general motion diminishes, and tends always towards rest. But this is owing to the various resistances which bodies meet with in their motion, especially from friction, or their rubbing upon other bodies in their progress, by which their motion is chiefly consumed. For, when by any contrivance this friction is much diminished, we always find that the motion continues for a longer time. Thus, when the friction of the axis is lessened by friction, wheels applied to it and turning round with it, the great wheel will sometimes continue to revolve for half an hour; and when a brass top moves on a very small pivot on a glass plane, it will continue in motion very smoothly for a great number of minutes. A pendulum suspended in an advantageous manner will vibrate for a great while, notwithstanding the resistance of the air. Upon the whole it would appear that if the friction and other resistances could be taken quite away, the *motion would be perpetual.* But what sets this in the clearest light is, that a body placed on the deck or in the cabin of a ship continues there at rest while the motion of the ship remains uniform and steady; and the same holds of a body that is carried along in any space that has itself a uniform motion in a right line. For, if a body in motion tended to rest, that which is in the cabin of a ship ought to fall back towards the stern, which would appear as surprising when the motion of a ship is uniform and steady, as if the body should of itself move towards the stern when the ship is at rest.

SUBSTITUTION OF STEAM FOR ANIMAL POWER.[†]

The steam engine is acknowledged to be the most important modern agent of civilization. Much of the slavish toil endured by our forefathers in manufacturing and agricultural pursuits has been dispensed with, by its application. Sea and land are now traversed with an ease entirely unknown before its introduction, effecting intercourse with the remotest nations on the face of the earth. The iron horse harnessed to our carriages, laden with the heaviest goods, outstrips the fleetest racer,—enabling merchant and traveller to reap the benefit of a mighty power with an economy of time and money utterly unattainable by other means. The substitutution of animate for inanimate power has from facts been proved to be easy of operation and effectual in its results, and as the natural tendency of every operation in these days of progress is, or should be, to obtain the greatest return for the smallest proportionate outlay, there is no doubt that within a few years steam will be applied to most of the work now done by horses. From animal power being everywhere limited, and also expensive in its application, it is evident that some more powerful agent, more economical in working, becomes necessary; and for this purpose there is none more *powerful, useful, cheaper,* or more *manageable* than *steam* power.

A new plan, illustrating the City of Dublin, has been prepared with considerable labour, by Mr. D. E. Heffernan, C.E. We have no doubt that the enterprise of the originator will be substantially appreciated.

ANCIENT PAVEMENTS.

Several cities had paved streets before the commencement of the Christian Era; nevertheless, those which are at present the ornament of Europe (Rome excepted) were destitute of this great advantage till almost the 12th or 13th century. It is probable that those people who first carried on the greatest commerce were the first who paid attention to good streets and highways to facilitate same. We are told by Isidorus that the Carthagenians had the first paved streets, and that their example was soon followed by the Romans. Long before that period Semiramis paved highways, as appears by her own vainglorious inscription. The streets of Thebes, and probably those of Jerusalem, were paved during the time of its kings. In the year U.C. 188, Appius Claudius, then Censor, constructed the first real highway—the Appian Way—termed the queen of roads. Some allege that the pavement of the streets commenced in 578, others in 584, others in 459. Streets paved with lava, having deep ruts for the wheels of carriages and raised footpaths at either side, were discovered both at Herculanæum and Pompeii. Cordova, in Spain, was paved as early as the middle of the ninth century. Lutetia (Paris) was not paved in the twelfth century, and even in 1641 many of the streets had no pavements. London was not paved at the end of the eleventh century. Several of the principal streets, such as Holborn, were paved for the first time by Royal command in 1417, others under Henry VIII., some in the suburbs in 1544, others in 1571 and 1605, and Smithfield market in 1614.

ROYAL DUBLIN SOCIETY.

The fifth evening scientific meeting for the session of 1860-61, will be held on Monday evening, March 18. Chair will be taken at eight o'clock. Board Room—1. Mr. J. B. Doyle, to bring forward an instance of injury to gaspipes by rats. 2. Mr. John Locke, Progress of discovery in Central Australia. Dublin Statistical Society—1. Dr. George F. Shaw, on the Use and Abuse of Apprenticeships. 2. Mr. Randal W. MacDonnell, on some suggestions for better insuring the Prevention of Crime.

ROYAL AGRICULTURAL SOCIETY OF IRELAND.

At the last monthly meeting with reference to premiums for labourers' cottages, Mr. Hardy moved "That the Provincial Gold Medals be continued as prizes for 1861, on the same conditions as formerly." Adopted.

Major Scott was of opinion that if the £10 medal were awarded as a prize for improvement in labourers' cottages, it would prove more advantageous to that class than by being appropriated for newly-erected buildings, and conceived that a £5 premium would effect more good in this way than their £10 did hitherto.

The Chairman said that both objects were most desirable, but the difficulty was want of funds.

Mr. Donnelly moved "That the terms and conditions now in operation in reference to provincial medals for the erection of labourers' cottages be those upon which the county medals for a similar object are to be hereafter awarded," and remarked that eight ladies from the county Meath had come forward as associates. In every county where £5 was subscribed the society were prepared to add £5 more. Seconded, and passed unanimously.

Five plans of executed works were submitted during 1860 by the following, and judges from the society have been deputed to report thereon.

1. Lord Digby, improved cottages.	Leinster.
2. Do. newly-erected cottage.	
3. W. B. Smythe, Esq., newly-erected cottage.	
4. Mr. Mosly, newly-erected cottage.	
5. Lord Lansdowne, improved cottages.	Munster.

It is proposed by the inhabitants of Balbriggan and Skerries to memorialise the Board of Trade to construct a refuge harbour at the latter place.

A bill to faciliate the construction and improvement of harbours by authorising loans to harbour authorities, is being introduced this date into the House of Commons, by Mr. Milner Gibson.

New Designs for Measuring Rules.—Our attention has been directed by Messrs. Booth Brothers of 63, Upper Stephen-street, to recent improvements in the above indispensable article for all connected with building pursuits. In one case the *ferrule* or fishing-rod folding principle is applied, and the area of the rule is circular, not oblong as hitherto, thereby rendering it more portable; in another, by a sliding action, a rule capable of measuring a number of feet in one length is closed into a very small compass.

[†] "Steam on Common Roads." By C. F. Young, C.E. (London: Atchley and Co.) Reviewed in this No.

STEAM ON COMMON ROADS.*

Without professing to be members of the "far-seeing" community, we confessedly lean to the conviction, that wonders in the matter of locomotion are still in an incipient state in the womb of time, and that even the progenies of scientific research and skill so far developed, will prove little better than mere abortions when compared hereafter with those of our successors. Animal labour has been gradually paling before mechanical appliances, with or without—as the case may be—steam as an auxiliary; and again, for aught we know, steam in *its* turn may hide its diminished head when some new motive power presents itself. The application of "steam to common roads" is one which, in the present age, can suggest little of novelty or originality of conception; its practicability and desirability are admitted facts, and yet, shame on the lukewarmness of our national temperament, which in many things would seem to abhor innovation, it remains in a state of abeyance, is regarded as "a curiosity," but its practical utility as a public desideratum fails to be appreciated.

Under the above title, and to induce attention to this partially dormant element of locomotion, a valuable illustrated work has just issued from the press, treating the question ably in all its bearings, and furnishing an interesting history of the practical application of steam to ordinary road traffic. We find that "exactly a century ago, Dr. Robinson, subsequently Professor of Natural Philosophy in the University of Edinburgh, then a student at Glasgow, threw out some idea of applying the power of the steam-engine to the moving of wheel carriages, and that in 1769 a Frenchman, named Cugnot, completed and practically applied a locomotive carriage, on three wheels, and with a two single-acting cylinder engine, with pistons acting alternately on the front wheel, to common roads. This machine, when carrying four passengers, could not travel faster than *two and a-quarter miles per hour*, and the size of the boiler not being sufficient, it would not continue to work longer than twelve or fifteen minutes at a time; accordingly the inventor, seeing its deficiency, set about constructing a new machine, which produced more satisfactory results. Contrasting the above speed with that attained by the steam carriage of the Earl of Caithness, in August, 1860—viz., *fourteen miles an hour*—and moreover the outward appearances of each, it must be conceded that the principle has at least developed itself to an extent sufficient to justify important consideration on the propriety of universal adoption. Referring to the capability of the latter for its purpose, the *Banff Journal*, in August, 1860, says—"The Earl and Countess of Caithness and Mr. Ross started from Inverness in his steam carriage. Owing to its being market-day, the road was filled with horses and conveyances of all kinds, but the steam carriage passed through them all without any inconvenience to the general traffic or alarm to the horses. So perfectly was it under control, that it was stopped more quickly than an ordinary carriage and horses could draw up, which was done as often as there seemed any danger of horses being frightened. The run to Beauley (fourteen miles) was done in one hour and twenty minutes, including fifteen minutes for water and numerous other stoppages. When there was a good length of straight road, eighteen miles an hour was done with great ease. The carriage went up hills and down steep declivities in the most satisfactory manner, and they reached Clashmore successfully the same day, after a run of nearly seventy miles. The carriage is being run over the steepest roads in Scotland, and is proceeding to Barrogill Castle, a distance of eighty miles."

Assuming the above statement to be correct, and we have no reason to apprehend the contrary, the practicability of the adaptation is so far defined. A question, therefore, suggests itself—"*Why* is not steam traction more general?" and this our author ably answers in the following remarks:—"The greatest, the most determined, and at the same time the most contemptible obstacle it has had to contend with is *prejudice*; than this I know of none greater except it be impossibility. Engineers, as a body, seem to have been wrapped up in the belief, that it was 'impossible,' and they have not only 'believed' it to be so, but have spread and propagated this opinion with great zeal and perseverance. Unfortunately, however, for the traction engine, its chief advantage—namely, its *economy in application*—becomes a disadvantage to an important and influential class of persons who are useful in promoting speculative undertakings; because such large profits as are made on locomotive railways, in the shape of law expenses, percentage, &c., cannot be made out of them by lawyers and engineers, from their simplicity and facility of employment; therefore we find all such persons advocating railroads. Next, the *excessive tolls* on steam carriages, imposed no doubt from a determination on the part of the trustees to obstruct, as much as possible, the use of steam as a propelling power, arising from the erroneous idea that it *must* be more injurious to the roads than traction by horse power, has acted in such a manner as to totally prohibit their use in some parts of the country, if put on with a view to making them a profitable investment." We believe, however, that, as in all other instances, time will effectually remove misgivings as to this; public necessity will demand and compel it; and it may not perhaps be drawing unreasonably on our imaginative faculties to assume, that even before the present generation shall have passed away, we may see our street vehicles, omnibuses, &c., propelled by the iron horse, and moving through crowded thoroughfares with as much ease and grace as the participators in "a mazy dance."

In the concluding paragraphs the author introduces to notice a curious incident connected with an experimental trip through Hyde Park, of a road locomotive intended for the Brazils, wherein an engine and train of six four wheeled waggons, with all the latest improvements, became embedded in the ground over an old ballast pit, but was speedily righted, to the astonishment of all present, by removing a small portion of earth in front of the shoes, enabling the formation of an incline, by which the engine literally "walked out."

In the United States considerable progress has been made in the practical application of this principle to common roads, and it is stated that in Chicago, Ill., and Massachusetts, there are five or six steam cars carried on two "bogies," the engine on the front "bogie," and the boiler in the car, the steam passing down through the spherical joint which connects "the bogie" to the body of the car; moreover, that these cars have been found economical on branch lines. Our transatlantic friends are sure to set us example in this as in that of horse passenger tramways, about which latter, as applying to our city, some remarks may be found elsewhere.

It occurs to us that this principle of locomotion would fitly present a desirable field for the enterprize of capitalists, to introduce under the auspices of a public company, into the suburban districts of important cities and towns, public conveyance propelled by steam power, and whatever amount of prejudice might beset its path at the onset, we have no doubt of its proving substantially remunerative. Some years ago (perhaps twenty) a huge cumbrous engine traversed our streets, tearing up the roadways, causing horses to take fright, &c., and the outcry became so general that its progress was forbidden by the authorities; but we must bear in mind that so great are the improvements since effected, that an engine of 15 tons weight, and train of 18 tons, will scarcely leave more weight on a soft and even spongy soil, than an ordinary coal waggon, and, moreover, that the outward appearance is considerably diminished in bulk, and consequently the probabilities of accidents through fright to animals lessened. Should a decided movement for practical application at any time henceforward result, the author of this interesting and admirable work may congratulate himself on being the medium for its inauguration, and in reward for his laudably directed labour and ability, independent of the boon derivable therefrom by the public, we earnestly hope for a successful consummation.

FREE PUBLIC LIBRARIES.

In our last number we quoted from a cotemporary a paragraph to the effect, that the attention of the Lord Mayor had been directed to the desirability of establishing a free library in Dublin on similar principle to those in Manchester, Liverpool, and elsewhere; and *apropos* thereto, and to satisfy ourselves of the particulars connected with the foundation of these establishments and their working, we proceeded to the towns named, and, through the kindness of the respective librarians, collected all facts in connection therewith. The Manchester Free Library is situated in an important building at Byrom-street, possessing some noble and handsomely decorated apartments, communicating with a spacious staircase, and originally devoted to purposes of a very different character, foreign to literary pursuits, but which we need not now particularise. However, sometimes "out of evil cometh good," and the existence of the library is attributable to a few gentlemen who urged the then Mayor, Sir John Potter, to adopt the necessary steps for its formation, and which was effected in the year 1854, with comparatively little preliminary trouble. A sum exceeding £10,800 was raised by public subscription, and during the first 18 months of its existence upwards of 7,000 volumes of books were presented gratuitously to aid in the formation of a library. It now comprises a reference library of 30,000 volumes, four lending branch libraries, containing upwards of 22,000 vols., with a public newsroom in addition to each, and like that at Liverpool is mainly supported by a borough rate of 1d. in the £1 on the assessable property. The principal apartment on the ground floor is devoted to a newsroom, but only a certain class of "news" periodicals are admitted therein, and the committee are said to be particularly scrupulous in the rejection of all of a sectarian or political character; the upper is the library, with a librarian's apartment off same, and above that again are book stores, &c. We were much struck, on entering, at the decorum and silence that prevailed in this apartment, where probably some hundred readers of all classes were assembled, and which is a striking proof that where public benefits of an educational character are conferred, the masses of every order of society testify their appreciation by their demeanour. The issue of books during the year ending 5th September, after its establishment, were as follows :—

---

* Steam on Common Roads, by Charles Frederick T. Young, C.E.; and its Progress in the United States, by Alexander L. Holley, C.E., and J. F. Fisher, Engineers, New York. London: Atchley and Co.

	Vols.
From the Reference Department	64,578
From the Lending Department	77,767
Total	142,345

Amongst the early donors to the library were H.R.H. the Prince Consort, the British and Foreign Bible Society, Sir John Potter, Thomas Bazley, Esq., President of Chamber of Commerce; the Earl of Yarborough, Trustees of the State Library of New York, and Henry Houldsworth, Esq.; and subsequently numerous important additions were received.

The example set by Manchester was speedily followed in Bolton, Oxford, Winchester, Norwich, Aberdeen, Cambridge, Bristol, Sheffield, Preston, Newcastle-upon-Tyne, &c. On the occasion of the opening of the Rochdale-road Branch Library, on the 4th June, 1860, the chairman stated, "that the librarian was constantly receiving inquiries as to the management, &c., of the institution, for guidance in other towns," and further, that in looking through the reports of the Bolton, Cambridge, Sheffield, Birkenhead, Westminster, Liverpool, and Salford libraries, found all to declare, in most emphatic terms—first, that *the expectations of the promoters had been exceeded*; second, that *no damage had been done to the books but what was astonishing for its inconsiderableness*, and that the actual losses sustained were of a marvellously unimportant character. During five years, in which time the library had circulated 790,000 books, the loss sustained had only been 20 volumes, averaging perhaps 2s. each. If these things were done in the *green* wood, what might be done in the *dry?* If such were the achievements of free libraries in the past, what might they not anticipate for the future? If so much had been accomplished under the disadvantages of novelty and inexperience—and of the comparatively limited demand for reading, which alone a partial education of the people could supply—what would they not do when the improvements and extension of education—youthful and adult—now so rapidly progressing, have had time to produce their natural, inevitable, and most satisfactory results? In 1838 the Government grant for education was £20,000; in 1860 it was £793,000!!! The other branches of this library are at Hulme, Campfield, and Ancoats. The character of books comprehended in this institution, as far as we had an opportunity of judging, seem to be of the highest standard, comprising the best works on manufacturing industry, statistics, antiquities, architecture, engineering, mining, geology, chemistry, mineralogy, meteorology, astronomy, natural history, botany, anatomy, and physiology, &c.

Passing thence to Liverpool, we need scarcely remind our professional readers that the building in which the library is situated formed the subject of a memorable competition, and was subsequently erected after the designs of Mr. Weightman, architect, town surveyor. Whatever may be its architectural merit—and it has some—it is placed under considerable disadvantage in close proximity to the most perfect classical composition of modern times—St. George's Hall. The approach is up a steep incline to a spacious terrace in front, confined by a handsome retaining wall, capped by a balustrade, and thence to the building by several flights of steps. The principal façade presents a hexastyle corinthian portico, pedimented and centrally placed, and at each end are antæd projecting wings, the intermediate spaces presenting five entablatured square-headed windows, with sunk panels over each, of somewhat similar character to those in St. George's Hall. Above the central portico rises a superstructure, within which is the roof over the hall—a noble apartment, with galleries above and arcades below, but whose architectural effect would be immensely improved by the judicious introduction of colour.

In certain portions of the building are placed the reading and library apartments, the Derby Museum, gallery of arts, &c., the arrangements being of a very comprehensive character. Connected with this institution are botanic gardens, public parks and squares, and we find by the eighth annual report that considerable improvements had been made in the former, and a pavillion for the performance of music erected in the park, also that the squares and gardens have been maintained in a clean and orderly condition.

It may be remarked that the opening of this building on the 18th October, 1860, was celebrated with much *eclat*, there being a general holiday and a procession of the mayor and civic authorities to the hall, in which Lord Brougham, the Lord Bishop of Chester, Sir Robert Peel, M.P., and numerous other notabilities attended. Mr. William Brown, the munificent donor of the building, formally presented it to the mayor; in the course of the proceedings his statue, by Mr. Mac Dowell, was inaugurated. All honour to the man endowed with such a princely spirit! A donation of £1,000, presented through Mr. Brown by his late partner, Mr. Shipley, to be devoted to purchase of works for the library, was not the least gratifying incident of the occasion. Subsequent to this period, we find that an additional apartment, 80 by 50 feet, with spacious galleries, has been erected, also at Mr. Brown's expense, for the exhibition of new patents and improvements of a scientific character. The library contains a magnificent collection of volumes, and by the last annual report, October, 1860, we find that the number issued during the previous year was 195,962, as against 202,534, in 1858-9—apparently exhibiting a falling off, but satisfactorily accounted for in the fact, that public taste was declining in the reading of works of mere fiction and amusement, those of a scientific and educational chrracter being extensively appreciated. The present contents of the central reference library are 31,453 volumes. Nearly *half a million* of books per annum are issued from the *lending* libraries, being at the rate of 3,000 per diem, 332 per hour, or nearly 6 per minute during the whole time the libraries are open. At present there are 6,881 male readers and 1,768 females, but unfortunately the gentler sex seem to patronize almost exclusively *works of fiction*. The instances which are continually coming to light of the special usefulness of these lending libraries are stated to be interesting in the highest degree, and the opportunities afforded to working men of perfecting themselves in the studies belonging to their own occupations by access to the best books, have proved in many cases most valuable. Very recently the superintendent reports that a labouring man, who has obtained all his education by means of these libraries, has gained one of the prizes offered by a London publisher for an essay on "the education of the working classes," and that the same man has recently been appointed manager of a chemical manufactory, a promotion due, according to his own statement, to the advantages hence derived. Let us hope that the benefits of such institutions may be speedily extended to this country, and we know of no one so eminently qualified by his influence, commercial position, and philanthropic excellence to inaugurate a movement in this regard as the worthy chief magistrate who at present, for the second time, occupies the civic chair of Dublin.

RELIGIOUS ART TASTE.

HAPPILY for our national credit, "the dark age" of art in religious edifices is gradually emerging into oblivion, and the antiquated, blockey, barn type structures which studded this island, are paling before the taste of the modern architect. Perhaps in no portion of the United Kingdom is this much-desired innovation comparatively more manifest than in this metropolis, and it has simultaneously became our duty and our pleasure, independent of sect or persuasion, in pursuing our mission, to chronicle the various improvements that have recently taken place, or are in course of development. Amongst the more important works are those at St. Patrick's Cathedral, the new churches of St. Saviour, Dominick-st., and St. James' two parochial churches, James'-st., the Molyneux in Lesson-st., and those in the neighbourhood of Rathgar (alluded to in last number), each of which we have particularized in our columns, and which certainly contribute materially to the architectural character of the city and southern suburbs; but even passing to others less comprehensive, we find that an impulse has been given to religious taste, which is highly commendable. Somewhat under the above title, the *Freeman*, in describing certain works in the church of the Conception, Marlborough-st. (elsewhere quoted), has the following remarks:—

"Religious taste may be defined to be—that faculty of the soul affected by the elegant arts as applied to the worship of God. Religion has subsidised and hallowed all that is refined in sculpture, painting, and the fine arts, and employed them as auxiliaries in exciting sentiments of piety and directing the soul to the worship of the Deity. Those faculties are operated upon under God, and those affections produced by the elegant arts through the instrumentality of the senses, the imagination, and the judgment. Good judgment, as well as religious taste and devotion, will tolerate nothing else within the temple of God than that which is useful, auxiliary, and subordinate to the promotion of those feelings of awe, veneration, and piety, with which every Christian soul should be impressed on entering within its sacred precincts. Many of the monumental structures of modern times erected within our churches are little more than the rude accumulations of ill-shaped stones, objects of deformity rather than ornamentation to the temple of Divine worship—worthless for all purposes of utility, and possessing no claims to have been the productions of true religious taste—often destitute of even one emblem of Christianity to symbolize the holy faith professed during life by the departed individual it was intended to commemorate, or the charity that animated him, or the cheering hopes in which he died of attaining a glorious immortality. When we contrast the sculptured emblems of broken columns, and inverted torches, and urns, and winding sheets, and wailing widows and orphans, and other lugubrious emblems of mortality, with the monumental creations of true religious taste, such as a mortuary window of stained glass, representing in glowing and beautiful colouring some of the mysteries of our holy faith, we instantly proclaim the triumph of true religious taste over the heathen relics of unholy ages."

CHARACTERISTICS OF GOTHIC TRACERY.

THE origin of tracery may be dated from the close of the 12th century, from which period it was gradually developed into its more perfect form, after passing through a variety of gradations, from the simple *cinq* or *tre* foil to the flamboyant, decorated, &c. At a very early period it became customary, in the case of doors and windows, to enclose two small arches within one larger one, leaving a tympanum or blank space between the larger arch and the heads of the smaller ones, suggesting a favourable opportunity for perforation to increase lighting area, and moreover relieving the eye of the blank space. This was the first advance towards its development, and the aperture was pierced in the form of a circle, quatrefoil, cinqfoil, or other simple figure, and sometimes the spandrels were similarly treated. Hence originated *plate* tracery, the surface of the stonework being flat, and opposed to the subsequent *bar* tracery, which, as the title implies, is where the patterns of the openings were formed by the intersection of bars of splayed or moulded section, one portion of the surface being more prominent than others. In some edifices *plate* and *bar* tracery may be found in the same window, showing a stage of development. The latter altered considerably in form and variety of design with succeeding periods, being first disposed in simple patterns, to which the name *geometrical* was given, then *perpendicular*, *decorated*, *flowing decorated*, &c. All tracery is geometrical, consequently the former term is inappropriate, but serves to distinguish a period. The perpendicular characterises that tracery wherein vertical lines predominate, with occasional horizontal lines, such as transom bars, and the patterns partake of stiffness of character. The decorated and flowing decorated present a greater freedom and variability in curvature of lines and richness of finish. In all the above instances the practice of cusping the various figures is very common, such ornamentation being seldom omitted. When the tracery is of a complicated character we find a sort of subordination observed amongst the less significant members; thus the principal compartments of a window are divided by large bars, consisting of a large assemblage of mouldings, of which only a portion are employed in the bars which form the subdivisions. The Gothic buildings of France are noted for a peculiar form of tracery termed *flamboyant*, from its flame-like appearance. It is similar to some examples of our flowing tracery, but differs in this, that the leaf-like openings always terminate in a sharp point at the top, and thus assume rather the appearance of flames. The date of any ancient Gothic building can be defined as accurately by its tracery, as can the style of any classic building by its columns and entablatures.

PURE AIR FOR ANIMALS.

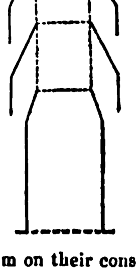
THERE are few of the conditions affecting the health of animals which have a greater influence than the state of the atmosphere they habitually breathe. In air charged with putrescible organic matter, health is impossible. Of course, the question of health is one of degree; and animals may be, in a general sense, free from active disease, and yet greatly below the condition in which they are capable of that amount of exertion and endurance which is incidental to the highest health.

Atmospheric causes are ever acting; inspirations of air are made many times in a minute; and if the air contain any impurity which acts unfavourably upon the blood of the tissues, how vain to hope for health. The old theory of atmospheric pollution was, that oxygen was consumed and carbonic acid generated, and that the disturbance in the proportion of these two gases was the cause of all the ill effects of bad air; and that these ill effects were always in proportion to the deficiency of oxygen, and the excess beyond the normal quantity of carbonic acid. It has been found, that although there is truth in this theory, it is but part of the truth; the other part is the presence of organic matter in the air, and the fact that this organic matter is liable to putrescence. If in ordinary circumstances the air could be kept free from this latter cause of pollution, it is highly questionable whether inconvenience would be experienced from the diminution of oxygen, or the slightly increased proportion of carbonic acid—the law of diffusion is ever operating to maintain uniformity of composition—and it is found by experience that if air is free from other impurities, a much larger proportion of carbonic acid can be breathed with impunity, than is ever found in the atmosphere of the most crowded rooms. The offensive smell we perceive on entering a close and crowded apartment ought at once to warn us of the presence of some other impurity than carbonic acid, as carbonic acid is entirely scentless. The odour is to be attributed to the organic matter exhaled from the skin and lungs of the occupants of the apartment.

In a stable we have necessarily exhalations not only from the skin and lungs, but also from the droppings and urine of the animals, or from the pavement which has been in contact with them. It is *this* which is the chief source of inconvenience and danger. The organic matter in the air is liable, in consequence of its finely divided state, to rush into putrefactive fermentation, and then to act as an active poison in degenerating the blood, exciting sub-acute fever, with headache, nausea, and loss of appetite. It is not possible to prevent the presence of organic exhalations in the atmosphere in which animals are confined, but science has supplied us with the means of rendering it innocuous—but for its liability to putrescence it would do little harm; this liability can now be removed.—*Agricultural Review.*

SMOKY CHIMNEYS.

AN admittedly intolerable nuisance is a chimney that will not draw *at all*, and equally so is one that has its respiratory organ disturbed by every blast, and with each puff for breath returns a volume of smoke into an apartment. Yet many such there are, even in our most modern and otherwise best constructed buildings. A too straight or too quickly curved flue, a low chimney stack—at least low as regards surrounding objects—and various other causes, serve to produce this nuisance. The ingenuity of inventors has been lavished on its alleviation, and we verily believe that the records of the Patent Office would serve to show a preponderant proportion of apparatuses alleged "to cure effectually smoky chimneys," beyond those connected with any other department of building appliances. How far a legion of those do *not* answer in practice, is a fact which that unerring teacher, experience, has fully demonstrated; but again, that there do exist means to accomplish the object, is equally patent. Communications have been addressed to us in an editorial capacity by individuals requesting suggestions to remedy defects in various matters connected with ordinary buildings, viz., damp walls, insufficient sewerage, and amongst the rest "smoky chimneys;" but as we do not profess to be a potent consulting physician, prescribing effectually under all and every circumstance, as also being unwilling to usurp the privileges of our professional brethren, we invariably advise enquirers to consult their own "family doctor," and not expect advice for *nothing* through the medium of the *Press.* With the public, however, the case is altered, and it is the *duty* of a journalist to direct attention to such inventions as lay *legitimate* claim to merit. During a recent (and one of our periodical) visit to London, we learned that an invention for the purpose in question was found so effectual that it had been extensively adopted in numerous public buildings, private mansions, &c.; and having successfully sought the patentee, proceeded to satisfy ourselves as to its efficiency by personal investigation. At the Tower, where buildings are grouped in close proximity, materially differing in height, in fact, in one instance in "a very ditch" or moat; at Battersea New Bridge, exposed to every wind of heaven; at the old Adelaide Hotel, on London-bridge (now the general registry for seamen); at Regent's and Battersea Park lodges, where tall trees are clustered; and elsewhere, too numerous to particularise, Hagan's patent ventilating chimney tops *do* successfully and with equal efficiency cure "smoky chimneys." The secret of the invention—and we are justified in divulging it, as it is protected by patent—consists in the provision against draught and consequent return smoke, as may be seen by the section herewith; not only the ordinary upward current of the fire-place and flue being secured, but several auxiliary currents obtained in the chimney top itself, forcing the smoke upwards. The patentee claims "that the necessity of building tall chimney shafts or using long tubes is hereby guarded against." As the invention has been introduced to the notice of the Irish public, we hope to see its extensive adoption, and we may suggest for the information of some of our readers—though it is a matter to which we are on principle perfectly indifferent—that the patentee has some additional claim on their consideration, being himself *an Irishman.*



THE INTENDED MARKETS.

NOT the least important element universally reputed to be present in the constitution of the Irish is "uncleanliness of habits," and certainly the greatest stickler for the maintenance of national honour must be devoid of *two* of his senses, if, after a ramble through the localities where our so-called markets for edibles exist, he will not frankly admit that there is much reason for the characteristic epithet being appended. And this remark especially applies to Dublin,—the second city in her Majesty's dominions, the seat of Viceroyalty, learning, fashion, and moreover a gem, a combination of gems, in architectural beauty—for Belfast, Cork, and Limerick, nay, some of our pettiest towns with their neat and clean market houses—though they are unfortunately in the minority—put us completely to the blush. Where but here is to be found such a picture as presents itself in Cole's-lane, Moore-street, Pill-lane, William-street, and D'Olier-street markets? Fowl, butchers' meat, fish, and vegetables all huddled together in dilapidated stalls, and the two latter especially, at the feet of the purchasers, under the "open canopy of heaven," forming intimate acquaintanceship with the street puddle, and offering a tempting allurement to stray passers by of the canine species. Decayed vegetables, fish entrails, sawdust, sweepings from the stalls, and offal of every description complete the picturesqueness of the effect; but, alas, how revolting to decency, how detrimental in a sanitary regard! Who should wonder that pestilence would affect most fatally localities so circumstanced; and yet, breathing this poisonous atmosphere day and night, revelling, as it were, unconcernedly in filth, are numbers of our fellow citizens. Yet thence are transmitted the viands which furnish alike the tables of the rich and the poor man, forcibly illustrating the proverb that "if ignorance is bliss, 'tis folly to be wise." How noteworthy is the contrast presented in Liverpool, Manchester, and adjoining towns, which we visited last week! There systematic arrangement, with every requirement for sanitary welfare, abundance of ventilation, water, and scrupulous cleanliness, present themselves; each class of vendors occupies the place allotted to them, suitably adapted for their respective business. Purchasers are under shelter, and can supply their wants in comfort. Our Corporation, it seems, had no power to expend any of their funds to remedy this state of things, or to erect suitable buildings. A few private individuals, alive to the necessity of some improvement, and with a philanthropy which cannot be too highly appreciated, assumed the initiative, and prepared a bill for Parliament. This bill has passed the second reading in the Commons, and most probably will become law—a consummation devoutly to be wished for.

PREPARING FOR THE EXHIBITION.

WE notice that the committee entrusted with the arrangements for the exhibition to be held next May, in connection with the Royal Dublin Society, are bestirring themselves, and that the works at the Hall are in a comparatively forward state. Two galleries, running longitudinally over the aisles adjoining the nave, are in course of construction by Messrs. Courtney and Stephens, and are supported by iron framework with elliptical trellis girders, resting on shoes previously cast to receive them on the main columns sustaining roof. Some of the semicircular ribs of nave roof are being decorated in colours, but as yet we are hardly enabled to judge of the probable effect. A similar style of decoration to that on Museum roof is being adopted. Timber staircases of spacious width are being constructed by Mr. Walter Doolin, contractor for the woodwork and fittings. Awarding the committee all due merit for their desire to make the most judicious arrangements possible in connection with the existing building, we must again express our opinion that it ought to have been much higher to admit of the subsequent construction of galleries, which are only ten feet from the ground, and at once strike the eye of a visitor as unsightly.

NEW ROMAN CATHOLIC CHURCH, CLARE ISLAND.

A SMALL Roman Catholic church is to be built on this island, near Westport, county Mayo, according to plans, &c., by Mr. J. J. Lyons, architect, 17, Lower Gardiner-street, Dublin. It will be 70 feet in length by 25 in breadth, by 18 feet high to wall plate, and comprise nave, chancel, sacristy, and porch. At south-west angle will be a spirelet of simple but effective character, and provision for a bell made therein. The style adopted is lancet Gothic, the west and east windows being tall and graceful triplets, those of the sides single lights, with heads rising into gablets, breaking the outline of the eaves, and forming a pleasing and uncommon feature. The roof will be of open timber work, stained and varnished, with framed trusses in arched form springing from plain chamfered corbels. The furniture will be of the simplest character. [We are asked to mention that subscriptions for this building will be thankfully received by the Rev. James B. Davis, Clare Island.]

TOWNSHIP OF RATHMINES.

WE are reminded by a valued correspondent that, in referring to the defeat of Lord Ormonde, at Rathmines, as the only historical incident connected with it, we had overlooked the much older occurrence of the massacre of the citizens of Dublin, or rather the "men of Bristol," at Cullenswood, the memory of which has been perpetuated to this day by the name of "the bloody fields," attached to the spot, not very far from Lord Palmerston's new road, adverted to in our last number, where old Rathmines Castle stood till it was pulled down, about twenty years ago. The new road being constructed by Mr. Frederick Stokes, the Chairman of the Commissioners, and which we also noticed last number, runs through another spot having old associations connected with it, though only extending into the middle of the last century. It was then described as Ranelagh Gardens, and was a public place of amusement, no doubt named after its prototype in London, and eventually gave its name to the village itself. It was then merely called "on Milltown-road," and occupied the whole of what is now the nunnery grounds, and several adjoining premises. Report says that the good nuns have been so completely besieged with bricks and mortar surrounding them, that they intend when an opportunity offers to go further afield. The road referred to, not of much importance in itself, will help to complete a direct line of communication through the township from west to east, through Leinster-road, Cullenswood and Charleston avenues, and Appian Way—the new cut making a junction between the latter and Ranelagh-road.

In the west of the township, in addition to those already noticed, a terrace of sixteen houses of a superior class is half finished, in a new square at the rere of Leinster-road, to be called Grosvenor-square, and seven or eight new houses are to be built on Leinster-road west.

Some interest is created in the district as to the result of the census to be taken in a few days, and which is expected to show an enormous increase. It was in 1851, 10,189, against 7,886 in 1841, and will probably on the present occasion reach 14,000!! The preponderance of the fair sex is most remarkable, perhaps without any parallel in the empire on so large a scale, and goes on in an increasing proportion. In 1851 there were 6,299 females against 3,890 males—(in one townland, Baggotrath, they are two to one and nine over)—the increase in the previous ten years having been 751 males and 1552 females. Whether the ladies continue to favour the township in so large a proportion, the census will soon show. We know that very many of those now erecting new houses in the district belong to the gentler sex.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

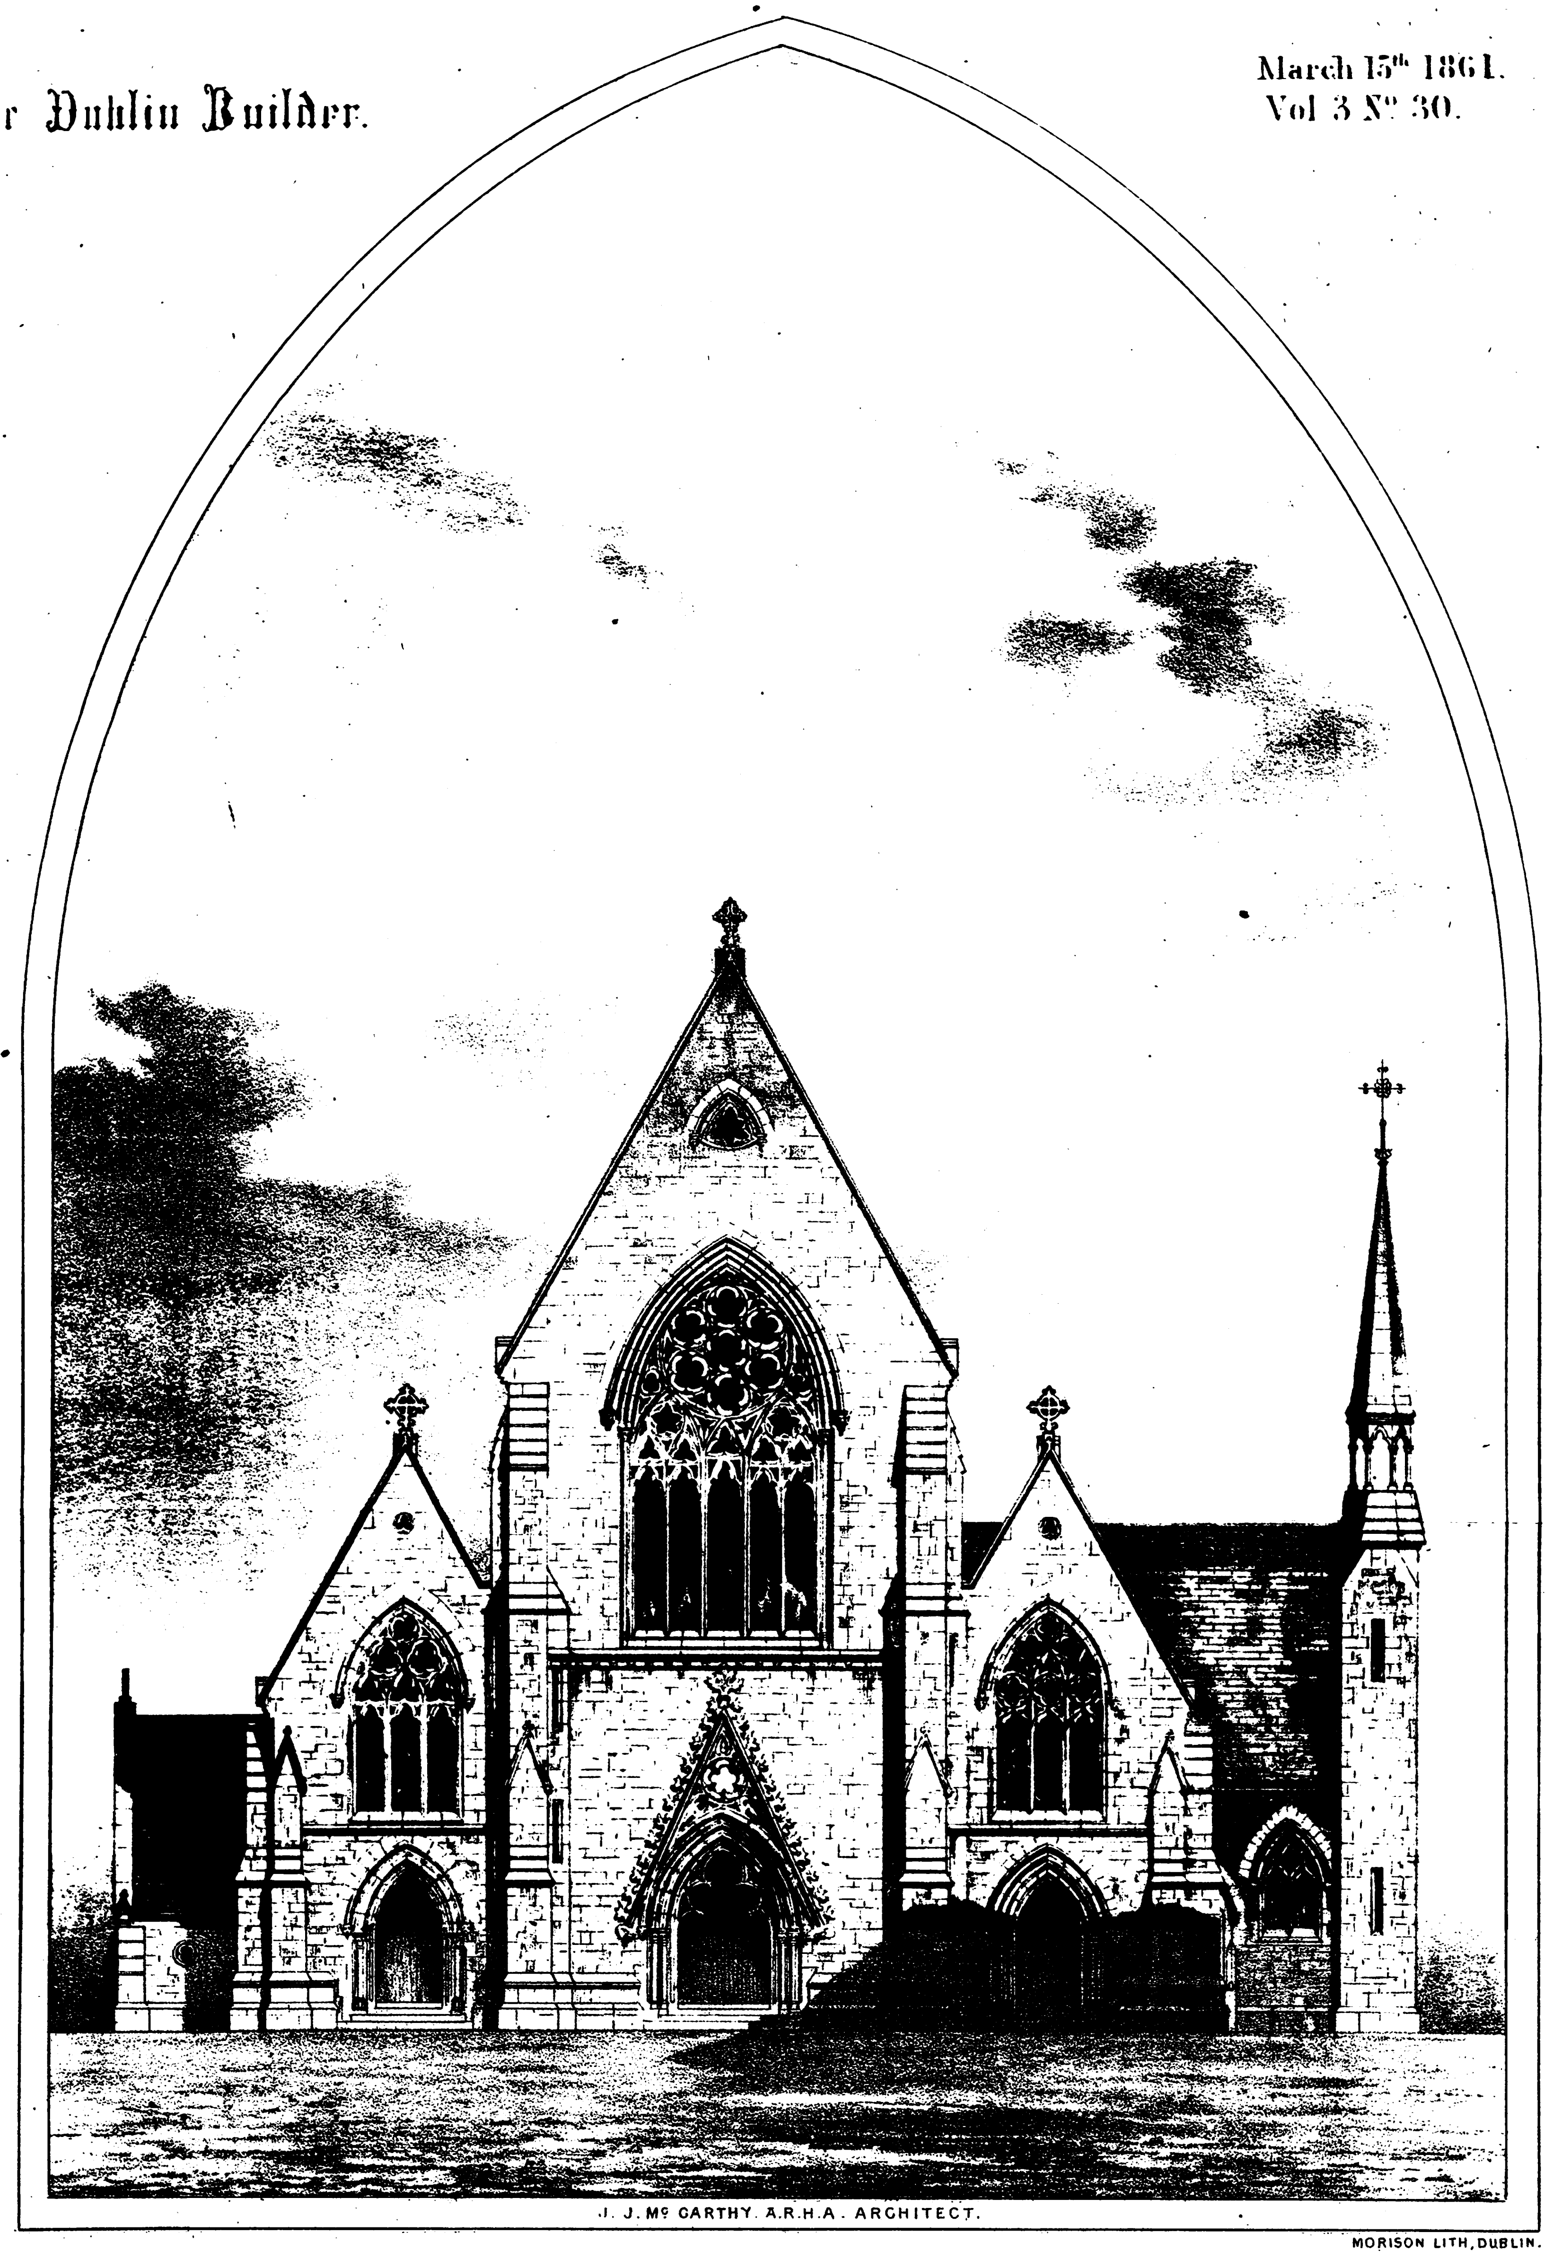
A MEETING took place on the 4th inst. After some preliminary business Professor Donaldson called attention to two ancient vases sent to this country by Rous, engineer to the Alexandrian railway. The largest of the two contained some calcined bones, and the smaller was one of the most interesting specimens that came under the Professor's notice. He believed that the former was of the period about 200 years B.C. The Chairman announced the result of the deputation of the Institute to the First Commissioner of Works relative to the decay of the stone at Westminster Palace, and said that that official assented to the views of the Institute as regarded *a commission*, but also expressed himself in favour of inventors directing their attention to the subject. Mr. Papworth read a paper by Mr. Waring, entitled "Notes on Romanesque Art in the South of France," and alluded to the appointment of Mr. Joseph, sculptor, to the curatorship of Sir John Soane's museum.

ENGLISH *VERSUS* IRISH ART WORKMEN.

As a painful illustration of the want of art education amongst certain classes of our workmen, it was remarked by Mr. Robinson, honorary secretary to the deputation from the committee for promoting the free opening of the Botanic gardens, awaited on the stucco plasterers, at their trade hall, on the 10th inst., "that the enormous sum of £3,000 was now being expended on the decoration of the new wing of Trinity College, and the new Kildare-street Club, all of which was paid to English and foreign workmen, because Irish workmen were found unable to execute this kind of work from not having any special artistic education. The Irish operative was denied the opportunity of cultivating his artistic tastes by closing against him botanic gardens and museums. Mr. R. detailed what he had witnessed in England and on the continent, where he had seen the artist merrily plying his chisel to the burden of some favourite ditty, while the flower, whose very petal was springing into life beneath his hand, stood before him in a bottle, in all the perfection of nature; and from whom had this artist that flower? From the curator of some botanic garden, or it was plucked in some country ramble.

The Dublin Builder.

March 15th 1861.
Vol 3 No. 30.



J. J. Mc CARTHY. A.R.H.A. ARCHITECT.

UNIVERSITY OF ILLINOIS

THE RAILWAY TERMINUS AT AMIENS-STREET.

YOUR correspondent in the last number of the DUBLIN BUILDER alludes to a proposed extension of the Kingstown Railway into Brunswick-street; it strikes me that extension is hardly so necessary in the case of this line as some others; for instance, the terminus of the Dublin and Drogheda Railway is so inconveniently situated as to be practically useless for short traffic, and consequently the magnificent district of Howth and the intervening localities are totally neglected and unused as building sites, although, perhaps, no other line running into Dublin possesses the same facilities for extension. From the nature of the property surrounding, a moderate expenditure of capital would bring the terminus into close proximity to Carlisle-bridge, crossing Beresford-place and Abbey-street. With a terminus so completely within the city, the Dublin and Drogheda Railway would soon rival the Kingstown line, and Howth become a favourite place of residence for the citizens. G. B.

[Apropos to this, it was (as we are informed) projected to have the terminus of the railway in question at Beresford-place, which would seem to be very desirable for public convenience, and to which no practical difficulty presents itself; but we learned recently that instead of coming *nearer* town, the company propose to erect extensive terminal buildings *farther* on, on the site between the waste ground adjoining the present terminus and Preston-street.]

CONSTRUCTION OF RAILWAY CARRIAGES FOR THROUGH JOURNEYS.

IT has often struck us while travelling long distances on railways that the present construction of carriages serves materially to diminish the comfort of passengers, present impediments to facility of transit, and moreover entail unnecessary expense on the companies, who are thereby obliged to maintain an extra staff of officials, which under ordinary circumstances might not be. If we take, for instance, the journey from London to Holyhead, how many stoppages are there per mail and express trains for taking in water and coke, procuring refreshment for passengers, and taking tickets? To the former instance—the mail—where every moment gained is a considerable object, not only to the passengers, but the general public the remark particularly applies; and what need would there be for the loss of the *hour* fully incurred in stoppages at stations for the above purposes, if the construction of the component parts of the train provided for them. The engine might, without any practical difficulty, be constructed to supply a sufficiency of both water and fuel for the journey; a refreshment room might be attached to each suite of carriages, as also a W.C.; facility of egress for the guard from one carriage to the other is also practicable; and the necessity of *any stoppage whatever* on the journey would thereby be effectually obviated. The arrangements of steamboats are far above those of railway trains. Is it not possible to have a boy steward and girl stewardess accompanying each train, to minister to the requirements of the passengers between Holyhead and London, as is the case between Kingstown and Holyhead? and if so, might not all the night staff of officials—save a porter to direct the signals—ticket clerks, and refreshment saloon keepers, who may be seen yawning for their natural repose on the arrival of the night mail at Chester, Rugby, &c., be dispensed with? Doubtless some of our readers will say this is very well in theory, but how is it to be applied to practice? Simply enough, answer we. Alter the internal arrangements of seats: instead of transversely, as at present, place them longitudinally, as in an omnibus—1st, 2nd, or 3rd class, as the case may be—so that a thorough passage in each carriage be secured. Then, at each end of this passage, constructed in the vertical framework of each carriage, let there be a small door and a moveable falling flap, communicating with the next carriage, and under the control of the guard or steward, who by a bell might be summoned instantaneously from one part of the train to another. Thus each passenger can have his or her wants attended to without stoppage at stations, which is very often too anxiously looked for in case of sudden illness, &c. In a former number[*] we urged the desirability of "sleeping apartments" on long lines, and the suggestion has been receiving much consideration at head quarters. We trust that the above will be judged equally entitled thereto; indeed, even on the plain principle of "interest" it would seem to demand it from railway companies. The first practical benefit to be derived therefrom by the Dublin public would be that the special London letter delivery of eight o'clock, a.m., might, by *the saving of the hour on the road*, merge into the ordinary provincial letter delivery, and numerous hands in the Post Office be dispensed with.

A COLUMN FOR CRAFTSMEN.

NO. I.—CARPENTRY.

(Continued from page 445.)

THE names of Sir Christopher Wren and Peter Nicholson are most popularly associated with the attainment of pre-eminent skill in carpentry—the timber trussing of the dome of St. Paul's Cathedral, London, and the temporary self-suspending scaffolding beneath it, being of themselves alone sufficient, independent of the former eminent architect's other great works, to immortalise his fame; and the elaborate geometrical and practical diagrams and illustrations, with copious descriptions, comprehended in the works of the latter, are, despite the productions of more modern innovators, recognized to this day as the only reliable and standard authority, stamping indelibly the memory of the author as one "on whose like we ne'er shall look again." On the application of mechanical principles to carpentry, Professor Robinson, of Edinburgh, contributed to the *Encyclopædia Britannica* elaborate papers, and the celebrated engineer, Alex. Nimmo, did similarly for the *Edinburgh Encyclopædia*, but after Nicholson's, Tredgold's works are the most important on this subject.

The principal operations connected with the *constructive* department of carpentry, are the formation of roofs, floors, bressumers, lintels, and all manner of bearing timber and framework, scaffoldings, &c. Of the above, probably the most important and on which science has been brought to bear to the greatest extent is "roofing." The invention of the pediment roof is justly attributed to the Greeks; but as the most of their public buildings were "hypæthral," or open to the sky, we have no examples of any important constructive attainments by that people. The Romans employed timber to a considerable extent, constructing theatres and amphitheatres wholly therewith, and their roofs over public buildings sometimes displayed great skill, and moreover were decorated, as in the Basilica of Peter, erected by Constantine. The ancient Egyptians, Babylonians, and Persians, as well as other eastern nations, had their roofs quite flat; the Greeks, slightly inclined; but in the middle ages the Gothic roofs were very high pitched, and the tie-beams omitted to obtain lofty ceilings. In most old buildings in Britain the equilateral triangle seems to have been the standard pitch; subsequently the ridge was lowered, the rafters being three-fourths the breadth, and then called *true* pitch, but the *square* is also thus designated. *One-third* and *one-fourth* the width of the span is popularly adopted in modern practice for ordinary house building, and for such structures wherein the roof is not a special architectural element. It is seldom lower, unless indeed when paltry and mistaken economy intervenes. High pitched roofs present the advantage of throwing off the rain and snow with greater facility, and consequently decreasing the probabilities of damage by leakage; low roofs, however, are much cheaper, requiring shorter timbers. When executed with care and on proper principles, the roof is an important addition to the strength and stability of a building, binding the whole firmly together, and protecting it from the effects of the weather; whereas if the reverse, the consequences may be serious, main walls becoming thrown out of the perpendicular, unequal pressure caused, &c., sometimes resulting in total destruction of the whole. What are called ordinary jack rafter roofs are employed usually where the span does not exceed 20 feet, or thereabouts, but above that amount trusses of various constructions, which we shall presently describe, are employed. For a span not exceeding 14 feet it is usual to dispense with ceiling joists, causing the collar ties to answer the double purpose, but above that span the imprudence of omitting them is unquestionable. There are instances, however, where sheds and other buildings of 20 feet span are covered with simple collar-tie and Jack-rafter roofs, but sooner or later it becomes a matter of regret that such a "penny-wise pound-foolish" course should have been adopted. Where trusses are employed, the construction varies considerably, according to span and other circumstances, and the simplest forms are most popularly known by the terms king and queen post respectively. The former comprehends a tie-beam from wall to wall, an upright piece of timber resting thereon in the centre, its upper end framed into principal rafters of same thickness, for which a joggled head is formed on the post, and again its lower, also joggled, to receive the feet of diagonal struts, sustaining the principal rafters about midway or nearly so. The truss thus formed is independent for the time being of the ordinary roof rafters, which are subsequently made to rest on purlins or longitudinal timbers, bearing from truss to truss. At the intersection of the king post, the tie-beam, and the principal rafters, it is usual to strap the joints together with iron of approved quality, and sometimes to bolt them. The queen post truss has its vertical timbers somewhat similarly constructed, but they are two in number, and placed equidistantly *from* the centre, the heads being connected by a hammer beam, and having a straining sill at bottom.

(To be continued.)

---

[*] See No. 20, Vol. iii.

SEASONING TIMBER.

ONE of the great secrets of the stability of ancient edifices before those of the moderns generally, was the immense care bestowed on the seasoning of their timbers previous to using—a precaution which now-a-days is all but totally disregarded. Chance *may* rule it that when a builder is declared contractor for a certain work, he *may* have on hands a large amount of timber thoroughly or even partially seasoned, but should it not be so, the result will speedily declare itself in the opening of the joiner's work, cracks in the ceilings, partitions, &c., The majority of our best timber is imported from the north of Europe, and is immersed in docks, floating therein, till sold for use; the consequence is, that becoming swelled so much beyond its former and ultimate capacity, it will, if hastily framed together while the very water is in its composition, in drying, contract so rapidly and to such a degree as to cause the effects above stated. Some people fancy that the immersion of timber seasons it, but we are borne out by facts and experience in questioning the truth of such a statement. In many cases dry rot is engendered in the timber of hastily-constructed buildings by the quantity of dock water thus pent up and used while in a dropsical condition. After timber is felled, it should be immediately piled up perpendicularly in a dry place with a free circulation of air round it, and so placed as to prevent undue exposure to rain or sun. Some people prefer keeping timber as moist as possible, and after a fortnight's immersion the boards are set upright and turned every day, a practice which some allege causes the flooring to be of a much better quality than that obtained from boards many years seasoning. The sudden decay of timber is generally owing to the sappy nature of the exterior surface, incapable of remedy by any application of paint, the latter proving actually injurious if applied, since it hinders the free admission of air and heat. Timber is sometimes subjected to a process called charring, or scorching over a flame, till the surface assumes a crusty appearance. Various methods have been from time to time proposed for seasoning timber, and preventing its rapid decay, amongst which we may enumerate Kyan's, Payne's, and Burnett's patents. Mr. Kyan's infusion is corrosive sublimate, and the process consists in submerging the timber in tanks for about a week, then taking it out and drying it. Sir Humphrey Davy had previously recommended a weak solution of the same thing as a wash where rot had made its appearance. Dr. Birkbeck made a favourable exposition of Mr. Kyan's process. Payne's process, besides professing to preserve timber from dry rot and the ravages of insects, is said to render it uninflammable, or at least to deprive it in a great measure of combustibility. The effects ascribed to Burnett's patent are that it hardens and improves the texture. It enters into permanent chemical combination with the ligneous fibre, and does not come to the surface by effervescence, and no amount of washing or boiling will remove the chemical compound. Further, it renders the wood uninflammable when used of a certain strength. The basis of the process is chloride of zinc, having peculiar affinity to woody fibre. There is no decomposition produced.

TRAMWAYS FOR DUBLIN.

AT a recent meeting of the corporation a report was read from Committee No. 1 in reference to a proposal by Mr. Train, the patentee of the tramway system, to lay down tramways in the streets of Dublin on the same terms as he had agreed to lay them down in Manchester, London and other towns in England. The committee had referred the matter to Mr. Neville, the city engineer, who recommended the corporation to allow Mr. Train to try the experiment in Dublin by laying down a line of tramways along the route to Clontarf, or by Brunswick-street to Sandymount. The report having been read for the first time, was ordered to lie on the table.

Alderman Lambert said that as the matter was one of considerable importance it would be well to dispose of it without further delay, and if the council did not object he would move the suspension of the standing orders with a view to the discussion of the question.

Alderman Reynolds objected to the suspension of the standing orders. The report was not the report of the committee, but of Mr. Neville, and the subject was one of too much importance to be hastily disposed of.

Mr. Joseph said that the corporation ought not to sanction the introduction of tramways into Dublin until their value had been completely tested in London, Manchester and Liverpool.

The committee for rebuilding St. Andrew's Church propose to transfer, for the benefit of the city, the semicircular piece of ground in St. Andrew-street, measuring 26 feet in the centre, provided the corporation will contribute the sum of £500, estimated for completion of the boundary railing and stonework.

BIOGRAPHY OF PALLADIO.

THIS eminent architect was born at Vicenza, in Italy, in 1518. He obtained instructions from the poet Trissino, who discovering in him a genius for sculpture and the arts connected with it, taught him the elements of mathematics, and explained to him the works of Vitruvius. He soon obtained distinction as an architect, and having an opportunity of accompanying his patron to Rome, he employed all his faculties in examining the remains of ancient edifices in that capital, and formed his taste upon them. On his return many works of importance were committed to him, which he managed with great skill, and obtained for himself a high reputation. He was now sent for to Venice, where he built the palace Foscari in the style of pure antiquity. Several other Italian cities were afterwards decorated with magnificent edifices, public and private, of his construction, and he was invited to the court of Emanuel Philibert, Duke of Savoy, who received him with distinguished honours. To Palladio is chiefly attributed the classic taste which reigns in so many of the buildings of Italy. His master-piece is reckoned the Olympic theatre at Vicenza, in imitation of that of Marcellus at Rome. He died in that city in 1580, having greatly improved the art, not only by his edifices, but by his writings, which are standard performances. Of these the following account is given: his *Treatise on Architecture*, in four books, was first published at Venice in 1570, folio, and had several times been reprinted. A magnificent edition, in three volumes, folio, was published at London in 1715, in Italian, French and English. Another, equally splendid, has since been published at Venice, in four volumes, with the addition of his inedited buildings. Lord Burlington published in London, in 1730, a volume entitled, *Indisegli delle Terme Antiche di Andrea Palladio*. He composed a small work, entitled *Le Antichita di Roma*, not printed till after his death. He illustrated Cæsar's *Commentaries*, by annexing to Badelli's translation of that work, a preface on the military system of the Romans, with copper-plates, designed for the most part by his two sons, Leonida and Orazio, who both died soon after. Palladio was modest in regard to his own merit, but he was a friend to all men of talents; his memory is highly honoured by the votaries of the fine arts; and the simplicity and purity of his taste have given him the appellation of the Raphael of architects.

In Palladio's designs, the ground storeys are generally composed of arcades of not very ornamental design, serving as basements to the principal storeys above, which are decorated with an engaged order, and most frequently with a pediment in the centre of the building above the cornice, though sometimes when a pediment is introduced, the cornice is discontinued beneath it. His buildings frequently have vestibules consisting of three arches or rectangular openings in front. The arches of his arcades are usually of semicircular form, but sometimes the space beneath the piers is subdivided into three portions by two lesser piers, the central compartment only being arched over. This form is sometimes carried out in his windows, which, however, are usually rectangular; sometimes also a semicircular shape is adopted, divided into three parts by vertical mullions.

In his churches he follows the Basilican form faced with a portico consisting of an order with entablature reaching to the height of the building, and covered by a pediment rising with the nave roof, those of the aisles having each a kind of half-pediment to agree with the slope; so that the central pediment has the appearance of having been placed in the centre of another so as to divide it equally into two parts. Amongst Palladio's other works, those of the church of the Redeemer and the Olympic Theatre at Vicenza, stand conspicuous.

The form of this latter building is semi-elliptical, round which the seats are extended in front of the proscenium. The entire width of the building is 109 feet, that of the proscenium 80 feet, and its depth 21½ feet. The front of the scena is composed of two tiers of Corinthian columns on pedestals, the lower tier of which are detached with pilasters behind, and the latter are half-columns attached to the walls.

The church of the Redeemer, at Venice, was built by this architect. The form would be that of a Latin cross, were it not that the nave is flanked on either side by three chapels open to the body of the church ranging the entire length of the nave, and receding from it to the same depth as the transepts. The division between them and the nave is effected by an arcade of semicircular arches springing from entablatures over Corinthian pilasters, which flank the piers of the nave. These piers are faced towards the nave by half-columns coupled, and extending to such a height as to carry an entablature over the arcade; above which on each side is a clerestory pierced with three semicircular windows, divided into three by vertical mullions. The choir is surrounded by isolated columns, and its extremity, as also those of the chancel, is apsidal. At the intersection a cylindrical drum is supported on four large arches, and is surmounted by a cupola or dome.

The church is considerably elevated above the ground, and is approached on the exterior by a flight of stone steps extending the breadth of the nave, and fronting the portico, which consists of two three-quarter columns and two pilasters, covered by a pediment. On each side of this, a wing projects in the line of façade, adorned with Corinthian pilasters than those of the portico, and continued round the sides of the building. The roofs of the aisles lean to, and in the façade present the appearance of a second pediment broken in the middle for the insertion of the portico.

After the death of Palladio, Italian architecture began to decline under the auspices of Borromini.

PHIDIAS.

THIS renowned sculptor—indeed the most so of antiquity—was an Athenian. The distinguishing characteristics of his works were grandeur and sublimity, and he particularly studied optical effect. To this purpose it was related that having, in competition with Alcamenes, made a statue of Minerva to be placed on a column, the work of the latter appeared so finished when viewed on the ground that it was universally admired, while that of Phidias seemed to be a mere rough sketch; but when both were seen from their destined situations the beauties of the first were lost, while the second produced the most striking effect. After the battle of Marathon he converted a block of marble, which the Persians had brought for a trophy of their expected victory, into a fine statue of Nemesis, the goddess of Vengeance. His reputation was so high at Athens that Pericles regarded him as his particular friend, and appointed him superintendent of all the public edifices with which that city was decorated. One of his greatest performances was a colossal statue of Minerva, in the Parthenon, in which work he displayed his skill in minute sculpture, no less than his grandeur of conception in the main figure. On the convexity of the goddess's shield was represented the battle of the Amazons, and on its concave surface the combat of the gods with the giants, whilst her slippers were adorned with the fight of the Centaurs and Lapithæ. On the breastplate was a Medusa's head. The base contained the birth of Pandora, with twenty figures of the gods. Phidias is said to have been the first who brought the bas-relief to perfection; his fame and fortune excited envy, and several accusations were brought against him, which he was enabled to repel. At lengh, however, he was charged with having introduced the portraits of himself and Pericles in the battle of the Amazons, and this being regarded as a kind of profanation, he was thrown into prison, where, according to Plutarch, he died. Others, however, affirm that he escaped to Elis, where he afterwards executed his Olympian Jupiter—the most remarkable piece of sculpture in all antiquity. It was a colossal statue, 60 feet high, of incomparable majesty and dignity in its attitude of expression. The name of the artist was engraven on the base. The Eleans, in gratitude for this work, settled upon his descendants a perpetual office, the sole duty of which was to preserve the lustre of the statue.

NEW ARTIFICIAL LIGHT.—Professor Bunsen finds that the brightest artificial light hitherto tried is magnesium wire burned in the flame of a common spirit lamp: its brilliancy is only 25 times less than that of the sun, and its photo-chemical power only 36 times less. Here, then, is a light which will enable photographers to carry on their operations at all hours of the night as well as by day. A wire fine enough to be wound on a cotton-reel will give as much light as seventy-four stearine candles of five to the pound. No galvanic battery is required; all that is needful being to contrive that the wire shall unwind steadily from the reel, and pass into the flame of the spirit lamp. The cost is, however, considerable, and will remain so till some way shall be discovered of producing magnesium cheaply, the price of one gramme of wire (15½ grains) being 9s.; but with photographers, whose consumption would only be by a few seconds at a time, this would hardly be an objection.

NEW MOTIVE POWER.—A new motive power capable of replacing steam in some or all of its applications, has long been a desideratum. A French experimenter, M. Hirn, has devised a mechanical arrangement, by means of which he proposes to make use of the enormous power exerted when a mixture of coal gas and air is set fire to. The violent explosion which it is well known takes place under these circumstances, is confined in a strong cylinder fitted with a piston, and the latter being driven up and then back again at each ignition, communicates motion to the other parts of the machine. The gaseous mixture is exploded by means of the electric spark. A small experimental machine has been made by the inventor, who speaks favourably (of course) of the feasibility of the plan on a large scale. Meanwhile, engineers are waiting until a two-horse power machine on this principle, which it is proposed to make, shall have been carefully tested and examined, with a view to its practical results.

GEOLOGICAL SOCIETY.

A GENERAL meeting of the Geological Society was held on Wednesday evening in the Museum Building, Trinity College. At eight o'clock the chair was taken by the President, the Rev. Professor Haughton.

The minutes of the previous meeting having been read, the following gentlemen were elected members of the society:—Charles F. Johnston, Esq., 9, Eustace-street; William Lewis, Esq., C.E., 13, Nelson-street; Dr. A. Hudson, 2, Merrion-square, C. M. Whitney, Esq., Ross Carbery, Cork; E. H. Blake, Esq., Farmers' Club, Sackville-street.

Mr. R. Mallet, C.E., gave a most interesting and able sketch of the physical features of Southern Italy, and of the results of the earthquake exploration of 1857. Dr. Davis complimented Mr. Mallet on the very interesting character of his communication. The President said he wished, in conjunction with other members of the society, to make some observations on the communication of Mr. Mallet. As the hour was somewhat advanced, he thought it better to postpone the discussion until the next meeting of the society.

The reading of a paper by Mr. Frith, C.E.. on the Volcanoes of the Sandwich Islands a paper by R. H. Scott, M.A., on the method of copper smelting practised at Oker, in the Unter Hartz, and on the geology of the neighbourhood; also a paper by the president on a magnesian limestone formation, at the base of the coal measures in various localities in Ireland, were postponed until the next meeting of the society.

INSTITUTE OF CIVIL ENGINEERS FOR IRELAND.

A GENERAL meeting of the above society was held on Wednesday evening in the new building, Trinity College, for the purpose of hearing papers read by some of the members: M. B. Mullins, Esq., in the chair.

The Secretary having read the minutes of the last meeting,

Mr. Shaw explained, by means of a model, the railway break which he has lately invented. This break is a complete novelty, and consists of a catch upon each pair of wheels in a train, operated upon simultaneously by means of a rod running along the bottom of the carriages, and which is under the control of the driver. This break differs essentially from those at present in use, from the fact that it clasps the wheel towards the bottom, and not at the centre, thereby giving greater and more immediate control over the motion of the train. The present breaks are objectionable in these respects:—First — much labour and time are expended before any effect can be produced; secondly—the resistance offered by the wheels gives a tremulous motion to the carriages; and thirdly, the mechanism required is very complex and troublesome; all which objections would be obviated by the new system. In addition to these advantages he (Mr. Shaw) believed it would contribute more than any preceding invention to diminish the number of railway accidents, which were so frequent of late. As regarded the expense, he believed from all the information he was able to procure, that it would not be more than £20 for each carriage.

Mr. Frith then read an interesting paper upon the best method of constructing a concrete wall, especially with reference to the river Dodder. His theory was, that the best concrete was that which most closely resembled the natural one, such as might be seen in the neighbourhood of Kingstown Harbour. And if an artificial cement could be made like the natural one, he believed it would be better than masonry. The great fault which he found with the cements of the present day was, that they were made too rich; in other words, there was too much lime put into them, to the exclusion of other matter.

The Chairman suggested that an analysis of the natural concrete should be obtained, to enable the society to carry out Mr. Frith's views, if practicable.

Mr. Hassard was next introduced to the meeting, and read a very long and elaborate paper upon the Vartry scheme of supplying the city with water; there was, however, nothing new in it, the whole subject having been finally discussed over and over in the Corporation, Mr. Hassard assuming the population of the city to be 350,000, and that the quantity of water for each individual for all purposes should be 25 gallons per day. That quantity appeared to be large, but experience showed that no less than that would be considered sufficient. Mr. Hassard then went at much length into the several details of his plan as regarded the rainfall in the district of the Vartry catchment-basin; the geological structure of the same, the drainage area, the sites for reservoirs, &c., and stated that he believed that the entire cost of the works would not exceed £450,000, which would require a rate of about 1s., 6½d. for each individual, or 16s. 8d. for each house supplied with water. He concluded by stating that he considered himself rather unjustly treated, inasmuch as his name was not mentioned in the report of the Royal Commission, as immediately connected with the Vartry scheme. Whatever the merits of that scheme might be, there was no doubt that he was the first to introduce it to the notice of the public.

A discussion followed on the subject, after which the meeting adjourned.

CHAPEL ACCOMMODATION—NORTH DUBLIN UNION.

A report was read from the special committee appointed by the board to inquire and report as to the best mode of improving the chapel accommodation for the Catholic inmates. The committee reported that, with the assistance of an architect, they had considered various suggestions which had been made as to the improvement of the chapel, that their plans had been submitted to them, and that they recommended that which they considered the cheapest and which would afford the best classification of the inmates and give additional house accommodation. The cost of carrying out this plan would be about £400.

THE GENIUS OF THE GREEK.

Again to hallow'd haunts return'd,
Bright with names we all adore,
Where those hero souls that burned,
Sanctified the soil of yore.
By the classic streams and meadows,
By each sunny shore and creek,
Draped in never-ending shadows,
Rich in genius of the Greek.

Pure, unsullied love of labor,
Warm impulses, noble aims;
Back when shepherd's crook and tabor
Hung on branches by the streams,
Where the olive and acanthus
Grew, to grace that art antique;
In the fabl'd far Atlantis—
Rich in genius of the Greek.

O ye bright inspiring fountains—
Springs, of primal art and taste,
Rainbow, arched upon the mountains,
Scintillating, pure and chaste.
Apostrophised in ruins scatter'd
By lorn pool and lichen'd peak,
Old mighty marble shrines shattered,
Rich in genius of the Greek.

From out of ruins grand and solemn,
Streak'd with glaze of reptile slime,
Above each frieze and fluted columns.
Clogg'd with damp decay of time;
Swelling forth from porch and portal,
Immemorial echoes break,
Redolent of life immortal—
Rich in genius of the Greek.

Land of old heroic spirit,
Rise thine halo wreathed head;
Names like thine for aye inherit,
Glory from their mighty dead.
Heirs of art still unexampled—
Athens, from your torpor speak;
Lo! he comes, the Goth that trampled,
Rich in spoil robb'd from the Greek.

Lamp of pristine architecture
Beacons to all distant time,
In your radient reflecture
Souls once more will soar sublime.
Virgin art, and beauty vernal,
Pointing homeward, ye bespeak
Triumphs, matchless and eternal,
Rich in genius of the Greek.

C. C. H—— Y.

Pure Literature.—The Messrs. Chambers, of Edinburgh, say, that while the cheap press is flooding the nation with books and periodicals, works of an injurious and immoral tendency are passing out of favour. They offer the following estimates as the result of careful enquiry into the cheap periodical trade. 1. Works of an improving tendency, circulation per month, 8,043,500. 2. Works of an exciting nature, but most positively immoral, circulation per month, 1,500,000. 3. Works immoral and opposed to the religion of the country, circulation per month probably under 80,000.

RAILWAY ACCIDENTS.

The attention of the House of Commons has been directed by Mr. Bentick to the frequency of railway accidents, and the non-adoption of precautionary measures by companies, urging legislation to compel companies to adopt such precautions as the general testimony of railway officials has shown to be necessary. Mr. Dalton asserted that the primary thought of railway directors was the safety of the public, and it was best left in the hands of the former. Mr. Gibson, on behalf of the Board of Trade, replied that "if that department at present possessed no functionary specially qualified as an engineer, the simple reason was, that no need now exists for the service of such an officer. With regard to the motion before the house, he objected to its vagueness, since it called on the legislature in general terms to provide precautions against the occurrence of accidents without specially mentioning the nature of these precautions, or vindicating the authority by whom they should be selected and carried into effect. To draw up any bill in accordance with the terms of the resolution would, in fact, be impossible. The causes which principally led to the occurrence of these catastrophes were—viz., negligence on the part of railway attendants — imperfection of the material, and excessive speed. On neither point did he consider that either parliament or the executive could interfere with any beneficial effect. Precautionary legislative interference he regarded as impracticable, but ample redress was provided by Lord Campbell's act, under which the principal railway companies had, within the last five years, paid not less than £313,000 as compensation to persons injured, or to the relations of those who were killed by accident on their lines."

Notes of New Works.

A beautiful side altar has been recently erected in the Church of the Conception, Marlborough-street. It is intended as a tribute to the memory of the late O'Conor Don, M.P, by his son. The altar is of simple construction, but the architectural character of the design, the harmony of coloring, and the brilliancy of its enrichments, render it a specimen of very correct taste. Mr. J. J. Lyons, Lower Gardiner-street, furnished the drawing; the marble portion of the work was carried out by Mr. R. Hibson, Talbot-street; Mr. Wm. Hughes, of same street, erected the superstructure; and the decoration and gilding were by Mr. G. B. Star, Ormond-quay.

The Ecclesiastical Commissioners have advertised for tenders for repairing the churches of Colaghty and Drumkeeran, County Fermanagh; also Badony Upper, Cappagh, and Dromore, County Tyrone.

At the Neptune Rowing Club, Ringsend, a new and splendid ball-court has been erected, after drawings by, and under superintendence of, Mr. Richard Hill, C.E. The flagging and cementing have been executed in good style by Mr. J. Carroll, builder. Apart from other considerations, we feel at all times a desire to chronicle improvements of this class, serving as they do to provide healthful and manly recreation for the young men of our city. We recently noticed that an additional building had been erected on the premises of the University Rowing Club, in same locality.

The local correspondent of the *Freeman* at Bray mentions that a contract has just been concluded with Mr. Byrne, road contractor, Dublin, to build a wall 7 feet high above water mark, at an expense of £2,800, from the town bridge to the railway bridge, a distance of some six hundred yards. It is to enclose from the river on its north bank the ground purchased by O'Reilly Dease, Esq., from the Commons Commissioners. It is suggested that a sea wall beyond the railway bridge, carried out through the sand bar, with a short corresponding wall on the south wall from the present dock entrance, would form a very good harbour at the mouth of the Bray river. Were gates added to the mouth of the present excellent dock, a more commodious and convenient harbour for its size would not exist.

The church of Taney, Co. Dublin, is about being enlarged by the Ecclesiastical Commissioners.

The new Railway Station at Foxrock is in a forward state. The new Westminster road leading to it will be completed in a few weeks. It is being planted on both sides, and will be one of the prettiest roads in the county. Eighty-one acres of these lands have now being let, and in every case for handsome detached villas, in lots of one to six acres each.

Messrs. Campbell and Dunn have been declared contractors for the new church at Kilcock. Mr. M'Carthy, architect. Amount £6,175.

A new dwelling house is to be erected at Hartlands, County Meath, according to plans by Mr. S. Symes, architect.

A new Convent for the Sisters of Mercy is to be built at Cahir, County Tipperary.

The Earl of Longford has given 12 acres of building ground, adjoining the Longford Cathedral, for male and female schools, &c. Expenditure £30,000. John Bourke, Esq., architect.

The Town Commissioners of Longford, at their last monthly meeting, has contracted with Mr. John Mullen, builder, for flagging under the inspection of James Bell, Esq., C.S. Amount £900.

The Galway Town Commissioners are about entering on the *troubled* waterworks question, and we hope they may be pilotted through it more skilfully, and with greater facility, than the metropolitans. They seek plans, specifications, &c., for a new and improved supply.

A contract has been entered into for the construction of a railway between Holywood and Bangor, and in consequence the Belfast and County Down Company purpose abandoning the intended line from Coaly to Bangor.

The works on the Omagh and Dungannon Railway are in such a forward state as to justify an expectation of the opening on 1st prox, when there will be through communication between Dublin and Belfast *via* Dungannon.

Petitions against the following bills have been deposited at the Private Bill Office:—Cork, Blarney, and Macroom Railway; Cork and Macroom Direct Railway, Downpatrick and Newry Junction Railway, Dublin Corporation Waterworks, Enniskillen and Bundoran Railway, Great Northern and Western Railway (capital, &c., bill), Limerick and Foynes Railway.

The Grand Jury of the County of Sligo have passed a resolution in favour of the direct railway between that seaport and Enniskillen.

It is stated that the Great Southern and Western Railway Company will not oppose the Clara and Banagher line.

There is likely to be a contest between the promoters of the respective lines from Downpatrick to Newry, and Castlewellan to Banbridge.

The Dublin, Wicklow, and Waterford Railway bill has passed the committee of selection, who have presented a special report on the subject to the house.

COURT OF BANKRUPTCY AND INSOLVENCY.

In re Hugh Kelly, a Bankrupt.—We are pleased to learn that an arrangement has been effected in this case with the creditors.

In re Keeran Ronan.—The insolvent was a carpenter and builder. Mr. Greaves opposed his discharge on behalf of the detaining creditor, Mr. Bulger, the proprietor of an Italian warehouse, whose debt was £14, of which £11 consisted, as the creditor stated, of cash lent. He complained that on several occasions on which the insolvent borrowed money from him, he promised to repay the amounts out of what he would receive for contracts which he was executing for customers. He did not do so, but on being processed by another party, borrowed a further sum from Mr. Bulger of £1 17s. The creditor accepted a bill which the insolvent did not pay, and eventually he had been arrested under a decree.

The insolvent deposed that he had lost on three contracts, about which he was questioned. When obtaining the additional cash, in order to meet the process, he only borrowed 5s.

Judge Berwick said he would adjourn the case in order to hear from the gentlemen for whom the insolvent did work what they had paid him.

THEATRE ROYAL.

THE delineators of American and Irish character respectively—whether authors or dramatists—are wont to draw most unscrupulously on their imaginative faculties, and the subjects presented as faithful portraitures are not unfrequently such as are only suited to be classed in the lowest grade of pantomimic buffoonery. The stage Yankee and the stage Irishman are consequently popularly believed to represent truthfully the respective national peculiarities, while, in fact, if we come to analyze them they are preposterous exaggerations. Although sensible of this fact, yet it is a strange inconsistency that an Irish audience will estimate the cleverness of the artist in proportion to his absurdity, and while being caricatured to their very faces, warmly applaud his flat wit and forced drollery. In all probability it is the same with our Transatlantic brethren. The farce of "Our American Cousin," one of a *repertoire* now in course of performance at the Theatre Royal, in which Miss Julia Daly sustains the prominent part, is, at least as regards Yankee character, a clever and truth-telling satire on the popular supposition. "The Cousin," aware of the notion pre-conceived by her grand relations in Europe, humours it for a period by an artificial personation and assumption of those outlandish peculiarities attributed to her countrywomen; but the denouement, when she casts off "the Yankee Gal" stage-garb as it were, and reveals the real manners, language, and address of an *American lady*, is very effective, and displays the admirable talent of the artist. Miss Daly's acting is vivacious and easy, and yet so much grace and dignity are apparent at times in the less *go-a-head* representations, that we are disposed to judge most favourably of her capacity to occupy an eminent position in the higher walks of the drama, should she enter upon them. Her vocalism is also very pretentious. The public are beginning to appreciate her talents, and to return substantial acknowledgment — a circumstance the more complimentary as it is *merit* which *commands* and not *fashion* that *induces* it.

Miscellaneous.

LEAD IN WATER SUPPLY.—At the meeting of the Manchester Literary and Philosophical Society, recently, Dr. Grace Calvert stated that he had been engaged for the last few months in investigating the action of the Manchester Water Works water on various kinds of leaden pipes, and that he was arriving at such results as would show the necessity for serious consideration on the part of the inhabitants of the city with respect to the evils arising from the introduction of the water into their dwellings through leaden pipes. Being requested by the chairman to give his opinion, Dr. Angus Smith said that he had never found any Manchester water which had passed through lead pipes to be entirely free from lead. At the same time, the quantity is practically equal to nothing; yet there is a great difficulty in knowing what is hurtful: water with as little as one-hundredth of a grain of oxide of lead per gallon was said to have produced lead paralysis; whereas it was considered generally not to be hurtful until it contained one-fortieth of a grain. We have little idea of the extreme susceptibility of some persons; and it is better to avoid lead as much as possible. Long lead pipes should be avoided, and lead cisterns are extremely dangerous, especially with soft waters, including Manchester water. Soft water dissolves lead more readily than many hard waters; and, if the hardness be due only to the earthy carbonates, the lead becomes coated instead of being dissolved. But, if the hardness be due to chlorides or nitrates, the water dissolves lead much more rapidly than pure water. It is a mistake to suppose that pure water dissolves lead more than all impure waters. Some very pure natural waters dissolve lead simply because they contain chlorides, although in small quantities. Some lead pipes, too, are easily affected. He had spent a long time in obtaining a suitable coating for lead to protect water from its action, and had not quite succeeded; but he had given his results to a friend, who had gone further; and, having obtained great success, patented the process. However, he was told that no one would buy lead pipes of the kind, as they cost half-a-crown per cwt. more than the ordinary ones. People complain of evils from which they refuse to escape. It is, however, better to avoid lead than to avoid pure water because of its action on lead.

THE ATLANTIC MAIL STEAM NAVIGATION COMPANY.—The misgivings so reasonably entertained by the unpropitious antecedents of this company seem to be at length set at rest, at least judging from the following paragraph quoted from the *Freeman*, which may be regarded as more than ordinary authority on the subject:—"The certainty now afforded as to the early opening of the Galway contract service is calculated to give great satisfaction. The fleet of the company are now of a first-class character, and all the doubts that prevailed as to the company being ready to commence the service are removed by the fact that two of the new ships are lying ready for inspection at Southampton, and that the Adriatic, one of the best and fastest, as well as largest ocean steamers afloat, has been purchased by the company within a few days. The energy displayed by the Malcomson Directory is most creditable to the head of the eminent firm of Malcomson, Brothers."

THE GIGANTIC IRON LIGHTHOUSE.—The *Birmingham Journal* gives an interesting description of a new iron lighthouse, which is being constructed in Birmingham for the Spanish Government. The following are its principal features and dimensions:—"The general form of the lighthouse is that of a huge black column, surrounded with a network of iron, arranged octagonally, and tapering pyramid-like from a base of 50 feet in diameter to 12 feet at the summit. From the centre foundation pile rises a pole or cast-iron column to a height of 31 feet, and from this point radiate massive iron girders or brackets which support the platform of a dome-shaped dwelling house for the lighters. The round balcony enclosing the platform on which the lighting apparatus is to be fixed is of wrought iron, and measures 18 feet in diameter. Altogether, the weight of the lighthouse and its iron framework is about 170 tons. The cost of the optical portion of the work alone will be upwards of £1,000, and the total cost of the light apparatus, with the lantern, upwards of £2,000."

More than 1,000 years ago the Chinese built suspension bridges of more than 1,000 feet span.

HALFPENNY STEAMBOATS.—There is, probably, no country in the world that can lay claim to such an example of private enterprise for public accommodation as is exemplified in the halfpenny steamboat. It is a cheap ride from London to Westminster Bridge for a penny, but the ride is still cheaper between Dyers' Hall Wharf and the Adelphi for half that sum. The merit of this enterprise is great because it is normal. It has not arisen in consequence of opposition—it is not the spasmodic result of ruinous competition; but the deliberate growth of cool calculation, in which the debtor and creditor sides of the account were well weighed, and the balance safely estimated to be in favour of the parties who developed the scheme. The halfpenny steamboat is a great boon to the working classes, properly so called. It saves their time, their limbs, and their shoe leather. It not only carries their persons, but likewise their heavy burthens. The Jew clothesman is a great patron of this mode of conveyance. It must be a thing after his own heart, cheap and accommodating. Whatever the size of his bag, and the number of old hats he may have collected in the course of the day, the capacity of the halfpenny steamboat is sufficient to hold them. At the fag-end of a hot day the wandering and footsore Hebrew finds a haven of rest in one of these little boats. Where, we would ask, is there anything to compare with them? Take into account the value of labour in this country, and we challenge a comparison with every water conveyance in the world to produce a parallel with the halfpenny steamboat on the Thames. Talk of the flat-bottomed boats on the American rivers, the cheap fares on the Rhine, or the lazy trekschuiten of the Dutch canals; can brother Jonathan, the philosophic German, and the sturdy Hollander combined, produce such a ha'porth of ease, comfort, and convenience, as the halfpenny steamboat affords? We won't say anything just now upon the unhappy condition of the "silent highway," but we will point to the panorama of interesting objects with which the Londoner is so familiar, but which to a stranger is worth a guinea to look upon, and which he has the privilege of seeing to great advantage as he lolls at his ease during his cheap ride. What magnificent bridges! They are the wonder of the world. What a glorious cathedral, and how majestic appears the mighty St. Paul's! The Temple Church and Gardens, too, and the cloister-like buildings around; not to mention the Suspension Bridge, dangling in the air; Somerset House, and in the distance the House of Lords, with the venerable Abbey. All these things to be seen, and the advantage of a long ride for a single halfpenny! —*City Press.*

EXHIBITION OF 1862, LONDON.—The committee is to include the following gentlemen—The Marquis of Hartington, M.P.; Lord Stanley, M.P.; Lord Naas, M.P.; Lord Stanley of Alderley; the Right Hon. the Lord Mayor of London, the President and Vice-President of the Board of Trade, Thomas Basley, Esq., M.P.; Thomas Field Gibson, Esq., and John Gott, Esq., commissioners of the exhibition of 1851; Dr. Lyon Playfair, H. Cole, Esq.; Mr. William Dargan, the President of the Royal Agricultural Society, the Chairman of the Society of Arts, the Chairman of the Royal Dublin Society, the President of the Institution of Civil Engineers, the President of the Institution of Mechanical Engineers, and the Presidents of the Chambers of Commerce of the United Kingdom.

TENDERS

For a new building about being erected at Wexford for the "Young Men's Christian Association." Mr. E. T. Willis, architect.

Mr. R. Price	£1,100	0	0
Mr. T. Willis	855	16	0
Mr. Wilkinson	775	0	0
Mr. P. O'Connor	760	0	0
Mr. J. Redmond (accepted)	650	0	0

For the several works in the erection of a church at Kilcock. Mr. J. J. M'Carthy, R.H.A., architect.

Beardwood and Son	£10,200
John Farrell	9,422
Freeman	6,500
Campbell and Dunn (accepted)	6,175

NOTICE.

Post-office Orders and Remittances should be made payable to MR. PETER ROE, *Printer and Publisher*, 42, MABBOT-STREET, DUBLIN.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* DUBLIN BUILDER," 42, MABBOT-STREET. *All other Communications should be addressed to the "Proprietor and Editor,"* 17, LOWER GARDINER-STREET.

A PERFECT WATCH FOR 30s.

Superior finished movements, jewelled in two holes, in stout engine-turned Silver Cases, and hard enamel Dial. Constructed to go while winding, and containing some of the newest improvements Price only 30s. Sent post free and safe on receipt of a post office order for that amount, including a shilling for postage, by EDWARD LEVER, Watch Manufacturer and Jeweller, Hooper-street, Goswell-street, London.

"This is a strong servicable Watch, and well adapted for youth's or for ordinary wear."—*Standard.*

Lever's Celebrated 3-Guinea Watches.

First-class highly finished jewelled movements with patent escapements, and hard enamel Sunk Seconds Dial in elegantly engraved and engine-turned double-backed cases, manufactured from the best Silver, with maintaining power to go while winding, and all the latest improvements.

"This Watch is sufficiently strong for the working man, and will last a lifetime, while its attractive and elegant appearance renders it well worthy of the pocket of the Nobleman." Price only 3 Guineas.

Ladies' Gold Watches.

With elegantly engraved Gold Dials, from 4 Guineas.

"These Watches are all that can be desired in finish, taste, and design, and leave nothing to be wished for but the money to buy them with.—*Standard.*

Gentlemen's Gold Watches, from 5 Guineas.

First-class highly finished movements, jewelled in all the necessary holes with patent escapements, maintaining power to go while winding, and all the latest improvements. Elegantly engraved and engine-turned double backed solid Gold cases, and hard enamel Sunk Seconds Dial, price, from 5 Guineas. Or with elegant Gold Dials, 10s. extra.

Chronometer Balance Watches.

To go in any climate whether hot or cold. These Watches are so correctly adjusted that they will perform with equal accuracy in extremes of temperature without varying. Price, in Silver, from 8 Guineas; Gold, from 14 Guineas.

Hunting Watches.

Have an additional case to protect the glass and face from injury. This extra in the Watch, increases the cost 30s. Silver, £3 Gold.

Presentation Watches.

With engraved backs, to carry out emblematically any particular object. Price, Gold from 6 Guineas.

Watches for Sporting, Medical, Astronomical and Scientific purposes.

Just published. The Illustrated Treatise

On Watches and Jewellery,

Post free, for two stamps, entitled:

What to Buy and Where to Buy it.

"Containing a large amount of useful information for those who intend purchasing a Watch, and valuable advice to these who already possess one." With engravings of Watches, Patterns of Jewellery, Chains, &c., BY EDWARD LEVER, Watchmaker and Jeweller to Her Imperial Majesty the Empress of the French, Inventor of the Patent Lever Watch. The Binnacle Chronometer, &c., Hooper-street, Goswell-street, London.

"By the aid of this book persons residing at any part of the Globe can select, with the greatest certainty, the Watch best adabted to their use.—Sent post free for two stamps direct from Hooper-street, Goswell-street, London."

12,000 of these Watches in the hands of the public attests the value of this invention.

On board H.M.S. *Adventure*, in the Arctic Regions, for two years the ship's time was kept by one of LEVER's Watches, all other Watches on board having stopped.

OPINIONS OF THE PRESS.

"The fact of these Watches being made entirely by females will at once account for their extraordinary cheapness"—*Morning Star.*

"A good Watch at a trifling cost."—*Weekly Times.*

"In taste, elegance, and design, these Watches surpass everything."—*Globe,*

Prize Medals awarded by the Paris Exhibition, the National Academy of Science, Paris, and the Society of Arts, London.

Gold Pencil Case for 3s.

Post free for 36 stamps.

The Sultan Scarf Pin.

A very fashionable article of jewellery, much admired for its neatness and elegance. Price, 3s. 6d., post free for stamps to that amount.

Cameo Scarf Pins.

A richly carved female's head, elegantly mounted, price 8s. 6d. entitled,

Beauty;

Also the fashionable Scarf Pin,

Garibaldi,

Being a correct likeness, richly carved in Cameo. Price 4s. 6d.

The Empress Brooch.

This is the fashionable Brooch of the present day, being exactly similar to the one made for her Imperial Majesty THE EMPRESS OF THE FRENCH.

This article of jewellery is universally admired for its elegant and majestic appearance, and forms a very suitable present for a lady. Price 8s. 6d.

Silver Watch Chains having gone out of fashion, we have discontinued selling them.

Good Solid Albert Chains, 18s. each. Superior make, 22s. A variety of patterns to select from.

Ladies' Guard Chains, from 26s. each.

Gentlemen's Guard Chains, from 26s. each.

The fact that we can sell a Good Solid Albert Chain for 18s. and a Serviceable Watch for 30s. sufficiently proves the cheapness of our articles.

Every Watch warranted, and sent free and safe by post, on receipt of a remittance.

Post Office Orders to be made payable to EDWARD LEVER, at the General Post Office, London.

Old Watches, Gold, Silver, Plate, Diamonds, &c., bought or taken in exchange for new articles—the full value allowed.

EDWARD LEVER, Watch Manufacturer and Jeweller, Hooper-street, Goswell-street, London.

Persons residing in any part of the Globe, need not hesitate to forward remittances to this establishment, all orders by post receiving immediate attention, every article sent out being carefully and securely packed in boxes made expressly for transmission, to guard against the possibility of loss or injury.

Captains, Merchants, Shippers, and Wholesale Buyers treated liberally with.

The Dublin Builder.

VOL. III.—No. 31.

LEGAL LIABILITIES OF ENGINEERS, ARCHITECTS, BUILDERS, AND WORKMEN.

SCARCELY a law term passes that some new question involving a greater or a lesser amount of interest, and in which some one of the above classes occupies a prominent position, is presented. Misunderstandings arise between the professional man and his client, or between the latter and his trade employées, or not unfrequently between *all* parties concerned, and to clear them up recourse is had to that happy (?) alternative—litigation! What is the cause of this? Answering our own question, we submit that the cause is *simple*, but the effect generally *disastrous*, arising from "undefined relations between employers and employed." Very many of the practising professionals of the day pursue their avocations without either knowing or giving a thought to the responsibility they incur from incompetency to perform what they undertake on the one hand, or for negligence on the other. Under this head those of most common occurrence are, such as relate to inadequate constructive provisions, resulting in the settlements of walls, falling of roofs, floors, girders, bressumers, &c., encroachments on neighbours' territory, or want of precaution in protection from injuries during rebuilding, incomplete specifications, passing unsuitable workmanship and materials, unexpected extra works, and a host of other matters of which every day instances are afforded. We will suppose that an architect is engaged to make a set of working drawings for a building on a marshy or otherwise objectionable foundation, and either from incompetency on his part, or neglect in studying the necessity for adopting proper precautions, a portion of the superstructure becomes insecure, or the whole comes toppling over some day, who, may we ask, is to pay the damage? Is it the client? We should think *not*: he confided his work to an assumed to be properly qualified professional man, relying on his skill to secure for him an equivalent for his money, and a structure suited to his requirements. Is it the builder, if such there had been? We should say *not*, provided he implicitly followed the drawings and specifications. Who, then, but *the architect*? Hence "the legal liability!" But this is only a solitary illustration out of a legion; enough, however, for our purpose. In a few days the opinion of *our twelve judges*, in the memorable and protracted case of Kempston *v.* Butler, will be before our readers, and we shall then know more definitely than we do at present the extent of a contracting builder's responsibility as regards damages arising to neighbours' premises during progress of rebuilding operations. It is evident, however, that much has yet to be learned by our professional practitioners and builders respectively on this subject, and as the best source for information we would refer them to a recently published work, entitled "The Law of Contracts,"* the object of which is more readily explained by quoting the author's own words, viz.:—"To place before the professions to which it is addressed, the legal liabilities that members of those professions incur in their various relations as employed and employers; and not exclusively intended for the legal practitioner in the actual practice of the law, but having more especial reference to persons engaged in engineering and architectural pursuits and operations; indicating the rocks and shoals by which those, so engaged, are surrounded in their daily transactions, and seeking to guide them."

The opening chapter treats generally of contracts, their nature, considerations to be provided for and against, conditions precedent, &c. Referring to architects' certificates, the following case is cited:

"A building contract contained a proviso that the payments thereby agreed to be made to the builder should only be due, provided the certificate of the surveyor or the employer for the time being should first be obtained; and an action being brought for the balance alleged to be due on the contract, it was held that under the general issue the absence of the certificate of the surveyor was a good answer to the action; and that the plaintiff was not at liberty to show that it was withheld fradulently or collusively with the defendant."

It has frequently happened within our own personal experience that after a contract had been entered into, and was, to use a familiar phrase, "signed, sealed, and delivered," a subsequent *verbal* understanding as to dispensing with certain items, was pleaded by the builder, and consequent exemption claimed; but our author tells us that "leave or license *cannot* be pleaded to a breach of contract, but the defendant must *show* an exoneration or discharge from its considerations." In some instances, as in some of those to which we refer, the exemption may be conceded, but the "legal right" is defined as above, should it be disputed. Partly bearing on omissions in specifications, allusion is made to a case wherein after a builder had entered into a contract "to provide the whole of the materials, or otherwise—in the particulars of specification—necessary for completion of the work," he refused to *lay* the flooring boards without extra payment, because the flooring was not specially mentioned, and the other party taking possession proceeded to lay the boards as prepared by the builder, and successfully defended the builder's claim for trover. One of the questions most frequently involving litigation is that of "extra works," and the author, who has treated the subject in a very comprehensive manner, says:—

"If, notwithstanding an express stipulation in a contract between a private individual and a builder, that no alterations or additions shall be admitted or paid for unless directed by the architect by a writing under his hand, the alterations and additions are made without such written authority, the employer will be at liberty to dispute the account for them, and to refuse a settlement. What amounts to a written authority may sometimes admit of dispute, especially if it do not clearly express what alterations or additions are thereby intended to be authorised; and great care should therefore be taken to leave no loophole for doubt upon a point which, if it exist, may lead to misunderstanding between the parties and litigation. It may be said that it is not possible to give a written authority for *every* extra work which is directed to be done; but such an argument would not hold good in the face of an express stipulation in a contract; and therefore whether it be considered possible or not, builders will act advisedly in declining to make the required alterations or additions, unless they be ordered in writing, and their nature and extent be clearly expressed in the document. They need not, however, be necessarily expressed in words; for if they be clearly set out in a plan or drawing, signed by the architect, with the words specifying or indicating the work to be extra, such would be considered as much an order in writing as if the whole of the details had been specified in words at length."

It is no uncommon occurrence that at the winding up of accounts for a building, a proprietor who had made his pecuniary arrangements to suit his expected demands, finds to his dismay a lengthened document politely enclosed by his builder in the shape of "a little bill" for extra works *ordered by the architect*; but the right of the latter to do so unlimitedly under all and any circumstances is thus clearly disposed of: "the liability of the employer will depend *upon the extent of authority* he gave to his architect in respect of the works, and if he did not authorise him to order the execution of any but those to which the agreement either directly or indirectly refers, he would be exonerated, *and in that case it would be for the builder to consider how far the architect had made himself personally responsible*." Here is a fact that should be indelibly recorded and well digested by both old and young practitioners, some of whom think very lightly of ordering *ad infinitum* and without the least regard for the client's pocket. We do not observe, however, any consideration of the very questionable point, "does knowledge of the fact that extra expense is being incurred and no objection offered constitute a responsibility to any extent?" "Party walls" ever have been, and ever will be, a *quæstio vexata* both for property owners, architects, and builders, and even "gentlemen of the long robe" themselves; the subject, however, in all its bearings, is ably treated in the work before us. The following case amongst many others is cited:—

"An action was brought by a reversioner of a house against the owner of the adjoining for pulling it down without shoring up the plaintiff's house, in consequence whereof it was impaired, and in part fell down. Plaintiff *being nonsuited* upon a rule obtained to set nonsuit aside, it was held, first, that the plaintiff could not recover, on the ground of the defendant *not having given notice that he was about to pull down his house*, that not being alleged as the cause of the injury; secondly, that as the plaintiff had not alleged *or proved* any right to have his house *supported* by the defendant's house, he was bound to *protect himself by shoring*, and could not complain that the defendant had neglected to do it. It appeared that the two houses were very old and decayed, the party wall being weak and defective; that for some time struts of timber had been carried across a lane on the east side of defendant's house to the opposite side of said lane; plaintiff's house adjoined defendant's eastward; when the latter was taken down the struts were removed, and no upright shores placed within plaintiff's house to sustain floors and roof; that if either of these measures had been adopted *it might have stood.*"

---

* The Law of Contracts or Legal Liabilities of Engineers, Architects, Contractors, and Builders. By W. Cunningham Glen, Barrister. London: Atchley and Co., Great Russell-street.

In England much more than here it is a usual practice for architects to furnish quantities, but the author justly remarks, "it is one reprobated by the profession, and those of a higher class never do so." In illustration of the liability incurred by those who do the following case is cited:—"An architect advertised for tenders according to plans, specification, and quantities; on the latter the defendant—a builder—framed his tender, but they proved to be inaccurate." Mr. Justice Byles, in summing up, directed the jury that the defendant had stipulated that the plaintiff should pay him for the calculation of the quantities, and having been paid for them was liable to compensate him, if the bill were not reasonably correct, and the jury thereupon found for the plaintiff.

The above citations serve to illustrate the practical and comprehensive character of the work, but to all such as are engaged in engineering or building operations, and who desire to steer clearly through the Syllas and Charybdis which beset them in their professional career, we would suggest that they become possessed of so skilful a pilot as is here obtainable.

MORE ABOUT "THE VARTRY."

Mr. Hassard, C.E., the originator of the Vartry project for improved supply of water to this city, has addressed the following letter in reply to some of Professor Galbraith's statements in opposition thereto:—

"First, as to rainfall. Enniskerry and Ballysmuttan are 10½ miles apart. They are almost due east and west of Kippure Mountain, being distant from its summit 6½ and 4 miles, respectively. The mountains of Slievebane, 2,128 feet; Seafin, 2,364 feet; and Kippure, 2,473 feet above the sea, are directly to the westward (from which quarter it is alleged that the greatest amount of rain is derived) of Enniskerry, and intervene between it and the Ballysmuttan drainage area.

"Mr. Bateman's gauge at Ballysmuttan, 750 feet above the sea, gives the rainfall as 62 per cent. greater than in Dublin, the guage in Dublin being, I presume, at an altitude of about 100 feet. This will give nearly ten per cent. increase for each 100 feet of greater elevation.

"Mr. Barrington's guage at Enniskerry, at an altitude, I take it, of 400 feet, or thereabouts, gives, for the seven years from 1853 to 1859 inclusive, an average of 33·82 inches of rain, whilst the ordnance guages at the Phœnix Park, at an altitude of about 150 feet, give an average of only 23·36 inches of rain for the same period. The rainfall at Enniskerry is, therefore, 45 per cent. greater than at the Phœnix Park, and the increase is at the rate of 18 per cent. for each 100 feet of greater elevation. So far, therefore, as information derived from rain guages will enable us to form an opinion, it appears that the rainfall is greater on the eastern than on the western side of the hills, as indeed sometimes occurs. Practically, I believe, there is little difference.

"The Vartry drainage area is due south of Enniskerry, being only three miles distant at the nearest point, and has mountains of a similar character to Kippure, &c., to the westward—viz., Warhill, 2,250 feet; Douce, 2,384 feet; Gravale, 2,352 feet; Duffhill, 2,364 feet; and Mullaghcleevaun, 2,783 feet; Tonlegee, 2,307 feet; and Glendesan, 2,684 feet above the sea, and distant from 1 to 6½ miles, so that precisely the same impediments to the deposition of rain exists in both cases.

"I scarcely think that any one will venture to assert that the rainfall in the Vartry valley, at the mean elevation of about 1,000 feet, is not, at least, equal to that at Enniskerry, at an elevation of 400 feet, both places being on the same parallel of longitude, the mean distance apart being only 6 miles, and being under précisely similar conditions as regards elevated ground on their western flanks, and from which they are both equally distant.

"If the rainfall at the Vartry were no greater than at Enniskerry, it would still give, according to Mr. Barrington's guage, for the seven unprecedented dry years before mentioned, an average of nearly 34 inches of rain, which, after deducting the 16 inches for loss, asserted to be necessary by Professor Galbraith, will leave almost 11 inches as available, equivalent to a supply of about 18,500,000 gallons daily.

"But, in addition to this, we have storage, the object of reservoirs being to impound the surplus waters of wet seasons for use in periods of drought; here the reservoirs projected will have a capacity sufficient to meet a deficiency of two inches of rain for three, or of one inch of rain for six years consecutively.

"Secondly—As to the Vartry basin, which Professor Galbraith states to be a *flat upland valley, well adapted for laying out a shower of rain to dry.*

"In this case we have no theory to apply; it is a simple question of figures.

"The head of the Vartry valley, at Calary church, is at an elevation of 825 feet, bounded on the west by the Douce mountain, 2,384 feet high, and two and a-half miles distant; on the north-west by Priest-hill, 1,132 feet high, and one and a-half miles distant; and on the north-east by Calary-hill, 1,152 feet high, and also 1½ miles distant; the average slopes of the ground from the watershed to the river are here, therefore, at the rates of about 1 in 9, 1 in 26, and 1 in 24 respectively.

"At a mile lower down the valley, on the north of Ballinasloe bridge, we have the river 770 feet, the hill on the west 2,075 feet high, and two and a-half miles distant; and the hill on the east 912 feet high and half a mile distant, the average slopes of the ground from the watershed to the river are here, therefore, at the rate of about 1 in 10, and 1 in 18, respectively.

"Just south of Tithewer, three and a-half miles from the head of the valley, we have the river 700 feet, and the hill on the west 1,565 feet high, and 2½ miles distant, the hill on the east 1,100 feet high, and two miles distant, the average slopes of the ground from the watershed to the river are here, therefore, at the rate of about 1 in 15 and 1 in 26, respectively.

"At Roundwood we have the river 660 feet, the hill on the west 865 feet high, and half a mile distant, the hill on the east 782 feet high, and also half a mile distant; the average slopes of the ground from the watersheds to the river are here, therefore, at the rate of about 1 in 13 and 1 in 22 respectively.

"The central part of the valley is throughout flatter than at the sides, or outer portion of the collecting ground, which is of steeper slopes than the averages I have given above; it is also rocky upland, which circumstances I think perfectly justify the expression in my paper, viz.—'Here the upper portion of the collecting ground is steep, from which the water would flow off rapidly.'"

THE NEW VESSELS FOR THE GALWAY LINE.

WITHIN a very limited period the Atlantic Mail Company will be re-inaugurated under a new *regime*. As the undertaking is a national one, a few particulars of its new fleet will be read with interest:—

The Hibernia (recently launched) was built in 1860 by Messrs. Palmer and Co., of Newcastle-on-Tyne. Her length over all is 375 feet; length over keel, 360 feet; breadth of beam, 40 feet; breadth over paddles, 70 feet; and her depth of hold. 32 feet. She is built with seven water-tight bulk heads, or eight water-tight compartments, so that in case of a leak breaking out in one part of the ship it would be confined to the particular compartment in which it occurred, and the safety of the vessel would be in no way affected by it. Her engines are 800 nominal horse-power, but are capable of working to a power immensely beyond that figure. They were built by Messrs. J. B. Palmer and Co, of Newcastle-on-Tyne, and consists of three oscillating cylinders of 88 inches diameter, with a seven feet stroke. Besides there are auxiliary engines of seventy-five horse-power for working air and other pumps, and also two small donkey engines to fill the boilers, wash the decks, &c., which, when in harbour, are worked with separate boilers. The steam for main engines is generated in eight boilers, heated by forty furnaces. The boilers are fitted up with Beardman and Galloway's patent super-heating apparatus. The boilers represent 20,000 square feet of heating surface, and the bunkers are fitted to carry 1,400 tons of coal. The saloon is 108 feet in length, and 20 feet wide. It is furnished with two long lines of tables, with moveable seats on either side, and is capable of accommodating 200 persons at table. Her register is 3,000 tons, and her burthen 4,400 tons. On her official trial, at the measured mile in Stoke's Bay, she accomplished an average speed of 14½ knots an hour, or 16¾ miles, in the teeth of a heavy nor'-west wind. The Columbia (also recently launched) was built by Messrs. Samuelson and Co., of Hull, and her dimensions are those of the Hibernia. Her engines also are of 800 nominal horse power, with two oscillating cylinders of ninety-eight inches diameter, and eight feet stroke. She has also got auxiliary boilers fitted up with Partridge's patent super-heating apparatus. The Anglia, which is to be a sister ship of the Columbia, is being built also at Hull, and will be launched about the middle of May. The Adriatic is also a magnificent ship, and has weathered many a gale gallantly.

PROCEEDINGS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

On the 18th ult. this body held its usual periodical meeting, and the venerable Professor Donaldson was deputed by Sir Gardner Wilkinson, F.R.S., to read a paper by him on "*The Saracenic style of architecture distinct from the Byzantine*," an abstract of which we reprint as follows:—

"That the Saracenic is borrowed from the Byzantine is perfectly true, and this is quite in accordance with the history of other styles, but though any one of them may be originally derived from a predecessor, it is not on that account precluded from assuming a new and independent character when it has remodelled and adopted those elements it found suitable to its requirements, and has made them its own, and in all cases it may be safely predicted that each new style is derived from more than one parent. The architecture and artistic ornament of ancient Greece are sufficiently decided in their character, and yet if we were to claim from them all they derived from others, we would deprive them of many most essential features, and should prove that we had not observed how this very habit of adoption and adaptation was one of the merits of the Greeks. They perceived the beautiful wherever it presented itself, and they scrupled not to borrow even from the so-called "Barbarian," who in early times was as much more advanced in taste than the Greeks as the Saracens were than the Crusaders who affected to despise them; and it is this very habit of adoption and adaptation which we should do well to practice at the present day in preference to the too frequent effort to introduce some novelty, from a love of variety, of notoriety, or the mistaken notion of invention in art.

"At the period of their earliest conquests, when the Arabs advanced into Syria, and captured Damascus, in the summer of 634 A.D., neither their wants nor their taste had aspired to the erection of buildings dignified by beauty of design; and the practice of architecture was still unknown to them. They were only acquainted with a very primitive form of building in their own country, and for some time after they had established themselves in Syria and in Egypt they employed Christian architects, and were not themselves sufficiently acquainted with the arts of construction to erect any large building. As the early Christians adopted the basilica, or in some cases the Pagan temple, the Moslems sometimes adopted the Christian church, or borrowed ideas from their Pagan predecessors; and in many instances the churches of a conquered province, having been relieved of the distinguishing emblems of Christianity, were readily appropriated to the unadorned services of Islam. Indeed they were sometimes satisfied in obtaining from the Christians half a church as a place of worship, and the great church of St. John the Baptist, at Damascus, continued to be the joint property of the two religions from the capture of that city in 634 A.D., to the reign of the Ommiade Caliph Weleéd, A.D. 706, and though said to have been then pulled down and replaced by the present mosque, and to have received the name of Giama-Beni-Omméek, or El Ammowee, from its supposed Ommiade founder, it evidently was merely altered by him; and the decay of the whitewash and stucco on the exterior of the walls supporting the great dome, with which the scruples of the 'faithful' then covered and concealed the coloured mosaics and their golden ground, reveals here and there the original ornamentation of a Christian time. Moreover, from appearance of this rectangular building, it is evident that the roof above its pediment was heightened at the time when the dome was super-imposed upon it, and that the side and end walls, including the pediments, are of Christian date; so that we at once perceive how much has been introduced by the Moslem architects upon the once continuous line of the roof between the two pediments. Mr. Porter also states that on its inner walls and piers this part was coated with the finest marbles, in beautiful patterns; while on portions of the wall above, and on the interior of the dome, may be seen fragments of fine mosaic, representing palm trees and palaces. There is also a Greek inscription of Christian time, of which he gives a copy, and which with the mosaic and its general plan, sufficiently establishes the date of the building. The dome, according to Mr. Porter, is nearly 50 feet in diameter, and about 120 feet in height.

"The few mosques, erected about that time by the Arabs in Syria, were marked by many characteristics of the Christian style, and certain Byzantine features continued to be attached to them in that country; but these were chiefly confined to the cupola and ornamental accessories, and even then every new building acquired that variety of feature which, through their extended conquests, was speedily introduced into the architecture of the Arabs. In Egypt, Barbary, and other countries, the same number of Byzantine elements did not find a place, even in the earliest mosques, and this is only consistent with what might be expected, since their style was at first that of each country where they happened to be erected, and we are not, therefore, surprised to find that in those of the oldest time the dome is wanting in Egypt and in Barbary; and the principal characteristics of Byzantine architecture are rarely, if ever, to be traced there. Indeed, it was not till a much later period that the dome held an important position in the mosques and tombs of Cairo, and the oldest raised there were those which bore the least affinity to the Byzantine style, as I shall presently have occasion to show. Nor do Saracenic mosques present the most distinguishing features of that architecture. We look in vain for that arrangement so peculiar to it—of the upright wall with its row of arches standing over others springing immediately from columns, so well known in Sta. Sophia, at Constantinople; in San Vitale, at Ravenna (built also in the time of Justinian, A.D. 534), and in other churches; nor are the bridge-like galleries, or columnar screens, so remarkable at St. Mark's, in Venice, met with in any Arab mosque.

"These and other Byzantine features are as much at variance with the character of a Saracenic building, as would be the triforium of one of our cathedrals, and while Byzantine churches differ in their character from an Egyptian mosque, what can be more unlike the former than the earliest mosques of Cairo? as for instance those of Amr, of Ahmed-ebn-Tooloon, of El Hakem, built, the first about 642 A.D., the second in 876 A.D., and the third in 1003 A.D.; in none of which did the founders introduce the dome, or any of the most marked peculiarities of Constantinople. If we compare their hypæthral rectangular court, and the covered corridors that surround it, with their flat roof, to a Byzantine church, I will venture to say that no plan or elevation could be found more at variance with it, and the very feature which claims the most marked relationship to the Byzantine style—the dome—was not introduced into the open court till centuries afterwards, or about the end of the thirteenth century.

"Such hypæthral courts with their surrounding colonnades bear a much nearer resemblance to those before ancient Egyptian temples; and the area and portico of Luxor or of any other of those marked monuments, might be thought at first sight to have a claim to be the prototype of those Moslem courts. Even the colonnades of a Roman forum, and of some Roman temples like that at Zaghwan, near Tunis, or like those round the courts at Baalbek, with a similar peristylar arrangement, bear a greater resemblance to those of the works than any Byzantine building. In the Arab edifices above mentioned we see no domical structure, nor any of the peculiarities of Byzantine architecture, and the cupola or kobbeh, in the area of the mosque of Ahmed-ebn-Tooloon was not put up till the reign of the Melek Munsoor-Hesam-e'deen-Lageen, A H. 696, in the month of Saffer (answering to A.D. 1297–98) as recorded in the Arabic inscription it bears.

"The conquest of Egypt began in 638 A.D. Babylon, afterwards called Fostat, and now Old Cairo, was taken by Amr in 639, and Alexandria at the end of 640; and soon afterwards the whole of Egypt fell into the hands of the Arabs. It was at this period, A.D. 642, that the two mosques were first founded, which still bear the name of Giama-t-Amr; one near old Cairo, the other at Asooan; and the tent of Amr, like those commonly used by the Arabs, of goat's hair, being called Fostat, gave its name to the new city which took the place of Egyptian Babylon.

"The mosque of Amr, therefore, being the first erected by the Arabs in Egypt, or, indeed, in any of the conquered provinces, is of the highest interest in the history of Saracenic architecture. Nothing, however, appears to exist of the original structure; and the only part which dates during the first century of the Hegira is probably a portion of the exterior wall on the south-eastern side, which bears the impress of a mode of building common at that period. Indeed, the whole edifice was altered and apparently rebuilt between the years 642 and 712 A.D.; and as at first it measured only about 75 feet in length by 45 feet in breadth, its plan must have undergone considerable changes ere it reached its present dimensions.

"In the reign of Abd-el-Melek (the son of Merawan I.), great alterations were made by his brother, Abd-el-Azees, about A.D. 699, and by Weleed in 712–713, as well as by the Abbaside Caliphs; and under Mamoon the son of Haroon E'Rasheed, its dimensions had increased to about 435 feet in length by 225 in breadth. It was also repaired by Ahmed-ebn-Tooloon, and by his son; by El Hakem-le-Omr-Illah; by Yoosef-Salah-e'deen (Saladin), and by others. Extensive additions appear also to have been made at the beginning of 1400 A.D., and other repairs date as late as the time of Murad Bey, at the close of the last century.

"In the earliest periods of their history the Arabs were satisfied with imitations, or modifications of the buildings of each district where they settled, and this explains the diversity which exists in the character of those raised by them, and by the native architects they employed in different countries, while it accounts for the subsequent combination of various elements in their architecture when they became sufficiently advanced to form a new and independent style. For we must recollect that the Moslems, from the time they conquered Syria, Egypt, Western Africa, Persia, India, and other countries, about 80 years after the death of Mohammed, had added whole populations to their ranks, they had long ceased to be merely rude invaders from Arabia, and their converts, long practised in the arts and architecture of their respective provinces, brought with them the knowledge possessed by the Byzantine Greeks, the Copts, the Persians, the Indians, and others who had joined their ranks. No wonder, then, that with such varied contributions to the common stock the new architecture was marked by the remodelled types of so many different styles. The Byzantine Greeks gave it many of its earliest ornamental devices and other features; the Copts, more in favour in Egypt than the Greeks their religious and political rivals, were constantly employed in that country by the Moslems as builders; Persia, as history and the infallible evidence of style proclaim, had the greatest influence on the character of its oldest buildings; and we know that architects from that country had long before been employed by Justinian at Constantinople.

"India, too, furnished numerous marked features, among which may be noticed the minaret, the merab, or niche of prayer, the bracket, and other peculiarities of its monuments; and many instances might be adduced of the spread of the prevailing characteristics of different styles throughout the most distant countries conquered by the Arabs. Some were less readily adopted in certain districts, owing to previous predilections, or to the nature of the climate. In one place covered buildings were a necessity—in another they were not required; and thus, while previous habit suggested the addition of the dome in Syria and some northern countries, the Egyptian Moslems did not admit it till a later time, and then only as an adventitious feature gradually welcomed by them, through the influence of the Kurd, Turkman, and Circassian Soltans, who succeeded to the throne of Egypt after the dissolution of the Fatemite Caliphate in 1171 A.D. For the oldest mosques in Cairo of 879 and 1003, as we have already seen, have no dome or other distinguishing feature of Byzantine architecture; and the small one in the court, covering the font of ablutions, is of later time. They consist, as I have before stated, of the hypæthral court surrounded by colonnades, with a minaret on one side or at two or more of the corners; and the hypostyler portion of the upper, or prayer, end, and was covered by the same kind of flat roof as the corridors of the court.

"Of the architecture of the Abbaside Caliphs we know little, though the distinguished leaders of that dynasty were great encouragers of architecture as of all the sciences and arts; and the only building now remaining of that period in Egypt is the Mekeeas, or Nilometer, in the Isle of Roda, which, founded by the Caliph Mamoon, was rebuilt by El Motawukkel-al-Allah-Gafer, the tenth prince of that dynasty, A.D. 862; and the peculiar character of its Cufic inscriptions prove it to be of that age. M. Coste thinks they are of 198 A.H. (814 A.D.), and of 233 A.H. (848 A.D.), but they are, at all events, not later than the time of El Motawukkel, or 862 A.D.

"At Kairawan, in the modern regency of Tunis, the old capital of the Fowatem or Fatemites, the founders of Musr-el-Kahirah or Cairo, the pointed arch is thought to date at a very early period, and one which I was shown at Kairawan, in a building covering a well, is reputed to be coeval with the Sahaba, or companions of the Prophet. I need scarcely say that this is more than improbable. We cannot believe it to be of the age of Moawiah, in whose reign the city and the great mosque were founded by Ogba (Okba), A.D. 670, according to Leo Africanus; and though the simple corbelling of the dome, in the upper part of the building, gives it an early appearance, it does not seem to date as early as Ibrahim-Ebn-Agleb (Akleb), who established the new dynasty of the Aglebites in Africa, A.D. 800, and who added so much to the city that he was considered its second founder. He was the same who built the suburb called Rasheed; and the port of Mahdeeh was founded by El Mahdee, the first of the Fatemite Kings of Africa, about A.D. 910; and if I mention these two places, it is because future travellers in that part of the country may have opportunities of making inquiries there, which I was unable to do, being obliged to return to Tunis in time for the departure of H.M.'s ship Beacon, and in which my lamented friend, Captain Graves, had kindly given me a passage from Malta. Unfortunately the difficulty of examining any building at Kairawan and the neighbourhood has till lately been very great, owing to the prejudices of the Moslems, who look upon it as a holy city, and are everywhere in Barbary averse to European intrusion; and when I went there in 1845 only two other Christian travellers had been permitted to lodge within its precincts. I was, however, enabled to make many more observations than I had expected, owing to my speaking Arabic, to my travelling in the Eastern dress, and to the opportunity I had of meeting and overcoming the objections of the people, which last happened in this manner: On leaving the Governor's house I was warned to be very prudent, and not to excite attention by attempting to draw or write while anyone was in sight, particularly while going near the mosques. I took care, therefore, whenever I ventured to make any memoranda, to do so under the cover of my capacious bornoos; and I had succeeded in avoiding all suspicion, till, on coming opposite the eastern gateway of the Great Mosque, I stopped to examine its pointed arch. Thinking that no one was within sight, I proceeded to make a hasty sketch of it, when some of the faithful, whom I had not perceived within the gateway, came forth in great anger to inquire into my most suspicious proceedings. It was too late to stop and affect innocence—my offence was too evident; therefore, without waiting for the outburst of their indignation, I advanced to meet them, and, after the usual salutations, told them I had come from Cairo, where the learned declared that the Egyptians had invented the pointed arch, but that as the Fowatem princes went from Kairawan to Musr-el-Kahirah (Cairo), and used the pointed arch at that time in their buildings, there was a possibility of its having been employed long before at Kairawan, and I was therefore anxious to know if they could produce any proofs of a prior claim. This so disarmed their prejudices that, with a view of maintaining the claims of their city, they took me to every pointed arch in the place, except, of course, in the interior of the mosques; and though disappointed in my hopes of meeting with some of great or well-defined authority, I was enabled to see the one already mentioned, and to copy the Cufic inscription at the city gate, as well as to make other observations and even hasty sketches of the buildings themselves.

"The Great Mosque is rectangular, surrounded by a high wall, with numerous projecting buttresses and towers, at intervals; 174 faces north and south, by 101 east and west, having had originally eight entrances, four on the east and four on the west side, some of which are now closed, and over each gateway is a cupola. The interior I believe to consist of the usual hypæthral court, surrounded by colonnades, with a deep hypostylar hall at the south, or Mekkeh end. There is nothing on the outside which has the appearance of great age; and, from what I could learn, it has been often repaired and probably remodelled at various times, though they pretend that it was always restored in exact imitation of the earlier work. The principal minaret, which is called Soma, stands on the north side, towards the north-east corner. It is a square tower, consisting of three tiers or storeys, capped by a small dome or cupola, and it is said to be the oldest part. It has round-headed arches, but one over the door on its western side, has a slight inclination to the pointed form. Over the eastern and western doors of the mosque the arches are pointed; but these are probably of no very early time, though the corbelling of the cupolas is very simple. They are not very unlike in this respect to the cuboletta at Palermo, and St. Giovanni degil Eremiti, built about 1132; and in one place under the side arches, before the eastern gate, is an Arabic inscription. The round horse-shoe arch generally prevails throughout the exterior of the mosque, and though some are of an oval form, nearly resembling the pointed, few are decidedly of that character except those before mentioned. In the centre of the court is a lofty dome, visible above the walls, similar to, though higher than those in the mosques of Cairo, where ablutions are performed before prayers. I afterwards visited another mosque with three arches in front, which are round, inclining slightly to the pointed form, and with a certain appearance of age, but which is contradicted by the date of the Cufic inscription above them, showing that they were erected A.H. 846, A.D. 1443.

"The facts already stated are, I trust, sufficient to disprove the opinion that the Saracens had no style of architecture, and that it was merely Byzantine. They also explain why, in the remotest parts of Islam, one edifice was found to resemble in many of its characteristics another founded in Barbary or in Egypt; at the same time that they show why others were different, and why certain countries had their own peculiarities. Indeed it is easy to perceive how it happens that, though the Saracenic borrowed from the Byzantine, its character was so distinct. Nor is it a singular instance of the career quite independent of the predecessor to which it was indebted for its earliest features.

"It has been thought that because the Greeks were sometimes employed by the Sultans of Egypt to erect or embellish their mosques, that these must necessarily be Byzantine; but, so far from this being the case, they fail to be a counterpart of that style, either in their plan or their elevation. Moreover, Copts were at one time as much, or probably more, employed in Egypt as builders; and certain characteristics prove how greatly the Arabs were indebted to the Persians for their assistance and example. I may also observe that many domes of their mosques have more of a Sassanian than of a Byzantine character; as may be seen from the palace of Serbistan, and the great mosque of the Tak-Kesra (given by Mr. Fergusson, in his Handbook of Architecture), which last was built by Mushirvan, or Chosroe (Khosrou), the contemporary of Justinian, calls to mind the large vaulted recesses of the Arabs of later times, such as we find in the mosque of Soltan Hassan, at Cairo; and it is not improbable that Persian taste, welcomed by Justinian while raising the numerous edifices with which he beautified Constantinople, may have also had its influence on Byzantine architecture.

"If the Saracens on their first issuing from Arabia adopted the churches of the Christians as places of worship, or availed themselves of the assistance of Greek, Copt, Persian, and other architects, in erecting their mosques, they did not object at much later periods to profit by similar assistance, nor distain to borrow from the architecture, and even the materials of the churches of the conquered provinces, and a mosque at Cairo, which by the inscription it bears, proclaims that it was built by Naser Mohammed, in 698 A.H. (1299 A.D.), has a doorway brought from one of the churches at Akka (Acre), in Syria. In other parts it displays throughout the characteristics of the Saracenic style; but the doorway is singular among those of Egyptian buildings, being, of Christian (so-called Gothic) style, with clustered columns supporting a cusped trefoiled head, such as might be met with in one of our churches. It is probably of the early part of the 13th or the close of the preceding century.

"This work is also remarkable for the character of its cupola, ornamented with the fretwork which afterwards became so elaborate and florid in the Alhambra and Alcasr in Spain, and which is rarely seen at the mosques in Cairo.

"If the golden and coloured mosaics were used at Alexandria, and obtained the name of *opus Alexandrinum*, they were simply derived from the same source as those of Constantinople, and were quite unconnected with the Arabs and their architecture, of which, indeed, they never became marked features, except in the houses of Aleppo and Damascus. They adorned a niche of prayer, and a few isolated members of a wall, as of a pulpit or some portion of an early Italian church, and neither these nor any other solitaryfeatures are of any importance in the consideration of an identity of style.

"The fact is, the term 'Byzantine' has been often used in a vague and inconsiderate manner, and it has been too hastily supposed that every building, in which the dome is a dominant feature, was indebted for it to Constantinople. But not only was the dome not confined to that style, but it was not even first used by the Byzantine Greeks. In Italy, and in some other countries, it descended directly from its first originators—the Romans, without being derived through an intermediate Byzantine channel, and if it passed through the Greeks of Constantinople to the eastern provinces of the empire, it was transmitted to them with certain modifications merely, by the followers of those by whom it had been originally invented, and the credit of its first application on a grand scale belongs evidently to the Romans.

"The Byzantine style has certainly its claims on the gratitude of the Saracenic architects for having transmitted to them certain architectural features, of which they availed themselves during the formation of their own; but it must be also admitted that they soon learnt how to develop and improve upon, and that they were as much or more indebted to the Persians for the early formation of their style. The changes, too, which the Arabs introduced into the dome, were such as to give it a new character. At the same time all will allow that Byzantine architecture was less removed from that of Rome than was the Saracenic from the Byzantine; yet no one thinks of questioning the existence of a Byzantine style, nor should we doubt the propriety of giving a new name to any of those styles which has partly grown out of a predecessor. If we refuse to admit this we should deny the well-known progress and development of art, and should view architecture as if it had no history, and it would be as reasonable to disbelieve the existence of various languages, because they had proceeded from one common origin."

An interesting discussion followed, in which Messrs. Fergusson, Kerr, J. W. Papworth, and the Chairman (Mr. Godwin) took part.

A special meeting was also held on the 25th inst., to consider the recent appointment of Mr. Bonomi as Curator of Sir John Soane's Museum, resulting in a resolution carried by 26 against 10, to the effect that "there was not sufficient evidence of qualification."

ROYAL NATIONAL LIFE-BOAT INSTITUTION.

The annual general meeting of the friends and supporters of this institution was held on Thursday at the London Tavern: Admiral the Earl of Hardwicke, in the chair. The meeting was influentially and most numerously attended.

The noble Chairman expressed the pleasure he experienced in taking the chair on the anniversary of so important and national an institution, as that of the Life-boat Society. As its philanthropic objects became more known and appreciated they would be supported by the public at large (hear, hear). The large fleet of life-boats which the institution now possessed required constant outlay to keep them in a state of efficiency; but he felt that no work of mercy and humanity—such as that so successfully carried out by the national Life-boat Institution—would ever lack support in a maritime country like ours (hear, hear). After having dwelt on some other points, his lordship called on

Mr. Lewis, the secretary, to read the annual report.

The report began by stating that year by year the field of the operations of the National Life-boat Institution had extended, its life-saving fleet had been added to, and the greater in proportion to the number of wrecks on our coasts had been the number of lives that have been saved from premature death through its instrumentality. By its Charter of Incorporation the institution was now legally entitled, by the bequests of deceased persons, to possess landed property to the amount of £2,000 per annum. Her Majesty the Queen, who since 1837 had been the patroness of the Society, had, in appreciation of the important and national character of the work of the institution, become an annual subscriber of £50. During the past year it had established 17 new life-boats on the coast, and others were in course of construction for several other places. The institution now possesses no less than one hundred and ten life-boats. Some of them had been directly instrumental in saving *two hundred and ten lives* from thirty-four vessels during the preceding year. Since the 1st of January last, the life-boats of the Society had also saved no fewer than one hundred and sixty-two persons. The committee had taken steps to provide the life-boat stations of the institution, wherever desirable, with standard barometers, properly fitted up, and the daily indications of which would be registered on a chart or diagram by the side of the instrument. The total number of wrecks on the coasts of the United Kingdom during the past year, was 1,379. The average of the last seven years being 1,184, whilst the total loss of lives in 1860 was 536, the average for the last seven years being 800. The number of lives saved during the year 1860 by the life-boats of the institution, the rocket apparatus, and other means, was 3,697. The total number of persons saved from shipwreck from the establishment of the institution to the end of the year 1860, either by its life-boats, or for which it had granted rewards, is 11,856. During the past year the institution had granted 16 silver medals, 14 votes of thanks inscribed on vellum, and the sum of £1,111 12s. 4d. in pecuniary rewards, for saving 455 shipwrecked persons. The operations of the institution may be thus briefly stated:—Since its formation it has expended on life-boat establishments £46,350 8s. 3d., and has voted 82 gold and 673 silver medals for distinguished services for saving life, besides pecuniary awards, amounting together to £14,015 19s. 11d. Its medals and other honorary awards are much coveted by the coast boatmen and men of the Coast Guard service, and the amount and prompt payment of its pecuniary rewards, afforded general satisfaction. Its medals were not unfrequently presented at public meetings. The total receipts during the year 1860 amounted to £14,027 11s. 2d.; of this sum no less than £2,721 had been given by philanthropic individuals to defray the cost of *fourteen* life-boats. Legacies had also been left to the institution during the past year by several benevolent persons. The expenditure during the same period had been £13,085 8s. 11d., of which sum £6,834 17s. 4d. was expended on additional life-boats, carriages, boat-houses, and necessary gear, and £3,056 3s. on the necessary expenses of repairs, painting, and refitting, £1,266 15s. 10d. in rewards for services to shipwrecked crews, and £1,665 6s. 2d. on coxswains' salaries, and for the quarterly practice of the boats' crews. The institution had incurred further liabilities amounting to £4,419 for various life-boat establishments, &c. Whilst the committee were, happily, able to report so favourable and encouraging a state of the financial department of the institution, they felt that looking at the vicissitudes of the future and the unforseen magnitude which the operations of the society had assumed, they must not for a moment relax their endeavours to enlist that co-operation and pecuniary assistance of all classes of their countrymen, which can alone secure the permanent efficiency of the important work which they had undertaken to superintend. They therefore appealed to the country at large to assist them to maintain in a state of thorough efficiency the numerous life-boat establishments of the institution.

The report having been moved and unanimously adopted,

Various other resolutions pledging the meeting to renewed exertions on behalf of the truly benevolent and national objects of the institution, and the usual complimentary vote of thanks having been given to the chairman, and the same having been acknowledged, the proceedings, which were of a very interesting character, terminated.

Arrangements for the Belfast Show.—The Royal Agricultural Society of Ireland will have a Cattle and Implement show in Belfast very shortly, and Mr. Birmingham is at present in Dublin arranging with the exhibitors at the Royal Dublin Society Show.

South Mayo Agricultural Society.—The objects of this newly formed society are to promote the interests of agriculture, to the advancement of rural economy within the district, by attending to the regulations of markets, fairs, &c.; by offering suggestions for the social and moral improvement of farm servants, and plans of cottages, farm buildings, &c., and by taking evidence in recording at the close of the season the prices of Agricultural produce, not otherwise ascertained, to hold a Cattle Show in the Month of September, annually, at some Town within the District, where prizes shall be awarded for Stock, &c. The first Show of Cattle, Sheep, and Agricultural produce, shall be held in Ballinrobe, where there will be a public dinner.

ULSTER HALL, BELFAST.

THE buildings now in course of erection under the title of the Ulster Hall—the subject of our illustration—form a parallelogram, 235 feet by 90 feet, running from Bedford-street to Linen Hall-street, the entire space occupied being nearly half an acre of ground. The general arrangements of the place has the great hall with corridors on either side, forming the central portion of the building. In front of this, and extending to Bedford-street, is the wing which contains the principal entrances, waiting rooms for audience, lobbies, &c., and over these on the second storey the minor hall; in the rere, extending to Linen Hall-street, is that containing the rooms provided for the accommodation of the performers, the board-room, rooms for porters, kitchen, and other offices. The principal entrance is from Bedford-street, through an arched piazza, 16 feet wide, under which carriages can set down. Opening on this is the vestibule, 30 feet by 28 feet, with a waiting-room 25 feet by 17 feet on either side, and retiring rooms also attached. The vestibule leads to a lobby 12 feet wide, extending along the end of the central hall, giving access to it and to the corridors, and containing the principal staircases to the galleries and minor hall. The minor hall, which is intended for the purposes of smaller concerts, lectures, and exhibitions of works of art, is 68 feet by 32 feet, and will give seat accommodation to 400 persons. It will be principally lighted from the roof.

The great hall—which is the principal feature in the building, will be much larger than any music hall in Ireland, and exceeded by very few in Great Britain—is a parallelogram of 138 feet long by 63 feet wide by 63 feet high, with the angles cut off by curves 10 feet radius; the ceiling will be flat, with circular coves and panelled. Around three sides of the interior will run a gallery 10 feet 6 inches wide, and which is intended for the first-class seats. Along either side of the hall a corridor 8 feet wide and two storeys in height is inten-thus giving the greatest possible facilities for the ingress and egress of audiences, and for the classification of seats. The entire seat accommodation, including galleries, is for an audience of 2,000 persons. The orchestra will accommodate 300 performers, beside space for organ, &c. The rooms in the rere wing, for the accommodation of the performers, will communicate with the orchestra by passages affording separate entrances for the solo and chorus performers. The entrance to this wing will be from Linen Hall-street. In addition to the principal entrance there will be two others in Bedford-street, communicating directly with the corridors, and also a carriage-way entrance in Franklin-street.

The building is being principally erected in brick; the principal front in Bedford-street will have the piazza of stone, the remaining portion of the front being finished in cement, with stone architraves and dressings to windows. The front in Linen Hall-street will be finished in red brick, with white brick dressings. The works are at present more than half advanced to completion. The contract has been taken by Messrs. D. and J. Fulton, and is being carried out under the immediate superintendence of the architect, Mr. W. J. Barre.

OPENING OF THE FIRST STREET RAILWAY IN LONDON.

THE indefatigable George Francis Train has succeeded in the consummation of his desires to introduce his street railway system into London, and that too in the face of an opposition which nothing but extraordinary energy and determination of purpose could have surmounted. So far the trial at Birkenhead has proved most successful, but "circumstances alter cases," and a line of road from a ferry to a park in a provincial town presents less impediments to facility of locomotion of *any* character, than a leading thoroughfare in an over-crowded metropolis. Besides there are other obstacles in the latter instance, not the least of which are the slowness of the public to appreciate anything of innovation upon the old "humdrum" system, however great the improvement may be; and again the determined opposition of that portion of the community whose pecuniary interests are affected detrimentally. For better for worse, however, as the sequel must within a limited period tell, the system has been inaugurated in the modern Babylon amid vociferous cheers on the one hand, and groans "not loud but deep" on the other. A goodly gathering of gentlemen (of the Press), besides some members of the aristocracy and the First Commissioner of Works were present at the proceedings, and afterwards did every justice to the hospitality of the world-renowned street railway promoter.

The line extends at present from the marble arch towards Notting-hill, but is little better than a mile in length. It is, however, projected to extend the system considerably both in this locality and elsewhere in London, should the experiment prove satisfactory. The "cars" are of similar construction, if not perfectly identical with those already described by us as in vogue at Birkenhead, and were built by Messrs. Prentiss and Co., of that town. Both externally and internally they are an immense improvement on the old 'busses, and the caparisoning of the horses—which are high bred—contributes much to the general appearance.

FINE ARTS AND ORNAMENTAL ART EXHIBITION—ROYAL DUBLIN SOCIETY.

FOR some time past all has been "bustle" in the Agricultural Hall, preparing for "the show" of cattle and implements which commences on the 2nd inst., as well as for the approaching art and art manufacture exhibition which will in its footsteps quickly follow. Indeed the energy displayed is truly commendable, and suggests much reason for hope, that the slowness of temperament for which at least we enjoy a national reputation amongst our friends at the other side of the Channel is gradually fading away, and that Irish enterprise and anxiety to be elevated socially and commercially are developing themselves *surely*, however marked by tardiness may have been our antecedent career. We would be the last to throw a damper on well-directed exertions, and though as regards matters of detail we sometimes have been compelled to take an exception, nevertheless we unite most heartily in wishing the intended exhibition every success. Preparations are now in a very forward state, indeed, excepting the decorations of the hall and the arrangements of the stands and fixtures, everything is ready, and these will be proceeded with immediately after the show is over and all cleared out. On the boundary and other walls a suitable ground of timber-work, covered with crimson cloth, will be prepared for the reception of the pictures, and a magnificent collection, including some we believe by the first Belgian, Flemish, Dutch, French, Italian and English artists, together with the "Sheepshanks" series from the Kensington Museum, and from the Royal Galleries, is expected. The nave and aisles will be—we doubt not tastefully—arranged with sculpture, banners, &c., and in the galleries the jewellery, needle-work, embroidery, &c., departments will be placed. The assistant-secretary to the committee—Mr. Parkinson—has been for some time in London and elsewhere soliciting art contributions, and we are informed with great success. We are much pleased in announcing that the orchestral arrangements will be under the direction of our talented fellow-citizen—Mr. R. M. Levey—who for many years has contributed largely to the gratification of the music-loving portion of the community in his capacity as leader at our national theatre and at the various principal societies in the city. A magnificent organ by Messrs. Bevington and Sons, of London, constructed for the Sydenham Palace, is being erected in the Grand Hall, and will form not the least interesting feature. The general dimensions of the hall are 240 feet by 30 feet wide for the nave, with aisles of the same length by 17 feet, and 23 in width, respectively, at either side, the latter forming the Picture Gallery. The roofs of each are semicircular and decorated. An area of about 2,000 superficial yards is afforded for the display of Pictures. Refreshment and retiring rooms for Ladies are being erected outside the boundary wall of the court-yard. All so far seems to promise a period of much enjoyment, and we trust that the several steamboat and railway companies of Ireland and the Kingdom generally will perform the part which the public is reasonably entitled to expect from them in offering every facility for streams of visitors to the city while the exhibition remains open.

BALBRIGGAN AND SKERRIES FOR A HARBOUR OF REFUGE COMPARED.

A CORRESPONDENT (W. I. Earls) directs our attention to the advantages presented by Balbriggan before Skerries for the construction of a harbour of refuge, for which there is a great want on the eastern coast; and referring to the latter says—"As one well acquainted with the locality, I do not think it would be advisable to expend a large amount of money on the construction of works, the success of which would be questionable. At present Balbriggan has a pier extending more than 600 feet in length, built by the late Baron Hamilton at a cost it is said of upwards of £15,000. Many vessels have been saved here in easterly and south-easterly gales, but it is open to the north and north-east, and I have known vessels to be wrecked trying to make the harbour during the prevalence of storms from these points. Ships are constantly cast away on the rocks under the Martello Tower for want of a pier or breakwater extending therefrom to within a convenient distance of the present pier head, and were this erected it would cut off the current which at present sweeps along the strand, and send the swell to expend itself on the rocks to the south of the tower. An eminent engineer estimates that the space enclosed would be 11 acres, and the cost of construction less than £4,000, to secure a harbour of refuge easy of access, free from drift sand, and at a considerably more moderate cost than in the case of Skerries."

[We are not prepared to argue this point fully at present, but from a superficial observation must state that as the first indispensable in a harbour of refuge is abundance of water to float craft at *every stage of the tide*, our correspondent's theory would seem to be problematical, inasmuch as Balbriggan harbour is *all but dry* when the *tide is out*. We insert the remarks, however, as they probably may lead to further correspondence on a subject in which we and the public generally must feel an interest.—ED.]

OF THE
UNIVERSITY OF ILLINOIS

NEW CHARTER FOR THE ROYAL HIBERNIAN ACADEMY.

IT had been already announced in our columns that an election of some additional architect academicians of this institution recently took place, and the ratification of the choice of the body, awaited the arrival of the charter. This royal instrument has at length arrived, and the following are the names of the academicians in the order recited therein, who it will be observed are increased from twenty to thirty. President and Trustee—Catterson Smith; Treasurer—George F. Mulvany; Secretary and Trustee—Bernard Mulrenin; Keeper—Matthew Kendrick; Academicians—Thomas Bridgford, William Brocas, Frederick W. Burton, Martin Cregan, Hugh Frazer, Charles Grey, Henry Macmanus, Patrick Vincent Duffy, Edwin Hayes, Michael Angelo Hayes, Edward Hayes, Andrew Nicholl, George Sharp, Daniel Maclise, and Francis Danby, artists; Terence Farrell, Joseph Robinson Kirk, Thomas Alfred Jones, Thomas Farrell, and John Henry Foley, sculptors; Sir Thomas Deane, Charles Lanyon, Patrick Byrne, J. J. M'Carthy, William George Murray, and John J. Mulvany, architects. The members of the academy had originally decided to have the name of our distinguished countryman, William Mulready, R.A., enrolled in the new charter; but that gentleman declined the proposed honour on the ground of his advanced years, and preferred the request that he might be placed instead upon the list of honorary members of the academy. We sincerely hope that under the new constitution additional vigour will be infused into this body so pre-eminently qualified to take a position amongst the first art institutions in the kingdom.

THE UNITARIAN CHAPEL COMPETITION—EXTENSION OF TIME.

WE learn that the committee entrusted with the arrangements for erection for a new meeting-house in Stephen's-green for the Unitarian congregation (as already noticed), have almost at the last moment decided on extending the time for sending in plans to the 26th inst. On principle we believe that such a course is both *injudicious* and *unfair* to the competitors generally, but more especially in the case of *limited* competition, which this is, inasmuch as that architects usually suit their office arrangements, and sometimes incur extra expenditure to meet hurried business, and which would be rendered unnecessary if timely notice of the *precise* period their plans would be required were given in the first instance; besides it *suggests* an assumption of there being *sub rosa* favouritism towards those who were "caught napping," and at last moment seek for an extension of indulgence. We have no personal interest in the matter in question, and our remarks are intended to apply *generally*.

THE MIDLAND GREAT WESTERN RAILWAY TERMINUS.

IN a former number we alluded to the extensive alterations in progress at this building, which is of such comparatively recent erection, comprehending the entire reversing of departure and arrival arrangements. Why the necessity for this important outlay was not obviated in the *first* instance we are not now disposed to enquire, though, perhaps, for obvious reasons we might be justified in offering an opinion, but quote from the *Freeman*, the following paragraph descriptive of the works in question:—

"To-day or to-morrow the alterations which have been for some months in course of preparation come into effect at the Broadstone terminus. To avoid the inconvenience and possible dangers of changing rails as hitherto in leaving or arriving the trains were compelled to do, the platforms have been altered from one side of the building to the other. The south-west will, in future, be the departure side; the north-east the arrival, the travellers leaving Dublin passing the front of the terminus, and reaching this platform by a handsome colonnade, supported with metal pillars, and through a spacious ticket-office. On this the departure platform will now be found the waiting-rooms, and in an additional storey the offices of the traffic manager, engineer, and auditor, also spare rooms, suitable for branch company's uses, all to the number of nine, opening on a corridor 300 feet in length. On the opposite side the arrival platform has now been formed. It opens on a magnificent colonnade, 50 feet in width by 600 in length. This is appropriated to vehicles of every description, which can leave its inclosure with the utmost celerity. The alterations are decided improvements. They have, we understand, been carried out under the supervision of Mr. C. Wilkinson, of Westland-row. The interior of the station is being further beautified by the painting in bright colours of the roof, pillars, and delicate iron work of the spacious and graceful shed—the building, altogether, presenting a railway terminus in every way worthy of a great and enterprising company.

DOOMED PROJECTIONS.

THE extent of disfiguration recently carried on in some of the principal streets in this metropolis, and in utter defiance of all local authority, and regard for symmetrical appearance, has suggested the desirability of a bill in parliament, to compel all proprietors of buildings to remove unsightly projections at present in existence; as also to preclude the probability of future attempts by builders or others to exceed the line which defines the contour of the streets. In a previous number[*] we pointed specially to one in Great Brunswick-street, then in progress of erection, and quoted a clause of the Metropolitan Building Act (London), providing against same, but it and several others have been since completed, to the great detriment of our otherwise beautiful city, and we trust that the most stringent provisions of the intended act will be speedily applied in all such cases.

FREE OPENING OF THE GLASNEVIN BOTANIC GARDENS.

WHATEVER may be the ultimate result of the agitation now being pressed for the above purpose, those who advocate—as we earnestly do—physical and mental recreation for "the sons of toil," must at least appreciate the devotedness with which the committee are pursuing their mission. From the numerous documents extensively circulated through the city, and which forcibly evidence the laudability of the movement, we—in our desire to render every reasonable publicity to the proceedings—quote the following from the most recent:—

"The Committee for promoting the freer opening of the Glasnevin Botanic Garden, believe they cannot better introduce their present appeal, than with the following quotation from the report of the select committee of the House of Commons, in 1836, on the Royal Dublin Society—'Your committee are of opinion that the Garden ought to be open to the public *as many days as order therein will admit.* It is obvious that the greater the amount of enjoyment and utility secured to the public, the more popular will be the Society, and the greater the inducement to look upon it as a national institution.' In this spirit we submit the following facts for consideration.

"*The Dublin Public Gardens.*—In 1841 the Garden of the Zoological Society, Phœnix Park, was first opened to the public on Sunday at 2 p.m. The number of visitors, previously but 16,000 per annum, was at once raised to 97,405, and has since gone on steadily increasing, until it is now 156,701, of whom 134,926 are Sunday visitors, paying 1d. admission fee, and for whose good conduct the reports of the society bear ample testimony. The Royal Dublin Society have not adopted this policy, with the exception of opening for a few hours on two working days in the week, they adhere to the system of former years at their Glasnevin Botanic Garden, which is the *only public garden of its kind* in the vicinity of Dublin. Accordingly, we find but comparatively a small increase in the number of their visitors. In 1849, the first year for which they furnish returns, they had 24,784; in 1859, 41,736; and relative to the expenditure on the garden, we find the outlay fixed in 1815 at £1,500 per annum. It is now, after a lapse of forty-five years, but £1,700.

"*Kew and Glasnevin Systems of Admission Compared.*—During the summer months, the season for visiting a botanic garden, Kew Garden is open on Sunday from 2 p.m., and on the other days from 1 p.m. to sunset. Glasnevin Garden is open to the members of the Society only on the Sunday. To the public it is open free on but three working days from 12 to 5, and on one day from 2 to 6. Now, if we suppose the Glasnevin system applied to Kew, the following would result. In 1857, out of 361,798 there were Sunday visitors 185,599. All these should be excluded; and then as Kew Garden is open free 12 hours on the six days, for every five that Glasnevin is, seven-twelvths of the number of its working-day visitors, or 90,000, should be also excluded, leaving but 86,000 out of 362,000 as eligible for admission. No one in London would propose the adoption of a system involving the exclusion of nearly four-fifths of the visitors to Kew. May it not then be inquired why that system should be established and upheld in Dublin?

"*Present Position taken by the R. D. S. on the Question.*—The repeated refusals of the society to alter their system led to the formation of this committee, which after ascertaining that a very large proportion of their fellow-citizens coincided in opinion with them, decided on the 19th of February to make the following application to the society. 'That our hon. secretaries be instructed to bring under the official notice of the Council of the Royal Dublin Society the existence and objects of the Committee, with the intimation that we would only be too happy, should the Council by its spontaneous action anticipate the wishes of the great majority of the citizens of Dublin, and the recommendations of the Science and Art Department, and thus render our further proceedings unnecessary.' This resolution having been conveyed to the Council of the Royal Dublin Society, was thus replied to:—'Royal Dublin Society, Kildare-street. March 1st, 1861. Gentlemen,—I did not fail to submit to the Council of this Society at their meeting on yesterday, your letter of the 22nd inst., together with the resolution and pamphlet which accompanied it, advocating the opening of the Botanic Garden, the property of this Society, to the public on Sundays, &c., and I am directed to inform you that the Council have not power to carry the objects contemplated by your committee into effect. I am, &c., &c., W. Edward Steele, M.D., Assistant Secretary.'

---

[*] Page 377, "Street Disfigurations."

"*How and for what the 'Property' referred to in the preceding was acquired.*—In 1791, and subsequent years, the Irish House of Commons granted divers sums for the specific purpose of establishing a Botanic Garden near Dublin for the instruction of farmers, gardeners, dyers, and other artizans, in their respective callings; and the Society, then called the "Dublin Society," being incorporated and largely endowed by Parliament, for the 'Promotion of husbandry and other useful arts,' was selected as the most fitting body to be intrusted with the application of the money, and with the carrying into effect the intention of the Legislature. Accordingly in 1795, when the several grants amounted in the aggregate to £1,200, that sum was expended by the Society in purchasing from certain tenants of the Dean and Chapter of Christ Church, at Glasnevin, their interest in 16 Irish acres of land and the buildings thereon. The land thus acquired was forthwith laid out as a Botanic Garden, and the public requested to aid the Society by donations of seeds and plants, &c., in promoting the instruction and improvement of the artizans and agricultural classes; and in 1796 the Society was able to invite those classes to attend lectures, and otherwise make use of that which was provided *for them* by a beneficent Parliament.

"*Recapitulation.*—It will, we hope, be conceded, that under the present system this garden is not used for the purpose for which it was founded — *the instruction and improvement of the working classes.* Nor can it be said the Society is therein engaged in carrying out the objects for which it was incorporated, the title for all its grants and subsidies—'The promotion of a knowledge of husbandry and other useful arts among the natives of Ireland.' The term 'natives,' was not intended by either their founders or by legislators to apply to the mid-day loungers and people of fortune, to whom only access is now granted. This garden is the only public Botanic Garden at or near Dublin, and it concerns all who are interested in the progress and elevation of our people to enquire why they should suffer under a disadvantage and disability not imposed upon the people of London, or of any other capital city in Europe; and as all public institutions, in proportion to their public utility, have a title to State support, we may ask why should this Society be allowed to interpose a barrier to the fitting endowment of our only Botanic Garden as a school for the study of nature, by having it complete in every department, and furnished with everything conducive to the rational enjoyment and instruction of the people, and as an institution progressing with kindred ones elsewhere, not stationary or stunted in its growth, by being restrained and dwarfed down to the limits fixed in 1815. In the solution of this question we confidently hope for the aid of all, whether Irishmen or Englishmen, who believe with us that it is by doing full and ample justice to our people their progress in the scale of nations is ensured, and they become the more and more interested in the constitutions and government under which they live, the more they share in all its privileges and advantages."

In reprinting the above we place implicit reliance on the published statements, that while the committee urge a principle moderately, they by no means desire to be considered, either collectively or individually, as occupying a position of antagonism towards the Royal Dublin Society, for which, as a national benefactor to science and art advancement, we—as all must—entertain every regard.

THE MUSEUM OF NATURAL HISTORY.

Every stranger is struck with the noble pile of buildings connected with the Royal Dublin Society. The grand central mass is finely supported by the Agricultural Hall on the south-west side, and the National Gallery and Museum of Natural History on the south and north. The Museum, when opened to the public, will add to the intellectual enjoyments and promote a healthy progressive taste for practical science and art among the classes for whose use it is intended, but we regret to say the Museum is yet in a very incomplete state. The building is finished, but the objects of its institution are yet unfulfilled. The Society has drawn largely on its resources to satisfy the conditions required by the Treasury. Nearly 12,000*l.* have been expended, of which the Society and the Government contributed nearly equal proportions. There it stands, a monument of architectural skill, and the public derive no benefit from its beauty beyond surveying its fine proportions. The cause of this backwardness is the inability of the Society to arrange the immense collection of specimens in suitable cases. If the Society had not drawn on its resources for the Agricultural Hall, it would have money enough to supply cases. But the building fund for the Hall having amounted to 3,600*l.*, and from a wish to avoid any further appeal to parliament, the committee having increased the sum they were under terms to raise for the Museum from 2,500*l.* to nearly 6,000*l.*, they have exhausted their resources and are necessitated to ask assistance from the Treasury. The sum required is not very large, only about 4,000*l.*, and it is to be hoped in the miscellaneous estimates a vote for the amount will find a corner. The estimate, proposed by the Clerk of Works to the National Gallery, has been submitted to the Lords of the Treasury, and we believe, favourably entertained. Doctor Carte and his assistants have been for some time assiduously engaged in classifying and arranging the collection of specimens which in almost every department of natural history is unusually rich. The Museum contains the following large and valuable collection:—The mineralogical and zoological collections of Leske, the German mineralogist, purchased for the Society by the nation; the great collection of Greenland minerals, formed by Sir Charles Giesecke; the mineralogical collection of the late Baron Joy; a portion of the collection made during the geological survey of Ireland under Sir Richard Griffith, Bart.; the geological and zoological collections of Sir F. Leopold M'Clintock, R.N., and other Arctic voyagers: the extensive and valuable collections of British mollusca, bequeathed to the Society by the late Mr. Thomas W. Warren; together with a collection of the birds of Ireland, deposited with the Society by the Royal Zoological Society of Ireland, and by Mr. Robert J. Montgomery; the extensive zoological collections of the late Sir W. Jeffcott, of Penang; the duplicates from the museum of the Hon. the East India Company, including valuable geological specimens from the Himalaya mountains, presented by Sir Proby T. Cautley; a collection of the birds of Jamaica, presented by Mr. Thomas March, clerk of the crown; and a collection of the land and fresh-water mollusca of the same island, presented by Professor Adams; a valuable collection of the birds of Nova Scotia, presented by Captain Bland, R.E.; a highly interesting and valuable zoological collection from the Crimea, made by Mr William Carte, surgeon to the Royal Hospital; Thompson's collection of crustacea, presented to the Society by the Royal College of Surgeons, Ireland, together with several minor donations far to numerous to mention in detail.

But this treasury of collections is useless for want of cases, and unless the government give a helping hand they are destined to remain for a long time in obscurity. We are not insensible to the liberality of the British government and parliament in enabling Dublin to enjoy the same advantages as Edinburgh in possessing a repository such as the Museum affords. We would be content with the fruits of that generosity, and impose on the Royal Dublin Society the completion of the work in putting up the necessary fixtures provided always they were in a position to do so. If the Society was in funds, or if the members had exhibited any parsimony in supplementing the public grant from their own pockets, we should certainly say the fixtures devolved on the Society, and were not strictly chargeable on the government. But when it is borne in mind that the Society has already expended, out of admission fees and subscriptions, the very large sum of ten thousand pounds for the Museum and Agricultural Hall, it is entitled to some consideration from the government. To Lord Derby's ministry we owe the public grant for the Museum, and we are sure the present ministry will be equally liberal in assisting to complete the work of their predecessors. We are not too sanguine in hoping that the next estimates will contain such an item, to render available, for public and educational purposes, one of the finest collections in the empire outside the British Museum.—*Freeman.*

TURKISH BATHS AND EASTERN POPULATIONS.

DR. HAUGHTON recently addressed a letter to the *Building News* in which he says "he saw no parallel in the East to the filth, vice, and misery of Liverpool," which statement, together with various others referring to the Turkish Bath system, has been replied to by a correspondent of that paper in somewhat the following terms:—

"Then he must be as blind as a mole. From my medical knowledge of Eastern populations I assert, without fear of contradiction by any who have made use of their senses while travelling in Asia, that the vices prevalent among them are so horrible as to be unimaginable by Englishmen, and impossible to allude to more plainly. The horrors of the Turkish harem are revolting; abortion and infanticide are common and unpunished occurrences. The daughter of the Sultan died mad from being made the repeated victim of these crimes, while hundreds of men are rendered impotent by causes which the doctor ought so be able to guess. The French troops in Beyrout are suffering terribly from a certain malady.

Drunkenness is a vice more frequent among Moslems and Christians than is imagined. The former get drunk in their harems. The late Pascha of Damascus was notoriously addicted to this vice, while the Christians and their priests indulge in raki till they are rendered maudlin and fuddled. The filthiness of the Christians is greater than that of the Moslems, from the latter keeping their heads shaved, but all are cursed with vermin. There are two Turkish baths at Beyrout, and as the floors are laid with drains, it is simply impossible for there ever to be half an inch of water on the floor. And, indeed, water is far too costly in that city to be used otherwise than most economically.

"Dr. Haughton is mystified by reference to 'harrowing the head.' Then I am very sure he never had a Turkish bath, or he would recognise a polite term for an operation which consists in the attendant scratching with his nails the head of the attendant after it is well soaped. As for 'rinsing,' if the Doctor should ever have heard of a dictionary of the English language, edited by an Englishman—a certain Samuel Johnson, LL.D., and could obtain reference to a copy of the work, he will find therein that to rinse means 'to wash, to cleanse by washing, to wash the soap out of clothes,' and, therefore, out of hair.

"One word to the Turkish bath. European residents in the East rarely indulge in it, and a reference to Porter's 'Handbook for Syria and Palestine,' intro. p. 54, will show what opinion that well-informed Orientalist entertained of it. During seven years' residence he never but once entered a Turkish bath, and reports the opinion of a medical friend that the 'torture process' 'may have the effect of irritating the cuticle, and weakening the frame,' which I fully believe.

"During a tolerably long residence in the East I have refrained from these baths, to which I impute my freedom from boils, diarrhœa, and fever, although when in Russia, North Germany, and even Paris, I freely indulge in Russian baths, which are as refreshing and invigorating as the Turkish ones are enervating and abominable."

INTERNATIONAL EXHIBITION OF 1862.

The site and general plan of the building for the Great Exhibition of 1862 have been decided upon by the Commissioners. The part of South Kensington adjacent to the Museum and bordering upon the Horticultural Society's new gardens has been selected as the locality. The building will cover an area somewhat exceeding 26 acres, being greater by more than three acres than the space occupied by the Exhibition of 1851. There will be nearly 200,000 feet more flooring, without counting the 300,000 feet which will be appropriated to the wings, than were required by its predecessor. The forthcoming structure will be 200 feet high at its greatest altitude—the domes—while the greatest height of the Hyde Park Palace was only 160 feet. The new building will be 1,200 feet long and 700 wide, while the former was 1,200 feet long and 400 wide. The contractors have undertaken the erection for £200,000 the estimated cost being £300,000; the remaining £100,000 to be paid to them in case the profits exceed £500,000, a sum which they did exceed in 1851. Instead of the structure being composed of glass and iron—the chief materials of the Hyde Park Palace—the Commissioners have resolved that the elevations for the new building shall be for the most part constructed of brick, in order to afford a better protection for the valuable fabrics and the rare works of art which are expected to be on exhibition. The time of its existence is to extend from May 1st to October 15th; and it is understood that the opening and closing ceremonies will be under the personal supervision of her Majesty.

SAXON ARCHITECTURE.

THIS style is exhibited solely in churches, and other ecclesiastical structures, and prevailed from the time of the conversion of the Saxons to the Norman conquest.

When the Saxons first obtained possession of the country, they were pagans; a barbarous race, much inferior to their predecessors, the Britons, in the cultivation of the civilized arts. It would appear that they did erect some buildings of importance, as we find Gregory the Great giving permission to St. Augustine to make use of their temples for the purpose of Christian worship; but of what description such buildings were, we have no conception; nor, indeed, are we certain that they did not employ such buildings as they found already erected in the country, rather than erect new ones for themselves. Be this, however, as it may, we are here only concerned with their Christian edifices. Of these, the first, occupied by the missionary Augustine, was one at Canterbury, dedicated to St. Martin, which Bertha, the Christian queen of the pagan king, Ethelbert, had been in the habit of using. This, however, was not a Saxon edifice, but probably a church of the ancient Britons which had escaped destruction by their treacherous allies. From this it is evident that many churches were erected even in St. Augustine's time, and of the erection of some of these we have authentic records. The first erected was the cathedral church of Canterbury, built on the site of an old Roman church, and which St. Augustine dedicated under the title of Christ's Church.

Within thirty years from Augustine's death, Paulinus had succeeded in converting to Christianity, Edwin, the king of Northumbria, and became bishop of that province. His see was fixed at York, where Edwin immediately set about building him a church, which we learn was built of timber, and dedicated in the name of St. Peter. From such humble beginnings arose the splendid cathedral which now adorns that city. This timber-structure was erected previous to the baptism of the king: shortly after that event, however, he took care, by the direction of Paulinus, to build in the same place a larger and nobler church, of stone, within which the smaller building, which he had first erected, was enclosed. During the erection of this building, Edwin was assassinated by his pagan subjects, and the church was completed by his successor, Oswald. After this, Paulinus crossed the Humber to preach the gospel at Lincoln, where he succeeded in converting the reeve or governor of the city, who was a man of considerable wealth, and who undertook the erection of a large and magnificent church of stone in that place. It was destroyed by the Danes, and afterwards rebuilt by Gilbert de Goure, earl of Lincoln. Paulinus is also said, by historians, to have built the church at Southwell, Nottinghamshire, which still exists, and in a good state of preservation; but evidently much of its architecture is of a later date than that of Paulinus. At the close of the seventh century, St. Chad, bishop of York, built a church at Barton-upon-Humber, where there is still standing an edifice of undoubtedly Saxon character. The successor of St. Chad was a man of somewhat different stamp, of the name of Wilfrid. Active, persevering, and accomplished, he added considerably to the temporal dignity of the church, and was one of the greatest builders amongst the Saxon bishops. He was only thirty-five years of age when he entered upon his duties as bishop of York, and one of the first objects to which he gave his attention, was the cathedral. He found the church built by Edwin and Oswald in a state of miserable neglect, the old roof dropping with rain-drops, and the windows open to the weather, and giving entrance to the birds, which made their nests inside the building. He repaired it substantially, "roofing it with lead," (being probably of thatch originally) "and prevented the entrance of birds and rain by putting glass into the windows, yet such glass as allowed the light to shine within. He also washed the walls of the old building, "and made them, as the prophet says, whiter than snow." St. Wilfrid seems to have been the first to introduce the use of glazed windows into England, the light having been previously admitted into their buildings by openings covered with trellis-work, or with dressed skins of beasts, or sometimes with transparent horn or hair-curtains. Wilfrid had his glass from France; and Benedict Biscop, at a later period, is said to have brought from the same country artisans, to teach the English the method of its manufacture. Some reputed remains of this church at York, have been discovered beneath the present cathedral. At Ripon, Wilfrid built another church "of polished stone, with columns variously ornamented, and porches;" but his most famous work is the church at Hexham, which is described in glowing colours by Stephen Eddius, a cotemporary with Bede. He assures us that it had not a rival on this side of the Alps. Deep foundations, he says, were dug in the ground for the construction of subterraneous chapels, and passages of communication. On these foundations walls were raised to a prodigious height, and were divided into three stages or stories, supported on square pillars and polished columns of different marbles. The capitals of the pillars and the arcades, and arch-walls of the sanctuary, were adorned with sculpture, paintings, and figures in relief, judiciously coloured; blue, green, and yellow, being the more predominant hues. The church was surrounded by galleries inside, and divided by inclosures and staircases, so that you might make the circuit of the building without being seen from below. In the galleries above and below, were chapels dedicated to Our Lady and St. Michael, to apostles, martyrs, and confessors, all provided with the necessary ornaments.

Benedict Biscop was another builder, who erected the monasteries of Monk-Wearmouth and Jarrow; he seems to have brought masons and other artificers from Fance. He was a cotemporary with Wilfred, and lived at the close of the seventh century. Adhelm, at a somewhat later period, was the founder of the abbey of Malmsbury, and two churches in the same town, one within the abbey and the other without, for the villagers or townspeople; he also built churches at Dorchester. The church of St. Peter at York, was rebuilt about the middle of the eighth century, in consequence of having suffered from fire in 741; it is described by Alcium in his poem *de Pontificibus et Sanctis Eccles.* Ebor.; who makes particular mention of its pillars, arches, vaulted roofs, windows, porticos, galleries, &c., which are the characteristics of a finished building.

Acca, bishop of Hexham, was the builder of a noble church at that place, and is said to have adorned the side-walls with little tabernacles or shrines, arching over altars in honour of apostles and martyrs; at which the people often knelt in prayer, and on which were placed caskets, containing sacred relics. A new church erected

Miscellaneous.

New Work on Timber Roofs.—We learn that a comprehensive illustrated book on the above important department of building construction is in course of preparation for press by Messrs. Atchley and Co., publishers, Great Russell-street, London. It will contain most valuable working details, full size, and judging from the general style in which some excellent professional works have been produced at same establishment, we have every reason to expect that the new comer will be an important acquisition. It might not be amiss to suggest, that such of our readers as have executed timber roofs of other than ordinary construction, would communicate particulars to that firm. We believe a companion work on "iron roofs" will soon follow, and to this our suggestion would equally apply.

Trade Catalogues.—Occasionally we referred to some illustrated catalogues produced by English and Scotch manufacturers, and in fact forming both interesting and instructive volumes in various branches, but we are pleased to see that there still remains amongst ourselves a sufficiently enterprising spirit to render available the capabilities of *our* townsmen in the typographical arts, and we desire specially to notice a catalogue of goods manufactured by Messrs. Kennan & Son, of Fishamble Street, in this city. It comprises illustrations of wire fences, and the various tools and strainers requisite for their erection, sawing machines, circular and otherwise, chests of workmen's tools, agricultural and washing machines, garden furniture, steam engines, entrance gates, &c., in all, some 70 diagrams, and is altogether a very creditable little work.

Novelty and Efficiency of Modern Agricultural Machinery.—We have been favored with a copy of Messrs. Richmond and Norton's new Implement Catalogue, issued at their depot, South John-street, Liverpool, descriptive and illustrative of a *new series* of Agricultural Implements and Machines. These are now so well known that it is scarcely necessary that we should recommend *all* thrifty farmers to supply themselves with the newly improved machines for the preparation of food for cattle.—*Liverpool Post.*

Strike of Painters, Plumbers, and Glaziers, of Wolverhampton.—The painters, plumbers, and glaziers of Wolverhampton are on strike. Up to about four weeks ago their wages were 22s. a week for working ten hours and a-half a day—namely, from six to half-past five, with half an hour for breakfast and an hour for dinner. At that time they applied for a rise in their wages of 2s. per week. The masters gave them 1s., and it is said promised the other shilling on a future occasion. Three weeks ago the men applied to their employers to complete their promise, and also to reduce the work by half an hour a day. A few of the unimportant employers acceded to the request; but the others declining to give any satisfactory reply, the men struck work last Monday morning. Since then the masters have met and resolved to concede the half hour, but refuse to increase the wages. On this decision being notified to the men, they resolved not to return to work till the masters had complied with the whole of their demands. The masters assert that they made no promise at the time of the last advance, and they are now prepared to give either the 1s. advance or to concede the half hour, but they are not disposed to do both; and they say that generally their customers are supporting them in this determination.

Ingenious Safety Railway.—An ingenious invention by Mr. Wright, of Lombard-street, London, is at present attracting much attention. It is designed to render almost impossible accidents upon railways, and the plan is so simple and so forcible as to merit it all the interest with which it is regarded. It comprises a safety-kirb and life-guard, the former being, in fact, an aditional rail, which is elevated on each side of the ordinary way. At each corner of the carriages life-guards or supports are placed, which, in the event of a wheel breaking or any similar accident, descend upon the elevated rails, entirely preventing the carriages from capsising or leaving the way.

Farm Buildings and Labourers' Dwellings.—Amongst the applicants for loans under Landed Property Improvement Act in the former department are—

Charles Conyears, Castletown, Limerick, ...	£500
George Vesey Stewart, Lisbeg, &c., Dungannon, ...	500
Richard Grove Annesley, Annesgrove, Fermoy, ...	155
John Blakeney, Graignebann, Tyaquin, Galway, ...	400
James Fetherstone H., Ballintober, Moycashel, ...	400
Stephen E. Collis, East and West Shanaway, Kerry,...	750
Beecher P. Fleming, Derrylea, Kildare, ...	990
Total, ...	£3,695

And in the latter—

St. John Blacker, Tullahinch, Kerry, ...	£400
Fulke Greville, M.P., Delvin, Westmeath, ...	750
	£1,150

Ancient and Modern Ink Manufacturers.—A sort of reflection appears to be cast on the boasted progress of mankind in the operative arts, when the fact is brought prominently before us, that manuscripts written before the tenth century have for the most part retained the original blackness of their ink, whilst documents written *since* that period for the most part show indubitable signs of perishing or perishableness, so far as relates to their ink. Many, doubtless, who peruse this need not go beyond their own family records for proof of that here stated. Many a letter penned not more than ten years ago shows unmistakeable signs of perishableness as to its ink. Why is this? How comes it that ancient and mediæval people could manufacture permanent inks, whilst we, with all our boasted chemical resources, so often fail? The answer is plain enough. Fast writing is a desideratum as well as permanence of writing. Now, fast writing involves easy flowing, and easy flowing demands a thin ink. Charcoal may be powdered very fine, and it may be suspended for a time in gum water, or thick material similarly mucilaginous, but it *cannot be dissolved*; and herein lies at once the difficulties of using it, and the permanence of it where used. The liquid modern inks are in point of fact dye-stuffs, and the processes of dyeing were very little understood previously to the tenth century.

The Turkish Bath.—This is now beyond doubt one of the institutions of this country. We have long been famed for our medical schools and practitioners, and it is one of the most remarkable facts that the Turkish Bath should, in presence of these, have sprung up with greater vigour in Ireland than in either England or Scotland. It is said that medical men are generally opposed to innovation. If it be so, how is it that this innovation has made such way, exactly when the faculty may be supposed to be the most capable of offering effective resistance? We believe that the profession is more liberal now, as it is unquestionably more enlightened, than when the above was predicted of it; and that now really enlightened men, such as this country boasts of, are ready to seize upon every means which human ingenuity places at their disposal, for the alleviation of pain and preservation of life. But there is reason to believe that the Turkish Bath is not such an innovation as some suppose. Dr. Barter has received from the east, through the instrumentality of Mr. Urquhart, what is in reality a revival and more perfect development of the old Irish *Tigh fallais*. The Milesians may have brought the institution with them from the east, or it may have sprung out of the necessities and ingenuity on the green isle of the west. But now east and west have met in the south of Ireland, and amid the Groves of Blarney the Irish Bath has been brought to the present stage of perfection in the hands of Dr. Barter. Dr. Barter is not a man for keeping his light under a bushel. Hence it is that from Blarney the bath has spread, until now every province can boast of more than one in operation or in course of erection. The metropolis itself has one on each side of the river, and the bath at Lincoln Place is at once an ornament and a sanitary acquisition to the city.

The Progress of Science.—It is delightful to see many reasons for believing that science, technically so called, is becoming more and more interesting to the general public. At one time the genius for discovery was a perilous gift; and those who possessed it were looked upon with an evil eye, as persons in the service of witchcraft and necromancy. A life passed in gazing on the stars and among the mysteries of numbers and diagrams, or one spent in the laboratory, was too removed for the ways of common life to seem to have any lawful object in view, or to possess adequate attractions for men, unless in the awful compensations of communion with the lower world. Although the long period of conflict between the rights of mind and the despotism of superstition ceased many centuries ago to be universal, there still remained those hindrances to a popular science, which arise out of the essential nature of discovery in unfamiliar studies, except when these are removed by the method of exposition which was destined to be the birth of a later epoch. A change, however, has taken place, and the numerous lectures upon every valuable branch of science, now being everywhere delivered to crowded audiences, cannot fail to reverse the past, and make the names of our scientific benefactors as much household words as formerly they were proscribed or were heard only within the circle of professional life.

Architectural Partnership.—We learn that Mr. Thos. Turner, architect, and Mr. Thomas Drew, architect, have entered into partnership, and their offices will be in Belfast.

Professor Davy, Royal Dublin Society, commences on the evening of the 17th inst. a course of six lectures on "The history, chemical constitution, properties, and agricultural applications of the most important natural and artificial manures."

There are 31,000 miles of railway in the United States. Their average cost and equipage is 36,000 dols. per mile. The cost of operating a mile of railway paying a dividend is 2,000 dols. per mile a year. The roads which pay ten per cent. dividend—gross—6,000 dols. per mile

A new church is to be erected at Piltown, county Kilkenny.

The committee of the Protestant Orphan Refuge are about having sundry building works done at their house (late St. Stephen's school), Haddington-road, according to plans and specifications by Mr. Rawson Carroll, architect.

A new lunatic asylum for the Co. Monaghan is to be erected. There is to be another for the Co. Mayo, for which Mr. George Wilkinson is the architect.

A sum of £1,600 is still required to enable the committee for rebuilding St. Andrew's Church to proceed. The Ecclesiastical Commissioners submitted a design which would cost £9,000.

The consulting engineer to the Sligo Extension line reports that between Longford and Boyle fencing and earthworks are in active progress, masonry advanced, bride over rive Boyle all but complete, and other works forward; also that between Boyle and Sligo earthworks are in an advanced state, all principal bridges complete, sixteen miles of line—seven only being continuous – constructed, and two and a-half of permanent way laid down. Same engineer reports that *in re* Liffey branch line contract has been let, and arrangements for obtaining possession of land sufficiently forward to admit of early commencement of works.

The towns of Thurles and Skibbereen are to be placed under the Towns' Improvement Act.

Exhibition of Pictures.—There is at present on exhibition at the ante-room, Rotundo, an extensive collection of pictures by British and continental artists.

Improvements in Clonmel.—The enlargement of our butter market house, through the liberality of Mr. Bagwell, M.P., is progressing towards completion. When finished, Clonmel will be able to boast of a first-class market, under proper and careful supervision, and with first-class accommodation—a market inferior to no other in the country, and one that will bring back that large share of trade that our town once possessed before the "demon of discord" raised its horrid front amongst us. In the same locality we perceive the shambles are undergoing an entire reconstruction, and on a very commodious plan. The change will be esteemed as a boon both by buyers and sellers. Lately some well appointed victualling establishments have been opened in our principal streets, and the number of our unoccupied houses has lessened in the same proportion. Indeed idle premises are, we are glad to say, "few and far between;" and, passing through the Main-street, a decided change for the better must be perceived. There still remain two or three unsightly objects: we allude to the very dilapidated remains of the ruinous houses which were removed under the operation of the towns' improvement act. The sites are good; and, from what we can learn, advantageous terms would be held out by the lessor to parties willing to treat for these premises.—*Clonmel Chronicle.*

Messrs. Shekleton, of Dundalk, have sent a steam fire-engine for exhibition at the Royal Dublin Society's Spring Show; Messrs. Musgrave, Brothers, of Belfast, iron workers, have engaged a large stand, and no doubt will present an attractive display. Indeed, generally speaking, we learn that Irish manufacturers have come forward most spiritedly, but of this and other particulars we shall be better enabled to speak in our next number.

The Borough of Dublin Bill.—Application will be made to Parliament during the present session for leave to insert a clause in this bill, to authorise the Corporation of Dublin to enter into contracts for paving and lighting the streets.

TENDERS

For four cottages to be erected at Buxton, Sundays Well, Cork, for Mr. William Lee. Mr. Richard R. Brash, architect.

	In Brick.	In Stone.
Richard Burke	£1,200	£1,240
M'Sweeny and Clayton	1,137	
Edward Martin	1,125	1,030
Richard Martin	1,035	
Simon Kenefick (accepted)	920	950

THEATRE ROYAL.

The Colleen Bawn.—Mr. and Mrs. Dion Boucicault make their first appearance at the Theatre Royal this (Easter Monday) evening in this drama, which is a tale of Irish life said to be replete with interest. The fame of the gentleman in the capacity of author and actor has been long since heralded, and the lady is also represented to be a charming and accomplished actress. We shall have occasion to speak more fully in our next.

Note.—We are unavoidably obliged to hold over our "Column for Craftsmen," till next publication.

To Correspondents.

A. H. & Co., New York (Received; thanks); J. P., Rue Fontaine, Paris (We publish only *twice* a month; what are your terms for correspondence on scientific and artistic subjects?).

NOTICE.

Post-office Orders and Remittances should be made payable to Mr. Peter Roe, *Printer and Publisher,* 42, Mabbot-street, Dublin.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* Dublin Builder," 42, Mabbot-street. *All other Communications should be addressed to the "Proprietor and Editor,"* 17, Lower Gardiner-street.

A PERFECT WATCH FOR 30s.

Superior finished movements, jewelled in two holes, in stout engine-turned Silver Cases, and hard enamel Dial. Constructed to go while winding, and containing some of the newest improvements Price only 30s. Sent post free and safe on receipt of a post office order for that amount, including a shilling for postage, by Edward Lever, Watch Manufacturer and Jeweller, Hooper-street, Goswell-street, London.

"This is a strong servicable Watch, and well adapted for youth's or for ordinary wear."—*Standard.*

Lever's Celebrated 3-Guinea Watches.

First-class highly finished jewelled movements with patent escapements, and hard enamel Sunk Seconds Dial in elegantly engraved and engine-turned double-backed cases, manufactured from the best Silver, with maintaining power to go while winding, and all the latest improvements.

"This Watch is sufficiently strong for the working man, and will last a lifetime, while its attractive and elegant appearance renders it well worthy of the pocket of the Nobleman." Price only 3 Guineas.

Ladies' Gold Watches.

With elegantly engraved Gold Dials, from 4 Guineas.

"These Watches are all that can be desired in finish, taste, and design, and leave nothing to be wished for but the money to buy them with.—*Standard.*

Gentlemen's Gold Watches, from 5 Guineas.

First class highly finished movements, jewelled in all the necessary holes with patent escapements, maintaining power to go while winding, and all the latest improvements. Elegantly engraved and engine-turned double backed solid Gold cases, and hard enamel Sunk Seconds Dial, price, from 5 Guineas. Or with elegant Gold Dials, 10s. extra.

Chronometer Balance Watches.

To go in any climate whether hot or cold. These Watches are so correctly adjusted that they will perform with equal accuracy in extremes of temperature without varying. Price, in Silver, from 8 Guineas; Gold, from 14 Guineas.

Hunting Watches.

Have an additional case to protect the glass and face from injury. This extra in the Watch, increases the cost 30s. Silver, £3 Gold.

Presentation Watches.

With engraved backs, to carry out emblematically any particular object. Price, Gold from 6 Guineas.

Watches for Sporting, Medical, Astronomical and Scientific purposes.

Just published. The Illustrated Treatise

On Watches and Jewellery,

Post free, for two stamps, entitled:

What to Buy and Where to Buy it.

"Containing a large amount of useful information for those who intend purchasing a Watch, and valuable advice to those who already possess one." With engravings of Watches, Patterns of Jewellery, Chains, &c., By Edward Lever, Watchmaker and Jeweller to Her Imperial Majesty the Empress of the French, Inventor of the Patent Lever Watch. The Binnacle Chronometer, &c., Hooper-street, Goswell-street, London.

"By the aid of this book persons residing at any part of the Globe can select, with the greatest certainty, the Watch best adabted to their use.—Sent post free for two stamps direct from Hooper-street, Goswell-street, London."

12,000 of these Watches in the hands of the public attests the value of this invention.

On board H.M.S. *Adventure*, in the Arctic Regions, for two years the ship's time was kept by one of Lever's Watches, all other Watches on board having stopped.

OPINIONS OF THE PRESS.

"The fact of these Watches being made entirely by females will at once account for their extraordinary cheapness"—*Morning Star.*

"A good Watch at a trifling cost"—*Weekly Times.*

"In taste, elegance, and design, these Watches surpass everything."—*Globe,*

Prize Medals awarded by the Paris Exhibition, the National Academy of Science, Paris, and the Society of Arts, London.

Gold Pencil Case for 3s.

Post free for 36 stamps.

The Sultan Scarf Pin.

A very fashionable article of jewellery, much admired for its neatness and elegance. Price, 3s. 6d., post free for stamps to that amount.

Cameo Scarf Pins.

A richly carved female's head, elegantly mounted, price 8s. 6d. entitled,

Beauty;

Also the fashionable Scarf Pin,

Garibaldi,

Being a correct likeness, richly carved in Cameo. Price 4s. 6d.

The Empress Brooch.

This is the fashionable Brooch of the present day, being exactly similar to the one made for her Imperial Majesty The Empress of the French.

This article of jewellery is universally admired for its elegant and majestic appearance, and forms a very suitable present for a lady. Price 8s. 6d.

Silver Watch Chains having gone out of fashion, we have discontinued selling them.

Good Solid Albert Chains, 18s. each. Superior make, 22s. A variety of patterns to select from.

Ladies' Guard Chains, from 26s. each.

Gentlemen's Guard Chains, from 26s. each.

The fact that we can sell a Good Solid Albert Chain for 18s. and a Serviceable Watch for 30s. sufficiently proves the cheapness of our articles.

Every Watch warranted, and sent free and safe by post, on receipt of a remittance.

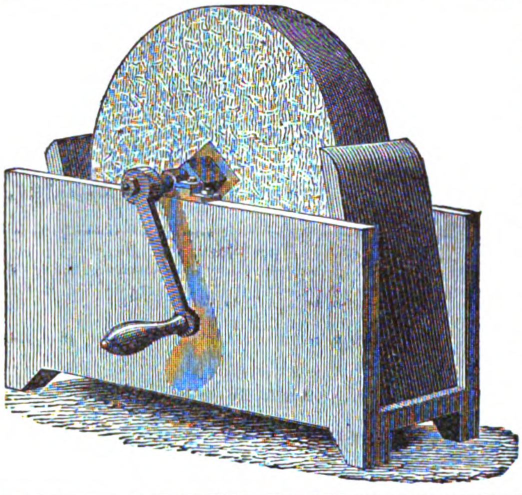
Post Office Orders to be made payable to Edward Lever, at the General Post Office, London.

Old Watches, Gold, Silver, Plate, Diamonds, &c., bought or taken in exchange for new articles—the full value allowed.

EDWARD LEVER, Watch Manufacturer and Jeweller, Hooper-street, Goswell-street, London.

Persons residing in any part of the Globe, need not hesitate to forward remittances to this establishment, all orders by post receiving immediate attention, every article sent out being carefully and securely packed in boxes made expressly for transmission, to guard against the possibility of loss or injury.

Captains, Merchants, Shippers, and Wholesale Buyers treated liberally with.



GRINDSTONES.

For the Farm or Workshop, all sizes.

SAWS.

Cross-cut, Hand, Pruning, and all kinds, of the best quality.

AXES.

The American Axes for felling, also Carpenters' and Wheelers' Adzes and Hatchets, of every description, at

METCALF & CO'S
Artist Warehouse and
Plane Manufactory,
35, GOLDEN-LANE, DUBLIN,

SUCCESSORS TO

SITES FOR DETACHED HOUSES—BRAY LINE.

THE Lands of FOXROCK, GALLOPING-GREEN, and KERRYMOUNT, are now being laid out for

DETACHED VILLAS,

and will be let at very moderate rents, in large or small lots, from half an acre upwards, at from £6 to £12 per statute acre. They command magnificent views of sea and mountain, are but two miles from Kingstown and Monkstown, and a few minutes' walk of Stillorgan station at one end, and Carrickmines at the other, besides which a new station will shortly be established between them on the lands of Foxrock, whereby the entire of this beautiful building district will be within from two to ten minutes of railway accommodation.

A few superior sites will be reserved for Terraces, with and without pleasure ground in front.

A large number of lots have been already let, some of the houses are nearly finished, and others in progress. Omnibusses will shortly ply between Foxrock and Kingstown for bathing, shopping, &c.

Lease for ever. Landed Estates Court title for most of the property; the rest is held direct from the Ecclesiastical Commissioners.

N.B.—Bricks, Stone, Sand, and Lime on the property. Lithographed maps, showing the new roads, &c., may be had from

BENTLEY AND SON,
110, GRAFTON-STREET, DUBLIN.

HURLFORD FIRE-CLAY DEPOT,

47, COOK-STREET, GLASGOW.

JOHN ROBSON begs to draw the attention of Gentlemen and Farmers to his superior

CATTLE TROUGHS FOR FEEDING CATTLE,

which were awarded the First Prize at the Glasgow Highland Agricultural Show, in August, 1857; at Aberdeen, September, 1858; at Glasgow Local Show, June, 1858; and at other Agricultural Shows; and Medal, 1859, at Edinburgh Highland Agricultural Show.

HORSE MANGERS WITH GRUEL-BOX, SINGLE MANGERS, PIG TROUGHS, SHEEP TROUGHS,

Always on hand, Gas Retorts, Flue Covers, Fire Bricks, Flooring Tiles, Plain and Ornamental Chimney Cans, Ground Fire-clay of best quality; Oncomes for Vents, Ventlings, round and oval; Patent Square Ventlings for to prevent back smoke, and give good ventilation into rooms; Stack Pillars, which were awarded the Silver Medal at Glasgow, June, 1859; at Edinburgh Highland Agricultural Show, August, 1859; Sewerage Pipes, from 2-inch up to 24-inch bore, which were awarded the First Prize of £5 at Edinburgh Highland Agricultural Show, August, 1859; Field Drain Pipes, which were awarded the First Prize at the Highland Agricultural Shows—Aberdeen, September, 1858, and Edinburgh, August, 1859.

All Orders sent to the above Address will be promptly executed.

TO THE CLERGY, ARCHITECTS, BUILDERS, AND OTHERS.

F. SWINBURN'S TRANSPARENT OAK, SATIN, AND MAHOGANY STAINS, for DEAL, PINE, &c., are acknowledged by Architects and Builders to be the best of any Stains yet introduced. These Stains in no way obscure the natural grain and feathery appearance of the Wood, but bring it out in a beautiful manner, the effect surpassing the ordinary mode of Painting, as well as the costly process of Graining, and at less than one-half their cost.

The OAK STAIN of Four Tones of Colour, is sold ready for using, at per Gallon—Extra Deep, 7s. 6d.; Deep and Middle, 7s.; Pale, 6s. They require no sizing, except as a matter of economy to save varnish. Specimens, with Testimonials, free upon application to

F. SWINBURN,

FRAMING, FLOORING, AND BENCH CRAMPS,

OF EVERY DESCRIPTION, AT

BOOTH, BROTHERS,
63, UPPER STEPHEN-STREET.

MESSRS. Isaac & W. R. FARRELL, ARCHITECTS, ETC., Beg to inform Builders and others that they have added a Measuring and Valuation Branch to their Office, for which they have secured efficient Assistants, to enable them henceforth to supply Estimates, Valuations, and Measurement of Artificers' Works, as formerly carried on for many years by Mr. Isaac Farrell, of this Firm.

Office—25, LINCOLN-PLACE.

TO CONTRACTORS.

MR. WM. DOOLIN, Building Surveyor and Measurer, is prepared to afford Contractors all information as to prime cost on all material; take out Quantities, and prepare Estimates.—Offices, 27, TALBOT-STREET.

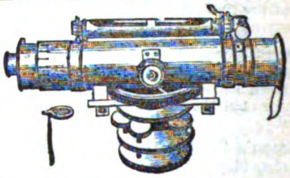
W. MAXWELL,
Agricultural Engineer and Architect,
BALLINASLOE.

SQUARES—W. F. STANLEY'S

IMPROVED.

Recommended in "The Engineer" and "Builder." 42 in., 5s. and 7s. 6d.; 31 in., 3s. 6d. and 5s. 6d.; 23 in., 2s. 6d. and 4s. Improved Architects' Scales, Boxwood, 2s. 6d.; Ivory, 8s.; by post. Improved Architects' Drawing Instruments. List of Prices on application.

Manufactory—3, GREAT TURNSTILE, HOLBORN, LONDON, W. C.



THEODOLITES, LEVELS, CIRCUMFERENTERS, Mathematical Drawing Instruments, Scales, Rules, Tapes, T Squares, &c.

JOHN ARCHBUTT, 20, Westminster Bridge Road, Lambeth, near Astley's Theatre, respectfully calls attention to his Stock of the above articles, manufactured by superior workmen. The prices will be found considerably lower than ever charged for articles of similar quality. An illustrated price list forwarded free on application. 8-inch Dumpy Level complete, 6 guineas; 10-inch ditto, 8 guineas; 14-inch ditto, 10 guineas; with compass, 1 guinea each extra. Best 5 inch Theodolite, divided on Silver, 18 guineas.

SURVEYING, ENGINEERING, ARCHITECTURE, &c.—PRACTICAL INSTRUCTION is given in SURVEYING, Levelling, Civil Engineering, Architecture, Building, Draughting, Mapping, Measuring and Valuing of Land, Timber, Buildings, &c., by Messrs. HYDE, SMITH, and LEWIS, Civil Engineers, Architects, Surveyors, etc., in a short Course of Instruction on moderate terms, including FIELD WORK and the use of the INSTRUMENTS. For Prospectuses, apply at the Offices, 24, Guilford-st., Russell-square.

N.B.—An Architectural, Engineering, and Mechanical Class for Architects, Builders, Engineers' sons, etc., on moderate terms, including instruction in Drawing, Coloring, Taking out Quantities, etc.

TO BRASSFOUNDERS, ENGINEERS, REFINERS, ETC.

THE PATENT PLUMBAGO CRUCIBLE COMPANY beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist.

For Lists, Testimonials, etc., apply to Battersea Works, London, S.W.

The Dublin Builder.

Vol. III.—No. 33.

THE WORKS AT ST. PATRICK'S CATHEDRAL.

NEARLY a year ago was commenced the task of rescuing this venerable fabric from the demolition with which the withering hand of time, infallibly and speedily, threatened it—a task volunteered through the princely munificence of an individual whom we may be proud to regard in all the relations of life as a countryman, and prouder still as a fellow-citizen. During that period various contrary opinions have been elicited upon the character of the works in question, and the fidelity with which the promised restoration was being carried out; but observing our invariable rule to hear with equal attention and courtesy both sides, these were inserted in the pages of this journal, without any reference to editorial identification therewith. Feeling, however, that the work had sufficiently developed itself to form a judgment, and indeed confessedly yielding to some pressure from without—as it has been repeatedly urged upon us, in pursuit of our peculiar mission, to devote a special article thereto—we come to consider the question; but prior to detailing particulars of present operations, a short glance at the history, features, and previous circumstances connected with the cathedral suggests itself as most essential.

Like all other large old churches, this shows specimens of different styles, for, besides the Early English of the original edifice, we find parts that have been renewed or added in the Decorated, and in the late perpendicular, as well as the incongruous innovations—miscalled restorations—made at various periods. The church itself belonged to the latter part of the twelfth century, but the tower, a substantial and somewhat ornate edifice, was added by Archbishop Minot towards the close of the fourteenth. To the same period must be referred the western half of the nave on the north side (which, from some unexplained circumstances, presents an arcade, with unequal bays), the mullioned windows of the aisles, and probably also the beautiful decorated windows at west end of the nave, north aisle. The great west window belongs obviously to a much later period, that of the perpendicular style, perhaps, of the middle or latter portion of the fifteenth century. The flying buttresses of the choir are evidently additions to the original plan, introduced not as mere ornaments, but to resist the outward thrust of the stone vaulting, perhaps at the time when the tower was built, or between that and the substitution of the great single western window for the primitive lancet lights, like those of the transept at York. After the church had been thus completed, there ensued a long period of neglect, which varied only by some feeble and occasional efforts at reparation during three centuries, in the worst and most tasteless style. The south wall of the nave and the west wall of the south transept required support early in the eighteenth century. This was given by the application to each of a flying buttress, *strong* but *clumsy*, and void of any artistic feature. These buttresses, which are still standing, were surmounted by stone globes, like those so frequently placed on the piers of gate entrances in the country. It is probable that these, and other well-meant, but tasteless alterations, were made in Swift's time, but he deserves credit for his care to preserve the monumental figure of Archbishop Tregury (fifteenth century), which, after extricating it from the ruins of St. Stephen's chapel, he caused to be inserted in the west wall of the nave, northwards of the great entrance, where it can be still observed, one of the very few sepulchral objects that harmonises with the church itself. In a corresponding position to the south of the western door is the broken monument of Archbishop Saundford (thirteenth century), found when the chapel of the B. V. Mary was pulled down, about twelve years ago, and placed in the nave by direction of the present dean. The north transept, which for several centuries had been used as the parish church of St. Nicholas Without (*extra muros Dublin*), was permitted to become ruinous, and about forty years ago was totally, but unnecessarily, removed. It was rebuilt, but in such a manner as offers nothing to be commended but the material and the workmanship. Its architect appears to have disdained any attempt to conform to the style of the remaining portions of the ancient edifice. Dean Dawson, nearly thirty years ago, renewed the west front, but with many incongruous and ugly features. A more ambitious effort has subsequently been made at the east end, under the auspices of an English architect, who completely demolished the original Lady Chapel, but rebuilt it on its old plan and foundations, only displaying in its eastern gable some of *his own fancied* improvements,' and of quite a different period of architecture to the remainder. He also took down the north-east and south-east flying buttresses, as far as the springing of their arches, which he removed, and about three years elapsed before they were rebuilt. Their pinnacles he did not rebuild in their original pattern and figure, but substituted others, so as to make them disagree with all the remaining originals, and he also erected two lofty pinnacles to flank the eastern gable of the church, which never previously had any such appendages. The four pinnacles he thus introduced not only produce an ill effect by their obvious disagreement with the others, but even more so by their being over-capped, the basis of the cap being much in excess of the octagonal prism on which it stands, and beyond whose faces it projects on every side. He also removed the old mullioned windows from the choir aisles and from the north aisle of the nave, replacing them by simple lancet lights of the most ungraceful curves and proportions, with a very scanty and insufficient splay towards the interior. The pitiful attempt to imitate masonry by lines and streaks on the plastering must be remarked by every attentive observer. Within the choir a real restoration was made by clearing away two heavy wooden galleries and several partitions, by which the aisles had been cut off and converted into mere passages. But if the plans, of which this was a portion, had been completed, the church would have been completely changed in its external aspect, by the substitution of pinnacles for turrets not only on the main building, but on the tower itself, just as if the spire had been an original feature, instead of an interpolation of the eighteenth century. Fortunately, the requisite funds for so much "*Carpenter's*" Gothic (to use a popular term, perhaps peculiarly applicable in this instance) could not be obtained, and enough of the old church was preserved to supply authentic patterns for a true restoration.

When Mr. Guinness, early in the year 1860, had determined to engage in the work of restoration, he obtained the assistance of two well-known professional architects* who carefully examined the condition of the church, with especial reference to the stability of its several parts. They ascertained that the south wall of the nave, the greater part of the south transept, and some other portions of the church and its appendages were not only in a dangerous state, but were quite incapable of repair. There were, however, other parts which could be preserved by suitable works of reparation. Immediately after this accurate survey, Mr. Guinness communicated to the Dean and Chapter of St. Patrick's his own munificent offer of defraying the entire cost of the restoration without allowing any deviation from the original; and his next care was to obtain photographs, of every part to be renewed. The work was then commenced under his own assiduous and personal supervision, at the period above stated, and considerable progress, as may be inferred from the following, has been made:—The south wall of the nave has been entirely taken down, and is now fully rebuilt without any deviation from its original plan, excepting the introduction of intersecting arched opens in the lower triforium, which, though not originally existing in this portion of the building, and therefore that probably it must be conceded that there does appear here a departure from actual "restoration," nevertheless it has been most judiciously treated and in faithful imitation of a precedent afforded in the south transept. The massive piers which support the series of great arches on which the whole superstructure of 5 ft. thickness is reared, consist of granite, encased in Caen stone, which is also the material of the vaulting shafts, the mouldings, and all the other ornamental parts of the interior, except only the single slender column at each jamb of the triforial openings into the nave, which is formed of limestone. Against the north wall of the nave two flying buttresses have been erected to give support; these buttresses and their pinnacles agree with those of the choir. The clerestory of the choir on the south side, and that of the east side of the south transept have been extensively repaired. All the windows in those parts have been renewed in exact conformity with the original stonework of which they are facsimiles, but in more durable material. The exterior face of the wall has been removed and replaced with ashler of excellent workmanship, and the corbel-table and parapet completely renewed. The three flying buttresses on the south side of the choir, which were so decayed as to be dangerous, have been almost entirely rebuilt. The arches of the two have been permitted to remain, that of the third has been replaced, but the shafts and caps of the three are all new, and exactly of the old pattern without any alteration. The design has been censured, by a correspondent of the *Dublin Builder* (15th April, 1861, page 485) who objects to what he describes as "hard and unpleasant in outline, the fans scratched with ill-cusped mean pannelling, the mouldings hard and unfeeling, and a bold, ugly spike surmounting the whole," but which he admits to be a "very proper finish to such a severe study." It must be conceded to our correspondent that the sharp spikey termination is *not* pleasing to the eye. It may be doubted whether it existed in the original pattern, and certainly might have been advantageously replaced by an obtuse, truncated, or obeliscal termination. But in defence of the sharp form, there is the example of one pinnacle on the north side of the choir which, he ought to know, was *restored* not many years ago by the late Mr. Kingsmill, and which deserves notice not only for its excellent material and workmanship, but also for being the only specimen of true restoration that St. Patrick's possesses anterior to the great work in which Mr. Guinness has already made so great a progress.

---

* As we are informed, Mr. Patrick Byrne and Sir John Benson.

Those who would fairly estimate the present restorations should, while there is yet time, compare the new works with the old in corresponding situations. Thus the north and south sides of the nave, and the east and west sides of the south transept may be brought into comparison. There is still remaining one of the original flying buttresses, as yet untouched, on the north side of the choir. Agreeing with all the others in the figure and ornamentation of its pinnacle, it yet differed from them in the inclination of the gablet ridge, which instead of making a right angle with the axis of the shaft, the effect of which would be displeasing, dips from it with an angle of 120 degs. When viewed in profile from Cannon-street, this buttress presents itself most agreeably to the eye. It is worth a careful study, and has also another feature of its own, in the absence of any diminution of its bulk until it reaches the gablet. The true difficulty of the restoration will, however, be the south cross end—partly rebuilt in the worst style about fifty years ago—which, according as it may be treated, will either be a dignified and most effective part of the general view, or a discordant object, that will disappoint all previous expectations arising from the taste and correctness of what has been up to this time completed; and not an important one for the builders practically to deal with, in restoring the groined ceiling of the nave, is the discrepancy between the bays of the north and south walls, those of the former being irregular both in widths and heights, while those of the latter are quite uniform. It would seem however to be a matter of prudence on the reasonable assumption, that the rebuilding of the north wall of nave identical with that of the south will be a mere question of time—to disregard totally the irregularities of the latter, and, as far as we have learned, we believe this is the probable course to be adopted.

The execution of the works is entrusted by Mr. Guinness to the Messrs. Murphy, of Amiens-street, builders, and we are fully prepared to testify that they have performed the task with unexceptionable excellence, but which will be better understood by looking at their work than by reading a description. They have not, like some of their predecessors, fallen into the error of using the soft Caen stone for quoins, angles, water tables, or any other exposed or exterior works, but have adopted excellent lime-stone obtained from the quarries at Tullamore, Skerries, and the neighbourhood of Drogheda—each being used in a different portion of the work. The shoring of the nave roof partly sustained by a mass of masonry such as above described, and in a height of 60 ft., some 2 *ft.* 7 *in. out of plumb*, was successfully accomplished by them, without a single injury suffered by any of their numerous workmen, and at least must demonstrate to the most sceptical the amount of practical skill that has been available amongst the employeés of Mr. Guinness.

Reviewing, therefore, in the abstract, *all* circumstances connected with the restoration of this cathedral, we must admit that, while maintaining on *general* principle that those who engage in works even of a comparatively insignificant character would do *best* to secure competent professional advice, to guide them *ab initio, usque ad finale*—and the more important the work the more desirable the precaution—if even only in the event of failure to secure a responsible object for censure—nevertheless, that, as this has been strictly—or nearly so—a matter of restoration, with every existing detail as a guide, studied faithfully, and with an earnestness of purpose unsurpassed either inside or outside the professional pale, the work, as an architectural whole, is successful in its treatment, and the noble-hearted benefactor is entitled to unqualified national approval.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE presentation of the Royal Gold Medal, £50 prize, in connection with the Soane Medallion, and the book prizes, took place on the evening of the 22nd ult., Mr. Cockrell presiding. The recipient of the gold medal on this occasion was Mr. P. J. B. Le Sueur, who replied in the following terms:—

Mr. President, Gentlemen, and dear Colleagues,—I am extremely flattered by the signal honour that you confer on me, and I am the prouder inasmuch as I receive here a mark of distinction that is unique. This is not a question, in fact, of one of those decorations awarded, and often even lavished, by men in high places, and without doubt generally of uncontestable worth, but not always possessing the aptitude necessary for judging works of art. Your institution, on the contrary, possessing all the knowledge necessary for the thorough appreciation of monumental productions, its approbation has an incomparable value, which I appreciate with heartfelt conscience, and which fills me with the liveliest gratitude. It has been said that the arts are cosmopolitan. Thanks to the facility of communication, the truth will become daily more evident, and artists of all countries may form, perhaps, ere long, but one immense academy. Living in an age of eclecticism—feeling one's way, as it were, we have a great task to fulfil—that of giving to art a character peculiar to our times. This task is difficult; yet let us not be discouraged. Numerous publications enable us to become better acquainted with the monuments of all ages, and all countries; they are precious documents which our predecessors very imperfectly possessed. Let us hope that the comparative study of these fertile elements may produce at last not a new architecture, the hope of which is utopian, but a new shade of style, which will become the seal of the architecture of the latter half of the nineteenth century. London and Paris, being not only the largest capitals in Europe, but the nearest to each other, it belongs to us to give the impulse, and I am proud of being a link in the chain which will unite indissolubly the two countries. The recollection of this day will be precious to me, as consecrating between us those intimate relations which must extend and become general in the future. For myself, gentlemen and dear colleagues, I shall co-operate with all my heart, urged by feelings of the deepest gratitude.

The other prizes were awarded in the following order:—

To Mr. Walter Paris, Fergusson's "Handbook of Architecture," for the best design for a literary and scientific institution.

To Mr. Richard C. Carpenter, Petit's "France," for the second best design for ditto.

To Mr. Edward Tarver, Gwilt's "Encyclopædia," for the best set of monthly sketches.

To Mr. Walter Paris, "Parker's Glossary," for the second best ditto.

The £50 prize claimed by Mr. Thomas Vaughan, jun., of Stoke Newington, the successful competitor for the Soane Medallion in 1859, was awarded. This gentleman being in Naples, his father attended for him and received the prize, the president requesting him to convey to his son the congratulations of the Institute.

Mr. F. Pepys Cockerell read a paper on "The Architectural Accessories of Monumental Sculpture;" and Professor Donaldson, after alluding to it in complimentary terms, added some lengthened remarks on the subject, and Messrs. Papworth, C. H. Smith, and Horace Jones also joined in the discussion.

CONVERSAZIONE AT THE ARCHITECTURAL ASSOCIATION.

ON the 19th ult., the second conversazione for the season was held by this society at the Conduit-street Galleries, and there was a goodly assemblage present. Mr. T. Roger Smith, president, referred to Mr. Tite, M.P., having, at the commencement of the session, placed at the disposal of the association a sum of money as a prize, and the report of the judges was accordingly read thereon, which stated that "a total number of 102 drawings had been submitted by 17 parties in competition for the £3 and £2 prizes respectively, to the former of which (a design for a club-house) Mr. Harris was found to become entitled, and the latter Mr. Tarver, for sketches in the class of design." Mr. Tite presented the prizes, which respectively consisted of "Fergusson's Handbook of Architecture," and a volume by "Viollet le Due," and the recipients were highly complimented by that gentleman on their ability. After a vote of thanks to Mr. Tite and other proceedings, the meeting separated.

IRON CONSTRUCTION.*

The golden age is past; we are now in the iron age. The framework of our country is iron; her sinews are iron. Through iron arteries her vital fluid is forced by the pulsations of a thousand iron hearts; her nerves are iron, stretching their wiry fibres in a network from the great brain, and flashing injunctions to the most remote extremities that are almost analogous to the dictates of the human will. This is the feature of our age. Glass may strive for partnership or follow in the wake, and share the glory of its elder brother, but iron must inevitably succeed to the title and honours of this century. It is only by directing the attention to it that the prevailing presence of iron in our daily lives becomes properly evident. Such things as railways and iron ships are too conspicuous to be noticed, and one seldom remembers that the lamp-posts are iron, and the iron roots from which they grow are spreading unnoticed for miles under our feet. What should we do without fire-grates and down-spouts? What would joiner's work be without nails? Send a bagfull to the backwoodsman, and you may then learn to appreciate them properly. Even the humble scraper at the door is an invention that cannot be surpassed, and in the quality of fitness is unexcelled. The way to appreciate both nature and art is to keep your eyes open, and think about it. An architect usually has but little to do with iron until he finds it on the ground at his work, as it is almost impossible for him to attend at the melting to see if the metal is of the right sort, but in most cases it is usual to insert strong scarecrow clauses into the specifications about the particular mixture of cast iron, the absence of cold shuts, and other ills that castings are heirs to; or perhaps the brand of the wrought-iron bars and plates is named, and as a check upon both, test bars and tension per square inch mentioned. This is all very necessary for security, but, as I have suggested, is, in practice, only the *cave canem* of the Romans, who seldom kept a dog that would bite. Almost the only power the architect has is to ascertain if the form of his casting is what he intended, unless by a few experienced taps he can judge of the metal by its ring, for external appearances are very little to go by, if the airholes are neatly stopped up with lead or putty. It is the same with wrought-iron to a great degree: imperfect welding or rolling may be all concealed by a well-worked surface; and although the facilities for testing wrought-iron are greater than for cast-iron, there is still a perilous amount of uncertainty, for I have seen a piece of iron stand fifty tons well at one moment, and within half an hour afterwards break with a load of ten. Under these circumstances, I feel justified in directing my attention to iron construction as a subject requiring much more elaborate study than construction with material whose acting force usually depends upon gravity alone. It may, however, be truly said that gravity is the ultimate source of all the strains that arise in building, but for convenience it is necessary to resolve the resultant into compression and tension. It was formerly usual to employ iron chiefly, to resist the latter, but economy of space and length of bearing have brought in its services for both. The mere names of cast-iron and wrought-iron imply two separate sciences, which, in themselves, would take a lifetime to learn, and I can do little more in this paper than offer a few brief notes upon the main principles and difficulties in the more ordinary forms of iron construction which come within architectural practice. The first point to be considered in obtaining a casting is to find out accurately what it has to do. This is, in some cases, easy, but more generally difficult, and frequently instances that appear simple are, on consideration, found to be complex. One common example may suffice to explain the sort of difficulty to which I allude. Suppose a shop front of more than the Building Act width, in which the inevitable column has to be fixed, and suppose that the proprietor, since he has to put one there, determines to make it work. To effect this end, the beam is reduced in strength so that it would not carry the superincumbent weight unassisted, a portion of the weight falls upon the column, but how much? It is only a poor approximation to ascertain what the beam *will* bear, and then say that the column carries the remainder. But suppose this to be done, it is not enough. Suppose the column to be in the position shown in the drawing, the greater length of the beam on the one side will have more deflexion than the other, and the strain on the cap of the column is greater on that side, thereby throwing a diagonal strain upon the column, for which it should be prepared. If cores were always in the centre, and cinders absent from the metal, or at least equally distributed through it, this preparation could be made, as it is found a column deflects in a definite station to a known power of the length and diameter. All this, however, is not done. The usual plan is to look out for something nearly like the case in point, that has stood well, and—follow the leader. In the example before us such a course is as good an one as can be adopted, from the fact that the case is simple, and examples are numerous. It illustrates, however, the remark I commenced with—that an apparently simple case may, on reflection, turn out to produce complex strains, and hence the difficulty of what work the casting has to do. In the production of an article in cast-iron, three things should be borne in mind—firstly, the object and strength required; secondly, how is it to be moulded; thirdly, how is it to be fitted together. The paper then went into various details, and concluded as follows:—The practical man wants simple tools, and when the results are liable to so much uncertainty, an approximate result is sufficient to be a safe guide for an educated architect. I do not for a moment depreciate the utmost refinement of science. Science is always consistent with all successful practice; but I maintain that although the architect may with care and skill work out the form of a casting most correctly according to theory, neither he nor the man who makes it will know much about it until it is smashed in two. Under these circumstances, then, I say that simple rules are sufficient; and as an instance I may quote one for the strength of pipes that has never been printed before, but which I am certain answers perfectly well for ordinary sizes. It is based upon the fact that a 10-inch pipe, 1 inch thick, will stand 100 yards pressure of water. The coincidence of 1-inch metal, 10-inch diameter, and 100 yards pressure, are sufficient. For every inch in diameter increase or deduct by one-tenth of an inch, and for every yard of pressure add or deduct one-hundredth of an inch. For columns, calculation requires care, as the circumstances vary very much, but a safe plan is to find the diameter of a solid column necessary to bear the compression, and then distribute the same area of metal in a tube to form a hollow one, and if the thickness of the metal is proportioned so as to be one-seventh of the external diameter, the strength of the column will be increased by more than half. The diagram shows also a simple plan of doing this. The line B.C., which is simply a tangent touching the inner circle, is the diameter of a solid column, containing the same metal as the hollow one. A convenient example to remember, as a guide, is the remarkable fact that a column of this sort 10 feet long, having an area of 10 inches of metal, will bear ten tons. These are the kind of rules which can be carried about for use at a moment's notice; for, after all, it is really not so much what we know as what we can make use of that is valuable. I fear that the ambitious title which has, without sufficient caution, been affixed to this paper, has raised expectations which are now disappointed. The subject is so wide in its grasp, and requires so much elaboration to be perfect, that it has seemed more prudent to limit the illustrations to the simplest every-day examples, as the same principles govern both large and small undertakings. The capabilities of the material are immense, and it is a special blessing upon our island that it produces so plentifully the three important elements of its production—ore, coal, and lime. These have made our country the nursery-ground for mechanics to supply the whole world, and this character has become now naturalised to our race. The nation is made up of individuals as a faggot is of sticks. If we all, even to the smallest, try to do our best, and each one contribute his little power to the general strength, then, with ordinary care, we may still maintain our position as the workshop of the world.

A FEW REMARKS ON ACOUSTICS.*

If conduction is to assist, then there must be one dimension decidedly predominating over the others, and that dimension should be the length away from the speaker; and should regulate the width and height, with the proviso that in these buildings the proportions should be rather long than short, and rather low than high.

With one example of an influence upon sound in galleries and long rooms, which is unquestionably due to the proportions of the room and will be modified by every modification of those proportions, we shall have done with the topic.

It must have often occurred to persons listening to music in a tolerably long hall or gallery, to notice that there are portions where the sound appears more distinct than in others. This was very noticeable in the Floral Hall at the time concerts were given there, and may, I understand, be detected in St. James's Hall.

This phenomenon coincides with an interesting investigation of Savart, published by him in the "*Annals de Chimie.*" He invented an apparatus for showing visibly the actual condition of the air in a room during the time that a continuous sound of great intensity was kept up; and I mention this investigation, not as having been pushed so far by him as to lead to any practical result, but rather as showing that methods exist by which we may, perhaps, be able to arrive at information as to the acoustic condition of air in rooms, to a degree hitherto unattempted.

The sound employed in this investigation was that of a bell fixed in front of an open cylinder of such dimensions as to be suitable to reinforce powerfully the note of the bell, and a sound was obtained by this apparatus of such intensity as to be hardly bearable. The effects of this sound on the air were made visible by a sort of artificial ear formed of a thin membrane stretched tightly over a small wooden frame, and sprinkled lightly with sand.

---

* Abstract of a Paper read by Mr. William Stubbs at the Liverpool Architectural Society, on Wednesday evening, April 3.

* From a series in Architects and Mechanics' Journal.

This membrane when near the bell became excited, so that the sand on its surface was thrown into an agitation, but in moving it to and fro along the room, places were found where the agitation varied—in some parts it became very intense, in others very moderate; and on exploring every part of the room it was established that the points of greatest intensity formed a spiral line, making several revolutions during the length of the apartment. On opening an end window this spiral could be traced as continued into the air beyond for a considerable distance. The distance from one turn of the spiral to another was not equal to the length of the undulation proper to the note sounded; it became greater the larger the apartment, and in a long gallery approached the length of the sound-wave.

When the windows in a chamber were opened, the position of this line of loudest sound—which, by-the-bye, was distinctly perceptible to the ear, as well as visibly demonstrated by the moving sand—was altered; but moving about the sounding apparatus from one part of the apartment to another did not cause any such alteration, which seems to show that this property of a room, if once decidedly manifested, cannot be altered by moving the position of the speaker, but will only be affected by changes in the room itself.

We have now got together some few materials for the design of an acoustic building. Let us for a little consider how they have been applied, or can be applied, to various descriptions of structure, commencing with an inquiry how far the simple consideration of size ought to modify the treatment.

The safe limit of direct radiation can, of course, only be very approximatively ascertained; but comparing the results obtained by Saunder's experiments with the observations of that accomplished philosopher as well as architect, Sir Christopher Wren, we may say appropriately that if we were to enclose a space not exceeding 70 feet in length by a somewhat smaller breadth, we should be quite safe in presuming the natural radiation of a human voice of ordinary power would reach all the audience with no assistance, when the speaker was placed in the best position for being well heard, provided always we were able to insure that no echo from any part of the walls should interrupt. Should our building be much larger than this size, it will become desirable to assist, if practicable, the voice of the speaker.

If we apprehend a considerable interference of any obstacle with the sound, this may be too great a dimension to be safe. If, on the other hand, circumstances are all favorable, it may perhaps be exceeded.

The conditions under which a single speaker can best address an auditory depending upon direct radiation have been already referred to. The building should have a circular outline, and be, in extent, something more than a semicircle. The seats should rise one above another, and the speaker should be pretty well forward among his auditors, and the remotest auditor should not be beyond the limits of direct radiation.

The most perfect type of these buildings seems to have been an ancient Greek theatre, especially if we bear in mind that the chorus, which occupied the most forward part of the stage, was the most prominent feature in the earlier Greek plays. In modern buildings this form has unhappily gone out of fashion, except for scientific lecture-theatres; but there is one fine example in the great Handel orchestra at the Crystal Palace, the appearance of which when full will convey some idea of what the auditorium of an ancient Greek or Roman theatre must have been when crowded with people.

Roman theatres differed from the Greek ones in the auditorium not exceeding a semicircle in extent, and in being constructed, even down to a late period and when of large size, of wood, the resonance of which material was, as Vitruvius tells us, relied upon to reinforce the sound: consequently, the *echeia* or brazen reinforcing jars introduced into Greek theatres were not adopted in Rome.

LAZARETTOS.

LEPROSY during the middle ages was a common disease in Italy and other parts of Europe, and the lepers, or persons afflicted with it, were called lazzari. Hence the term lazaretto applied to the hospitals where such persons were confined. In England similar receptacles were sometimes called lazar-houses, or houses of lepers.

John Howard, the distinguished philanthropist, whose services in the cause of humanity can never be forgotten, was the first who drew public attention to the state of the lazarettos on the continent. In the year 1785, he personally inspected most of these institutions, and in his work entitled "An Account of the principal Lazarettos in Europe," has given a complete exposition of the plans of the buildings, and their chief regulations. The result of this inspection was the adoption of many of the valuable suggestions made by Howard; and many a weary traveller, suffering under the annoyances of the quarantine system, has had reason to bless the name of the man who did so much to alleviate them. Although some improvements have been made since Howard's time, the main features of these buildings remain nearly the same. His description of those he visited, therefore, may, even at the present day, be considered a faithful one, and interesting to those who, "living at home at ease," have little idea of what it is to be in quarantine. The first lazaretto he inspected was that at Marseilles, which is situated on elevated rock near the city, at the end of the bay, fronting the south-west, and commanding the entrance of the harbour. It is a spacious building, and its situation renders it very commodious for the purposes of trade. Within the lazaretto is the governor's house, a chapel in which divine service is generally performed, and a tavern from which persons under quarantine may be supplied with necessaries. In order to prevent any communication not allowed by the regulations of the establishment, there is a double wall round the lazaretto; and at the gate there is a bell for calling any person within this enclosure; and by the number and other modifications of the strokes, every individual knows when he is called. At Genoa the lazaretto is situated on the sea-shore, near the city, detached from other buildings, and encompassed by a double wall. Another lazaretto, belonging to the Genoese, stands on a rising ground at Varignano, near the gulf of Spezia. At Leghorn there are three lazarettos. At Naples the lazaretto is very small, and is situated on a peninsula near the city. Vessels having *clean* bills of health, lie at the entrance at the port, near the health-office, but those with foul bills are required to perform their quarantine at the lazaretto. At Messina the lazaretto stands on an island near the city. The health-office at Zante is in the city, at the water-side. The old lazaretto is distant about half-a-mile from the city, and situated on a rising ground near the sea. There is another, called the new lazaretto, which is appropriated to a numerous body of peasants, who pass over to the Morea, to work in harvest time; on their return they perform here a seven days' quarantine; and other persons perform fourteen days quarantine in the old lazaretto. The lazaretto at Corfu is finely situated on a rock surrounded with water, about a league from the city. The lazaretto of Castel-Nuovo, in Dalmatia, is on the shore, about two miles from the city; at the back of it there is a delightful hill, which belongs to a convent of friars. Persons in quarantine, after a few days, are allowed to walk there, and divert themselves with shooting, &c.

In order to obtain the most complete and satisfactory information, by performing the strictest quarantine, Howard determined to go to Smyrna, and there to take his passage to Venice in a ship with a foul bill. He was thus enabled to give a particular account of his reception and accommodation in the new lazaretto of this city, which is chiefly assigned to Turks and soldiers, and the crews of those ships which have the plague on board; and this he thought the more necessary as the rules and tariffs of the other lazarettos in Europe have been evidently formed from those established at Venice. The city of Venice has two lazarettos, appropriated to the expurgation of merchandise susceptible of infection, coming from suspected parts, and for the accommodation of passengers in performing quarantine, as also for the reception of persons and effects infected in the unhappy times of pestilence. The old lazaretto is two miles, and the new about five miles distant from the city, both on little islands, separated from all communication, not only by broad canals surrounding them, but also by high walls; they are of large extent, being about 400 geometrical paces in circumference. Of these Mr. Howard has given a particular description; with an account of the regulations and mode of government to which they are subject, and a plan of the old lazaretto. At Trieste there are two lazarettos; one new, but both clean, and a contrast to those which he had seen at Venice. Of the new one he has given a plan. It is surrounded, at the distance of about twenty yards, by a double wall, within which are separate burying-places for Roman Catholics, Greeks, and Protestants. Howard closes his account on the principal lazarettos in Europe with the outlines of a proper lazaretto, and an engraved sketch of a plan for its construction. He has likewise subjoined, in minute detail, various pertinent remarks respecting quarantine and lazarettos in general.

Within the last few years, however, more enlightened views on the whole subject of the quarantine system have begun to prevail, and are gradually obtaining support. Eminent medical authorities, both in this country and on the continent, have expressed the strongest opinions, as to its total inefficacy in preventing the introduction of disease; while on the other hand the injury done by it to the interests of commerce—injury, which cannot be adequately estimated—is earnestly and justly insisted upon by the merchants of all nations. It may be hoped, then, that these considerations may have their proper effect with those in authority, and that laws so oppressive and so injurious may shortly be abolished. A greater attention to sanitary regulations will go far to prevent the generation of disease at home; and then, even without quarantine laws, we need have little apprehension of contagion from abroad.

STREET RAILWAYS BILL.—An amendment proposed in the House of Commons by Mr. Vincent Scully, M.P., to the effect that this bill be read a second time in six months, was carried by a majority, consequently the consideration of the question remains postponed.

PROPOSED METROPOLITAN AND PROVINCIAL BUILDING ASSOCIATION.

An effort is at present being made to establish in this city an association similar to those in London, Liverpool, and elsewhere, not only to encourage an extension of building operations of a domestic class, but to enable those who can afford to lay by a small annual sum from their earnings to become house or other property owners with greater facility and under more advantageous circumstances than would be otherwise afforded. The success of the principle has been fully illustrated in various instances already, where the purpose of the promoter has been *bona fide*, where the fundamental rules were carefully prepared by qualified persons, where sufficient amount of support was accorded by the public in contributing to the general fund, and where the management was economical and judicious. These seem to be in the abstract the points on which alone success would depend in this country as in England, and with every good wish for the project, if it possess the elements above enumerated, we quote a few particulars from the prospectus submitted:—

"These associations, or societies, commenced to be formed in England about the year 1820, since which time (so manifest and important were the advantages found and proved) they have increased and multiplied to an enormous extent in almost every town in England; in Liverpool alone, at the end of the year 1859, there were 142 of these associations, with 15,052 *shareholders*, and an actual paid-up capital of *one million forty-seven thousand six hundred and seventy pounds*—each association having an average capital of £7,378, supplied by 160 members or shareholders.

"At the present moment there are *thousands* of men in England, from the ranks of tradesmen, clerks, mechanics, labours, &c., living independent, and many in affluence, from the rents of property derived from the facilities offered by these associations, combined with their own patience, perseverance, prudence, and economy.

"The plan is simple. A person makes a purchase of a house or other property. If not bought too dear, he can borrow from the association the money to pay for it, leaving a small margin for contingencies. The rents of the property, instead of being paid to a landlord, are paid to the association, in liquidation of the loan, by instalments. The borrower becomes the ostensible owner from the day the purchase is completed. Any sums he may spend in alterations, repairs, or improvements, will be for his own benefit, instead of a landlord's; and in a few years he finds himself the *bona fide* owner of the property, deriving an income from the rents, and has something to leave for the benefit of his family—of itself a proud consolation to the mind of every right thinking man.

"An important point must not be overlooked. A person desiring to purchase a property can always ascertain, *before he makes the purchase*, what amount he can borrow from the association; as such he does not involve himself in any penalty for breach of contract, or attempt to make a purchase he cannot complete. A person building property can receive one-half the amount agreed to be lent, when the roofs are on, and the remainder when completed.

"The rules and regulations will be formed and based upon the practical experience of the most successful of the Liverpool Associations.

"There will be two classes of shareholders, viz., the borrowers, and the invested shareholders. The *first* are those who have had money advanced on the security of property; the money is advanced to the highest bidder as often as the funds (or subscription) accumulate to a sufficient amount; the premium for such advances forms the principal *profit* of the association, and is divided annually, *pro rata*, to the non-invested or *second* class of shareholders.

"Repayments of loans will be made according to certain scales, at the option of the borrower.

"The committee will be elected by the shareholders from amongst themselves, and a new committee elected annually, the outgoing members being eligible for re-election."

The office of the secretary *pro tem.* is at 22, Eden Quay.

IMPORTANT JUDGMENT IN BANKRUPTCY.

In re Hugh Kelly, Timber Merchant.—This was an adjourned meeting for final examination, and to decide upon an offer of a composition of 12s. 6d. in the pound after bankruptcy.

Judge Lynch pronounced the following judgment:—

As a first objection to carrying out the composition, a question has been raised that no composition under section 149 of the act is valid unless it be a money payment immediately payable, or, as is qualified, necessarily payable in a reasonable time. I can see many reasons for this construction which did not at first impress me—the introduction into the section of the provision of the offer of composition being by the bankrupt or his friends, and the difficulty of a confirmed composition, with a postponed annulling of the adjudication, as must happen unless this construction be the true one, have all impressed my mind strongly; and I see a plain motive enough to leave it in the power of the creditors to arrange for an immediate money discharge in the cause of bankruptcy, leaving no room for bankruptcy within bankruptcy, which must happen if the arranged bills are not according to the terms of the arrangement proposed. Composition would then mean and be finality; and perhaps would be then the proper substitute for the court, in place of the absolute transfer of the bankrupt's whole rights worked by bankruptcy. However, saying this, I am prepared to rule that the statute authorises the carrying out the composition proposed by Mr. Kelly, which is a composition of 12s 6d., to be paid at postponed and definite periods; the postponed payments to be further secured by bills and other securities offered and accepted of. The language of the statute does not authorise me to say that it must be a money payment *in presenti*. The phrase "composition" does not *ex vitermini*, mean a payment in satisfaction; it means something to be taken in lieu of the whole debt; and I may admit it means a money arrangement to the extent that the something must sound in money, to be taken in satisfaction, and to be payment. And within this proposition, I think, is contained sufficient to meet the cases cited to me—namely, that the bankruptcy will not be annulled, and the security of its operation will not be taken from the creditors until a composition, agreed upon by the statutable majority of the creditors, has been paid in fact. I find in the report, *in re Mane* a passage cited as Baron Bramwell's judgment, different from all the passages given in the report in H. and N.. and showing also the same idea of a money payment before the annulling of the adjudication. Therefore I cannot agree that Baron Bramwell has ruled the proposition contended for, and the further case *in re Mane*, seems to me to show that the courts can mould the composition having regard to the securing a satisfaction by payment before annulling the adjudication. Some element of futurity as to payment must necessarily be introduced. If a bankrupt gives up everything to his creditors, the only money he can have is money in this court, and to limit composition to a money payment *in presenti* would really be only to allow composition by virtually returning to him something. This section seems to me analogous to the arrangements sections applied to a different stage of the proceedings, and its language is appropriate to the different circumstances—it is then composition; being an ascertained debt payable in the early stage it is, properly, arrangement in affairs not yet ascertained. I, therefore, must hold that a reasonable scope and effect was intended for this provision, and I think that to hold it a present money payment would be to make it, in effect, a nugatory provision. If, then, futurity of payment is within the scope of such composition, I cannot see the limit I can put it, so to exclude the composition in this case. Certainly it is proper here to consider the words of the section—"The court may. upon such acceptance being testified in such writing, and upon payment of such sum as the court shall direct, annul he adjudcation in bankruptcy." These words in our view seemed to make strongly for the objection that it should be an immediate and not a postponed payment, for they seem to infer an immediate annulling on the acceptance of the offer. However, I think these words may mean—first. that the court has a discretion by use of the word may, which, in the context. stands opposed to shall, or the payment of the sum may properly enough mean not a sum for costs or expenses not a natural provision, but the sum in satisfaction of the composition, and so rendered the clause would be appropriate to giving the existing security to the creditors at the same time that it gives a means of effecting a composition beneficial to the bankrupt, and approved of by the creditors. I freely confess that I have not brought my mind to a condition of full satisfaction in arriving at this conclusion; but having regard to the working of these clauses hitherto to the inconvenience of the limited operation contended for, and the fact that the other construction almost renders the clauses inoperative, I now hold that this composition comes within the section. and may be carried out, the bankruptcy only being annulled when the composition offered is fair. Another question was argued before me.namely, that this court is only mentioned in carrying out the composition, provided the statutable majority adopts it. Were this proved to my satisfaction, it would reflect on the other proposition, perhaps to the extent of altering my judgment; but I yield not to this proposition at all. By the terms of the statute the second meeting is appointed for the purpose of deciding upon such offer. This leaves to the court a judicial act to be done independently of the agreement of the creditors; but to the carrying out of the offer there must also be the agreement of the statutable majority; but this is not in limitation of the judgment of the court in deciding, but is necessary only to the carrying out of the offer; and this is naturally followed in this view by the word the court "may," still following up the provision as one within the discretion of the judge. Ruling. then, that I have a judicial discretion to exercise. I have then to consider how I should exercise it here. In this case a great body of the creditors thinks this is a prudent arrangement for their interest. On this point they have better means of judgment than I can have; all the facts of the case are before them, and they deliberately tell me they think it for their interest to have it carried out. It would be a strong thing for me to tell them that they are in mistake in a matter in which they have so deep an interest, and as to which they have such peculiar knowledge to enable them to form a judgment. Therefore, I could not in this case, even if I felt inclined to come to a different conclusion, venture to gainsay the decision of so large a body of creditors. Another objection, however, is made which I think is more proper for me, and on which I am authorised to form an independent judgment—that is, as to the conduct of the bankrupt—his negligent mode of trading—his inability to conduct an extensive trade by reason of his neglect—and also positive acts of impropriety in his dealings. Now, I do not mean at all to say in this case that I am satisfied with the mode in which Mr. Kelly has conducted his trade—a trade of the extent of his, carried on in so slovenly and negligent a manner, cannot pass here without censure; but still I do not feel myself authorised to say that it is such conduct in the trader as disentitles him to make with his creditors a composition approved of by them. Special cases were made against Kelly as to Patterson, and as to representations made respecting his property. If I believed that Mr. Kelly had committed acts as a trader, in regard to which I would refuse to pass his final examination, or even give a very long stay to the grant of the certificate, I would hold this a fair reason now to decide against this composition. However, on full consideration, I cannot arrive at the conclusion as to Mr. Kelly's dealing that it amounted to more than loose statements and negligent statements, but not made with any deliberate intention to commit any fraud.

In re Killen and Cunningham, Bankrupts.—The final examination of the bankrupts has passed, and an immediate certificate granted. The joint and separate estate of Mr. Killen paying 20s. in the pound.

Sweeny v. the Most Rev. Dr. Moriarty and the Rev. Dr. Mawe.—Mr. Leahy, Q.C., moved for a new trial in this case, which was an action by the plaintiff to recover a sum of money for extra work alleged to have been executed in repairing the Catholic chapel at Tralee, for which the defendants are trustees. The case was tried at the last Kerry assizes before Mr. Justice Keogh, and there was a verdict for the defendants. The new trial was sought for on several grounds. Conditional order granted.

APPROACHING ELECTION AT ROYAL HIBERNIAN ACADEMY.

An announcement to the effect, that the Academy would shortly hold an election of associates appeared in our last impression, and was advertised in some of our morning contemporaries. In reply thereto some candidates—whose names we consider it unnecessary to publish at present—were recorded; but we were much surprised by a subsequent reminder, that "to be eligible for associateship they must have been exhibitors at the Royal Hibernian Academy within two years of the time of election. Now, to say the least of it, this bye-law is replete with inconsistency. In the architectural department—as over and over again alluded to in this journal—the display has been for "the last two years" so *meagre*, so *wretched*, in every respect that to make contributions thereto a *sine qua non* to eligibility for associateship is absurdly preposterous. If the candidates *be* reduced to that list, the Academy will find very little difficulty *numerically* in arriving at a decision, as it would be about *as limited* as could be desired. And then with reference to the fulfilment of the requirement at the *approaching* exhibition, in the first place *is it fair* to make same known at the *eleventh* hour, on the very eve of the opening, and when the candidates may have other duties more pressing to attend to, rendering it impossible for them to comply? and in the second place is it desirable or necessary to make it at all? The condition may be interpreted as a mere submission of "specimens;" and let us ask, what professional practitioner of any worth or standing, however desirous for the honourable distinction of associateship, will be disposed to comply with that, which certainly approaches, however unintentionally, to the placing of the master on the same level as the pupil, who might desire to study in the art schools of the Academy? Were the recently-elected academicians subjected to the same condition—"an educational test"? Certainly not; and why should the associates either? The former and latter are chosen from the *same* professional body—however much seniors in practice and position the former may be, or may be assumed to be—and not in the latter case from the graduates; were it so, the proceeding would be perfectly legitimate, which with best wishes for the prosperity of the Academy, we must submit that it is *not*. According to our present information there is but one candidate on the list who has been an exhibitor during the last three years; some others are candidates who might have been, without the least trouble, exhibitors of drawings prepared for two important recent competitions, and who were not so. Suppose they should not contribute to the approaching exhibition, what will be the result of the election?

THE WELLINGTON TESTIMONIAL.

In reply to a correspondent's letter in last number, we are informed that the pedestal in front of the testimonial was removed by order of his Excellency the Lord Lieutenant, there being no funds at present—or likely to be—available for the purpose of erecting an equestrian statue, which the pedestal was designed to receive, and which would cost at least £8,000. The removal, therefore, of so useless an appendage must be regarded as a desideratum rather than otherwise.

CONTRACTS.

To remedy the evil effects accruing from the present system of concluding contracts, and to infuse some "good faith" into such transactions, the New York *Architects' Journal* submits the following suggestions:—

"1st. That aggregate tenders should be required only from *responsible* persons, and to include separate offers from *sub*-contractors of the various trades to be engaged, and who should sign a collateral bond with the principal contractor, so that the employer's architect may be enabled to judge of their respective capabilities and reputations.

"2nd. That a *stated* time be fixed for receiving the tenders at the employer's or architect's offices, and every contractor or his representative should present his in *propria persona*, and that after fifteen minutes grace expires the architect should, *in presence of all the parties*, inspect the offers, and audibly declare the amount of each and the result; and should the lowest appear *too low*, let him add together the amounts of the tenders, and divide the sum by the number of tenders, to see which offer comes nearest to his own estimate. Adding that 'if the system here recommended were universally adopted there would be fewer *disappointed hopes* and *falling buildings*.'"

[We are not quite as much satisfied as our Transatlantic brother that the suggestions even approximate to a tangible or satisfactory settlement of the very many questions presenting themselves in the course of every-day practice; and, moreover, we are quite certain that very few would be likely to subscribe to them.]

ENNISCORTHY MODEL NATIONAL SCHOOL.

This building has been recently completed by the Board of Public Works in the immediate neighbourhood of the town of Enniscorthy, facing the river Slaney and the main roads from the town to Wexford and New Ross, and at a distance of about 100 feet from the latter. The site contains two Irish acres, presenting nearly 400 feet frontage to road, and is partly enclosed with dwarf wall, surmounted by a neat iron railing, and having cut stone coping and piers, and partly by walls of rubble masonry, with plain half round coping. The ground in front of the building is laid out in terraces and slopes, and a circuitous drive leads from the entrance gate, which is placed near the angle next town, to the upper terrace. At the rere are playgrounds for the boys, girls, and infants respectively. The ground-floor comprehends boys' school-room, 40 feet by 30 feet; girls' do., 31 feet by 26 feet; infants' do., 31 feet by 20 feet, with class, cap, and cloak rooms in proximity; dining hall, 18 feet by 18 feet; study, 18 feet by 16 feet; masters' apartments, &c., &c. On the first floor are dormitories, bed-rooms for pupil teachers, lavatories, &c., &c., and in the basement are the culinary offices, servants' rooms, &c. Judging from the photograph forwarded to us, the building presents an effective exterior of irregular outline and Italian character, the infant school and class-room forming a one-storey wing, with rusticated Portland cement pedestal, semicircular headed windows and cantilever roof; the centre, containing entrance hall and porch, and the other wing, in which dining-room and study are situated, being two storeys in height, and having gabled terminations. Owing to the nature of the ground, the basement storey is only visible at one side (the latter) and on portion of the front, and has square-headed windows, with battered and rusticated piers in cement; the windows of the principal floor on these portions being also mostly square-headed, but all of those on the first floor are semicircular-headed, either single or in couplets, with dressings and key-stones. The material for walling is local rubble stone, the exterior from level of sills of ground-floor windows, and the chimney shafts being faced with red pressed brick from Courtown, granite being employed for the strings, chimney caps, &c. A plentiful supply of water throughout is always obtainable. The building has been erected under the directions of Mr. A. O. Lyons, Mr. Patrick Kerr being the contractor. Expenditure about £6,000.

TURKISH BATH QUESTION.

I addressed the following letter to the editor of *The Field*, and would feel obliged by your inserting it:—

Sir—On reading your article on the Turkish Bath, in last Saturday's impression, I could not avoid taking exception to the statement, that a year ago the question was almost unknown to the public. If by the public is meant the majority of the population, no doubt it not only was the case then, but it still is the case. Perhaps it might be more correctly stated of the London public, who have been so much behind the inhabitants of other towns in taking up this national question. Need I remind you of the fact, that it has been agitated in Dublin ever since the middle of the year 1857—that it has been brought before two scientific societies in that city, as also in Cork and Torquay—that public lectures have been delivered in connexion with it in Bradford, Bray, and Dublin—and that it has been written upon by the *Sheffield Free Press*, the *Dublin Warder*, the *Hospital Gazette*, and the *Irish Agricultural Review*, previous to the date fixed upon by you as the commencement of the great movement which is now going forward all over the country. It is not merely justice for myself that I call for, but also for all the early writers on the subject, whose works have been not a little copied by their successors, and whose existence you appear to ignore.—I am, sir, your obedient servant, Edward Haughton, M.D., 104, *Mountpleasant-square*, *Liverpool*, *2nd April*, 1861.

CAST-IRON ROOFING.

Sir—You would greatly oblige a large class of your readers by giving, in the columns of the Dublin Builder, good and substantial reasons *for* and *against* the use of cast iron as a roofing for dwelling-houses in cities, towns, &c., laid horizontally on iron or timber joists, as the case may be, forming either a promenade for pleasure, or safety from fire, or partially for cisterns for water, &c.—Yours, &c., Cast-iron, *Cork*.

[The subject shall be treated of fully in a future number, and is partly so in this, at page 493.—Ed.]

Presentation.—We learn that the Hon. and Rev. the Dean of St. Patrick's has presented Mr. Timothy Murphy, the builder engaged by Mr. Guinness, at St. Patrick's Cathedral, with a handsome piece of silver plate, in recognition of the skill and care displayed by the latter in this important work.

OLD ST. PAUL'S, LONDON.

THE ancient cathedral of St. Paul's must always be regarded as one of the great works of the architecture of the middle ages: in magnitude of dimension it far surpassed every other religious edifice of this country; and it is represented by historians as equally pre-eminent in magnificence and splendour of ornament.

The general form of the plan was a simple cross, with a very long choir, and a transept rather short in proportion to the extreme length of the building. The body of the church was in the Norman style of architecture; huge clustered pillars on each side divided the nave from the aisles and supported large semicircular arches: immediately above these extended an open gallery, with arcades of the same form and width as those below, but of a much shorter proportion. From this level a different style of building prevailed, for the windows above the gallery were pointed. The vaulting which covered the nave was also of the pointed form, of the simplest groined construction, with soffets and diagonal ribs only, similar to Salisbury cathedral and the transept of Westminster Abbey. Slender circular shafts, placed against the centre of each pier, rose from the pavement without any interruption of mouldings, and received the springing of the arches: the transept was in the style of the nave. Hence, we may conjecture that the original work of Maurice and De Belmeis comprehended the body of the church as high as the gallery; the vaulting being undoubtedly part of these works, which are mentioned as completed in 1221; and it thus became one of the earliest examples of the use of pointed arches in this country.

Sir Christopher Wren was of opinion that this Norman building had been erected upon the remaining foundations of the more ancient Saxon church, for these he found to be composed of Kentish rubble-stone, cemented with mortar of extreme hardness, and both much superior to the materials used in the superstructure.

At the intersection of the nave with the transept, four massy pillars supported the tower; and, from this part, a broad flight of steps led to the choir, which was enclosed by a magnificent screen, elaborately adorned with niches and statues. The choir, which was a grand specimen of the architecture of Henry VIII.'s time, was completely in the pointed style, with a vault of a more complicated structure than that of the nave, each severy being composed of five ribs. The Lady Chapel, at the end of the choir, was a continuation of the building in the same form and style, and terminated at the eastern extremity by a rose window of extraordinary size and magnificence. A spacious, lofty crypt, extending beneath the eastern part of the cathedral, was appropriated to religious rites, under the designation of the church of St. Faith and the chapel of Jesus. Three ranges of massy piers, enveloped by slender cylindrical shafts, divided the area into four equal aisles, and supported a high-pitched vault of the simplest groined construction. The exterior of the building presented a curious medley of the styles of different ages. At the western front, Inigo Jones had erected a portico of the Corinthian order, thus displaying a signal example of that bigotry in taste, which, only admitting of one mode of beauty, is insensible to the superior claims of order and congruity. This portico was, however, singly considered, a grand and beautiful composition, and not inferior to anything of the kind produced in modern times. Fourteen columns, each rising to the lofty height of 46 feet, were so disposed that eight, with two pilasters placed in front and three in each flank, formed a square peristyle, and supported an entablature and balustrade, crowned with statues of the kings, the predecessors of Charles I. who claimed the honour of this fabric. Had the whole front been accommodated to Roman architecture, it might have deserved praise as a detached composition; but though cased with rustic work, and decorated with regular cornices, the pediment retained the original Gothic character in its equilateral proportions, and it was flanked by barbarous obelisks and ill-designed turrets. A representation of this curious elevation is given in the works of Inigo Jones, edited by Kent. The great restorer of Roman architecture in this country, was, doubtless, pleased with having an opportunity of triumphing over the Gothic style of building, in one of its strongholds; and it must be allowed that he only followed the example of the architects of the middle ages themselves, who have generally shown as little moderation and respect for the works of their predecessors; since we everywhere find the styles of different eras engrafted upon each other, in the most crude and undisguised contrast.

It appears that the whole body of the church had been cased and reformed in the same manner which had obliterated every detail of antiquity, leaving only the general forms and proportions. The buttresses were converted into regular piers, and a complete cornice crowned the whole. Some of the windows were without ornament, while others were decorated in a heavy Italian manner, with architrave dressings, brackets, and cherubic heads. The transepts presented fronts of the same incongruous style as the western elevation, and without any of its beauties. At the centre of the cross, the great tower rose aloft in pre-eminent grandeur: this was in the simple style of the early Pointed architecture. In each side three remarkably pointed windows, and the same number above, but of a shorter proportion, gave an original character to the tower, with an air of great lightness and beauty. This was the foundation of an immense spire, of which, however there are no accurate representations; for though Dugdale gives a view of the church in its entire state, yet this could not have been taken by him from personal inspection, neither does he mention any authority; and we may observe, that the style of the spire there exhibited is evidently not authentic. At each angle enormous arched buttresses, the irregular additions of various repairs, had been erected to secure the declining tower. The rest of the building, eastward of the transept, remained in its original form, a fabric of pointed arches and flying buttresses. In the east front the most remarkable object was the rose window, which constituted the principal ornament of the Lady Chapel.

Like other ancient religious edifices, this cathedral had numerous dependencies; some of which were, the chapter-house, an octagonal building, of a rich and elegant pointed style, and surrounded by a cloister, two storeys in height, of great beauty; the *clocher*, or bell-tower, standing at the east end of the church-yard, a very ancient building, to which had been added, about the time of Henry III., a spire of timber and lead: it contained four large bells, which with the spire and an image of St. Paul. having been staked at hazard by Henry VIII., were won and taken down by Sir Miles Partridge.

THE BOROUGH OF DUBLIN BILL.

THIS bill, which is very much needed for the removal of present obstructions in our streets and thoroughfares, so frequently complained of in this journal, and for the prevention of future erections of similar character, has been before the select committee of the House of Commons. The members of the committee are—Mr. George, chairman; Sir E. Grogan, Sir W. Verner, Mr. Vance, Mr. Longfield, Colonel Dunne, Mr. Bond, and Mr. Ball.

Mr. Smith, solicitor to the Corporation of Dublin, adduced in his evidence, as an instance of an obstruction which could not be dealt with under the provisions of the Dublin Improvement Act, Messrs. Findlater and Company's brewery, at Russell-street, the wall of which has been advanced to the edge of the railing, and is a great disfigurement and inconvenience; that the same proceeding is going forward in Dawson-street, next Morrisson's Hotel; likewise that in Camden-street and Richmond-street are similar examples. The witness referred to an erection which had been reared at the corner of Merrion-square, in Upper Mount-street, but it was taken down, as a clause was found in the lease forbidding any such; further, on examination by the chairman, stated that "there was no power to prevent erections being built over the areas which project beyond the range of houses, though they do not absolutely project on to the flagway. In such cases as these, and in the analogous case of shop fronts, we seek for powers to prevent them from being built, or, if built, to remove them. One person had put up a sign board, originally with the view of increasing his business, but everybody had them now, and consequently they were of no advantage to anyone. It was proposed to give the Corporation power to remove them on paying the individual."

Mr. Longfield inquired who was to pay them? He objected to this provision. He should be for allowing everything to stand except cellars and cellar doors, which might, in particular cases, be absolutely necessary.

Sir E. Grogan said that as time was valuable, he had no objection to allow the words "cellars, cellar doors, and steps leading thereto" to be omitted.

The clause, as amended, was agreed to, as were also the remaining clauses. The bill was then ordered to be reported to the house.

At Messrs. John Martin and Son's periodical sale on 18th ult., the following goods were sold:—

130 tons best middling Memel timber, from 62s. 6d. to 70s. per ton.
164 pieces small Memel, from 57s. 6d. to 62s 6d. per ton.
100 pieces selected fresh crown Memel, at 82s 6d.
180 tons red pine timber, from 67s. 6d. to 72s. 6d. per ton.
140 tons white pine do., from 50s. to 57s. 6d. per ton.
70 pieces board pine do, from 65s. to 80s. per ton.
70 pieces birch, from 65s. to 67s. 6d.
4 fathoms lathwood, from £5 to £7 2s. 6d.
27 great hundred red deals, from £20 10s. to £29 10s. per 120 pieces of 12 x 9 x 3.
4 do. fresh Memel planks, from £22 to £24 2s. 6d. per do.
2 do. first quality pine deals, at £31 12s. 6d. per do.
3 do. second quality do., at £20 5s. per do.
31 do. Quebec spruce deals, from £15 5s. to £16 7s. 6d. per 120 pieces of 12 x 9 x 3.
A few lots do., do. (firsts and seconds), choice dimensions and prime quality, from £17 to £18 per 120 pieces of 12 x 9 x 3.
83 great hundred St. John spruce deals, from £14 5s. to £16 5s., average £15 5s., per 120 pieces of 12 x 9 x 3.

THE WESTLAND-ROW TERMINUS.

In our publication for February 15th we inserted a notice to the effect that, "an immediate extension of this terminus had been determined on, and plans prepared by the company's architect; that the three adjoining houses, respectively occupied by Mr. O'Gorman, auctioneer, the London and North-Western Railway Company, and Mr. Maguire, confectioner, would be included, and that the front of the remodelled building would face Great Brunswick-street instead of Westland-row, as at present." In a few days afterwards a general meeting of the shareholders was held, and the following occurred:

Mr. Pilkington lately read a paragraph in one of the newspapers to the effect, that an important extension of the railway terminus at Westland-row was intended, and that the premises were to be opened into Brunswick-street.

Chairman—"I wish to know where you got that information."

Mr. Pilkington—"In the Dublin Builder."

Chairman—"I assure you that the writer of that paragraph has enlightened us on a matter of which we never heard before. The subject has never been mentioned."

Here was a flat denial—a public impeachment—of the veracity of the Dublin Builder! and we, believing at the time that our informant *had really* fallen into error, at once made the *amende honorable*, and expressed by letter to the directors our regret at the circumstance, and there it ended; but our readers will judge our surprise at seeing for the last week or so the following announcement in the morning papers:—

"Mr. O'Gorman, auctioneer and valuator, begs to inform his patrons and the public generally *that in consequence of the Dublin and Wicklow Railway Company requiring the premises occupied by him in Westland-row, for the purpose of altering and extending the terminus*, he has removed to No. 19, Bachelor's-walk," &c., &c.

The London and North-Western Railway Company have *also* quitted the house *they* occupied, and we have every reason to know that the other party will follow as a matter of course.

How does the chairman of the Dublin and Wicklow Railway Company reconcile *this* with *his* statement *officially* and *publicly* made in direct contradiction to ours?

To our morning contemporaries, who widely circulated through their columns "the denial," we would respectfully submit that in justice to us publicity should be given to the above.

THE NEW CHURCH OF ST. JAMES.

Referring to this building, which was fully described in a recent number of this journal, we find that the following resolution was proposed and unanimously adopted at the Easter Vestry:—

"That the thanks of the parishioners are justly due, and are hereby given, to the Ecclesiastical Commissioners for Ireland for the liberal aid extended by them towards the erection of the parish church of St. James; a building reflecting the highest credit on their architects, Messrs. Welland and Son, who designed it, and on their contractor, Mr. Thomas Henry Carroll, who so expeditiously and satisfactorily carried out the design. And it is further resolved that the chairman be requested to communicate copies of this resolution to the commissioners and the contractor."

LECTURES AT THE ARCHITECTURAL EXHIBITION.

Mr. Beresford Hope commenced the session on the 30th ult., treating of "Architecture in London;" Mr. Kerr will follow, on 7th inst., on "Sir Christopher Wren and his times;" Mr. Freeman on "Romanesque Architecture," 14th inst.; the Rev. J. L. Petit on "the Revival of the Styles," 21st inst.; Mr. Pullan on "Church Architecture of the 19th century," 28th inst.; and on the 4th prox., Mr. G. E. Street on "the Restoration of Ancient Buildings."

Testimonial.—The members of the Dublin Library have presented a purse of 30 guineas to their secretary and librarian, Mr. Cregan, to mark their sense of the efficiency and courtesy with which he discharges the duties of his office. The Lord Mayor was the willing medium of the presentation, and some of the gentleman's opponents at his election were amongst the foremost contributors—facts which we feel much personal pleasure in recording.

THE ROYAL DUBLIN SOCIETY AND THE VETERINARY COLLEGE.

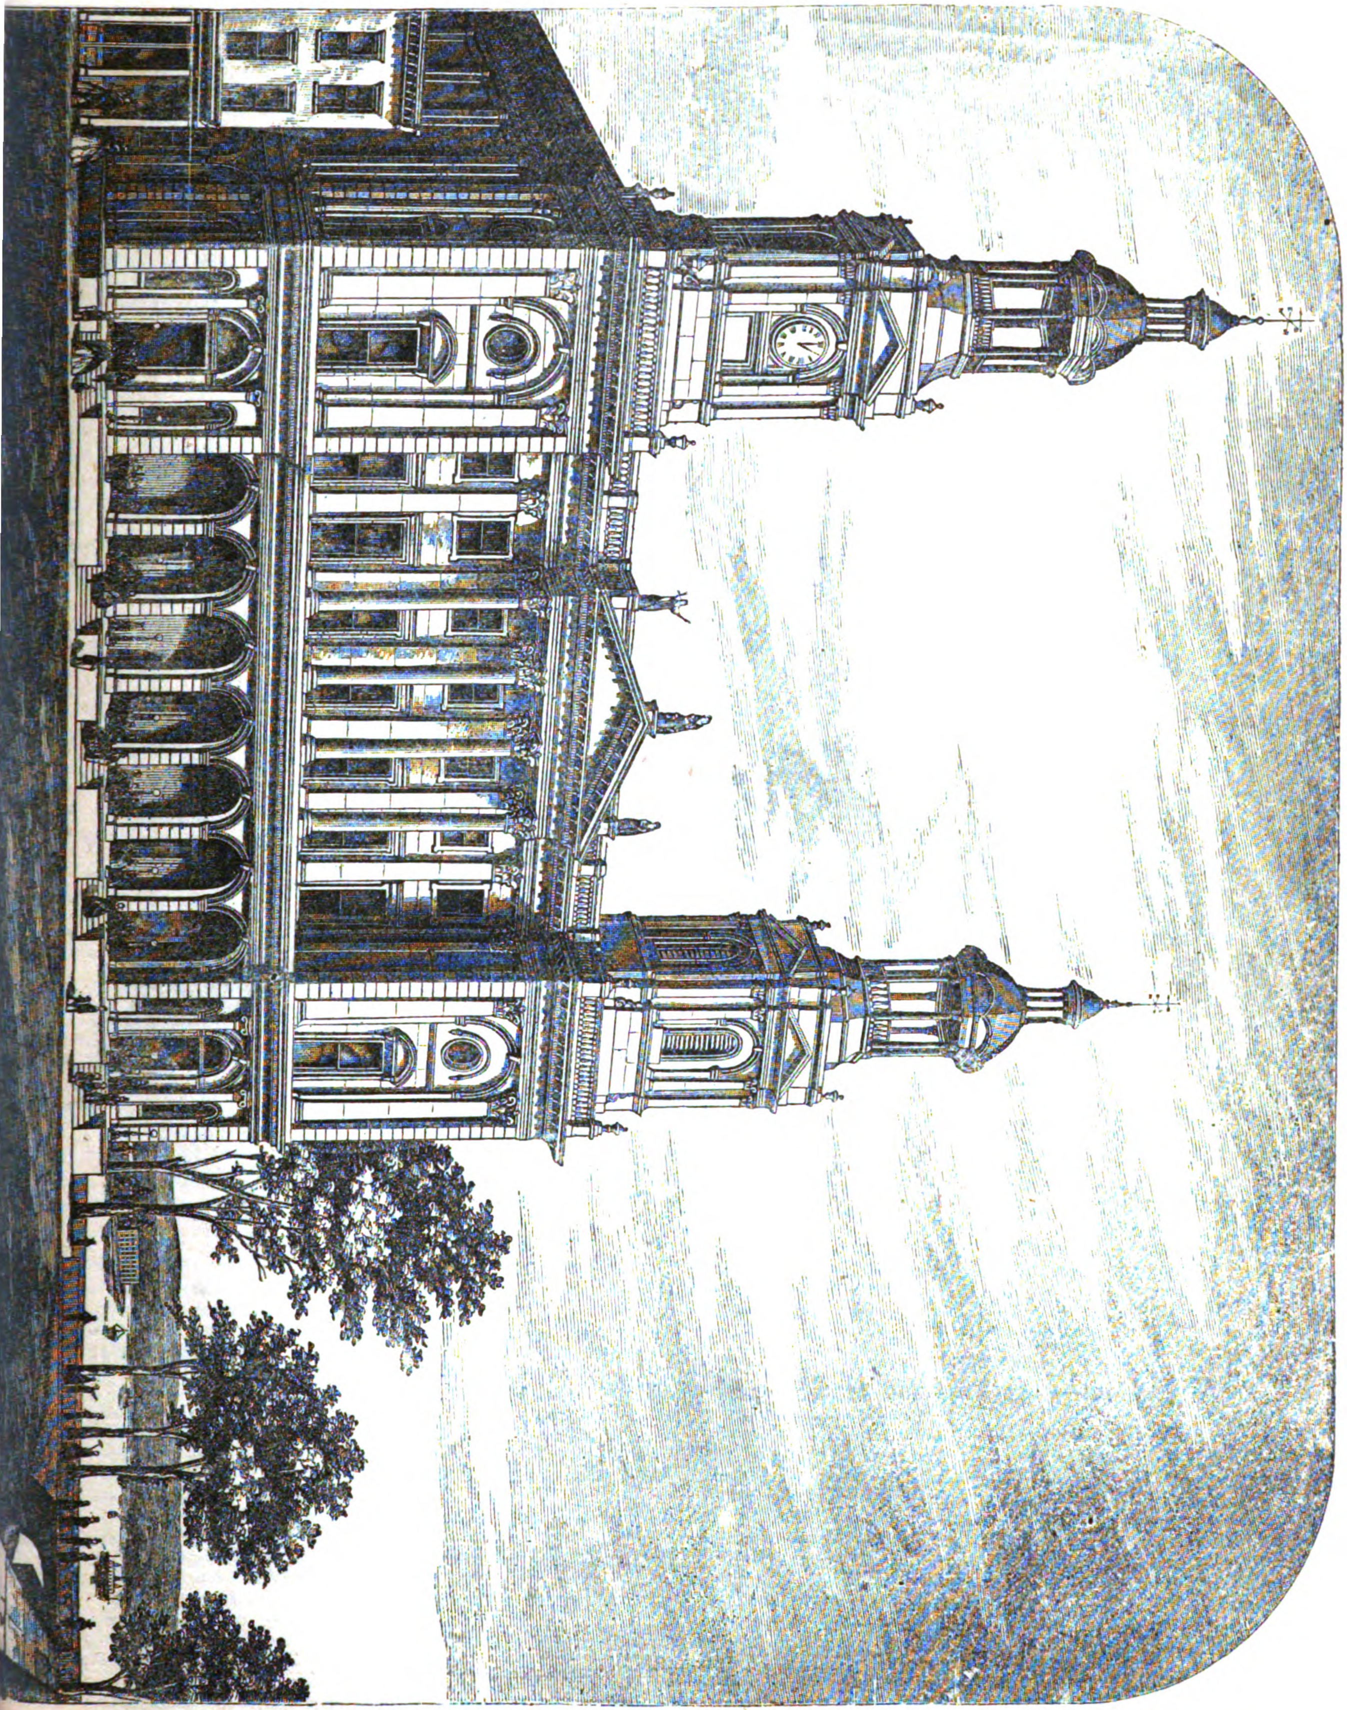
From the first mention of the proposal to found a Veterinary College for Ireland, there was no doubt entertained by any one of the necessity for the education which that institution was intended to confer. There was, it is true, a question raised as to who should provide the means of imparting this education, and some contrariety of opinion, seemingly, as to what constituted the requisite means. There were some who thought that a course or two of lectures, annually, would supply the want, and that these lectures, with some accessories, could well enough be provided by the Royal Dublin Society. The subject was thus brought before this venerable body; and, ever solicitous with regard to anything aiming at promoting the interests of Ireland, the matter was taken into serious consideration. If the Society had a duty to perform, it was not disposed to shrink from it; and it became the business of those who attend to such matters for the Society to know exactly what its duty was, and what means they possessed for performing that duty. A committee was appointed to report to the Council on the subject; and so determined were the Council and the Society to act according to the best information in the matter, that no fewer than three reports have been called for; and, in the light thus elicited the Royal Dublin Society has at last come to a decision. What that decision is, the following, which we take from a report adopted at the meeting, held on the 4th inst., will show:—

"In thus communicating to the Society the result of their inquiry, the Council feel called upon at the same time to observe that, the question of establishing a Veterinary College for Ireland, has not been confined to the walls of the Royal Dublin Society; since the reference to the Council in November last, the prospectus has been advertised of a joint-stock company, formed for a like purpose, upon commercial principles, under the provisions of the Limited Liabilities Act. Of that enterprise, it may be said, that while it indicates a strong public desire for a national institution, for the study of the veterinary art, the respectability of the names of the noblemen and gentlemen who compose the Council for its government, afford a guarantee that the undertaking has not been lightly entered into, nor without a reasonable prospect of success.

"The Society being desirous that Ireland should not longer be unprovided with an institution so much required, would probably view with interest the efforts of an idependent company to establish one; and so far from attempting the establishment of a rival or competing college, would rather give countenance and encouragement to a national enterprise of so much importance. Taking this view of the matter, the Council do not recommend that any immediate steps should be taken upon the reports now presented; but, that reading them in the proceedings of the society, any further action should be deferred until next session, whereby ample time will be given for the full development of the plans and resources of the company referred to."

These views, and this conduct of the Royal Dublin Society are in the most perfect accordance with what we have repeatedly said on this subject; and although some time has been allowed by the directors of the college to elapse, out of respect for the Royal Dublin Society, we feel perfectly assured they will now see that the time has not been by any means lost. They rested on their oars, not because they had any idea of abandoning the project to which they had put their hands, but simply that they did not wish even to seem to be in antagonism to so respectable a body as the Royal Dublin Society, and quite confident that they were but husbanding their energies against the time when the field of operations would be left perfectly clear for themselves. The field is now clear; and we believe we have good grounds for stating that it will be taken possession of in a manner which will leave even the impatient no cause to regret the delay. Not only have the directors been quietly preparing for the time which has now arrived, but they proceed to their work with all the countenance and encouragement which the Royal Dublin Society has so gracefully bestowed upon their efforts and exertions.

No one who has at heart the interest of the country in this matter, even if he took no special interest in the college which has been projected, can look upon the conduct of the Royal Dublin Society on this occasion, without increased sentiments of respect, nor without feelings of pride that the affairs of the country should be so sedulously looked after by a body of men governed by such praiseworthy principles. The sober, conscientious manner in which the matter was taken up at the beginning, and the graceful and courteous manner in which it is now, after mature consideration, dropped—or rather handed over to the company—are both in the most perfect keeping with our highest idea of what the character and conduct of such a body should be; and we have no doubt the council of the Veterinary College will meet the conduct and the views of the Royal Dublin Society in that spirit which the graceful conduct of the latter is so well calculated to inspire.—*Agricultural Review*.



PREMIATED DESIGN FOR NEW PLYMOUTH CHURCH, BROOKLYN, NEW YORK—J. R. HAMILTON, ARCHITECT.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

COUNTY SURVEYORS' ASSISTANTS.

TO THE EDITOR OF THE DUBLIN BUILDER.

SIR—A great deal has been said by the public journals with reference to the duties of Assistant Surveyors, and their remuneration—we believe with a good intention to us—and in almost every case there is an imputation of dependency on the contractors who work under us, and with whom we are necessarily brought into more immediate contact than are the County Surveyors, for they, as public officers, are not necessitated to walk from contractor to contractor, calling on each, in his turn, to point out the particulars of his contract that they may be examined into, whilst this is the express duty of assistants.

Now, we, as a body of men who pretend at least to some respectability, and who are entrusted, to a great extent, with the proper expenditure of the public money, and who are expected to possess not a small amount of intelligence, for we are supposed to be able to speak common sense to every gentleman of our several counties, and possess so much qualification for our office as shall satisfy not only the County Surveyors—gentlemen of superior abilities—but the chief engineer of the Board of Works, and not only these, but every gentleman and cesspayer of our several districts.

Are we, as a body of public officers. to remain quiet, and bear such calumnies as are vented from every pen, the feelings of which are entered into more or less by a prejudiced public? Surely we are bound, in duty to ourselves, to speak out, and demand such a position amongst our fellow-men as shall enable us to cast aside for ever such false imputations! Indeed, we feel grateful to our present Chief Secretary, and some others, for what they are trying to do at present on our behalf; but, withal, we believe ourselves still left in the shade, and that the present bill now before parliament does not provide ample remuneration for our duties and expenses.

Government should take into consideration that we are necessitated to keep a house, which must cost at least £25 per annum, and also to travel over our districts from twelve to sixteen times each year, attend at every sessions and assizes, and also attend to the call of every gentleman in our district, and are besides bound to the numerous calls of the County Surveyor, and necessitated to remain from home several days at a time, in going our necessary rounds of duty, at great expenses, all of which must be borne out of our pittance of £50 per annum,

The bill now before the House of Commons presents something of an amendment to the present salaries of the Assistants in Ireland. Clause eight (the only clause in which mention is made of us) is, that each of such assistants shall be paid such annual salaries not exceeding £80 per annum, as such grand jury shall direct, and the same shall be presented by the grand jury by half-yearly instalments at each assizes. We would now ask that the proposed bill be so amended, that we may be allowed not £80 but £100 annually, seeing that it shall be subject to be curtailed by the grand jury, if they shall so think fit.

And is it not too bad that the public should receive all the best of our days in their service, and after having worn us down to uselessness then cast us from them as a thing that has never done the least public good? Should we not be as much entitled to retiring allowances as other county officers? Humbly trusting that this omission is only an oversight, and that some of our Irish members will interest themselves on our behalf, and have these defects remedied, we subscribe ourselves, yours, &c., the useful servants of the public, ASSISTANT SURVEYORS.

Notes of New Works.

The Grand Jury of the county Mayo are about building a bridge, to cost not more than £400, on the road from Ballinrobe to Fairhill.

A new line of railway, extending from the town of Kells to Oldcastle, county Meath, is about to be constructed by the Dublin and Drogheda Railway Company. Mr. Blakiston, C.E.

Nearly 100 acres have been let at Foxrock, several detached houses are completed, and many others are in progress. The new railway station is nearly finished, the recently formed Westminster-road is fit for traffic, and other new roads are being constructed. Unusual facilities are offered to capitalists as regards certain building materials.

Two dwelling houses are to be erected at Ballybrack, according to plans by Mr. Caldbeck, architect.

New national bank houses are to be erected at New Ross, county Wexford, and Castlerea. Same architect.

A dwelling house is to be erected between Booterstown and Blackrock. Same architect.

The War Department are calling for tenders for works connected with the fortifications of the dockyards.

The committee of the Royal St. George Yacht Club have announced their intention of awarding a premium of £5 for the best design for a monument to the late Captain Boyd and his men. Cost not to exceed £150.

A large dwelling-house, in the early English style, has been commenced on the west side of Kenilworth-square, Rathmines. Mr. A. Jones, architect; Mr. W. Hughes, builder. The front is of Bridgewater stock brick, with Bath stone calp and white fire-brick dressings intermixed. The pointed gablets and their Bath stone weatherings, with the quaint arches over the window opes, will, we expect, form pleasing features in the elevation, and be an ornament to this square. "*En passant*," we would remark, it is to be regretted Bath stone dressings are not more generally introduced, as from the extreme facility of workmanship of this stone it becomes easy of adaptation to all purposes of ornament, while it resists the influences of our climate much better than is generally supposed.

The foundations of another large dwelling-house, for B. Faucett, Esq., have been just laid in Upper Rathmines. Mr. A. Jones, architect; Mr. Michael Kennedy, builder.

Mr. Joseph Kelly, timber merchant, &c., Francis-street, is erecting a handsome front entrance to his extensive concerns, comprising a lofty semicircular arched central gateway, flanked by coupled Roman Doric columns, resting on a cut stone pedestal, and surmounted by an entablature and blocking, with a smaller ope for pedestrians at either side, somewhat after the fashion, though less architecturally pretensious of course, of the ancient Roman triumphal arches. It will, when completed, form one of the most attractive features of its character in the city. The same gentleman is also extensively engaged in building dwelling houses and baths on his property at Bray.

The new church at Carrickmacross is abont to be commenced. It will be 150 feet in length by 50 feet in width, and comprehend nave, aisles, transepts, chancel, double sacristy, and spire, &c. The style will be decorated Gothic. Mr. J. J. M'Carthy architect.

The extensive alterations at Mr. Buckley's drapery establishment, Upper George's-street, Kingstown, have been just completed. Mr. J. S. Butler, architect; Mr. W. Hughes, builder.

The foundation stone of the new Cathedral to be erected at Monaghan will be laid on 8th June.

The Corporation of Derry have instructed the Mayor to communicate with the Board of Works with reference to the proposed registry office in Bishop-street, which they state would if completed be a disgrace to the principal street in that city.

A second side altar is in progress for the Church of the Conception. Mr. J. J. Lyons, architect; the works have been entrusted to Mr. W. Hughes.

The Standard and Colonial Assurance Companies are about rebuilding the houses at present occupied by them in Upper Sackville Street. The fronts will be of architectural character and in cut stone, according to designs by Mr. William G. Murray, architect.

Two dwelling houses are being built on Leinster road west, for Mr. John C. King, according to plans by Mr. Tarleton, Architect; Mr. Robert Donaghy, builder.

Extensive alterations and enlargements are being made at the church in Mullingar, according to plans by the architects to the Ecclesiastical Commissioners; Messrs. Barker, of Dublin, being the builders. Eight handsome traceried windows, in finely dressed lime stone, have been added, as also new galleries, staircases, furniture, &c. In excavating for portions of the works about 300 human skeletons, one of which was that of a giant seven feet in height and proportionately formed, were discovered, and carefully deposited in a vault under the church.

The triennial contract for the coast towns and batteries between Bray and Drogheda has been taken by Messrs. Barker, builders.

An important extension is about being made to the premises of Messrs. Henshaw & Co., of Christ Church Place, hardware merchants, &c., under the directions of Mr. Lyons, architect.

Extensive alterations are being made in the house taken by the National Bank, Newcastle West, County Limerick. W. F. Caldbeck, architect; Mr. Scanlan, Listowel, builder.

The number of works of art sent in for the approaching Exhibition at Paris is not less than 5,000.

SHAM ADVERTISEMENTS.—We conceive it to be our duty—having been duped ourselves—to put our readers on their guard against a certain person in London who advertised himself in recent numbers of this journal as an extensive watch manufacturer and jeweller, offering great inducements to purchasers whose remittances meet *no return*, there neither being the *individual* nor the *establishment* so advertised.

TURNING AND BORING GLASS.—The *Mechanics' Magazine* states that John Chedgey, of London, has succeeded in turning and boring glass, and has thus rendered it more applicable to a great variety of useful purposes. He makes glass cylinders perfectly round and smooth; also very strong glass pipes, as substitutes for metal in conveying acids and alkalies, and his cylinders are eminently adapted for the barrels of pumps. Glass tubes of moderate bore are quite common, but they are never made with a uniform size of bore.

THE WATER-WORKS BILL FOR IMPROVED SUPPLY OF DUBLIN.*

THE Select Committee of the House of Commons held its first meet-on the 16th ult.: Mr. Rice Talbot in the chair. Sir G. P. Galway, Messrs. Wyvill, Walter, and Brown Westhead (members) present.

The promoters of the bill were represented by Messrs. Calvert and Monk, Q.C.'s and Mr. Charles Barry, Q C., of the Irish Bar; and the counsel for the opposition were Sir William Alexander, Q.C., Mr. Hannen, and Mr. T. Webb, LL.D., of the Irish Bar.

Amongst the petitioners against it were the Provost and Fellows of Trinity College, the Rathmines Commissioners, the Earl of Meath, the Midland Great Western Railway, the Commissioners of the Borough of Wicklow, the Kingstown Harbour Commissioners, Messrs. Brett and Toomy, Mr. R. A. Mahony, Messrs. Holmes and Co.

Mr. Calvert opened the case and said, that the bill was one of the most important that had ever been brought before such a tribunal, and then referred *in extenso* in a very able speech to the history of the proceedings; the appointment and report of the Royal Commissioner on the various projects suggested; the nature of that now promoted by the Corporation, viz., the Vartry source, its capacity as a source of supply, cost of construction, the character of the opposition, &c., and concluded by saying that although on the one hand the petition in favour of the bill had been signed by upwards of 20,000 persons, the opponents had only obtained 1,000 signatures—a fact. however, on which his clients did not care to rely as they were satisfied that the evidence to be adduced would be sufficient to induce the committee to conclude that the preamble of the bill had been proved.

The first witness called was Dr. Corrigan, President of the College of Physicians, and Physician to the House of Industry, whose evidence was substantially to the following effect viz.: The quality of water in the latter house has been the cause of much complaint; the three requisites for good health were good *food*, good *air*, and good *water*; the North Union Workhouse was supplied from a foul part of the canal where the boats unloaded, and from that *alone*; at the Whitworth and Hardwick Hospitals the water has been *more than once* reported by the physicians as *very bad*; is of opinion that there is extremely little difference in the quality of the water on the different levels of the canal (produced samples of water before and after filtration at the hospital); filtering will not remove any impurity in solution, only organic matter; thinks that the water in the two canals is *utterly unfit for human use*; saw boats filled with manure on the canal; dogs swim in it, parties sometimes bathe in it; horses are sometimes carried in the boats, and soil the canal water; the higher levels are in a *worse* condition than the lower; the water is more still in the former, thereby favouring the growth of vegetable matter; wretched cabins are on the brinks; saw cattle in the water *for hours* of a summer's day; there are also large flocks of wild geese, from which source great impurities arise; a certain amount of velocity is necessary to render and keep water pure (Dr. Corrigan then experimented with a small filtering apparatus on water which contained poisonous solutions, to show that filtration would not remove them); is of opinion that the introduction of pure water into Dublin and other large cities would have a very favourable effect in diminishing intemperance; *never saw the Vartry water*; (cross-examined) made no analysis of the canal water; does not know the amount of animal impurity that would be injurious; believes that decomposed organic matter in *any* quantity is injurious; a large number of barges discharge their cargoes and lie at the harbour, from which the pipes supplying the House of Industry run; true, there are no barges in the basin itself; there is a filtering apparatus at mouth of supply pipe for hospital; the rate of sickness amongst the Dublin paupers is *greater* than among the country paupers; unpalatable and bad water induces people to *put whiskey in it*; quoted from his letter to Dr. Gray; the taste is acquired, the habit is established, and the hitherto temperate country liver returns home a dram drinker, to injure himself by his habits and others by his example;" cannot say how many were brought in sick into the union workhouses, or how many got sick therein, but can tell that during the whole of last year the proportion of the sick to the whole reached the *astonishing proportion* of *one* in *one and a-half* in the north, and *one* out of *two* in the south; the Dublin workhouses are situated in healthy positions, the South Union especially; the north lies below level of canal; country air is better than Dublin air; the lowest classes of Dublin are to be found in the liberties; the supply of food to the poor of Dublin out of the workhouse is very scanty; good sewerage is an element in promoting health; the General Hospital accommodation for Dublin is for 1,145 patients; in Cork 150 beds, exclusive of workhouse hospitals; the hospital referred to gets its water direct from a harbour into which the refuse of boats and barges is thrown; does not know that there are at the Broadstone harbour five large pipes to carry off the water; cannot tell that the existence of such pipes and the flow of the water would bring the impurities towards them; that would depend upon the bore of the pipes, and the level at which they are placed, with respect to the impure matter; cannot tell of how many gallons, or thousand gallons, or million gallons, the stuff he exhibited in a bottle yesterday, taken from the bottom of the filter, was the refuse; it was taken from five months' accumulation; before the filter was put up there was an order not to use the canal water, but to use well water; the latter does not require to be filtered; has not analysed the spring water; found it comparatively clean, and the other dirty and offensive; that was analysis enough; the deeply coloured water brought here did not pass through a filter; here is stuff (bottle No. 2) which was found in the bottom of the second filter; can hardly tell the difference in the colour of the two waters. and, therefore, cannot say that the first stuff would not have passed through. It may be simple deposit that never rose to the filter at all. Here is water (bottle No. 3) which has passed through all the filters; this black-looking dirty water is used in the hospital for culinary purposes; was drawn off for use; is satisfied that if the water generally used was of that muddy colour, there would be complaints as to it from the cook and others; if allowed to stand for five minutes it will get clear; after passing through the last filter the water goes into a reservoir containing 400 gallons; this water is taken from the pipe out of that reservoir, not from the bottom; the reservoir is only five feet six inches deep; did not take any water out of the pipes that supply the city; the stuff which was in the first bottle was a mass of living creatures called shrimps; some may have been bred in the vessel, and some may have been carried into it; they are carnivorous; they live only on organic matter, not at all on vegetables; animal organic matter is decidedly not the food of the greater number of fishes; some fish live on other fish; some organic matter in water would not be injurious; it must be in a state of decomposition to be injurious; beef tea contains a great deal of organic matter, and it is very good; the quality of the organic matter in the canal must be in a constant state of decomposition; weeds and animals die and decompose in it; the weeds rot away annually; has heard that it only moves at the rate of a mile a day; a great deal of the motion is surface motion; the existence of fish is not a test of purity; the carp lives in the mud, while the trout exists in rapid streams, there are trout caught in the canal, but cannot tell the amount; is not a fisherman, and cannot tell whether the trout caught are of the same class as those found in rapid streams; attributes the comparatively small rate of sickness in the South Dublin Union, as compared with the North Dublin Union, to the fact that in the former the Dodder water is used as well as that from the canal; the Dodder water is of a superior character, and the greater the admixture of that stream the better; the quality of the water was not affected so much by the quantity as by the nature of the animal matter which it contained; notwithstanding bad air, bad food, and bad clothing, persons may be greatly benefitted by the supply of good water, especially in such abundance as would flush the sewers; confined inquiry to the canal water supply, because it was the source of the present supply.

Surgeon Wilde examined—Is a physician and surgeon, Vice-President of the Royal Irish Academy, and a member of the Statistical and other societies; pays £2 8s. for water-tax—£1 10s. of which is the ordinary tax, and the residue for an additional supply; has to use force-pumps; at some times of the year it is pure, at other times it is offensive to the smell and taste, and would say, therefore, unwholesome; attributes the impurity to the decay of animal and vegetable matter in the canals; knows that the supply of water is not sufficient in Dublin; there have been many fires in Dublin for the last 20 years, and at none of them has there been a sufficient supply; saw in the *Times* of this morning a report of an inquest on the bodies of eleven persons who lost their lives at a recent fire in Dublin, and read that the coroner in addressing the jury said that this terrible calamity *was a solemn warning to the citizens to exert themselves to procure an abundant supply of water at high pressure*; from own experience, high pressure is necessary for the efficient protection of life and property from fire; the canals are, as it were, *open ditches*, subject to all sorts of impurities; all open conduits used for any other purpose than the supply of the city with water are to be deprecated. Witness then gave evidence as to the existence of spongillæ and animalculæ in the supply pipes of the city. Pieces of the spongillæ were exhibited. Had made a very careful examination of the substance *in situ*, and had it analysed by chemists; the large reservoir at Portobello was cleaned out about six weeks ago, and then found the walls covered *with a grey substance, like velvet*; in the pipes running from this reservoir found *masses of this vegetable material* about the size of his hand; as far as he could see into the pipes this substance existed; it was full of animaculæ; took away large quantities of this sponge for the purpose of microscopic examination, and it has been found that the skeletons of these creatures is composed of lime; considers the presence of these spongillæ in the pipes must be injurious; it is impossible that it could be otherwise; thinks that they could not exist in water which did not contain lime; knows the Vartry river; have made no chemical analysis of it, but the water is pure, cold, clear, pleasant to drink, and very hard to fish in owing to its extreme clearness; the geological formation of the country there is of granite and slate, which is far better for a water supply than limestone; there is scarcely any peat in the neighbourhood of the Vartry, and it would be a most eligible source of supply for the city of Dublin; knows the city of Drogheda well; it is unfortunately situated, not having a free current of air, and the water is also bad, to which circumstances the high rates of mortality in that town are attributable; in cases of epidemic, those who use *impure* water *are more likely* to take it than those who use *pure* water; does not consider the present supply of water to Dublin sufficient; many houses are altogether without water, and thinks it highly desirable that every house should be supplied; it would be greatly conducive to health if it was so; was in Dublin when the fire alluded to occurred, but did not witness it; the papers complained of the want of water on that occasion; knows nothing further as to that particular case, or whether there is a supply of water in the neighbourhood; had the spongillæ produced analysed by Professor Barker and Professor Apjohn; did not see that the inspector of the A division swore there was no want of water; saw the coroner's statement, that it was a solemn warning to the citizens to procure a supply of water at high pressure in all parts of the city; only knows of the existence of the spongillæ for two years and a-half; water is supplied from the canals to the city for over 60 years; they may have sprung up within the last few years; they cannot exist without lime and silicia; they have almost destroyed the water-works in Boston, United States; water deprived of lime would certainly lessen, and, theoretically, ought to destroy those animals; does not know what quantity of lime and silicia there is in the Vartry water, or whether there is any at all; there are some granite boulders in the Vartry, but the principal formation is slate; does not know of any city that *has suffered more from diarrhœa and dysentery than Dublin*; the last epidemic was in 1853, and was by no means an exceptional period; no statistics have been taken since 1851, but it has gradually decreased since then; the smaller the quantity of organic matter in water, the better it is for persons affected by those diseases; thinks that water with a mawkish and unpleasant taste is calculated to produce bowel complaints; spongillæ has existed for many years; only knows of it for a few years; the existence of spongillæ shows the existence of lime; does not know the quality of the Boston water, or what steps were taken to remove the spongillæ; the spongillæ adhered to the pipes, not to an incrustation on the pipes; it seemed to have a liking for iron, as it did not so much adhere to stone; has seen fish in the canals, but not near Dublin; botanists have lately handed over the spongillæ to naturalists; it was a disputed point whether the matter is vegetable or animal; inclines to the latter opinion; thinks the question has now been settled; the discovery of spongillæ was known during the whole of the present century; could not say that the particular kind found in Dublin has been found in rivers: has seen them in rivers in Connaught; the water that comes from bogs is coloured; has seen spongillæ in the river Suck; does not think that the spongillæ found in rivers is so offensive as that which grows in the pipes; after the spongillæ was discovered the corporation was anxious to have the canal water; believes Mr. Neville and Mr. Hawksley reported in favour of it; knows the water of the river Dodder; it is very seldom bright and clear; it is subject to floods, which keeps it generally muddy; passes it; has seen it in that state at Templeogue, below the mills; has not often had an opportunity of seeing it above the mills; the report of Mr. Neville, in which he was disposed to take the water from the canals, was made on the ground of economy; with respect to Dr. Corrigan's observation as to the Census Commissioners' returns of the statistics of disease, wishes to state that it is quite correct; as to the household returns, they are not reliable; they are deficient in number, and defective as to names; but with respect to hospitals, workhouses, and public institutions, it is a complete and perfectly reliable statistical return; it will be found to be very accurate when compared with books of a similar nature throughout Europe; is not aware of any disease having been caused by living on a bog and drinking bog water; never have ague on the bogs of Ireland; ague is only found in marshy districts, where there is a very different kind of formation; there are often very pure springs in the neighbourhood of our bogs, and the people of such localities drink that water; does not know that water coloured with peat is wholesome; the vegetable matter which bog water contains is not recently decayed, but is thousands of years old; spongillæ has been found in the Dublin pipes at a very great distance from the reservoir, rnd has remained there for months, rolling backward and forward, and continually giving to the water an unpleasant flavour.

---

* Being well aware that there are numerous readers of this journal, through the kingdom and elsewhere, who may not have had an opportunity of seeing the detailed reports of the proceedings on this important question, we reprint them from our daily cotemporaries as much *in extenso* as space will permit. The examinations of so many distinguished scientific men, have elicited information of the highest general importance, on the question of water supply to cities and towns, apart from local considerations altogether, and therefore demand a space for being recorded in every journal of such a character as ours.

Dr. Ringland, examined—Is a Fellow of the King and Queen's College of Physicians in Dublin; upwards of 22 years practising in that city, and connected with the Coombe Lying-in Hospital since 1841; attends to a large number of extern patients; has been for some time the physician-accoucher to an institution called the "Maternity;" had an opportunity of becoming acquainted with the sanitary condition of the poor in their own houses; the Lying-in Hospital is situated in the Liberties; it is directly supplied with water from the Poddle; derives its supply from the public fountains; the water from the former is used for laundries and for flushing water closets, and that for domestic purposes is obtained from public fountains; the water from the Poddle is so foul that the servants of the hospital refuse to use it; the houses generally are dependent on water therefrom; in many cases, when attending patients in their own houses, the medical men have been obliged to use the same water again and again for washing their hands, owing to the scanty supply, or to wait a long time until water was obtained from the fountains; has known instances of great risk to the lives of patients from the deficient supply; his house is supplied with water from the Portobello Basin; it is pretty good in winter *after filtration*, but it is *foul* and *bad* in the *autumn* even *with* filtration; has not analysed the water; good water is one element of good health, and I do not consider that good water; has seen dead animals, cats, and dogs, in the canal, and also the bodies of human beings floating in it; has frequently observed manure boats loading, and has seen manure fall into the canal; observed lately two boats passing near the city basin, one of them a cattle boat, and the bilge water was being pumped out of both of them; does not think that filtration will remove organic matter in a state of solution; has been twice at the Devil's Glen, and once at the Vartry river above the Glen; drank the water, and found it very pleasant and sweet to the taste; the present is not a satisfactory supply, from the pollution of the canals, also from the vegetation in the canals, and the stagnant character of the water; understands there are about 700 boats trafficing on the canals, with three men to each, making upwards of 2,000 men who make the canals their water closet; with respect to the houses of the poor, the people have such a distance to go to the fountains, they generally have very little water in their rooms; often had to remove foul water from their rooms; several people wash in the same water, and frequently it is often used for washing clothes, and then for washing rooms and stairs; it becomes most foul and offensive; thinks fountains a most objectionable source of supply from their distance. In cold and wet weather the people are liable to disease from exposure, a number of improper women assemble around and use most obscene language, which has the effect of contaminating young girls who are waiting there for their supply. In many cases of the trepanning of young girls has arisen thereby; considers water at a high pressure necessary. (Cross-examined) was not examined before the Royal Commissioner; nor asked to attend before him, has heard that the Poddle is supplied from the Dodder; in the poorer houses there are several families residing in each; would have the water brought into each room, but that would involve great expense; visited the Vartry; was brought through the catchment basin at Roundwood; the Vartry is about 25 feet wide, and about 15 inches deep, and is a rapid stream; no chemical analysis of the water was made in his presence; used the water on each occasion; in the glen it is a deeper river, but not so wide; experience as to the houses of the poor is confined to Dublin; he always filters the water which he uses in his own house; used it for several years, and enjoyed good health; heard it said and contradicted that the Vartry passes through a mineral district, Wicklow is a mineral county; knows the River Dodder; read the report of Mr. Hawkshaw; knows that he places it in the same class as the Vartry—in the first class. The water course is derived from the Dodder; observed it to be foul; there is a paper mill on the Dodder, which would account for the impurity of the water; does not know that the Earl of Meath has taken proceedings against the mill owner; took samples of the Vartry water at three places; saw the water of the tributaries to the river; it was quite clear; the majority of the houses in the Liberty have yards, and it would be quite impossible to get pipes into the yards, irrespective of the architecture of the houses.

Dr. Rawdon Macnamara examined—Is a Fellow of the College of Surgeons in Ireland, and a Licentiate of the College of Physicians, and Professor of *materia medica* in the College of Surgeons; has become well acquainted with the sanitary condition of the poor; at least eighty per cent. of the houses have no supply at all, and the water supplied to the remainder is infamously bad; the observations made as to the infamous quality of the water applies to the water of the canal; its impurities consist of organic and inorganic matter which in the summer months causes it to have a most offensive smell; agrees with the evidence given by Dr. Corrigan as the causes of that impurity; thinks it arises from decomposing vegetable matter and pollutions of various kinds mentioned; it appeared to him that there was no current whatever in the canal; thinks the water could not be purified by filtration tor so large a city as Dublin; is satisfied that the bad quality of water is a fertile source of diarrhœa; don't remember any case of fire in which there was a proper supply of water; even if there was a sufficient supply, high pressure would be necessary for the effectual extinguishment; visited the Vartry; drank the water, and it was perfectly clear and sweet; it appeared also to be very soft and to have a great sparkle in it; the water of the tributaries was not as clear as that of the river, but the difference was slight; the poor in Dublin have to go to the fountains for their water, and in many instances the people have great distances to go; made no analysis of the water; found the water perfectly colourless; saw but little peat on the catchment basin of the Vartry; very heavy rain fell in Dublin on the Thursday previous, which made him wonder to see the water clear; is distinctly of opinion that the water produces diarrhœa, and not the use of fruit in the fruit season; the eating of unripe fruit does predispose to diarrhœa; from dispensary books finds that in the first half of 1858 he had 96 cases of diarrhœa, &c.; in the second, 235; in the first half of 1859, 110; and in the second, 365; in the first half of 1860, 104; in the second half, 183; in the latter part of 1859 the water was most *offensive*, and the fruit the finest that had ever been seen in the city, while in the latter part of '60 the water was *good* but the fruit *unripe* and *bad*; these figures show that the water and not the fruit causes diarrhœa; cold and wet more disposes to diarrhœa than hot weather; looks on ripe fruit as being anti-dysenteric and anti-diarrhœtic; hopes for the sake of humanity, that the people who are opposing this measure to procure a better supply of water for the city of Dublin are not well acquainted with the condition of the poor; looks on good sewerage as an important element in the health of a city; portions of the sewerage of Dublin is in a very satisfactory state. He saw the Poddle had the appearance of *pea soup*; this was farther down than at the tongue; if there was no organic matter in the Dodder would consider it pure. The impurity of water depends on the quality and not the quantity of organic matter which it contains; it was since the present corporation came into office that the improvements in the sewerage of the city have been effected.

Dr. Phelan examined—Is Secretary to the Board of Superintendance of the Dublin Hospitals; the water supplied to those institutions from the canals was very bad, and some years ago, when governor of the House of Industry, made an order that no more water should be taken from the canal; in the hospitals the water has been filtered since 1858, and it considerably improved the water; never would allow the canal water to be used for drinking, brewing, making tea, or other purposes; knowing its impurity, has not the slightest doubt that an improved supply, both as to quantity and quality, is necessary for all classess in the city of Dublin; judges of the quality of the water by his palate, and not by any chemical tests.

The Chairman said the committee were unanimously of opinion that they had beard sufficient evidence as to the quality of the water and the deficiency of the present supply, and would wish the promoters to go into their evidence as to the mode in which they proposed to supply water to Dublin.

Mr. Boyle, inspector of fire brigade in Dublin, examined—At fires which occurred, there was no water to be had for a considerable time after the engines had arrived; the supply was also deficient at the fires which destroyed the Round Church, the Kildare-street Club; there was a sufficient supply of water at the recent fires in High-street and Grafton-street; owing to the defective supply of water, the fire destroyed the premises in which it originated, and sometimes spread to the adjacent houses; if there was a high pressure on the main and a sufficient supply of water, it would save a good deal of property; there is not sufficient water in the basins to supply the mains continually, so as to be always available for the extinction of fires. In some streets the water is only supplied during three days in the week, and fires may occur when there is no water in the main.

Francis Codd examined—Enumerated the circumstances connected with the consulting of Mr. Hawksley and his stated opinions, the refusal of the canal companies to supply the city on the same terms as before, the subsequent ineffectual negociations, the adoption of the Coyford scheme by Mr. Hawksley, &c.; is a magistrate of Dublin; was a member of the committee having charge of the water question eight or nine years ago; never heard an objection to the Royal commission, or to the report of the commissioner, until a letter from Master Fitzgibbon appeared in the public papers, calculated to excite great alarm and prejudice amongst the citizens, and this letter was written after the bill had been promoted and considerable expense incurred; as far as he recollects the press of all shades of politics *approved* of the recommendation of the Vartry as a source for the supply of Dublin, until Master Fitzgibbon's letter appeared; thinks that a better supply of water is absolutely necessary, and that the Vartry scheme is a good one, recommended, as it has been, by an engineer of such eminence as Mr. Hawkshaw, after holding a public inquiry; Mr. Alexander Boyle, a highly respectable citizen, and chairman of the opposition committee, withdrew from the opposition after the issuing of the commission; the rejection of the present bill would lead to great public inconvenience; if it were thrown out many persons who had subscribed to the guarantee fund would probably refuse to subscribe to promote another bill, and the citizens would be left without an improved supply unless it were provided by private companies; thinks it most expedient that the water supply of Dublin should be managed by the corporation; amongst the subscribers to the guarantee fund is Mr. Guinness, the great brewer; heard him state at a public meeting that the corporation were bound in honour to promote the scheme suggested by the Royal commissioner; believes that the members of the Corporation are actuated by the purest and most disinterested motives in promoting the bill, and have no other object than to benefit the citizens; does not think the opposition are actuated by a disinterested motive; Mr. Ennis, the chairman of the M. G. W. Railway Company stated at a recent meeting of that company that he did not like to give up £1,500 a-year, which they received for the supply of water from the Royal Canal, and therefore he opposed it; the Coyford scheme was changed into a canal scheme, on which we supposed the opposition would be abandoned; this left a defect in the bill, which the opponents took advantage of to defeat it on standing orders; is bound to say Mr. Ennis acted most fairly; Mr. Jeffers was acting as solicitor for the G. S. and W. Company, and he attended and opposed the bill on standing orders; Mr. Cane, a director of the Great Southern and Western Company, told him that he opposed for him; is aware that the opposition fund has been subscribed to by the Archbishop of Dublin, the Lord Justice of Appeal, the Chief Justice, and other persons of high position in Dublin; is not aware that the opposition committee have published a document repudiating having had anything to do with the issuing of the commission; has not read all the *rubbish* that has been written on both sides of this question; Master Fitzgibbon has lately become a Master in Chancery; is not aware of any instance of public spirit on his part until this water question drew him out, but he is a most respectable gentleman; has understood that Mr. Hawksley is a man of the very highest eminence as a water engineer; thinks it is wholly indefensible that the citizens of a great city like Dublin should be supplied with water of the character described by the eminent scientific men who have examined it, and that the providing of a purer water does not brook delay; a day should not be lost in putting an end to such an *atrocious* state of things as now exists.

Mr. Webb—Do you think there is such urgency for an improvement in the supply that not a single session should be lost in the adoption of a doubtful scheme, involving an expenditure of £300,000?

Mr. Codd—Thinks there ought to be no doubt whatever after the subject has undergone a careful examination by so eminent an engineer as Mr. Hawkshaw, and after it shall have undergone an investigation by this committee. Heard Mr. Hawksley say that he would have recommended the Vartry scheme, but that he thought it too expensive for the taste of the citizens at the time; the valuation of Dublin, which is an official one, and considerably below the actual worth of the houses, is £500,000.

Mr. Patrick Jeffers examined—Was a partner of the late Sir Matthew Barrington, and one of the solicitors of the Great Southern and Western Railway Company; opposed the bill on the part of Colonel White, Colonel Connolly, Mr. Cane, and other owners of land on the banks of the Liffey; never opposed bill No. 2; opposed the conversion of bill No. 1 into bill No. 2 under the circumstances stated; opposed the bill before standing orders on behalf of the riparian proprietors; attended the meeting on the part of the Great Southern and Western Company.

Alderman Roe, examined—Is a deputy lieutenant of the city of Dublin; ex-Lord Mayor, ex-sheriff, and has been for many years of opinion that an improved supply of water, in quantity and quality, is most necessary for the city of Dublin; has no doubt that the Vartry scheme is a most valuable one, and it is promoted by the corporation in that belief; there was some difference in the corporation as to the Coyford scheme, but there is very little dissent in the corporation as to present measure; founds his opinion on that of Mr. Hawkshaw, Mr. Hawksley, and other eminent scientific men; thinks it would be attended with bad consequences to the city if the bill was defeated; a great deal of the laudation of the canal water has been got up since the Vartry scheme was proposed; the opposition is composed of various elements; the gentlemen who take part in it were very much interested in a good supply of water; is under the impression that the corporation are bound to adopt the scheme proposed by the royal commissioner, more especially as it has been supported by the opinion of Mr. Hawksley, our own consulting engineer; Mr. Hawksley reported in favour of the canals, but that was from water taken at a higher level; thinks that would have been satisfactory; is not capable of instituting any comparison between that and the Vartry scheme; believes that the minority of the corporation on this question is confined to three or four members; thinks £800,000 would be a very moderate sum for supplying Dublin with water; water taken from the canal at a high level would be an improvement; would not compare the present supply with a supply from the Vartry; has heard that a petition in favour of the bill has been signed by 20,000 inhabitants of Dublin.

Alderman Kinaham examined—Is a magistrate of Dublin, ex-Lord Mayor, and a member of the waterworks' committee with Dr. Gray and Mr. Codd; is of opinion that an improved supply of water is essential, and that the Vartry scheme is a valuable one; it is promoted by the corporation *bona fide* for the benefit of the city, and there is very little difference in the council on the subject; thinks a delay in passing the bill would be productive of much evil to the city; the corporation were actuated by *bona fide* motives in advocating the canal and Coyford schemes; visited the Vartry, and think it the best water of the three.

Alderman Reynolds examined—Is a magistrate of Dublin, ex-Lord Mayor and M.P. for the city; believes that the corporation have come to a correct conclusion as regards the *quality* and *quantity* in promoting the Vartry scheme. There is an *urgent necessity* for an improved supply, and that is the opinion of the citizens; believes the citizens at large are in favour of the Vartry project; visited Vartry, and found the water pure, sweet, and soft; the corporation consists of 60 members, and of these 56 are in favour of the bill and four opposed to it; two or three of these are supposed to oppose as landlords; the opposition is made up of different elements; thinks pecuniary considerations influence the opponents; Mr. Guinness, the great brewer, proposed the first resolution in favour of the bill at a meeting of the citizens of all classes; the opponents were invited to attend, and did so; all the resolutions in favour of the bill were unanimously passed; a petition in favour of the bill was also adopted; the discussion lasted seven hours; is *perfectly satisfied* that the Vartry scheme is the *best* that could be devised; the corporation also considered themselves bound in honour to carry it out, having been recommended by a royal commissioner; a learned gentleman, who is also a man of literary attainments, also made a speech in opposition to the Vartry scheme, and said—"Surely you are not going to take the muddy water of the river that supplies the waterfall at Powerscourt." We all looked rather astonished, because the river that runs through Powerscourt is the Dargle, which has no more to do with the Vartry than it has with the Thames (laughter); Dr. Gray corrected the learned gentleman's mistake, and Dr. Waller thanked him politely for the correction, and then went on to discuss the chemical qualities of the water, with respect to which he had made so great a mistake; considered the financial question maturely, and believes that £300,000 is a very moderate sum for the construction of waterwork to supply such a city as Dublin; the taxation of Dublin is now very great; of course, increased taxation for water would be a matter of great importance; was told by Mr. Hassard that £300,000 would be ample, and that he thought the Vartry scheme could be carried out for £40,000 less.

(To be continued.)

IMPROVEMENTS AND PROGRESS OF THE CITY OF DERRY.—We are glad to learn that a new and attractive feature has been added to the "Maiden City," by the formation of a square in the west end, similar to those in our own. The large field adjoining the New National Model School has been laid out in a very handsome style for the purpose alluded to. In the area it is intended to erect thirty-four first-class houses, disposed over three sides of the space. The north side will form a terrace, consisting of 16 houses, five storeys in height, facing the river Foyle, and commanding (as will also the other houses) a most delightful view of the surrounding scenery, and, in order to render this the more enjoyable, the centre and extreme ends will be ornamented by handsome projecting windows, plate glass being used throughout; four of the houses forming a centre, and the wings terminating by two projecting houses, surmounted by pediments, ballustrading, &c.; Scotch stone dressings to the windows, &c. Already we observe one-fourth of this terrace is in active progress of erection. The east and west sides being on an easy gradient, the houses are laid out semi-detached, thus breaking the dull effect observable by stepping where there is a continuity of buildings. The centre of the ground is neatly formed into ornamental gardens, and planted, for the use of she residents. The space set apart for that purpose has been enclosed with fencing and ornamental gates, by Messrs. Musgrave, Brothers, Belfast. The roads, carting, and drainage have been completed, and every requisite to make the locality a first rate site have been secured, which with its natural beauty, commanding as it does a fine panoramic view of both the city and county, must make these houses most attractive residences, and a great boon to the citizens as large. The whole works are from the designs and under the superintendence of Mr. Fitzgibbon Louch, architect, Sackville-street, Londonderry. Samuel Law Crawford, Esq., is the proprietor.

On the opposite side of the river, at Fountain Hill, the property of Wm. M'Carter, Esq., T.C., we observe new roads formed and sites for villas laid off. The proprietor is erecting a handsome villa, now nearly complete, in the Italian style, with projecting roofs, bowed windows, with Scotch stone dressings throughout. Expenditure, £900.

Adjoining, a similar villa for Robert Cooke, Esq., is also in course of erection. The contractor for both villas is Mr. James Harrison, Derry; the architect is Mr. Fitzgibbon Louch, C.E.

THE VERNON ESTATE.

THE following letter has been received from the agent to this property, and with pleasure we accord it space for insertion:—

TO THE EDITOR OF THE DUBLIN BUILDER.

SIR,—I have just seen in your paper of the 15th inst. a statement with reference to this property, which appears to have been made without any knowledge of the facts. As it may tend to mislead the public with regard to the encouragement which is given for the investment of capital at Clontarf, I feel satisfied that you will gladly correct the misstatements therein made. I have been for about four years in the management of this property, and during that time Mr. Vernon has made leases on terms highly advantageous to parties who have built. The moderate restrictions in his leases are quite as necessary for the protection of the interest of the tenants who have built, as they are for the proprietor. In this view of them, the parties who have taken ground have all acquiesced, and I am not aware of a single negociation having been broken off in consequence of the restrictions in the building leases, nor have I ever known such a condition proposed as that mentioned in the statement in your paper, viz., "That the builder should ornament his dwelling with an expensive bow window." There cannot be any advantage in removing one set of cabins to substitute others, but for the building of houses that cost from £400 or £500 each, in terraces or for detached houses near the sea-shore, Mr. Vernon makes leases of land for terms of 150 years by the foot, or for building villas involving a larger outlay, more inland, he sets by the acre in lots suitable for such purpose.

THOMAS FRANKS.

21, Lower Fitzwilliam-street.

GLASNEVIN BOTANIC GARDENS.

IN the recent report of the curator, for 1860, submitted to the Royal Dublin Society, we find the following:—

"*Plant Houses and Conservatories.*—Although no new additions or alterations worthy of particular notice have been made in this department during the past year, the conservatories have undergone considerable repairs, by directions of the Commissioners of Her Majesty's Board of Works of Ireland. The whole of the curvilinear-roofed range has been painted with two coats of paint outside, and the central palm-house, with one of the wings of the range, the same inside. All the broken and badly cracked glass was taken out and repaired, consequently this range is now in good condition.

"With a view of rendering the heating apparatus more efficient, the committee of botany have ordered three of Miklejohn's patent boilers for heating plant-houses, &c., to be got, such as he exhibited a few year's ago at one of the Royal Dublin Society's exhibitions of improved implements, &c. These boilers have been placed in three of the houses where the old saddle-boilers were previously used, but had worn out; and the result is satisfactory, inasmuch as a higher temperature can now be obtained, with less fuel and labour than has been the case hitherto. It was supposed that the long, span-roofed house, built last year, could have been heated sufficiently for all the purposes required by the old smoke flue; but when practically tested, it was found that the amount of heat required to reach the extreme end from that where the furnace is placed twice burst the flue, and nearly destroyed all the plants in the house. This being the case, the committee gave directions for a cheap hot water heating apparatus to be erected in place of the flue, which has been done; and now the plants are safe, besides a saving of fuel effected.

"The architect of the Board of Works did not think it desirable to do much repairing on the old conservatories, which are soon to be replaced, a plan being at present in course of preparation by him for supplying more commodious structures, better adapted for the requirements of a public garden, than houses built upwards of fifty years ago now are. It is, therefore, earnestly to be desired that the small sum of money placed by the Treasury at the disposal of the Board of Works for this purpose may not prevent those plans from being carried out as they ought to be. In my report last year I pointed out the sort of houses which I considered should be erected, after having had the concurrence of the committe of botany. The architect has, I believe, taken that report, in some degree, as a basis to form his plans on; and I have agreed to be ready to give up the central portion early next May, when building operations will be commenced."

GLASGOW ARCHITECTURAL SOCIETY.—The seventh meeting of the third session of this society was held on Monday night, 15th ult, in the Scottish Exhibition Rooms, Bath-street, Mr. Charles Wilson presiding. Mr. David Haire read a paper upon "Decorative Art," which was followed by some conversational remarks by the members present; and after the transaction of some other business the meeting separated.

NOVEL APPLICATION OF PHOTOGRAPHY.—A photograph has been taken of the bed of the sea in Weymouth Bay, by a Mr. Thompson. The camera was placed in a box with a plate glass front and moveable shutter to be drawn up when the camera was sunk to the bottom. The camera being focussed in this box on land for objects in the foreground, at about ten yards, was let down from a boat, carrying with it the collodion plate, and the shutter raised and plate exposed for ten minutes. The box was drawn up, and the image developed was of rocks and weeds; but the great advantage anticipated to be derived from this application of the art is to obtain a knowledge of the condition of piers, bridges, piles, and structures under water.

SCENIC ARRANGEMENTS AND LIGHTING OF THEATRES.—M. Barthelemy, of Nancy, is said to have discovered improvements by which he professes to be able to raise or sink the entire stage, or part of it, at a few moments' notice, and to bring about transformations of the greatest complexity with rapidity impossible under the old system; also, in lighting more powerfully and with greater effect.

BIRMINGHAM FREE LIBRARY.—This establishment was recently opened, and the proceeding was immediately followed by an eager rush for the first reading of the books. Upwards of 1,000 volumes were applied for during the first afternoon and evening.

THE NEW RAILWAY STATION AT OMAGH.—The engineers visited this town a few days ago, and it is understood that the site likely to be fixed upon for the railway station will be those fields occupied by Bowland Barton and Armer Alcorn, on the other side of the road from the present passenger station. It is intended to form a new road on a straight line with John-street, the entrance to which would be at the lower end of the Methodist Chapel grounds. This arrangement, if carried out, would go far to meet the wishes of the inhabitants, as the passenger station would then be as convenient to the town as could be reasonably expected.—*Derry Sentinel.*

REMOVAL OF THE BALLAST BOARD.—We have been given to to understand the removal of the Ballast Board has been decided upon, and that it will in future be represented here by a single commissioner.—*Mail.*

THE ORIENTAL BATHS, LIVERPOOL.—The proverbial slowness of joint-stock companies in getting to work is certainly not exemplified in the case of the Oriental Bath Company of this town, as already a handsome building has sprung up, which promises to be a credit to Liverpool in every sense of the word. One thing is especially remarkable about the heated rooms, viz:—Their great size compared with those of any other concern in the country; and when they are domed in (as intended), we have no hesitation in saying that the effect will be more truly Oriental than that produced by the flat or arched roofs of the baths hitherto erected. The principle of the Eastern bath will be consistently carried out in the larger apartments; but those who desire it can have the use of an additional sudatorium, in which the air is comparatively dry, and the temperature higher than is used in the East. But it is not anticipated that it will be much used except under medical direction. We believe that one suite of rooms will probably be open to the public by the first of next May.—*Liverpool Post.*

WIDTH OF BROADWAY.—The width of Broadway at various points is as follows: At Wall street, 35 feet; Fulton 42 feet 1 inch; Chambers, 44 feet 8 inches; White, 41 feet 6 inches, Broome, 44 feet 8 inches; Seventeenth, 36 feet 5 inches; Twenty-first, 41 feet 5 inches; Twenty-fifth, 28 feet 2 inches; Thirty-second, 38 feet 9 inches—an average of between 50 and 41 feet.

BARK STOVE.—This kind of stove, sometimes termed *moist*, is a hot-house, the temperature and moisture of which is maintained by an open reservoir of hot water, or by a mass of fermenting matter. It is adapted to plants which delight in a warm, damp, atmosphere. The term bark stove has its origin in the circumstance that tanners' spent bark was formerly used as the chief source of the heat employed.

NEW CEMETERY FOR RATHDOWN UNION.—It is proposed to form a new cemetery for this union, and offers have been made to the guardians by Sir C. Domville of three to five acres at Shankhill at £10 per acre per annum; by Mr. Carter, to sell three acres at Dalkey for 500 guineas; and by a Mrs. Neill, the residue of a lease of three acres at Kill-of-the-Grange, for £140. Objections were recorded to each, but the subject has been referred to a committee to report.

TO UNITE STONE AND GLASS.—M. Bru, curator of the museum at Narbonne, has discovered that silicate of potash possesses, in the highest degree, the property of uniting surfaces of stone, glass, and pottery. It is applied with a brush to the surfaces which it is desired to bring into contact, and in a few days acquires a great solidity. It appears that the same material can also be successfully used in joinery, and for all the purposes to which common glue is applied.

TO SUBSCRIBERS AND ADVERTISERS.

Subscribers and advertisers to whom frequent applications have been made by circular and otherwise for various amounts of accounts furnished, will have the goodness to remit same to the office, as directed. It must be obvious to all that the character of this journal entails more than ordinary *expense for each publication, and judging from the good feeling manifested towards our mission by all classes, we are quite sure it is only necessary to remind those indebted that a multiplication of individual items, however small, serve to form a very important aggregate.*

NOTICE.

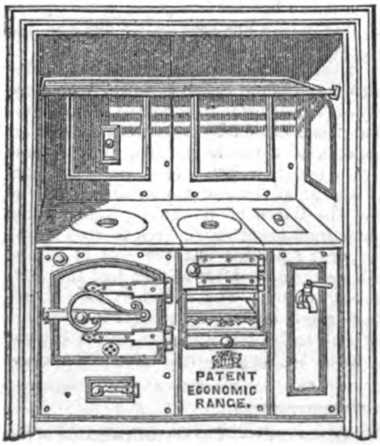
Post-office Orders and Remittances should be made payable to MR. PETER ROE, *Printer and Publisher*, 42, MABBOT-STREET, DUBLIN.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* DUBLIN BUILDER," 42, MABBOT-STREET. *All other Communications should be addressed to the "Proprietor and Editor,"* 17, LOWER GARDINER-STREET.

CLARK AND HUNT,

IRONMONGERS, FACTORS, & GENERAL MERCHANTS, 159, SHOREDITCH.

A LARGE ASSORTMENT OF BAR, SHEET, AND HOOP IRON, RANGE AND STOVE METAL.



Also a great variety of Elliptic, Register, Cottage, and other Ranges, fitted, always in Stock.

Register Stoves, with Solid Bars, per inch, 4½d.

Improved New Pattern Circular Check Register, with strong Bars and Trivets, 5d. per inch.

Best Solar ditto, with Fire-brick Back, per inch, 10d.

Bright Stoves, with Two Fires, 40s. to 100s. each.

Best Cut Clasp and Rose Nails.

1½-inch—15s. 1¾-in.—15s 2-in.—14s. 2½-in.—13s. 3-in.—12s. per cwt.

Best Sheet Cut Floor Brads, 12s. Best Cut Lath Nails, 15s. per cwt.

Cast Rain-water Pipe, 2-inch—9d.; 2½-inch—11d.; 3-inch—1s. 1d. per yard.

Cast Gutters, 4-in.—8d. O-G Gutters, clip on, 4-in.—11d. 4½-in.—1s. 1d. per yard.

Patent Line, Nos. 2—3s. 6d; 3—4s.; 4—5s.; 5—7s.; 6—9s. per gross.

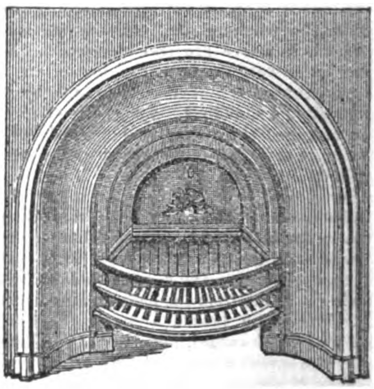
6-inch Rd. Ward Mortise, with best Furniture and Patent Spindles, 2s. 9d. each.

Light Elliptic and Register Metal, 13s. per cwt.

Dr. Arnott's Ventilators, 4s. each.

Brick Moulds kept in stock. Any size made to order.

BLACK ANNEALED FENCING WIRE, 12s. per cwt.



BEST BERLIN BLACK REGISTER.

Best Self-acting, with Bright Wought Bars.	
34 inches	54s.
36 „	56s.
38 „	58s.
42 „	60s.

Self-acting Cottage, with Oven and Back Boiler.	
30 inches	24s.
32 „	26s.
34 „	28s.
36 „	30s.

Best Japanned Registers, 40s.; Berlin Black, with Bright Mouldings, 60.; Bright Fronts, with Ormolu Ornaments and Two Sets of Bars, 90s.; Improved Cast Mangers, with Wought Hay-rack and Water Trough, fitted, 45s.

AN ILLUSTRATED BOOK OF PATTERNS WILL BE SENT ON RECEIPT OF POSTAGE STAMP.

The Dublin Builder.

VOL. III.—No. 34.

THE ROYAL HIBERNIAN ACADEMY EXHIBITION.

WITH increased interest—owing to circumstances hitherto fully recorded in these columns, and now unnecessary to allude to more than *en passant*—we proceeded to view the collection of paintings, sculptural and architectural works, at present exhibiting at the Royal Hibernian Academy; and though we cannot hope, in the limited time that intervened between the opening and our publication, to do even moderate justice to its importance, yet, reserving the pleasing privilege of recurring to it again and again, we note in current number a few remarks concerning it. The energies of the academicians, and more especially those of the officials whose peculiar province it is to act as "faggers" in preparing for exhibition—but who doubtless, in their most laudable enthusiasm for the advancement of art, become reconciled to their arduous, responsible, and comparatively thankless duties by the conviction that "the labour we delight in physics pain," must have been taxed in a more than ordinarily severe manner on the present occasion, considering that elsewhere in this city are being congregated, in a building devoted to somewhat similar purposes, some *two thousand* pictures of the choicest character. More honour is therefore due to them now than under ordinary circumstances; and viewing the result both numerically and with regard to its excellence, it has been rarely equalled, and certainly not surpassed, by any previous effort, at least to our knowledge.

Both foreign and British artists—of the latter of whom the sons of Erin form not the least important proportion—are well represented, and we have only to mention, that amongst the former are to be found the works of Starkenborg—No. 16, the Vale of Lauterbrunnen, a truly glorious production; Camille Venneman—Nos. 17, Resistance, and 55, Strolling Musicians, after that preeminent artist's well-known style; Eugene de la Croix—No. 25, Lion and Panther, an admirable animal study; Van Dwenter, No. 35; Kruseman Von Ellen, No. 43; A. DeBylandt, 84—all landscapes of considerable merit, together with many others, to convey a fair idea of its excellence in that department. One of the most conspicuous pictures in the exhibition is John Falconer's Pass of Glencoe—No. 49—in which that young Irish artist has excelled himself, though we are not not disposed to regard his View of The Dargle—No. 155—as a proportionately successful work. No. 162, by the same author, representing the brig Endeavour ashore at Bray, is a highly meritorious painting. Mr. P. Vincent Duffy, R.H.A., contributes—Nos. 18, Bray Head; 37, The Dargle; 77, The Vale of Rest; 100, Moonlight; 143, Ross Castle, Killarney; 146, The Haycock; 176, The Eagle's Nest and Purple Mountain, Killarney—all of which, but the latter especially, together with some water-colour drawings, in the anteroom, are quite in accordance with that gentleman's previously established reputation. No. 180, by T. H. Maguire, valued at £250, and representing Matilda relating Northam's history, has many notable points as to general effect, though we do not quite coincide in the artist's estimation of the whole. No. 61, In the days of the Merry Monarch, by the same artist, and valued at £300, is charmingly effective in its lights and shades. Amongst the academicians' works, the marine subjects by Kendrick demand premier notice, and the visitors, while admiring all, regard with additional interest No. 45, wherein the artist has perpetuated the memory of the unfortunate fate of Captain Boyd and his brave fellows at Kingstown on the 9th of February. Mr. M'Manus exhibits two pictures—Nos. 93, Venus in the Tent of Mars, and 95, a Hymn to the Setting Sun—both of a very ambitious character, in a style seemingly and peculiarly this artist's own. The oil and the water colours by Messrs. Edwin and Edward Hayes, and Not to be Caught, by Michael Angelo Hayes, are very noteworthy. Mr. Mulrenin, the courteous and efficient secretary, as usual has a goodly display of miniatures on ivory, beautifully handled, and Mr. Catterson Smith, the eminent portrait painter, also contributes some of his latest works in that line. We miss Mr. George Mulvany's portraits, which, without drawing invidious comparisons, are inferior to none others, but notice that No. 67, Francis I. surprising Henry VIII. in the Castle of Guisnes, in the vicinity of "the Cloth of Gold," is by that artist. The suggestion of the subject, which is delineated with considerable merit, is explained by the underneath quotation from Montfauçon's antiquities of France:—

> "The King of France, who was not a suspicious man, was much troubled that they distrusted each other's faith. One day he rose, contrary to custom, very early, and taking with him only two gentlemen and a page, the first he could find, with a Spanish cap on, mounted his horse without housings, and went to the King of England, at Guisnes. Brother, said Henry, who was highly surprised to see Francis enter his room alone, you have played me the finest trick ever man played another, and have shown me what confidence ought to be reposed in you by me, who surrender myself your prisoner, and plight you my faith."

We must for the present pause here and pass on to the antique gallery, where, while fully appreciating the beauties of the painter's art, admittedly is to be found "metal more attractive.'

In the architectural department we were led to hope that the recent acquisitions to the Academy, as well as the inducement of associateship, still an open question, would have ensured a specially meritorious display this year; but while confessing that it is somewhat better than a few of the preceding exhibitions, yet it falls far short to our mind of what it might and ought to be considering the available resources of our practising professionals, local and otherwise. Commencing, in the order of the catalogue, at the left of the entrance doorway, Mr. Trevor Owen exhibits his design for the Boyd Testimonial, as adopted by the committee; but our notions of a monumental structure harmonizing to some extent with those of a royal critic, who was pleased to designate the prototype of this—viz., the Wellington Testimonial in the Park—"an overgrown milestone," we have no reason to congratulate any of the parties concerned on the result. A little farther on, however, this gentleman retrieves himself by his exterior and interior views of the Catholic Apostolic Church, Liverpool; the latter being peculiarly noteworthy both in design and the handling of the drawing, although the artist's license is rather extensively encroached on in the colouring of the roof, and the former is by no means free from fault, but very questionable, especially as regards the tower and spirelet treatment. Mr. William Murray, one of the newly-elected R.H.A's., contributes a neat and effective view of the chapel and infirmaries of the District Lunatic Asylum at Grangegorman, a creditable production in its way, though we should have preferred a newer subject. Mr. Charles Geoghegan has a very phlegmatic design for a collegiate school (No. 558), though better in every respect to that by the same author for a Catholic Church (No. 600). Mr. Wm. Fogerty's competitive drawings for Presbyterian Church, Cork (the adopted design for which appeared in our number for March 1st), has some clever grouping about it, and colour is sought to be obtained throughout by introducing bands of dressed stone dissimilar to that of the body of the structure. We are not, however, permitted to regard favourably in *any* respect the same gentleman's drawing of a villa at Ennis (No. 616). Looking first at Nos. 564, 568, and 571, views respectively of the east portico of the Bank of Ireland, and the principal front of Trinity College, Dublin, the interior of our Town Hall, and the south-east view of the Custom-house, we were strongly impressed with the conviction of their being the productions of "an old master," nor were we disappointed on referring to the catalogue to find the name of Patrick Byrne, R.H.A., associated therewith. Though somewhat less pretensious in colouring than the style generally adopted by the architects of more modern schools, yet these drawings are very truthful, and suggest desirable subjects for study. No. 569, a design showing three sides of proposed Grosvenor-square, has no recommendatory feature as a work of art for exhibition, though in execution it may be found to answer its purpose very well, the houses being externally of the most common-place character, and the whole very strongly resembling a published lithograph of Queen-square, which everyone knows has no architectural pretensions whatever. We should have wished both for a better *drawing* and a better *subject* from the exhibitor—Mr. Caldbeck—who enjoying an extensive practice could have found no difficulty in providing both. Mr. W. J. Barre, of Belfast, contributes several drawings, viz.—(No. 570) exterior view of the Ulster Hall, Belfast, the basement of which displays a piazza with through carriage drive, somewhat after the fashion of that at the Covent Garden Theatre, but otherwise it is almost devoid of architectural features; (No. 576) interior of same building (illustrated in our number for April 1st), on which the artist has plied his brush too freely, and we hope the colours are not really intended to represent the hall as it will be decorated; (No. 580) Presbyterian church, Sydenham—apparently either a greatly burried or an unfinished drawing; (No. 601) Adam Clarke memorial church,—a better drawing, and presenting some notable points, in which, however, we cannot include the introduction of a concealed roof behind a battlemented parapet, surmounting the nave walls, and the chancel projecting therefrom after the ordinary manner, with exposed roof; (No. 605) view of Duncairn Presbyterian church; and (618) views of Bray and Rockcorry churches —a trio of drawings admitting of more suitable finish for exhibition purposes, and in some respects displaying close similarity in style and treatment. Messrs. Lanyon, Lynn, and Lanyon contribute the two views of approved design for St. Andrew's church (Nos. 575 and 578), previously exhibited in College-street, and illustrated in this journal (on the merits of which having previously expressed our opinions, it is unnecessary here to repeat them); also the approved design for Trinity church, Edinburgh (No. 612) —a truly meritorious composition — and a view of Killileagh Castle, county Down (No. 613), as lately restored, all in the first style of art, and contrasting strongly, especially in the manipulation, with the general works exhibited in this department, and fully sustaining the high character of that eminent firm. Mr. John J. Mulvany, R.H.A., has an outline perspective—apparently intended to be coloured—of a marine residence at Dunmore, in which a cantilever roof, with curvilinear outline, and a multitude of brackets, is the principal feature. Nos. 577, Clonea Church, 611, South-east view of St. Saviour's, and 614, St. Joseph's, Carrickmacross, are by Mr. M'Carthy, R.H.A. Messrs. Deane & Woodward have an enlarged design for the staircase angle of the proposed War Office, in the well-known adopted style of that firm; and two designs for the new Molyneux Church and Asylum (with which our readers are already familiar by illustration and description), by Mr. Rawson Carroll, and a sketch for the De Vesci Testimonial, by Mr. Charles Papworth, may be said to comprehend the entire display. The sculptural department, excepting the Goldsmith testimonial model, a Titania, by Lawler, and "Pastime," by Terence Farrell, comprises only busts and a head of the Saviour, which latter, however, is a remarkably meritorious work.

THE REMAINS OF ANCIENT ROMAN BATHS IN ENGLAND.*

MUCH curiosity exists as to the nature of the ancient Roman Bath, the accounts which have been given of it being often full of discrepancies. This arises to some extent from actual differences in the Roman system of bathing at different periods, but generally speaking it arises from blindly copying what others have written, without any investigation whatever of the sources of their information.

Fortunately we are not altogether dependent upon the "tender mercies" of compilers of classical dictionaries, but have means of informing ourselves on the subject, by the investigation of ancient ruins at our own doors, pregnant with relics of the past, and conveying to the educated eye much which is invaluable for helping us in the decision of present difficulties.

It may, perhaps, be supposed that there are no ruins now existing which are capable of affording accurate information on the subject, and, to a certain extent, this cannot be denied, but when the ruins recently excavated are compared with those of which detailed descriptions have been laid before scientific societies, many difficulties are got rid of which otherwise would be insuperable; and the entire system of bathing practised by the Romans becomes sufficiently manifest. The localities in which the most perfect ruins have been found are so distant from one another, and so well distributed over the country, as to prove that the custom of using thermal baths had become national, as will appear from the mere mention of the places —viz., Lincoln, Chester, Boughton parish, Kent; Carisbrooke, Isle of Wight; and more recently, Uriconium, near Shrewsbury.

Those enumerated have been found in a tolerable state of preservation, but traces of similar buildings occur in almost every district of the country.

The bath at Chester has been a good deal talked of lately, and was described by me in detail, at a meeting of the Royal Dublin Society (Lord Talbot de Malahide in the chair). I visited it personally on the 30th November, 1857, while bringing an invalid from Dublin to Florence, and it was owing to my not being able to find anywhere a correct account of it that I undertook to bring the subject before the Royal Dublin Society, which I did on the 8th of January, 1859. The ruins of Uriconium are worthy of far more attention than has yet been given to them, and the most interesting portion of them is fast disappearing under the hand of time. With a view of satisfying my own mind as to the nature of the buildings found there, I made a special trip to Shrewsbury about three weeks ago, and walked along the beautiful valley of the Severn until I came to the site of the ancient city. When pretty near the spot, I asked a man who was digging if he knew whereabouts the old Roman city was? He replied that there was no such thing there now; but he could direct me to "what they called the excavations." When I arrived, I was a little disappointed at the small extent of ground which had been excavated in the space of two years, but I was rejoiced to see five distinct systems of tile pillars, belonging to as many hypocausts, which, according to Mr. Thomas Wright, and the most competent authorities, belonged to the baths, or thermæ, occupying (with their appurtenances) nearly half the space which had been uncovered.

That Uriconium was a city of considerable magnitude admits of no doubt, as the fact may be proved in several ways. Whether we consult ancient records, or the accounts of buildings formerly discovered in the same locality, or visit in person the excavations lately made on the property of the Duke of Cleveland. These excavations were commenced on the 3rd of February, 1859, and a person is continually in charge in order to prevent the speedy demolition of the buildings, &c., by "cockneys" of an inquiring mind, who not merely stumble against the ricketty pillars, but generally pocket something or other, as a trophy of having "done" the city of Uriconium.

I cannot say whether the disintegration which the tiles are undergoing is owing to the effect of exposure to the weather, or the original quality; but it is certain that they are rapidly falling to pieces, and many parts now supposed to be *in situ* have evidently fallen down, and been built up again. That the Romans knew how to manufacture good tiles is well known, for those in the bath at Chester and elsewhere are very hard, and of remarkably good quality; but they are perforated with small holes at regular intervals, which those of Uriconium are not. In the latter city there are no bricks visible, such as we manufacture, but stone is freely used, and tiles are employed in all places where nice workmanship is required. They are not, however, by any means accurate in either size or shape, but are rough, uneven, and irregular in appearance. The general size of those forming the pillars of the alveus (or body of the hypocaust) is about 7 inches square, by 1½-inch thick, standing upon others about a foot square, and each pillar surmounted by another tile of the same size. In the most perfect of the hypocausts I counted 16 tiles in one of the pillars, cemented together, and making a total height of 3 feet 6 inches. Most of the pillars showed no trace of cement between the tiles, and were either originally laid without cement or had fallen down and been rebuilt. In each hypocaust there were a good many pillars, and the largest measures 43 feet in length by 85 feet in width. In height they were about 5 feet, counting a layer of concrete which was laid on the upper tiles to a depth of from 14 to 18 inches, and appeared to have been put down in two distinct operations.

It is not easy to say what was the exact arrangement of the public baths of Uriconium, as almost nothing is left of the flooring of the heated rooms, but from its general appearance I am quite satisfied that they comprised two distinct systems of rooms, one devoted to men, and the other to women, a kind of quality being observable in most of the arrangements. The most westerly hypocaust was pretty well preserved, and measured 37 feet by 25, and contained 120 pillars, which (when complete) stood about 3 feet high, exclusive of the concrete which was placed above them. Many circumstances concur in proving that the city was suddenly and violently destroyed, being sacked and burned to the ground (probably by the Picts and Scots in the middle of the 5th century), and it is very remarkable that the most perfect buildings are the public baths or thermæ, and the basilica or town-hall, immediately adjoining one another. This alone is sufficient to show the estimation in which the baths were held, and the importance to the state of their proper administration.

The bath at Carisbrooke was attached to a villa, and does not need any particular description. The soot of thirteen centuries was found still adhering to the tiles in large quantities, and the walls and ceilings were painted in the most gaudy colours (as red, blue, yellow, green, white, and black). At Uriconium it is said that some of the exterior walls of the buildings were found painted red with stripes of yellow.

The date of Vespasian's invasion of the Isle of Wight is believed to have been A.D. 43, and its subsequent taking by the Saxons, under Cerdic, took place nearly 500 years afterwards, so that we are thus enabled to form an idea of the time during which the Romans had possession of this country. The small lithograph to which I have alluded represents a bath found 160 years ago near the modern village of Wroxeter, very close to the site of the late excavations, and presents in a complete form the system of flue bricks running up the sides of the apartment, so imperfectly traced in the eastern hypocaust of Uriconium, and evidently belonging to the same city.

With the exception of Carisbrooke and Uriconium, it is, I believe, the most modern discovery of Roman civilization in England. The account of it was communicated by Mr. Clement Taylor Smythe to a member of the Society of Antiquaries, in the year 1841, and the ruin in question on the property of Charles Wykeham Martin, Esq., M.P., in the parish of Broughton Winchelsea, in Kent.

---

* From a paper read by Edward Haughton, M.D., before the Architectural and Archæological Society of Liverpool, 17th April, 1861.

Its extent from north to south was about 60 feet, and from east to west 80 feet, and the walls about 8 feet in height by 2 feet in thickness. The destruction of the roof of this hypocaust leaves us in the dark as to the arrangements for ablution in the hot room or caldarium, but if we are to judge from the usual arrangements of Roman baths found elsewhere (as at Pompeii), the recesses in the western sides of the sudatorium were probably reserved for this purpose, or for the hot water vessels, labrum, and solium. But the sink was placed at the opposite side of the apartment, so that water must run entirely across the room in order to flow off. Thus we see that the only room in which the atmosphere was not moist was the tepidarium, and that it had no hypocaust under it, but only a single flue, so that its object was that of seasoning the skin for the higher temperature of the caldarium, rather than the production of free perspiration. If any nation was ever fitted for the endurance of high temperatures in dry air, it certainly was the Roman nation, for the constant practice of gymnastic exercises (as a kind of preliminary to the bath) rendered the skin capable of performing its functions with great activity whenever necessity arose for it.

It does not appear that it was their practice to indulge in that kind of "roasting" which is now so fashionable, nor do we find mentioned by any author any such thing as the modern practice of drinking immense quantities of water in the bath. On the contrary, we actually find Celsus warning his patients against remaining too long in the baths, on the ground that vapour baths were debilitating when indulged in to excess. He might have said the same on any bath; but it is the use made of anything which determines its influence on society. When luxury was rampant and decency not inculcated by the prevailing form of religious belief, it was not to be expected that the Romans would have made any better use of the bath than they did, when an unhallowed civilization had reached its climax, and the city of abominations was living at its ease, and enjoying the spoils of many conquered countries. In Britain, however, the case was different. The hardy soldiers who ventured so far were not the men to spend their days in idle luxury, but they used the bath as a means of invigorating during the most arduous achievements; and it seems to me that, inasmuch as an Englishman is neither a Roman nor a Turk, the use of the bath in this country will neither be accompanied by the laziness of the one nor the sensuality of the other. On the contrary, I congratulate myself on whatever part I have taken in its introduction into the country, and believe that every man who has aided the cause may justly boast that he has assisted in giving the people a harmless enjoyment, which is capable of curing disease, preserving health, and giving new capacity for labour. The only true way of checking the intemperance and vice which unfortunately so much abound, is to increase the number of our innocent recreations, and thereby diminish the temptations of the people.

PROCEEDINGS OF ARCHITECTURAL SOCIETIES.

THE Royal Institute of British Architects held its annual general meeting on the evening of the 6th inst., and after the report of the Council had been read, the following officials were elected for the ensuing session:—*Vice-Presidents.*—Messrs. T. L. Donaldson, M. D. Wyatt, and G. G. Scott. *Honorary Secretaries.*—Messrs. T. Hayter Lewis and James Bell. *Honorary Secretary for Foreign Correspondence.*—Mr. F. C. Penrose. *Ordinary Members of Council.*—Messrs. B. Ferrey, W. Haywood, C. C. Nelson, J. Norton, E. M. Barry, J. Fergusson, R. Kerr, W. Slater, and J. B. Waring. *Treasurer.*—Sir W. R. Farquhar, Bart. *Honorary Solicitor.*—Mr. W. L. Donaldson. *Auditors.*—Messrs. Horace Jones and Arthur Cates. A long discussion took place on the question of the election of President. Professor Donaldson proposed Mr. William Tite, M.P.; and Mr. G. E. Street nominated Mr. Beresford Hope. No decision was arrived at, and the discussion was adjourned at a late hour to the following Monday.

The Architectural Association of London, on the preceding Friday evening, also held a special business meeting, at which the question of erecting a statue in the Westminster Palace to the late Sir Charles Barry, the representation of architecture at the forthcoming Great Exhibition, were, together with many other matters, discussed. The Liverpool Architectural Society has also held its concluding meeting of the thirteenth session, and the President, Mr. M. Hay, delivered an admirable address, from which we quote the following:—

"Architecture is a fine art, and like its sister arts exercises a refining and elevating influence upon the human mind, but in order that its influence be felt and enjoyed, it is absolutely requisite that some knowledge of its principles and its powers be obtained. This knowledge can only be acquired by study, but its acquisition is like the acquisition of a new sense or avenue of pleasure, or the entering upon a new world. Travel then becomes doubly interesting, and the embellishment of our own town by noble buildings and spacious and well planned thoroughfares, a desirable object. We have outlived those ages when the study of our art was confined to the guilds of the Freemason, when its language was intelligible only to the initiated, when its principles were secrets, and all round it wore the air and aspect of mystery. We, on the contrary, invite and encourage inquiry, knowing full well that it is mainly, if not entirely, through the fostering patronage of a discerning and appreciating public, that our art can advance. We would raise and foster public taste to such an extent that the artistic powers of the architect would be stimulated to the uttermost in order to gratify that taste. But such a taste can only be acquired by individual study, and that of nearly as laborious and extensive a kind to the layman as the professional. A pure, elevated taste, and sound critical judgment must be based on a thorough knowledge of principles and their general application. Architecture is moreover an art thoroughly conventional and constructive, and demands, in order to judge wisely of its works, even greater critical acumen than is requisite to judge of those of painting and sculpture, which are more directly imitative of nature. You will, however, meet with few who hesitate to hazard an opinion on architectural works, unprepared as they may be by previous study from forming any opinion. I believe that the grudging spirit in which the services of the architect are sometimes remunerated, and the grumblings and not unfrequently absolute refusal to pay for those services, are chiefly attributable to a deplorable ignorance on the part of a large portion of the public, of what those services actually are. The architect is considered a sort of angelic creature, living on ethere[illegible] food, cheap and choice as the air of heaven, or else, rejoicing in a private fortune, is independent of the fruits of professional toil, and is ready to draw out pretty pictures for any one, simply to amuse himself. The architect, I need not inform any here, is not this *lusus naturæ*; but one who, on the groundwork of an expensive education, has spent his youth in study and research, his later years in exploring the great monuments of modern civilization, at home or abroad, and is qualified and prepared to carry into execution the instructions of his client, for which he is entitled to a certain remuneration. If his client be a gentleman of education, and possess a knowledge of architecture, he will not have any serious difficulty, for every objection will be intelligible, and every suggestion worthy of consideration. If, on the other hand, his client be ignorant and conceited, there is no means of illustrating the absurdity of his whimsical notions, unless the architect possessed the magic power of calling into existence two buildings, one as desired, and the other as it ought to be. Some of the irregularities with which the profession is charged arise in a great measure from a prevalent impression that an architect's commission is just so much money lost or thrown away, and a great saving is thought to have been effected when his services are entirely dispensed with, and a builder employed in his place. An unwise proceeding is sometimes adopted of striking a bargain at something below the regular commission. At other times a greater folly is perpetrated, when a man has just that modicum of knowledge of building matters sufficient to engender the notion that he may be his own architect. The most wilfully blind and conceited generally find out somewhat, but seldom know or admit the full extent of the folly and extravagance resulting from these practices. Architects have been exceedingly remiss in not having determined ere this upon a scale of charges and fees to place in the hands of a client when their services are about to be engaged. The usual commission of 5 per cent. on the outlay is an exceeding vague one, for while, in some cases, as that of a large warehouse involving an expenditure of some thousands of pounds, it may be too high; in others, as that of shop-fronts, where a hundred pounds or two only is expended, it is very much too low, for here the same process has to be gone through of making drawings and large details, specifications, superintending the operations and settling up the tradesmen's accounts, as when fifty times the cost has been incurred.

"It is very important that each man should get into the right sphere of action, and take his proper place in the vineyard of art; important to his usefulness and to his reputation and happiness. He does this when he applies himself to that which he likes best and can do best. 'Each man,' says Emerson, 'has his own vocation. The talent is his call; there is one direction in which all space is open to him; he has faculties silently inviting him thither to endless exertion; he is like a ship in a river, he runs against obstruction on every side but one, on that side all obstruction is taken away, and he sweeps over God's depths into an infinite sea. This talent and this call depend on his organization, or the mode in which the general soul incarnates itself in him. He inclines to do something which is easy to him and good when it is done, but which no other man can do. He has no rival, for the more truly he consults his own powers, the more difference will his work exhibit from the work of another. When he is true and faithful, his ambition is truly proportioned to his powers. Every man has this call of the power to do somewhat unique, and no man has any other call.' This passage is fraught with most important suggestion and advice to the young student, who may throw the reins on the neck of his natural genius, and give his mind its natural bent. If he has a strong love for a certain style or walk of art, let him not abandon it because obloquy has been thrown on it by its foes. If he has a love for pointedness in architecture let him study Gothic, and devote himself to the practice and elucidation of its principles. If he has not a love for pointedness, let him not try to love it because he is told that as a Teuton he must love it. If he love the architecture that came to us from the south, let him cultivate his natural or acquired taste, and use every means to increase his susceptibility to the sublimity and beauty of the world around him, and to everything beautiful in the world of art, because *that* every man who aspires to be an artist should in a greater or less degree profess. But there are elementary studies which are a necessity to the architect, and ought to be mastered, though he may not feel any particular liking for them—such, for instance, as the study of the mathematics and mechanical construction, architectural statics, and dynamics. These are most important to the architect, whatever style he pursues, and some degree of proficiency every youth who would excel in architecture should attain to. They form a golden key to unlock the treasures of all styles, by which he is to acquire a mastery of their latent principles and laws of composition.

"Let the student of architecture not be discouraged by any aspect of the times, or suppose that the great days of architecture are past never to return. We shall not again build cathedrals, and pyramids, and amphitheatres—the spirit of our age does not call for them: but it will call for great works still, for works which will bring every faculty into play. Architecture must manifest itself in forms very different to what it assumed either in ancient Greece or medieval Europe. But it is the same thing in its essence that it was in ancient times, it is the art of the beautiful in building, and being connected with a higher state of humanity, and made subservient to loftier aims of social advancement, may become more powerful."

The Manchester Association met on the 1st inst., and Mr. Fisher read a paper on "Chemistry in Relation to Building," in which, after noticing the small attention usually devoted to chemistry in the education of the architect, the essayist referred to the action of the weather and other influences on the various materials used in building, and pointed out some of the best methods for preventing the decay and dilapidation which result from this cause; he described several reactions which take place during the setting of mortar, cements, &c., and called attention to the fact that slate and stone are the only two materials used on the exterior of modern buildings, in a natural state, unprotected from the weather, and that it appears probable that the coating of one of these, with some impervious preparation will ere long be deemed indispensible in all cases where durability is desired. Among other means of preserving stone, he alluded to the generally received opinion that this end is attained by setting it on its natural or quarry bed, and showed that under many circumstances stone bedded vertically offers more resistance to the penetration of wet, and is therefore preferable. The essay was concluded by a brief reference to the value of photography to the architect.

THE ART EXHIBITION AT THE ROYAL DUBLIN SOCIETY.

The 24th inst.—the birth-day of her Majesty—has been fixed upon as a suitable day for the inauguration of this unrivalled display of the choisest available art treasures in the three kingdoms. Although the vast collection of paintings, sculpture, carvings, manufactures, &c., which are being arranged in the society's great hall are gratuitously contributed by many public bodies, and public and private personages who are cordially co-operating in this fine arts congress, still a heavy expenditure has been necessarily incurred for the carriage of the contributions, the fitting up and decoration of the hall, the insurances and other accessory purposes which none but those actually concerned in the preparations could imagine. Those who visited the Great Exhibition of 1853, in this city, will be enabled to form some idea of the extent and value of this art collection when it is mentioned that, while there were in the Fine Arts Court, in Merrion-square about 1,000 paintings, there will be here nearly 2,000. Of these more than 1,600 have arrived, and are being rapidly placed. The great hall has been subdivided into three compartments, extending the entire length, of which the centre forms the nave, and the remaining two the aisles; and a series of elegantly designed and constructed galleries have been erected. There are to be seen some of the best of the immortal pictures of Titian, Corregio, Murillo, Salvator, Rosa, Paul Veronese, and in the same department come the works of the fathers of the Royal Academy of England, side by side with those no less illustrious accademicians of our own time, Reynolds, West, Lawrence, Landseer, Eastlake, Maclise, Mulready, Redgrave, Webster, &c. Some of the works referred to come from the Sheepshanks and Vernon collections. Amongst the historical paintings, which will, doubtless, attract a large share of attention, there are the Investure with the Garter of Edward the Black Prince, and the celebrated judicial rebuking of the warlike Henry V. when Prince of Wales. The designs are by Cope and Redgrave for the new Houses of Parliament Maclise's splendid pictures, Malvalio and the Duchess, is amongst the contributions from the National Gallery. There are portraits of General Ireton, Lord Nelson, Warren Hastings, Congreve, Dibdin, whose songs did more than all the bounty money of his time to man the British navy, and there is a portrait of Siddons, the expressive beauty of whose face, as well as the artistic merit of the painting, would alone repay a visit. Who is it that has seen the engraving of Landseer's "Dignity and Impudence," and will not hasten to see here the original, as also of the "School-Teacher," and Mulready's "Crossing the Ford?" In the third compartment are the works of the old masters, beautiful specimens of modern art from the Sotheby collection, which arrived last week, and it is stated also Mr. Alloway's contribution of Pompeii remains. Amongst the contributors of the old masters are Prince Albert, the Lord Lieutenant, Lords Drogheda, Besborough, Massareene, Talbot de Malahide, Harberton; Sir T. Larcom, Mr. Watkins, Sir R. Levinge, M.P.; Dr. Kennedy, Charles Brien, Mrs. West, Mrs. Purcell, Mr. White, Mr. Barton.

In the section of sculpture are busts of Moore, Sir L. M'Clintock, Lord Gough, &c., and a beautiful group denominated "The Mother's Kiss." The nave or central hall will have at one end Bevington's grand organ, the arrival of which has been unavoidably delayed. Upon the organ Dr. Stewart and Mr. Torrance will alternately perform on the "select" or "half-crown" days, Tuesday and Friday, when bands will also contribute their sweet sounds to regale the ear while the eye is dazzled. Curiously enough out of the entire week the day selected for the "working classes" by the Royal Dublin Society committee is Saturday, and on that impossible day to neglect their avocations, closing the week, they will be allowed in for a shilling each. The general impression up to the present, we think, has been that Monday is, of the six working days, the most available for the working classes. In the central hall will be the most practically useful portion of the exhibition, for here are placed the manufactures whose artistic excellence entitle them to admission into this art exhibition. Long lines of splendid glass cases will contain jewellery, plate, laces, poplins, china, porcelain, fancy articles in wood and leather, musical instruments, &c. Amongst the exhibitors are Forrest and Sons, Acheson, Allen, Kerr, Scates, Elkington, Mason and Co., Fry and Co. A handsome fountain in the centre of the hall, and from which water will be constantly playing, has been sent by Edmundson and Co. who also contribute a variety of beautiful articles in metal.—*Freeman.*

COLLEGE OF PHYSICIANS COMPETITION.

As already announced, the premises in Kildare-street, recently occupied by the Kildare-street Club, and destroyed by fire, have been taken by the College of Physicians for the purpose of erecting thereon a building suited to their requirements; and we learn that the following gentlemen have been invited to send in plans in competition:—Mr. Wm. G. Murray, John J. Mulvany, John M'Curdy, Duncan Ferguson, Turner & Drew, and Charles Geoghegan, architects.

THE KINGSTOWN WATERWORKS COMPANY.

When this bill was called on there was no appearance on the part of the oppositionists, viz., the Kingstown Commissioners and the Corporation of Dublin. It was, therefore, referred to the committee of selection. Mr. Barry, Q.C., appeared as counsel for the promoters, and Mr. R. D. Kane, as solicitor.

ROYAL DUBLIN SOCIETY.

The seventh evening scientific meeting for the session of 1860-61 will be held on Monday evening next, May 20. Chairs will be taken at eight o'clock. Royal Dublin Society (board-room)—Henry Lawson, M.D.—On the affinities of the groups trematoda, planariæ, and hirudinei; and on the formation of a new class of the anneloidæ for the reception of these animals. Henry T. Vickers —On the preparation of entire insects as microscopic objects. For exhibition—Portion of the lower jaw of the diprotodon Australis (gigantic kangaroo), from the river Condamine; and other specimens recently presented to the museum. Dublin Statistical Society (lecture theatre)—1. Judge Longfield—A plan for parliamentary mortgages. 2. D. C. Heron, Q.C.—On joint stock frauds.

One-third of Dr. Barter's Turkish Baths at Blarney has been consumed by fire.

NEW ST. PAUL'S, LONDON.

It being determined to erect a new cathedral, Sir Christopher Wren was nominated to the superintendence. To form a just estimate of the talents of the architect employed in conducting a work of such magnitude and national importance, it is necessary to consider those preliminary steps and contemporary opinions which must ever influence or control the proceedings of an architect. We shall, therefore, condense from his posthumous collection, the *Parentalia*, an account of the formation of the design of the present church.

Before the great tax upon sea-coal, which did not commence till May, 1670, it was expected that the expenses of the building would be defrayed by voluntary contributions alone, and therefore it seemed expedient to restrict the plans to an edifice of moderate bulk. Upon these considerations, the architect prepared a design and model of a structure, with a choir, vestibule, porticos, and a lofty dome. This was applauded by some persons as containing all that was necessary for the church of a metropolis, being of a beautiful figure, and capable of erection at an expense that might reasonably have been compassed; but being designed in the Roman style, it was not so well understood and relished by others, who thought it deviated too much from the old cathedral form; while some wished for more magnificence, and were unwilling that the principal church in London should be inferior to any similar structure on the continent. The architect, enlarging his ideas, endeavoured to gratify the connoisseurs and critics with a grand colossal design, after the best style of the Greek and Roman architecture. This being much admired by some persons of distinction, a highly-finished model in wood, with all its proper ornaments, was made, which was carefully preserved, and at length deposited in a room over the morning-prayer chapel of the present edifice. Sir Christopher always appeared to set a higher value on this design than any other he had made; but the prevailing prejudices still interfered, and the architect finally turned his thoughts to what was called a cathedral-form, but so modified as to reconcile, as nearly as possible, the Gothic to the new mode of architecture. Thus the design of the present edifice was formed; and, being approved of by king Charles II., a warrant was issued under the privy seal for beginning the work, May 1, 1675. The first stone was laid on the 21st of June following; and the works were prosecuted with so much vigour, that, within ten years from the commencement, the walls of the choir and side aisles were finished, with the circular porticos at the north and south sides, and the great pillars of the dome, were conducted to the same height. Some difficulties now occurred in procuring funds for the prosecution of this great work, but, through the operation of the coal duties, they all vanished; and, in the year 1710, the last, or highest stone, at the top of the lantern, was laid by Mr. Christopher Wren, son of the architect. Thus, by a fortune unusual to edifices of such magnitude and labour, this church was completed in thirty-five years, under the direction of one architect; and, as it has been commonly remarked as a singular coincidence, by one master-mason, Mr. Strong; and under one bishop of London, Dr. Henry Compton.

On investigating the exterior of St. Paul's cathedral, we find the general form to be that of a Latin cross, with an additional arm, or transept, at the west end, to give length to the principal point, and a semicircular projection at the east end, for the altar; there are also at the north-east, south-east, north-west, and south-west angles of the cross, square projections, which, besides containing staircases and vestries, serve as immense buttresses to the dome. This is extremely different, both in proportion and general effect, to the plan of St. Peter's at Rome, where the cross-shape is scarcely marked externally. The first object of attention is the *western front*, which is distinguished by a portico of two orders, the Corinthian supporting the Composite, of grand dimensions and rich arrangement. A noble flight of steps, of black marble, forms a basement to this portico, which is terminated at the summit by a pediment. On each side of the front is a steeple; one serving as a belfry, and the other as the clock-tower: singly considered, these may be said to want repose, but yet they are picturesque; and their springing forms not only harmonize with the cupola in the distant view, but also give effect and elevation to the western front, to which they particularly belong. Nor are they without parts of considerable beauty.

The entablature of the upper order is remarkable, from the consoles of the cornice occupying the whole of the frieze. In this, as in many other instances, we see Sir Christopher sacrificing a particular, to a general, effect; for this cornice, considered as the grand termination to the body of the building, required to be treated in a bold and striking style, rather than with that delicacy appropriate to the order. The idea of this may probably have been taken from the upper entablature of the Coliseum at Rome, where the same motives of general effect have prevailed.

The ornaments of the front are well executed; and though not remarkable for elegance, are placed with judicious frugality, so as to enrich without overloading or confusing the aspect. A very large composition, in basso-relievo, representing the conversion of St. Paul, occupies the tympan of the pediment. This is said to be the best work of the artist, Francis Bird. At the apex of the pediment is placed a gigantic statue of the patron saint, while St. Peter, St. James, and the four Evangelists, occupy situations at his right and left hand.

The rest of the building is a vast fabric of a wall decorated with coupled pilasters, arranged at regular distances; the intervals below being occupied with large windows, serving to light the side aisles, and those above with niches; in the pedestals of which are singularly inserted windows, belonging to galleries and rooms over the side aisles.

In the whole surface of the walling, the joints of the stones are marked by horizontal and perpendicular channels; a simple decoration, which, while it gives a vigorous expression of strength and stability, has the advantage of defining and rendering conspicuous the pilasters and entablatures.

The entrance-doors of the transepts are adorned by semi-circular porticos; objects equally beautiful, whether considered separately or in connection with the total mass of the building, which they adorn and diversify, by the contrast of curves and straight lines, and of insulated columns, with engaged pilasters.

At the centre, formed by the crossing of the nave and transept, rises an ample cupola, which is the most magnificent feature of the building. The basement of this part of the fabric is an octagonal wall, pierced through each side by an arcade; the two, which are in the direction of the nave, are open to the top, as are also the two in the direction of the transept; the other four have an intermediate arch, which supports the continuation of the dado or panelling above the entablature. The spandrels of the arches are spherical, and form a complete circle at the level of the summit of the arches. Upon the archivolt of the arches is placed a corbelled cornice of considerable projection, the upper side forming the floor of the whispering-gallery: from the floor of the whispering gallery rises a cylindrical wall, called by the French, *tour du dome*, for which we have no technical expression. This is surrounded by a Corinthian peristyle, so placed as to conceal the projecting buttresses of the cupola; and thus, by a happy combination of profound skill and exquisite taste, a construction adapted to oppose, with insuperable solidity, the enormous pressure of the dome, the cone, and the lantern, is converted into a decoration of the most grand and beautiful character. The idea of this arrangement was, doubtless, taken from the interior of the Pantheon at Rome, to which it bears a striking resemblance.

On the exterior side of the building, the general disposition is divided into eight parts by piers, containing staircases, with two columns attached to the angles of each. The spaces between the piers form eight recesses, having in each two columns, which at a distance, to a hasty observer, appear to be insulated; but they are in fact joined to the dome-tower by walls, serving as counterforts. All these buttresses are, however, pierced with arcades, so as to leave a free communication around this part of the cupola. The columns being of a large proportion, and placed at regular intervals, are crowned with a complete entablature, which, continuing without a single break, forms an entire circle, and thus connects all the parts into one grand and harmonious whole. Above the colonnade, but not resting upon it, rises an attic-story, with pilasters and windows, from which spring the exterior dome, of a bold contour, well adapted to the rising form of the lofty and elegant lantern by which it is crowned. It has been said, with some justice, that the columns of the cupola are too high in proportion to the body of the building, as they are indeed little less than those of the lower-order, but higher than the columns of the upper order. This incongruity would not have existed, had circumstances allowed the architect to construct the main edifice of a single order, extending the whole height of the building; but being baffled in this his original intention, it would have been too great a sacrifice to relinquish the peristyle, the noblest feature of the building, or to materially diminish the cupola.

Comparing the cupolas of St. Peter's and St. Paul's, we shall find that, though the latter has, in a great degree, been the model of the former, there is a material difference in the decorative part, though the general idea of the construction is the same. In St. Peter's, the buttresses of the dome-tower, though decorated each with two engaged columns and pilasters projecting from the cylindric wall, destroy the continuity, and render the effect disagreeable. The dome is likewise pierced with three ranges of little dormer-windows, which are suffered to spot and break the surface for the paltry consideration of lighting the interior staircases. The idea, originated in St. Paul's, has been prosecuted in the church of St. Genevieve, at Paris, where the appearance of a peripteral temple is completely obtained, as the columns surrounding the tambour are all insulated; but it is to be lamented that the dome itself should be so deficient in grandeur of dimensions and grace of proportions, as to destroy the effect of this beautiful decoration.

Beginning the examination of the interior of St. Paul's at the west end, we find the body of the building, as to the general form, entirely upon the plan of the ancient cathedrals; an edifice of three aisles, divided by piers and arches, and covered with vaulting.

Sir Christopher Wren has not only adopted the form of building practised by the architects of the middle ages, but he has imitated their mode of construction; for the lofty vault of the middle aisle is supported by flying buttresses concealed by an enormous screen wall. The architectural detail is in the Roman style, simple and regular.

"The Romans," says Sir Christopher, "though they sometimes used a hemisphere, as in the exhedræ of the baths, of the tribunes, of the temples, and basilicæ, yet, generally, they used a *plain cylindrical vaulting* where the walls were parallel, or cross-vaulting where the two cylinders intersected in diagonals, as in the Temple of Peace, and in all the theatres, in the passages under the steps. The moderns, whose arches are not circular, use commonly another sort, where the spandrels, resting upon the pillars, spring every way round as their arch rises in sections of circles, parallel to the horizon; that is, in four quadrants described from the angles of a square, and terminated by its sides; and at the summit these quadrants come in contact in the middle of the sides, the four curves forming a quadrilateral, each side being convex towards the centre; and the space thus included is filled with tracery work, which gives them great opportunity of divers variations, which I need not insist on. Another way (which I cannot find used by the ancients, but in the latter eastern empire, as appears at St. Sophia, and by the examples of all the mosques and cloisters of the Dervises, and everywhere at present in the east, and of all others the most geometrical), is composed of hemispheres and their sections only; where, as a sphere may be cut in all manner of ways, and that still into circles, it may be accommodated to lie in all positions of the pillars.

It appears that these domes are of considerable antiquity, and, from the reasons here given from the *Parentalia*, that Sir Christopher Wren was justified in his choice in their adoption; their form is beautiful; and, when investigated, it is truly geometrical. Each wing forms a flat dome, supported by four spandrels; a rich wreath of foliage encircles the base, while the centre and the spandrels afford spaces well adapted, and probably intended, to receive ornamental paintings. The western transept is a beautiful part of the building; here insulated columns and screens of iron-railing separate from the aisles, on either side, the morning-prayer chapel, and the consistory.

In the progress of examination, we come to the intersection of the nave and the transept; and here, instead of four openings, eight are produced, which afford striking and picturesque views in various directions; and, in this respect, St. Paul's differs from every church with which we are acquainted, the cathedral of Ely only excepted. On the other hand, the junction of the aisles with the central area presented difficulties, which have caused various defects and mutilations in the architecture. The central area, as before observed, is an octagon, supported by eight piers, with as many apertures; four of which, terminating the middle aisles, are forty feet wide, while the others are only twenty-eight feet; but this disparity only exists as high as the first order of pilasters; at which height the smaller openings are expanded so as to make the main arches all equal. Spandrels between the arches form the area into a circle, which is crowned by a large cantiliver cornice, partly supporting, by its projection, the whispering-gallery. At this level commences the interior tambour of the dome, consisting of a high pedestal and an order of pilasters, the intervals of which are occupied by twenty-four windows and eight niches, corresponding with the inter-columniations and piers of the exterior. All this part is inclined forward, so as to form the frustum of a cone. From a double plinth above the cornice of the pilasters, sqrings the interior dome.

The choir is of the same form and architectural style as the body of the church, and is terminated by a semicircular apsis. The stalls, an enclosure, though not remarkable for elegance of design, are valuable for their ornamental carving, which is by the masterly hand of Gibbons.

In surveying the decorative parts of the interior of St. Paul's, it must be acknowledged that the general impression is that of simplicity bordering upon meanness and nudity, a defect which implies no censure on the great architect, who has left his work in that state to receive the ornament of painting and sculpture, which the frugality of following times have withheld.

The few ornaments which exist are, in general, well executed, and disposed with judgment. The soffits of the grand arches, under the cupola, are in the best style of simple and appropriate decoration. The dome is painted by Sir James Thornhill, who has deformed this beautiful vault with an absurd, heavy, and fictitious architecture, serving as a frame to eight pictures representing so many actions of the patron saint. It is to be lamented, that instead of placing historical paintings in a situation where the spectator can distinguish nothing but the most obvious and general effect, some other system of decoration had not been adopted.

The design of the cathedral of St. Paul has been charged with various defects, the chief of which are the following: A want of proportion between the cupola and the body of the building; the division of the exterior into two stories, of orders of columns and pilasters nearly equal; and the coupling of the columns in the western front.

In the interior, the omission of the architrave and frieze of the order, in the spaces between the great pilasters of the nave, for the purpose of raising the summits of the arches above the level of the architrave; the circumstance of the tambour of the dome being inclined forward out of the perpendicular; and, lastly, the awkward junction of the side aisles and mutilated arches.

With respect to the general division of the body of the building into two orders of architecture, we have the authority of the architect himself, as expressed in the *Parentalia*, and exhibited in his favourite model, in favour of the single order; but, with regard to this, he was obliged to yield to circumstances, as the Portland quarries could not afford stones of the required dimensions; this necessity led to another, viz., the coupling of the order.

On an inspection of the ground plan of the building, it will be seen that the exterior pilasters are placed at intervals corresponding to the interior piers, an arrangement which could not be deviated from. As to the omission of the architrave of the order, above the arches of the interior, we are informed in the *Parentalia* that, in this respect, Sir Christopher Wren "always insisted that he had the ancients on his side; and that, in the Temple of Peace, in the great halls of the Baths, and in all the great structures of three aisles, this is done, and for this reason, that in these wide intercolumniations, the architrave is not supposed to lie from one column to another; but from the column to the wall of the aisle, so that the end of it only will appear upon the pillar of the inside of the great navis." This is a sufficient answer to those rigorous critics who would subject the composition of a cathedral to the strict rules which limited the Grecian temples; and it shows that the architect had studied those antique models, which, if not in the purest taste in point of ornament, were yet the most analogous, in general form, to the edifice he had to construct. But, though this was the ostensible excuse, it was not the real reason; for, upon referring to the section of St. Paul's, it will be seen that Sir Christopher has made the pilasters of the interior a little higher than the exterior columns, which could not be much without incongruity; and wishing to give the arches, opening to the aisles, as much elevation, and consequently, lightness, as the design admitted, he chose to encroach on the entablature of the order; and thus, by a slight alteration from general rules, he improved the effect of his building.

According to the large plan, published by Gwyn, the external length of the building, from east to west, exclusive of the projection of the portico, appears to be 502 feet; from north to south, excluding the two circular porticos, 244 feet; the breadth of the western front, 177; the diameter of the octagonal area, at the crossing of the nave and transept, 107; the diameter of the tambour of the dome, 112; and the diameter of the dome itself, 102. The total height, from the pavement of the church-yard to the top of the cross, is 370 feet. The total expense of the building amounted to £747,954 3s. which was defrayed by a duty on coals imported into London; but not less than £126,604 6s. 5d. was furnished by voluntary contributions, chiefly from the clergy.

LAW NOTE—A BUILDER'S LIABILITY.

The memorable case of Kempston *v.* Butler, respecting the falling of the house 82, Grafton-street during the progress of rebuilding 83 by the defendant, as contractor (and which has been already reported *in extenso* in the Dublin Builder), again came before the full Court of Common Pleas on the 8th instant, upon motion showing cause on the part of plaintiff against the conditional order obtained by defendant last term for a new trial.

Judge Christian first delivered an elaborate judgment, and said that the conditional order for a new trial had been obtained on the ground of misdirection on the part of the Chief Justice, in telling the jury that the custom alleged by the plaintiff to exist amongst the building trade in the city of Dublin was a reasonable custom; and secondly on the ground that the verdict was against the weight of evidence. As to the first ground, the question was whether the custom, as alleged by the plaintiff was reasonable. An averment of custom should be construed with the utmost strictness, and should not be aided by the court. The custom, as alleged in the pleading, was that if a party employs a person in the building trade to take down a house, that person is bound to shore up and take care of the adjoining houses; but if he takes it down himself he is not liable, for there was no allegation that such was the custom as between the owners, and, therefore, in his opinion it should be held void for unreasonableness. It was capricious and against the common law, and, therefore, in his opinion, the objection to the verdict on the ground of misdirection should prevail. As to the ground of the verdict being against evidence, before the court could say that in this city there existed a custom derogatory of the common law, they should see that the evidence in support of it was clear and unequivocal. The custom should be established by evidence of users as far back as memory could reach. User was to be proved by acts of usage, and not by the deductions of witnesses. The evidence here appeared to him to apply between builders themselves, to be used in construing their contracts, or matters of that sort; but as not interfering with the common law, which, in this case, was, in his opinion, clearly against the alleged custom; and, therefore, the defendant was entitled to a new trial on both points.

Judge Keogh declined to give judgment, as he had been sitting in the Consolidated Nisi Prius Court when the case was argued.

Judge Ball next delivered judgment, expressing his entire concurrence with the finding of the jury, but offering no opinion on the question of the reasonableness of the alleged custom, as that question was not properly before the court for decision.

Chief Justice Monaghan next delivered judgment. As to the grounds for misdirection, the case was twice tried, and on each occasion a special jury found. as a matter of fact, that the custom did exist as alleged, and in addition it appeared as evidence in the case that the defendant expressly promised the plaintiff that he would take care of the house, and see that it suffered no injury. The issue, in his opinion, did not involve the reasonableness of the custom, but as to whether such a custom existed in Dublin, and the arguments were also on that point; the real question in this case had not as yet been argued; and, by the decision the court would make, the parties could argue it—for an argument should take place on the record, before the matter could be decided, as to the reasonableness of the alleged custom. Upon the whole he concurred with Judge Ball, and the ruling of the court would be—No rule on the new trial motion, without prejudice to the defendant moving in arrest of judgment within the first four days of next term, until which time execution would be stayed, and each party to abide his own costs of the new trial motion. The registrar would also be directed to prepare the *postea*, and submit the draught to both parties before it was settled.

Arthur Baker v. *John Meighen.*—His lordship directed a verdict for the plaintiff in this case—an ejectment on the title to recover possession of the house and premises No. 8, Bolton-street—and reserved for the consideration of the full court the legal questions raised by the defence, which were of a technical nature, and uninteresting to the general public.

Connolly v. *Teeling.*—Action for amount of a builder's account. An interlocutory judgment was entered by the plaintiff, and the jury were now to assess the damages. Verdict for £640.

TRADES' UNIONS AND STRIKES.

THE following is an abstract of the Barrington lecture on the subject of "Trades' Unions and Strikes, and the Co-operative Principle," delivered recently by Mr. G. Gibson, A.M., in the lecture theatre of the Royal Dublin Society:—

"Trades' unions are by no means a modern institution; their origin is almost lost in remote antiquity. The national principle of voluntary union early produced guilds, which tended in no mean degree to the growth and rise of the middle classes. The guilds of early times nobly defended trade from the assaults of the nobles and the laws of Parliament, which constantly interfered against the labourer. But these laws were all necessarily inoperative, as they attempted an impossibility—to place wages lower than their unchanging regulator, the law of demand and supply, ordained. However, labour has been quite unshackled since 1824, from which time trades' unions have grown so much in numbers and power as to make the present inquiry a question of the day. A trades' union exercises, either as accessories or principals, various functions, which we must carefully discriminate, each from the other, as they cannot be praised or condemned summarily. In the first place, many trades' unions exercise the offices of friendly societies and other bodies of a similar character. I shall not pause to criticize these functions; blame would be ridiculous, praise superfluous. There are another class of functions which I cannot call by any single name, anomalous functions which exceed the scope of a friendly society, and yet stop short of any direct interference with wages. As illustrations of what I mean, I may mention periodical publications of the state of the trade, keeping a book of the names of unemployed men, &c. The mere fact, also, of the existence of a trades' union is not without its results as an education in the art of self-government. All these functions must meet with a favourable verdict from all impartial men. We now come to the marrow of the whole question, the functions of trades' unions which would regulate wages and partially do away with the law of demand and supply. This involves a short consideration of the labour question. The aggregate wages in a country can depend on nothing else save the labour fund. Trades' unions do not pretend to increase the aggregate labour fund; therefore, trades' unions cannot increase the aggregate wages in a country—they can only re-distribute them. Now, do you think that the trades' unions will be honester than the law of demand and supply? Where do the increased wages of the members of trades' unions come from unless from the pockets of those labourers who are not members? In considering this question economically, I regard the interests of all the labouring class more than the particular interests of small sections of that class, represented by trades' unions. There is a claim of trades' unions, always stoutly advanced, which I would notice—'Granted,' they say, 'that labour is a commodity; it is, but it is something more; it is a vitality, and we never can bring ourselves to think that it is to be bartered for, just like a senseless bale of cotton.' Now, what is the question? It is not a discussion of why man was created, or why he was endowed with certain powers and feelings, but simply a question of how much man will obtain for his labour when he proceeds to exchange it for the produce of the labour of his brother man. We say that the law of demand and supply can alone answer the question. Men may say, if they choose, that they are above that law, and refuse to be governed by it. This happened in the Dublin shipping trade, which is now absolutely ruined. The men said that they were vitalities and all that, but they could not make the ships say it, and accordingly the ship building trade moved away and left the vitalities to starve. It is constantly argued that, as a matter of fact, strikes are often successful. I do not consider it necessary to go at any length into a consideration of the several cases of successful strikes, as they have been discussed so much recently that there are few who are not conversant with their working. The division of labour has now proceeded to such an extent, the chain of industrial life is formed of so many and such fine links, that the harmony of each element, the strength of each link has assumed a terrible importance. No part of a chain is stronger than the weakest part. This should never be forgotten; each trades' union represents a link, and should not forget its responsibility. In the year 1836, the strike of 600 men spinners, at Preston, threw 7,840 human beings, satisfied and uncomplaining, out of employment, to starve. This requires no comment. I would not be misunderstood on this point. I do not say that a trades' union is bound to turn itself into one of those philanthropic institutions so common now-a-days, and forget the interests of their own members in a sentimental love for universal humanity. What I mean to say is this, that bodies of labourers, who vaunt lofty aims, and breathe noble aspirations, should pause and carefully consider whether their circumstances have come to such a sorry pass—whether the ruin that stares them is so utter—before they commit not only themselves, but thousands of their fellow-beings, to a course so admittedly hazardous as a strike. This movement, this increased growth of trades' unions, springing as it does from a rousing-up of the natural mind, must fairly be regarded as an indication of progress. Many men think that our social and industrial system requires a dissolution and reconstruction, that a system of antagonism between the two greatest classes of the community should be terminated if possible. The great evil at present is certainly the want of community of interest between employers and employed. How is this to be remedied? John Stuart Mill has suggested a practical solution of the difficulty. It lies in the extension of the co-operative principle, which, he says, "is the great economic necessity of modern industry." He means that when the capitalist and labourer shall become partners, when their interests become one, the future of our country will look brighter. The thought is noble, and worthy of its author, worthy of a great effort. Shall that effort be wanting? I cannot see that the co-operative principle would bring any danger to vested interests, or disturb the sacredness of property. So far from property being rendered insecure, it will obtain an additional guarantee from the change. Does not this stand to reason? Men who have nothing to lose are converted into men who have everything to lose. I cannot imagine a greater security or a stronger guarantee. It is difficult to anatomize a movement or deduce laws in the midst of a rapid transition. When buffeting the waves with might and main, the calmness of a spectacled philosopher on a rock above is utterly impossible. We are now in the agonies of change; classes artificially divided are seeking their natural affinities, and expelling from their organization elements which have been found deleterious. Under these circumstances it is not easy to divine or anticipate the verdict which impartial history will pronounce; but I have endeavoured to show that if the movement tends to the co-operative principle, no danger need be apprehended."

FRENCH LABOUR IN THE BRITISH MARKET.—Between forty and fifty workmen, belonging to the different building trades in Paris, arrived in London recently, *via* Dover, having defrayed their own expenses of transit, in the full persuasion that they would be readily engaged by the master builders to replace the operatives who had withdrawn from their employment.

EFFECTS OF FINE WEATHER ON THE LABOUR MARKET.—A short ten days since and numbers of labourers could be had throughout Westmeath at from 10d. to 1s. per diem each, now that weather suitable for spring operations has fully set in, it is found difficult to procure able-bodied workmen at 1s. 8d. per day, and in the vicinity of towns 2s., and even 2s. 4d., is freely given.

DEPRESSIONAL INFLUENCES ON ART UNIONS.

WE notice to each of the reports of the Art Union of Ireland, the Shilling Art Union of Dublin, and the London Art Union, respectively, the prize drawings of which have recently taken place, a premise to the effect, that a variety of circumstances connected with the present state of political and monetary affairs both at home and abroad, has acted prejudicially in these institutions. It is but reasonable to suppose, that with reference to projects involving amounts of magnitude or even comparative importance, that such influences would and must necessarily prevail when the general atmosphere of the political and commercial world has a lowering aspect, but however true, it does seem somewhat inconsistent that it should so *materially* affect others composed of individual contributions of an insignificant character. However, as sunshine by no means appears even now to be "looming in the distance," we would urge on those connected with our Art Unions to be warned by the past of the difficulties that may bestrew the path of future operations, and to apply the spur with increased energy and earlier than hitherto. Up to the present, considerable encouragement has been afforded by these institutions to young and to struggling artists, pecuniary and otherwise, and they have also served to stimulate even in a degree so far an increased national taste for art which previously had dwindled into a nothingness. Possessing, therefore, such characteristics, we desire to see them prosper, and trust that in each case the next year's reports will be more favourable.

THE ILLUMINATION OF COAL MINES.

AT a meeting of the Institute of Civil Engineers in Ireland, held on the 8th instant, Mr. Herbert P. Ripton, C.E, read a highly interesting paper on the above subject, chiefly descriptive of a peculiar lamp, invented and patented by him, the object of which is alleged to be twofold, and to afford a brilliant and effective light, equal to that of eight or ten candles, ensure perfect safety, and also to be capable of being burned without danger in the most explosive atmosphere. The invention consists of a gas-burner, on the Argand principle, supplied from a main tube running through the galleries of the mine, and is enclosed, not in wire gauze, but in a glass cylinder, so arranged by a simple invention that although closed at both ends, and completely shut in from the surrounding atmosphere, the combustion is constantly maintained. It is protected from fracture by a strong wire cage, which is also so adapted that any substance striking the wire will extinguish the light before reaching the glass cylinder. It may be erected and lighted in any part of the mine; and, if necessary, can be at once detached from the gas main, and removed to any other position where it may be required.

As a safeguard where hundreds of lives are placed in constant jeopardy, the inventor urges that this apparatus possesses advantages which may render its adoption in fiery seams universal; and further that it can be managed by the most inexperienced workman; and, after the first outlay, is the cheapest light that can be burned. The expense of erecting a small gas work is, in its present advaneed state, inconsiderable; and the whole cost of burning such a light as described above, with a power equal to that of ten candles, is but *sixpence a week*. It is estimated that the whole annual cost of 100 lights, that is, the yearly cost of gas consumed, together with the interest on the first outlay, and all other items, would not exceed a few hundred pounds per annum.

Referring to the wire-gauze lamp, the invention of the late Sir H. Davy, it is stated to have one great disadvantage, in consequence of which it is always used with unwillingness, and that this consists in the obscure and imperfect light which it affords; also that it cannot be used in an atmosphere of fire-damp, but. when that element manifests itself, must be immediately extinguished.

DISCOURAGEMENT TO CAPITALISTS.

SIR—The public—as well as the very unimportant unit, the subscriber hereof—has much reason to congratulate itself on the existence of at least *one* national medium sufficiently independent and proof against general misgivings to question occasionally the very questionable doings of certain parties, who will neither be led nor driven in the general van of improvement, in which every *well-wisher* of the community vies with his compeers to occupy a prominent position: and referring to your very apposite and excellent remarks on the contrast between the northern and the southern suburbs—Clontarf district especially—allow me to offer a few comments on the qualified justification of *the charge d'affaires*, in the former case as alluded to in your columns. Although it is universally admitted that "one story is good till another is told," yet I think that if a defence falls short of tangibility, or of an *exposé* of *some* amount of fallacy on the part of him who makes the charge, it merges into a very pitiable exhibition of fool hardiness, and as such only can I characterise that in reply to your article entitled "Restrictions in Building Leases," as regards the Vernon estate. You are, after a *suaviter in modo* fashion, accused of being "ignorant of facts;" now it strikes me that facts speak definitely in their own behalf, and what more incontrovertible do you require to rely on than the *actual condition* for many years *past*, and at *present*, of the property in question. In the vicinity of an important metropolis, and with all the advantageous recommendatory elements which nature could bestow, there is a scene of dilapidation and neglect unparalleled in the three kingdoms. Clontarf has its historical associations as well as its natural beauties, and for the former is greatly an object of curiosity with strangers; but as my peculiar avocations happen to throw me in contact with very many English and Scotch, I must in candour—but confessedly from national reasons—with regret, tell you, that the invariable remark is—to say the least—not complimentary to our appreciation of the advantages at command. Taking Mr. Franks on his own statements, which, I must say, seem to fence off the main point—but very clumsily—allow me to ask, who in his senses would expend his capital in erecting substantial dwellings on a 150 years' lease—the average *duration of two lives?*—and, moreover, with a ground-rent considerably disproportioned—all circumstances taken into account—to its actual value. This "lease on highly advantageous terms" is paraded before your readers as a conclusive argument against your strictures. Will any of them regard it as such? Again you are told that "Mr. Vernon makes leases for terms by the foot," or in some cases "by the acre," but *the rate* is not named; that was carefully evaded, most probably anticipating the reception such an announcement as 4s. 6d. a foot would meet with for this locality in its present condition, when *less than half the amount* would be nearer the mark. What about the sewers, boundary walls, &c., which other landlords, who *do* encourage, build themselves? *they* seem to have escaped the astute agent's notice altogether. Referring to the leases being "highly advantageous to those who *have* built," allow me to ask who are they?—very few and far between indeed. Mr. Byrne, who has recently finished a terrace of four houses in Castle Avenue, Sir John Bradstreet, and Mr. Tisdall, each of whom erected a single villa in the Green Lanes (some two years ago, and, sir, all of which I saw were noticed in the DUBLIN BUILDER), may be said to comprehend the entire of the speculative capitalists' operations on this improving estate, extending over a vast area. If the terms have proved so favourable as alleged to those who *have* built, how is it that there has been for so many years past such a display of black boards, and to no purpose, in various positions? Reference is made by Mr. Franks to a remarkable circumstance, viz., that "a single negociation has not been broken off in consequence of the restrictions in building leases;" but with all due deference to that gentleman's veracity, I will only say that *that* is not *exactly* in accordance with statements elsewhere; but as I am not personally interested on that point, I will not pursue it. Fearing I have trespassed unduly on the space in your very excellent and popular journal, allow me to submit a concluding suggestion, viz., that, for the edification of your readers and the public, you should extend your illustrative subjects to the antiquated architectural features on the Clontarf road. SUBURBAN.

Under a somewhat similar title we have received the following, authenticated:—

SIR—At length, in the person of the DUBLIN BUILDER, has appeared a champion sufficiently chivalrous to maintain my rights intact against a host of enemies perpetually besieging and plundering my estate, and I am both proud at, and grateful for, your skilfully directed attack against the citadel of the generalissimo, so feebly replied to therefrom. The northern suburb of Clontarf had so long and so successfully resisted all attempts at innovation, that I had nearly deserted it outright, and almost exclusively directed my attention to more favourable fields of operation; but as ubiquity is my characteristic, and is unattended by trouble, I hover about occasionally, in the hope that sooner or later I might gain a firm hold in that locality. The day, however, seems still as far off as ever, unless, indeed, your *partial* victory may serve to turn the *general* scale, and ensure an overwhelming acquisition to the ranks of my *corps d'armee*, which owing to the non-publicity of my cause by your contemporaries, has not been in the desired proportion. All must agree with you that the locality in question is *about* the most favoured by nature of any in the vicinity of our metropolis, and yet it is but my "shadow," not my "substance," that dwells there. Do, dear DUBLIN BUILDER, in your usual vigilant manner, acquire some employment for me here, even a trifle—"a slight brush"—to commence with, and probably I may "make work" for myself after a little. PROGRESS.

ORIENTAL BATHS IN LIVERPOOL.

THE Oriental Baths of Liverpool are making rapid strides towards completion, and in some respects differ from any that have yet been erected in any part of the kingdom. The heated rooms are covered in by lofty domes, lighted by stars of stained glass, and the arrangement of the interior of the tepidariums is that of sloping benches in the Moorish fashion. The largest hot-air chambers that have hitherto been built could easily be put into those of Mulberry-st.; and we anticipate that in the working of these baths the expectations of the public (which are far from small) will be fully realized.

THE WATER WORKS BILL FOR IMPROVED SUPPLY OF DUBLIN.

(Continued from page 505.)

RESUMING the report of this enquiry, but to avoid an almost unlimited amount of our space being occupied therewith, we are obliged to omit the evidence of Dr. Gray, J.P.; Mr. Glaisher, Professors Galbraith and Haughton, &c. (which, however, has in substance been already communicated through these pages), and pass on to that of the professional engineers examined on both sides.

Mr. Thomas Hawksley, C.E., examined by Mr. Calvert, Q.C.—Is one of the council of the society of civil engineers; in practice over 30 years, and have constructed many water works in Great Britain and throughout Europe; first visited the sites of the proposed water supplies for Dublin in January, 1855; highest level of present supply is 60 feet above the level of the sea, quite insufficient for the extinguishing of fires; there is a great deal of vegetation and a considerable amount of impurity in the water; found deposits of lime in the pipes, and a very large quantity of confervæ or spongillæ; the canals are not sufficient in dry years to supply the quantity of water required by the Corporation; in 1859 the quantity supplied by the canals was less than the requirements of the city by about one million and a-half of gallons; the corporation could not get from the canal companies a guaranteed and preferential supply; Mr. Neville and self were engaged to devise a scheme; in 1858 we were limited to £200,000 for the cost; afterwards, in 1859, the limit was extended to £250,000, and it has now been extended to £300,000; visited, together with Mr. Neville, the various water sheds from which the supplies were proposed to be derived; in August and October, 1859, we advised that it was possible to get the required supply within the cost limited, from Coyford—a place on the Liffey about 20 miles from Dublin; the water could have been distributed not only to Dublin but to the extra-municipal districts; there is a drainage area above the Coyford of 210 square miles; a bill was introduced and subsequently withdrawn, owing to the opposition to it, principally from the canal companies; after the withdrawal of bill No. 2 a royal commission was issued, and a report made by the commissioners in favour of taking the supply from the Vartry river; was also guided in consideration of the subject by the limitation of the cost; always held the Vartry scheme, suggested by Mr. Hassard in 1854 or 1855, as being the best for a supply to the city; the report in favour of the Vartry, which was made by Mr. Hawkshaw, gave universal satisfaction; Mr. H., between himself and his assistants, spent 60 or 70 days in the investigation; no consideration sàve that of cost prevented me from reporting in favour of the Vartry scheme; the waters of the Vartry are beautifully clear and soft, and the river rapid; there are no minerals worked in the district, and no probability of any being found there; it is the cleanest mountain district I ever saw; the formation is clay slate; the proposed large reservoir is calculated to contain 400 millions cubic feet—namely, 200 days—supply for the city; the water is to be taken to the city in 36 inch pipes; there will be only one embankment to impound the water, and that will be perfectly safe and secure; we have tenders for *bona fide* contractors for the construction of the works; the vertical height of the embankment will be about 60 feet; the amount of the tenders is £216,385 1s. 8d.; the main rain fall at the nearest guage to the Vartry, near Bray, is 34 inches per annum—33.82; the quantity that can be relied on at the Vartry is 34 inches per annum; allowing for evaporation, the available rain fall would be 19 inches, taken on the average of three consecutive dry years; the amount required for the city would be 14 inches; *entertains no doubt whatever that the quantity would be amply sufficient*; the yield will be 13½ millions of gallons per day; has never seen water equal to it, except that of Emerdale Lake, in Cumberlandshire, which is the finest water in the three kingdoms, and very similar to the Vartry water; the latter is very clear and soft; generally the water is perfectly colourless; the base and end of the embankment is rock, and the district is peculiarly favourable for the construction of works of the required description; the service reservoir will be 267 feet above the level of the sea; the estimates for purchase of land, buildings, compensations, contingencies, and reserve is £84,000; the reserve to be derived from the extra-municipal districts will be more than proportioned to the cost of the pipes, and, consequently, operate *to relieve the taxation* of the city of Dublin; from £6,000 to £7,000 a-year will be received from the districts through which the pipes pass, such as Kingstown, Bray, &c.—districts which none of the other schemes contemplated to supply with water; the revenue which would arise within the city by the application of the rates proposed by the bill is £28,824; the revenue for the extra-municipal districts will amount to £13,000; the expenditure in the extra-municipal districts will be £5,250, and the revenue about £15,000, and, therefore, the supply to those districts will be a source of *great profit*; they are occupied by persons in wealthy circumstances, and the houses mainly are of a first-rate character; they are badly supplied with water; some apprehension was entertained in the city of Dublin with respect to the cost of pipes for the extra-municipal districts; when the whole system is carried out, which will not be for many years, there would be 113 miles of pipes in the district at an expense of about £80,000; the general cost of gravitation waterworks is £2 per head of the population; in Dublin, taking the population at 350,000, the cost will be below £1 per head; in Liverpool the cost was £2 5s. per head, and in Bradford £5 per head; the taxation here, as limited by the bill, will be 1s. in the pound for domestic water-rate, and the rateable value in Dublin is 33 per cent. below the actual value, so that the domestic rate will in reality be only 8d. in the pound; this rate will vary in amount, but cannot exceed 1s. in the pound; the public rate is proposed to be an unfluctuating rate, because the purposes for which it is required will be constant—viz., the flushing of sewers, and other public purposes for which water is required; the public rate is 3d. in the pound on the rating, which will be in reality 2d. in the pound on the actual value; it is found where the public rate is not fixed that it gives rise to disputes between the owners and the occupiers; the cost of laying down the 25 additional miles of pipes will be about £15,000; the present service pipes are remarkably strong; they were cast in the old times, and are nearly twice as thick as the pipes that are cast at present; they will be strong enough to bear the proposed pressure; the estimates for the works proposed under this bill have been prepared with unusual care, because there was a good deal of discussion in Dublin on this subject; *bona fide* tenders have been received from persons who have gone over the plans made their own calculations; there are two tenders for the construction of the reservoirs; one for the laying down of the main pipes, by a contractor who has done much of that work in London, &c., a third from a manufacturer of pipes—Messrs. Cottrell, of Woodside, Staffordshire; from day to day the canal companies asked more money and offered less water (laughter); by the pressure which this scheme will give, the corporation will be able to supply large quanties of water in case of fires; Dublin has suffered much from fires, and many of them have been most calamitous; the want of water to work engines has been very much complained of; the pressure proposed from the canal was 210 feet; the proposed pressure will be 267 feet; the old pipes are capable of sustaining a pressure of 2,000 feet. (To Sir William Gallway)—The proposed pipes will not be two-thirds the weight of the old ones. A single thunder storm passing over a rain guage would destroy the calculation for the time being; aspect has, of course, a great deal to do with the amount of the rain fall; the Vartry catchment is favourably situated with regard to the winds from the westward, which are the wettest winds; is acquainted with the catchment area for the Kippure or Ballysmuttan scheme; the rain guages in the Phœnix Park, though kept for 23 years only, give the fall for 17 years; thinks that less than 20 years is not satisfactory as a period of observation; if the observations do not extend over a long series of years they are worthless; a drainage area of less than 13,300 acres in the neighbourhood of a mountain would not be sufficient for Dublin; speaking from experience an estimate of rain fall made from such results as those given by the Ordnance Survey Office on an increment of 2½ per cent. in respect to every 100 feet of height may be depended upon; the three driest years at Farraro give a mean of 28.22 inches rain fall; it is beyond Bray, about twelve miles from Dublin; never recommended Kippure as the *best* source, only under the circumstances of its cost being limited; knows that there is opposition to this scheme in Rathmines; does not know anything of the Commissioners; had the detailed estimates on which the calculation of £216,000 was made up, but thought it was a very unusual thing to produce detailed estimates containing lists of prices, &c., at such an inquiry as the present: would hand in his estimate, and the tenders which had been received for carrying out portions of the works, but for obvious reasons it was not desirable that these details should be made public, or be placed in the hands of the opponents of the bill; had nothing to conceal on the part of the corporation; would place every information fully before the committee, but unless the committee required the prices should decline to give them.

The Chairman said it was impossible for the committee to form an opinion without having some details before them; the only question was the extent to which those details should go. He thought a detailed estimate, showing the gross sum for each work, such as the cost of piping, the cost of earthworks, &c., would be sufficient. Was Mr. Hawksley prepared to give this information?

Mr. Hawksley replied that he would do so, repeated that he had nothing to conceal, and was desirous of affording the committee all the information in his power; assumes the mean height of the Kippure drainage area to be 1,400 feet; calculated fourteen inches and a half as the smallest quantity of rain-fall in the driest year capable of being stored and utilized in the Kippure district; assumes the mean elevation of the Vartry basin to be 1,060 feet, and estimates the available rain-fall to be 19 inches; constructed the water works for the Leeds Corporation; the drainage area of Leeds is very small, and the soil is sandy and favourable for evaporation; does not know the amount of evaporation in that district; estimates the population in the extra-municipal districts of Dublin at 64,000 souls; propose to give a maximum supply of 25 gallons a head per day; the capacity of the storage reservoir is fully 380,000,000 of cubic feet; have only two reservoirs; the service reservoir will contain about 40,000,000 of gallons, and the storage reservoir 2,400,000,000 of gallons; the estimate for the works of the storage reservoir is £36,680 13s. 6d., exclusive of land; the cost of the service reservoir is estimated at £15,067 17s. 7d., exclusive of land; we are prepared to comply with the requirements of the Lords of the Admiralty with respect to Wicklow harbour; that is included in the £83,644 18s. 4d. reserved for compensation and contingencies; thinks bridge and sluices are the contrivances which will be required; the rise of the spring tides at Wicklow harbour is six feet, and three only at neap tides; has been concerned in the works at the harbour at Lowestoff; does not think there would be any risk of flooding the adjoining lands by the contrivances suggested at Wicklow harbour, by which the water of the salt lake near the mouth of the river would be kept in; the water in the lake would only rise to the level of the tides [Mr. Hawksley exhibited photographs of the lake in question, the harbour of Wicklow, &c.]; these photographs were prepared for the present inquiry; a gentleman went over from *London* to take them; the Dodder water is not objectionable for manufacturing purposes; no new works would be necessary to make that supply available; the cost of the embankment for the proposed great reservoir is estimated at £18,250; there will be 306,220 lineal yards, at 1s. 2¼d. per yard; the tide does not overflow the railway at Wicklow, but the sea rolls in occasionally; one-third of the Dodder yields about 2½ or 3 million gallons of water per day; the entire of it would therefore yield about nine; does not speak of dry weather, and calculates the yield of one-third during such seasons at one million and a half; the principal manufacturers in Dublin are brewers and distillers, who use a great deal of water; hopes to get a sufficient supply of water from the Vartry for all purposes, but reserves the river Dodder as a supply for manufacturing purposes in case it should be required; at present the Dodder supply flows into one of the canal basins, and is mixed with the canal water; if the water from the canals should be discontinued we will dispose of the basins at Portobello and Blessington-street, and receive the Dodder water in the basin at James's-street; it is not contemplated to supply pipes to the entire of the extra-municipal districts for some years to come; the estimated water reserve from the city, including the water supplied for manufacturing purposes, will be 2s. per head on the population of Dublin, which we estimate at 280,000 persons; the expense of piping for the extra-municipal districts will be charged on the revenue derived from those districts solely; the sum of £300,000 will be charged on the city; the Kingstown Water Company have no works; understands, as an engineer, that the corporation intend to supply Kingstown as a part of the extra-municipal districts under the powers contained in this bill, and not otherwise; contemplates a supply to Kingstown of twenty gallons per day per head; the Vartry project had been frequently considered by him since 1854; the consideration of cost alone prevented him recommending it to the corporation; up to 1858 the limit imposed by the corporation in recommending a scheme was £200,000; it has now been extended to £300,000; Mr. Hassard admitted that his original estimate for the Vartry project was too low; he gave a revised estimate in 1858, the amount of which was £250,000, but the cost of the reservoir was guessed at; the amount put down was £45,000; witnesses' estimate for the Vartry reservoir is £36.000; Mr. Bateman, the advising engineer of the opposition committee, was the advocate of Kippure scheme; has always been strongly in favour of the Vartry scheme; never had a doubt on the subject; has never adopted the canals as the best source of supply for the city, and in the report of the 10th of November, 1858, recommending the canals in consequence of the consideration of cost, stated that the beautiful water of the Vartry was the best in point of quality, and that the expense of procuring that water alone prevented him from recommending that scheme to the corporation; the royal commissioner was much struck with the Coyford scheme, and asked whether a compensation reservoir could not be made; made plans for the satisfaction of the royal commissioner; a compensation reserve is generally estimated at one-third the entire produce, and not one-third the available water; advocated before the royal commissioner 160 days' supply, and the Vartry reservoir will contain 200 days' supply, exclusive of the supply of the river itself, which is running at the rate of four millions of gallons a day; in calculating the rain-fall of the Vartry district I have taken it most unfavourably for the district; calculates the rain-fall on the returns for the three driest years in the locality; in dry years the evaporation is less than in wet, because, though there is a greater evaporation positively, there is less liquid to be evaporated, and the greater the moisture the more the evaporation; fifteen inches is admitted by Mr. Bateman to be a large allowance for evaporation, and no doubt it is; but has taken it at that amount in order to be safe; Mr. Hassard, who suggested the Vartry scheme, is in the employment of Mr. Hemans, engineer to the Midland Great Western Company; the tax upon the city of Dublin will not be more than 2s. per head per annum on the population, which is very low indeed; it is only one halfpenny per head per week; in Liverpool the water rate amounts to somewhere about 4s. per head; the whole capital invested by the corporation of Liverpool was £1,800,000, but the largest portion of that sum was incurred in purchasing up two old water companies; the works constructed exceeded very little indeed the amount of estimate, excepting in certain costs which had been incurred by the corporation themselves; the original estimate was £400,000, and the actual amount expended was £1,800,000; Lough Owel is an immense lake covering 2,600 acres of ground, but the drainage area is very small, amounting to only 8,000 acres.

Mr. M'Cormick, M.P. for Londonderry; Mr. John Aird, an extensive contractor in Lambeth, and Mr. John Cochrane, member of a great iron founding firm in the North of England, were sworn and deposed that they had put in tenders for the execution of the proposed water works, amounting in the gross to £216,335. These were *bona fide* tenders, under which they were prepared to undertake and execute the works, and to give security for the due performance of their contract. Mr. M'Cormack's tender included the making of the two reservoirs, the tunnel, and all the other earthworks. Mr. Aird undertakes the laying of the pipes, and Mr. Cochrane, who stated that the firm to which he belonged were the most extensive pipe founders in England, furnishes the pipes requisite for conveying the water.

Mr. Cochrane, cross-examined—The contract includes not only the pipes requisite for the direct supply, but the bends and irregularities incidental to the branch supply; have satisfied myself that the pipes are of such a thickness that they can be cast for the money; cannot tell you the average thickness; must decline to give you the amount of my contract, or the proportion which it bears to the total amount.

Mr. M'Cormack, M.P.—Does not think any large amount is requisite to cover contingencies; we have gone into the contract carefully, and are prepared to meet every contingency.

Sir John Benson, C.E.—Practises in Cork; has had considerable experience as an engineer; have constructed the Cork water works, which have been in partial operation since 1858; they are now in full operation; the pressure is very high—one pressure being at 180 feet, and one at 360 feet; previously the water was at very low pressure; the inhabitants are perfectly satisfied, notwithstanding that they have to pay higher rates; have been informed by the doctors that the change has operated in a most beneficial and wonderful way, especially on the poorer districts of the city; have examined all the proposed sites in connection with the water plan; think it a most feasible plan; have never seen estimates more carefully prepared; *they are ample for the works*; met the contractors, and examined the proposed sites; all agreed as to the facilities for construction, and the sufficiency of the estimates; considers that the valley is well adapted for the catchment basin; does not consider that there are any engineering difficulties connected with it; the water is very pure; thinks the plan has been judiciously laid out, in order to supply the extra-municipal districts, from which a large revenue may be expected; the Ballysmutten district presents a remarkable contrast with the Vartry, in respect to the peat; in my opinion canals are not eligible sources of water supply, if any natural and pure source can be obtained; is not apprehensive of any injury to the harbour of Wicklow from the small quantity of water which is taken from the Vartry. (Cross-examined)—Has never constructed any gravitation water works; his experience is confined to the pumping system, on which principle the Cork works have been constructed; Mr. Hawksley was brought over at his request to report on the Cornish engine, which was to be used in dry weather, when the forcing power was not sufficient; there was a great deal of jealousy on the part of local manufacturers, who made more of the engine question than it was worth; the engine was found to burn more coal than was expected; the fact was we got too cheap an engine in the first instance; it was made by MacAdam, of Belfast; would not call the catchment basin of the Vartry a sloping upland plain; it is a mountain district; water pent up and stagnant in narrow canals must disimprove; the Romans used aqueducts to supply their cities, but they were often covered; was four days examining the Vartry district; should call the supply of a city of 100,000 inhabitants, such as Cork, something more than experience in distributing water; does not see any objection to a reservoir of 400 acres; the larger the body of water kept together the purer it is likely to be; his objection to the stagnation of the canal waters applied equally to the Grand and Royal canals; does not know the height of the railway above the sea at Wicklow, but should think it is only subject to damage from storms of extreme violence.

Mr. J. J. Byrne, examined—Is a land surveyor and valuer of estates, and have had upwards of 40 years' experience in that profession; has been extensively engaged in purchases for railway purposes; have examined the land required for the Vartry district, and is familiar with the details of Mr. Hawksley's estimates as far as they relate to land; has examined every field separately, and believes they can be purchased for the sums estimated; did not estimate the amount of compensation for mills on the lower Vartry; his estimate was £20,775 for the quantity of land required, including the service reservoir at Stillorgan; the land there was near the railway station, and was not far from Dublin; he had surveyed and valued the adjoining land for building purposes.

Mr. Parke Neville, examined—Is the engineer to the corporation of Dublin; has practised his profession from twenty to twenty-five years, and twelve years connected with the corporation of Dublin—ten years officially; is well acquainted with the canals and the supply of water which they afford; at present the water is taken from the levels within the city boundary; the level of the two basins on the south side is 76 feet above the ordnance datum; on the north side the level of the basin is 78 feet; the level of the line of quays may be taken at twenty feet; some portions of the city are higher than the basins, and particularly at the north side; some of the localities are not supplied with water; very numerous complaints have been received at the pipewater department of the quality of the water, and on account of spongillæ being drawn into the pipes; in the year 1858 was engaged with Mr. Hawksley in examining the sources from which a better supply could be obtained; there was no satisfactory result, and in 1859 we again considered the subject; the limitation of supply was to be ten millions of gallons, and of cost £250,000; recommended Coyford, which is 20 miles from Dublin; the water is generally well coloured; after heavy rain it is sometimes coloured with peat; it was found on analysis to be an excellent water; is sure the people of Dublin would never be satisfied to take a brown water; the corporation, in consequence of our recommendation, promoted a bill in 1860, which was ultimately abandoned; in consequence of the opposition to the bill negociations were opened with the canal companies, and bill No. 2 was introduced, the object of which was to obtain a supply from the Royal and Grand Canals; first became acquainted with the Vartry district as a source of supply for Dublin in the year 1854; it was then suggested as a source of supply by Mr. Hassard; immediately visited the district accompanied by Mr. Hawksley; considered the water very good and beautiful, and thought the plan was too expensive; the water is pure, clear, and soft in a great degree; it is judicious in an economical point of view to carry the water by Bray and Kingstown, and the supply to those districts will be a source of profit; Bray is increasing with greater rapidity than any district he knows of, and much frequented by the inhabitants of Dublin of the better class; the compensation to millowners is to be in money, not in water, which greatly simplifies the plan and improves it; it gets rid of the lower reservoir altogether, and the expense of maintaning it; the supply contemplated is 12 million gallons per day, calculated at 25 gallons per head per day; agrees with Mr. Glasher as to the extent of the rain-fall, and with Mr. Hawksley with respect to the estimates. (Cross-examined)—Deficient sewerage is one of the great causes of unhealthiness in a large city (counsel quoted a passage from a report made by Mr. Neville in 1853, in which he stated that a large quantity of earthy matter had been found in the pipes, and that when removed, there was an abundant supply to the street fountains); concurred in the canal scheme from motives of expediency; is now in favour of the Vartry; the estimate for taking the water to Leeson-street is £216,335.

After the address of Sir W. Alexander, counsel for the opposition, Mr. John F. Bateman, C.E., was examined—Is fellow of the Royal Society, and engineer to about twenty water works; devised and constructed works to supply two millions of people at an expense of two millions; constructed the works for the supply of Glasgow from Loch Katrine; examined the water shed of the Vartry district, which has an entire gathering ground of 13,628 acres, inclusive of the 600 acres which will be required for the reservoir, the rain-fall into which will hardly compensate for the evaporation; the extent of country available to rain-fall will be about 13,300 acres; a rain-fall of 14 inches and 4-10ths will be required to supply 12 millions of gallons per day; has reason for believing that 16 or 18 inches must be allowed in that district for loss by evaporation, &c.; with the exception of one-third of the whole district, about 5,000 acres on the east side of Douce Mountain, never saw a district in which the loss was likely to be so great from evaporation and absorption as the Vartry catchment; is engineer to the Bolton, the Dawen, the Chorley, and the Blackburn water works; described the situation of the catchment basins of the Sheffield and the Glasgow water works, and stated the result of the rain guages on the hills there, showing a rapid diminution of rain-fall from south west to north east; with certain winds the rain would have to pass over twelve miles of country more than 2,000 feet in height before it could be deposited in the Vartry district; never saw a basin so unlikely to collect rain as the Vartry basin; speaks of the flat and gradually sloping ground—not of the mountain side; the evaporation at the Vartry would be from 16 to 18 inches; would not reckon on a greater available rain-fall than 12 inches, which would be altogether insufficient; 14½ inches would be required at the very lowest to supply 12 millions of gallons per day; the evaporation and absorption at Kippure would be about 15 inches; the position of the two catchments is altogether different; is engineer to the Kingstown Water Works Company; the supply calculated on from the Kingstown catchment was 12 inches; it is more favourably circumstanced than the Vartry catchment; is aware of the fact that more rain falls on high land than on low land—in a mountainous district than in a plain, but the increase varies so much according to local circumstances that it is not safe to depend on any fixed or general rule; there is no rule by which the rain-fall can be calculated; has found by comparing the returns of the guages at Ballysmutten and Fassaro, from February to December last, that his view as to the fall of rain during easterly and westerly winds is confirmed; Fassaro is situated similarly to the Vartry district; has examined the estimates of the corporation, and made calculations thereon; estimate amounts to £227,000 against £216,000; the estimate of the corporation for the works—that is to say, about 5 per cent. higher; but the estimate makes no provision for contingencies, for which certainly 10 per cent. should be added, amounting to over £22,000, making in all £250,000 for the engineering works, not including purchase of lands, or compensation to millowners and others; the works are, no doubt, easy of construction, the site for the reservoir safe and eligible, and the works could be carried to Dublin without any considerable engineering difficulty; with reference to the purchase of land, is of opinion that you may almost double any estimate before you can get at the sum that will be required; considers that the limitation of the service reservoir at Stillorgan to three days' supply is not judicious; it should at least be large enough to contain ten days' supply, for if any accident happened to any part of the long line of works between it and the storage reservoir, the city of Dublin would be left without water; to increase the size of the reservoir in order that it may contain ten days' supply would take £18,000 more, which would have to be added to the estimate; the water of the Vartry is white and good, but believes it will be vapid to the taste, as all water from clay slate is; also that, from the shallowness of the stream, favouring the growth of vegetables, it will require filtration as much as the water proposed in any of the other schemes; should there be a failure, water could be got from the Dargle or Lough Dan, but that would involve the construction of an entire set of works at great additional expense; believes that an ample supply of pure water can be had for the city of Dublin for £100,000 less than the cost of the scheme proposed by the corporation; thinks by proper treatment the canal water may be rendered fit for human use, but it is a hard water, and not such as a city like Dublin should be permanently supplied with; it is a wholesome water, clear and potable, and the citizens can get on very well with it until a better scheme is carried out; believes the Ballysmutton scheme is the *best* and *cheapest* that can be devised for the supply of Dublin; the only objection raised to it by Mr Hawkshaw was the brown colour of the water, and considering that though a very eminent engineer, he is not conversant with water works; according to his calculation of the rain-fall, Ballysmutten would yield 27 millions of gallons, which would afford a supply of 12 millions of gallons to the city, and 6 millions of gallons as a compensation to the river, leaving a surplus of 9,329,000 gallons, which might go either for error in calculation, or for extra dry years, or for the rejection of the most highly coloured water; his estimate for carrying out the Ballysmutten scheme was £218,000, which included the purchase of land and way leave; so satisfied was he of the accuracy of his calculations, that he would undertake to carry out those works, and supply Dublin with water equal to that of the Vartry for £230,000, being £70,000 less than the promoters' estimate for the present scheme, and £100,000 less than his estimate of the cost of that project. (Cross-examined)—Was employed some years ago by the Royal Canal Company to report on their canal; is not now engaged professionally on their behalf; appears here on behalf of the citizens opposing the bill; appeared before Mr. Hawkshaw, the Royal Commissioner, in Dublin; believes that in the whole range of the Wicklow mountains, or in the entire of England, Ireland, or Scotland, you could not find a place which would produce such little rain-fall as this Vartry catchment (much laughter); heard of Mr. Glasheir's evidence; does not think that his conclusion is correct, said that the water of the Vartry has a vapid taste, owing to the want of æration; the plain portion of the Vartry catchment is two-thirds of the whole; spent two days in examining the district; as nearly as possible examined the whole district as well as if he had spent a week in doing so; a large portion of the surface of the Ballysmutten gathering ground consists of peat soil; the storage reservoir proposed at Ballysmutten would contain 312 millions of cubic feet, which would give ten millions of gallons of pure water per day for 210 days; the water is colourless during five months of the year, from December until May, and more or less coloured during the remaining months of the year; during the latter the springs, which are colourless, could be used for the supply of the city; the colour of the water depends on the temperature; the action of the sun on the peat and vegetation causes the water of the stream to be coloured, but at the same time the springs would be beautifully clear, and besides there will be months during the summer when pure water can be taken from the river and stored in the lower reservoir for the use of the city; is not aware that the contractors have tendered to undertake the work for the estimated sum subject to contingencies; heard their evidence, and saw the witnesses turning round to each other as if they did not know what to say about contingencies; the canal scheme, as proposed, would cost £137,000 for works; the capitalizing of the rent would be £90,000, and the cost of filtration £15,000, making a total of £242,000, being £58,000 less than the estimate for the Vartry scheme, namely, £300,000, and is satisfied that the present project cannot be carried out even for that sum; the canals at present yield water which the citizens may be satisfied with until they are perfectly sure that they have the very best scheme for an improved supply before them; is authorised to show that the Ballysmutten scheme is in all respects better than the Vartry, *cheaper* as regards *cost*, more *certain* as regards *quantity*, and as good as regards *quality;* does not now state that the Ballysmutten is the *very best* scheme that could be devised for the supply of Dublin, because he thinks that there has not been a sufficient investigation of the whole subject; about £40,000 or £50,000 would be the expense of bringing the water of Lough Dan to the reservoir, and besides, Lough Dan should be raised so as to insure the getting of the summer water; if you brought more water you would also have to increase the capacity of the Vartry reservoir, which is only just large enough for its own drainage; the difference between the area of the Vartry and that of Ballysmutten is about 4,000 acres in favour of Ballysmutten; estimates the cost of the proposed works at from £330,000 to £350,000; to that you must add the expense of pipes for distributing water through the city, estimated at from £40,000 to £50,000; therefore, the entire expense of carrying the scheme into operation would be about £400,000; four hundred thousand pounds does not represent the cost of the Dublin works as compared with £1,300,000, expended on the Manchester works, for the latter sum included all the preceding costs, the purchasing up of old companies, &c.; the new works, including everything, cost £700,000, and the £400,000 for Dublin does not include the existing debt of £72,000; the Glasgow works cost £1,800,000 for the supply of 500,000 persons, and the Liverpool works £1,500,000 for the supply of a like amount of population.

The inquiry, after protracted sittings, has been brought to a conclusion, and the preamble of the bill proved.

THE PHŒNIX PARK.

A MEMORIAL, signed by the Lord Mayor, the Roman Catholic and Protestant Archbishops of Dublin, the Provost, &c., has been addressed to the Lord Lieutenant respecting the condition of this park, and therein, amonst other matters, it is urged that—

"An obscure French or German town has gardens, fountains, and walks, where all classes meet, and which lead to facility of intercourse and self-respect, and a propriety of manner and dress, not always to be found on the part of the poor in the United Kingdom.

"It is hardly too much to assert that the attention thus devoted to the enjoyment of the people proves an accurate test of the social progress of the nation, and especially of the relation which exists between the governing body and the people at large. The Phœnix Park is the largest public park in the United Kingdom, and its area somewhat exceeds that of all the London parks united.

"About the year 1840 considerable improvements were effected in the park, which have largely added to its healthiness and usefulness. They were, however, abruptly stopped in the year 1847, and have unfortunately not been resumed. It is to be regretted that these improvements had not then been extended to planting timber-trees in the more remote parts of the park, to the embellishing and making more ornamental the entrance of the park nearest to the town, so as to give pleasing walks with flowering shrubs, so much enjoyed at Kensington Gardens or at Victoria Park, or even to the perfect drainage of the park. It is believed that the plan, which evinced considerable taste and judgment, has not been lost, and we have to suggest that it be gradually carried out, and the estimates moderately enlarged for the purpose, to such extent as may be consistent with other demands on the public expenditure."

Touching the same subject, the *Express* has the following:—

"It has always been the boast of Dublin that, whatever superiority might be claimed in other respects, we possess in our magnificent park an advantage which is unrivalled. The Phœnix Park is justly regarded with pride by every citizen, and with astonishment and delight by every stranger. For extent and natural beauty it stands unequalled in the British empire. Who can traverse without feelings of delight its verdant surface, gracefully undulating and clothed in its most gorgeous robe of emerald? Who can without rapturous emotion survey the glorious panorama which surrounds it, where the Divine Artist has painted in varied and indelible hues a landscape of imperishable beauty, and moulded forms of grandeur and sublimity which no human hand can ever imitate. Its historic memories excite the interest of the antiquarian, and stir the passions of the patriot. Here some monuments of the struggles and the triumphs of Ireland's native chieftains, the emblems of her subjugation by the proud invader, the traces of a former dynasty, are to be found, whether we turn from Chapelizod, the Castle of the great Duke of Ormonde, the asylum of the exiled Huguenots, the once famous centre and seat of Danish supremacy, and the noble residences of the Lords Deputy, to the ivy-crowned Hill of Castleknock, identified with the names of Bruce and Strongbow. The citizens fully appreciate the attractions of the park, but it is a matter of reproach that these are not developed and displayed as they deserve. Nature has bestowed her richest treasures upon it, but what has man done to improve the advantages which she has conferred upon him? Since the time when Sir John Temple, an ancestor of Lord Palmerston, obtained from the Crown the grant of some thousands of acres as a splendid reward for the substantial service of enclosing by a wall what had been a wild forest, successive Governments have treated it with neglect, and, until a few years ago, no care was bestowed upon its preservation or improvement. About the year 1840, some measures were adopted to remove the reproach which attached to its then disgraceful condition; but they were soon discontinued, and nothing has of late been done to extend the substantial improvements which were then effected. We are glad to observe, by a memorial which we elsewhere publish, that the subject has engaged the earnest attention of some of our most eminent and influential citizens, who intend to urge upon the consideration of the Government the claims of Dublin to a share of the funds so lavishly expended upon other parts of the kingdom. The document to which we beg to refer the reader makes an irresistible case, established by facts and figures; and we trust that it will enlist the cordial interest of the Lord Lieutenant in behalf of the most laudable object which the memorialists have in view.

THE TURKISH BATH.

THE following report, which was read by Dr. Power at the last meeting of the Board of Governors of the Cork District Lunatic Asylum, records some interesting facts as to the results of an application of the Turkish Bath in cases of insanity:—

"*Report on the Effects of the Turkish Bath in Treatment of Insanity. For the Board of Governors.*

"GENTLEMEN,—The Turkish bath established in this institution on my recommendation, aided by the inspectors, Drs. Nugent and Hatchell, approved of by the Board of Governors, and sanctioned by the Privy Council, having now been some months in operation, it is time I should report to the Governors my experience of its value as an agent in the treatment of the insane.

"It may be well, however, to introduce the report by stating a few particulars in explanation of the motives which actuated me in recommending it so confidently as a remedy likely to prove efficacious in the treatment of a malady so difficult of management and so afflicting in its nature.

"Any one conversant with those suffering under this disease cannot fail to perceive that there is a peculiar odour of a most disgusting character emanating from their persons, and most probably exhaled from the skin and its minute glands and fellicles. Now this must arise from an unhealthy state of the blood, which must exercise a deleterious influence on the system generally, and on the organs connected with operations of the mind in particular, and any means which effect the removal of the vitiated humours and other secretions must benefit the disordered intellect, and probably cure the diseased and tainted system where other means have failed. I have found that active and even violent exercise, powerful sudorifics and hot baths, have failed in correcting this unhealthy action of the skin and its glands.

"When I saw the Turkish Bath got up by Dr. Barter at St.

Anne's Hill, and experienced its power, its applicability to the production of the result I required at once struck me, and I have not been disappointed; but in all cases where the patients' state required it the digestive organs were put in healthy action before commencing the use of so powerful an agent, and in consequence of this precautionary measure, no untoward results of any kind have taken place from its use, except occasional faintness and slight headache, and these slight inconveniences have ceased to recur on persevering in the use of the remedy. The natural secretions and excretions are occasionally excited during the action of the bath, which demonstrate the varied extent of its action and power.

"In the great majority of cases, even those on whom the remedy has failed to make an impression on their mental disorder, signs of improved bodily health soon become apparent, such as clearness of complexion and skin, keen appetite, and increase of weight. One girl, a timid, frightened creature, refused to go into the bath a second time, saying it was hell; another refused in dread of getting a return of the vomiting and headache which she experienced on the first occasion. With these two exceptions, all who have once tried it express the greatest satisfaction at the result, and are loud in praise of the pleasing langour and tranquillity they experienced while in the bath, and for the day, sometimes two days after, the same calm tranquillity of mind continued to be felt. The justness of expression and correctness of language used by some of the commonest and most illiterate of them, while describing their sensations of comfort and enjoyment, was truly surprising, and indicates the strength of the impression produced upon them.

"Since the opening of the bath, in January last, 124 patients have been submitted to its action. Out of these eight are discharged cured, two to be sent out cured to-day, two cured and relapsed, improved and improving fifty-two, unchanged sixty, the latter being all cases of long standing in the house. Having shown so very favourable a result from the use of the Turkish bath, which far exceeds what I could have anticipated when I first directed your attention to the matter, I feel fully justified in calling on you to provide additional attendants to enable me to extend its use, and allow those who have not hitherto had the benefit of it to be placed on an equality with their more fortunate companions. Up to the present it could be used only two days in each week, being about 80 patients a week—40 males and 40 females. Now, if used the six days, its advantage would be extended to 240 per week, at little additional cost, as the furnace is always kept heated. Hot and cold water, independent of the laundry, should always be plentifully provided.

"I cannot conclude this report without stating as the result of my limited experience, that such a provision should constitute an appendage to every institution where many persons are congregated for a lengthened period within a confined space. It seems to me to possess a power of compensating in a degree for the absence of pure air and exercise; and it seems to me a Turkish bath should form a part of every union workhouse, and Government prison, and all similar establishments."

Notes of New Works.

A detached dwelling house is about being erected at Vico-road, Dalkey, in addition to those already mentioned, for Mr. Henry Gonne. Mr. Lyons, architect.

Additions are being made to the dwelling-house of J. C. Josephs, Esq., T.C., Artane, comprising new drawing and dining-room, conservatory, &c. Mr. Lyons, architect.

The gallery at Banagher Presbyterian Church, county Derry, before noticed by us, is now completed, at the sole expense of the Worshipful Fishmongers' Company of London, from the designs and under the superintendence of Mr. Fitzgibbon Louch, architect, Londonderry; Mr. James Adams, Culmore, contractor.

A manse, in connection with the above church, on the Worshipful Fishmongers' estate, has been erected at Banagher; style, Elizabethan, with sandstone dressings throughout, from Dungivin quarries. The works have been creditably executed for Rev. Robert L. Rogers by Mr. James Adams, contractor; the architect is Mr. Fitzgibbon Louch, C.E., Londonderry.

A large school-house, with master's residence, has been erected at Fintona, county Tyrone, for Rev. Henry Tottenham, under the superintendence of Mr. Fitzgibbon Louch, C.E., Sackville-street, Derry; Mr. Joseph M'Elroy, contractor. Expenditure, £520.

Mr. Thomas Henry Carroll, of Baggot-street, builder, has been declared contractor for a new church to be erected at Lurgan by the Ecclesiastical Commissioners; also, for another church at Bray, according to plans by Mr. Slater, of London, architect. In each case the expenditure to be about £6,000.[*]

A new dwelling-house, entitled Knockmaroon Lodge, is to be erected for Gilbert Burns, Esq. Mr. D. C. Ferguson, architect; Messrs. Cockburn, builders.

Four station buildings, goods stores, and various workshops are being erected on the Boyle and Sligo extension line. Mr. Wilkinson, architect; Messrs. Crowe, Brothers, contractors. Contract about £23,000.

A mansion house is to be built at Portlaw for Frederick Malcomson, Esq., according to plans, and under the direction of Mr. J. S. Mulvany, architect. Tenders have been invited.

The time for receiving tenders for the construction of a line of railway from Kells to Oldcastle—Mr. Blakiston, C.E.—is extended until the 16th inst.

The Countess of Glengall has purchased Castle View House, at Caher, and the demesne attached, lately the property of Mrs. Sargint, and her ladyship intends erecting thereon a suitable mansion for her future residence.

At the little churchyard of Caher it is intended to erect a very splendid and massive testimonial to the memory of the late Earl of Glengall, his lordship's mother, Emily Countess of Glengall, and his younger daughter, Lady Matilda Butler.

We hear that it is proposed to form a new road, communicating between the main approach to Clontarf and the Howth-road, commencing in the former instance near Mrs. M'Knight's tavern, and opening up a very advantageous range of building frontages, as well as affording additional facility of access between the two thoroughfares. Unfortunately, however, in this locality there is generally a vast amount of "talk" before any decided action, and we should be much better pleased to chronicle the matter in question as *un fait accompli* rather than a mere project.

Messrs. Moore, Brothers, contractors for the construction of the Liffey Branch Railway, have upwards of 400 labourers, together with masons, carpenters, &c., &c., and a large number of horses employed on the works, which they are pushing forward with all possible expedition.

A new road is about being formed at Enniskerry, to run parallel with the present street on its west side, from Mr. Shirley's Hotel up the hill, in the direction of Powerscourt gate. A large embankment must, however, be removed. Mr. M. Burke, engineering contractor, has obtained the work.

PARLIAMENTARY NOTES ON IRISH RAILWAY MATTERS.

IN the case of the Banbridge Extension Bill a question was raised before the committee of the house, relative to a certain level crossing in the townland of Edenderry, but a report from an officer of the railway department of the Board of Trade recommended that it should be allowed, and the committee confirmed it, requiring, however, that the company in addition to same should afford a communication by making a new road under the railway with a bridge affording a headway of 11 feet, which will be sufficient for all except high loads.

An arrangement has been made between the above company and the promoters of the Downpatrick and Newry Junction Railway, by which the former gave up a portion of the original scheme, for making a railway from Banbridge to Castlewellan, with branches to Rathfriland, Dundrum, and Newcastle, and confined their undertaking to a line from Banbridge to Ballyroney, with a branch to Rathfriland. The competing bill of the Downpatrick and Newry Junction Railway Company for making a railway from Downpatrick by way of Dundrum, Castlewellan, and Rathfriland to Newry, with a branch to Gorah Wood, has been agreed to by the committee in its integrity, without opposition on the part of the company.

The Londonderry and Coleraine Railway Bill has been amended in committee, and it empowers them to sell or lease their undertaking.

The allegations of the Downpatrick and Newry Junction Railway Bill have been found to be true.

The select committee of the House assembled to consider the Cork and Macroom direct, and Cork, Blarney, and Macroom Railway Bills, when Mr. Serjeant Wrangham, in stating the case for the promoters, said that he appeared for one of the two lines—viz., the direct line from Cork to Macroom, and against the line not *really* direct. The former was in length, from the terminus at Cork to Macroom, 21¼ miles, and the estimated cost was £118,000. In connection with it there was another recommendatory feature in the comparison between the two lines—viz., the branch from the village of Tower, forming a junction with the Great Southern and Western line, and which would bring the line into immediate connection with the whole railway system of the country. The importance of a line between Cork and Macroom is illustrated by the fact that there are two companies competing for the construction of such a line. It was of great importance that some line should be made, but it was of greater moment that it should not stop at Macroom, a place of considerable importance, as the centre of an agricultural district, but that it should be extended to points more important than even Macroom—for instance, to Bantry, which was only 29 miles from Macroom, and to the harbour of Berehaven, which was only 16 miles from Bantry—all these towns being brought through the junction with the Great Southern and Western Railway, into direct connection with the metropolis of Ireland. His line had this advantage also, that its station at Cork was adjacent to the Cork Butter Market, and also to the cattle station of the Great Southern and Western Railway, so that produce and cattle could be at once transferred from one line to the other, even though there were no junction, such as that proposed at Tower Village. On the other hand, the station of the opposing line was on the southern branch of the river, and, consequently, produce and cattle destined for Dublin should be drawn through the whole length of the city of Cork before they could reach the cattle station of the Great Southern and Western Railway. The cost of the branch line is estimated at £21,000, and the total cost will be £139,000. The promoters intended to make the line and the branch. The worst gradient was one in 100, and the greatest curve half a mile. It would be objected to the scheme that the line did not go nearer than three and a half miles to Ballincollig Barracks, while the opposition line approached within half a mile; but in order to travel by the latter line, troops coming from Dublin or Athlone would not have to change at Cork. They would have to do so in the case of the other line. In conclusion, he might state that the Great Southern and Western Company had withdrawn their opposition, and were now on the best terms with the promoters.

---

[*] For these and the works referred to in the three following paragraphs we are requested to mention, that Mr. Benjamin T. Patterson took out the quantities.

In support of the project several witnesses were examined, including Sir George Colthurst, Mr. St. John Jeffries, the Earl of Cork, Mr. W. G. Browne, Mr. Ilberry (traffic manager G. S. & W. R.), &c., &c.

Miscellaneous.

ROYAL NATIONAL LIFEBOAT INSTITUTION. — Rewards amounting to £19 10s. were given to the crews of the lifeboats of the Institution stationed at Margate, Drogheda, and Arklow, for putting off to vessels in reply to signals of distress, but which, after the arrival of the lifeboats, had got out of their dangerous positions, and proceeded on their voyages. The silver medal of the Institution was voted to Captain Goss, R.N., Inspecting Commander of the Coast Guard at Queenstown, who had previously received the gold medal of the Society for some distinguished services, and to John Slarke, together with £2 to the latter, and £16 to their boat's crew of eight men, for putting off in a Coast Guard boat during a truly awful night, and rescuing by means of the rocket apparatus, which was fired by them from a rock over which the sea was occasionally breaking heavily, twelve out of thirteen of the crew of the Austrian brig Uredon. It appeared that the ship, in endeavouring to make in the night for Cork harbour, during a heavy gale of wind from S.W., upon a dead lee shore, drove on some isolated rocks off Guilleen, about a quarter of a mile from the shore. The seas in their fury leaped up to the masts on which the poor creatures were crowded, and death in one of its most appalling forms stared them in the face, for they thought it was impossible for help to reach them in such a dangerous place. The silver medal of the Institution has been voted to Lieutenant Hutchison, of Kingstown, and Lieutenant Parsons, of the 35th Regiment, in testimony of their gallant services in aiding to save three out of four of the crew of the brigantine Industry, of Whitehaven, which during the memorable gale of the 9th of February last, was wrecked off Kingstown, on which occasion Captain Boyd, R.N., and his brave crew unhappily but nobly perished. Lieut. Hutchison, in rushing into the surf to save the master's life, was severely injured and rendered insensible, in which state he was himself rescued by some other men. It was reported that the Institution had, during the past month, sent new lifeboats and transporting carriages to Whitby, in Yorkshire; and to Irvine, in Scotland. A legacy of £500 was announced to have been received by the Institution from the late Mrs. Shedden Watson, who wished it to be appropriated in the purchase of a lifeboat, to be called "The Brave Robert Shedden," in memory of her late son, who was a lieutenant in the Royal Navy, and had been round the world in his own yacht. It was reported that a benevolent gentleman had intimated his intention to bequeath to the Institution £3,000, under conditions, to enable it to place two or three lifeboats on the coast. The thanks of the Institution were voted to the Rev. H. J. Hutchesson, M.A., for presenting to the Society £180, to pay the cost of the Dungeness lifeboat, and £20 in aid of its general funds. Also the Institution's thanks to a lady for her munificent gift of £200 to the Institution. The committee decided on exhibiting at the Great Exhibition of 1862 one of its first-class lifeboats on her transporting carriage. Payments amounting to £1,050 having been made on various lifeboat establishments, the proceedings closed.

A parliamentary return shows that the total estimate for works proposed for Dover is £650,000; for Alderney, £1,800,000; for Portland, £1,047,125. The votes still required to complete the works are—for Dover, £151,000; for Alderney, £363,000; and for Portland, £74,125.

ALTERATIONS IN THE NEW CUSTOM-HOUSE, BELFAST.—Lately as this beautiful and extensive building, comprising the most important of our public offices, has been erected, it has already been found necessary to make very considerable alterations in order to provide increased accommodation. The demands of the Post Office department have rendered it indispensable that additional room should be afforded for the transaction of its augmenting business. The office of the Local Marine Board has, therefore, been removed from the south to the north wing, and the space appropriated to the postal service. The Court of Probate is about to be immediately removed from Donegall-place to the Custom-house Buildings, and this has caused further extensive alterations. Among these has been the erection of two strong rooms, to serve as safes for the custody of deeds. These, which consist of a lower and an upper chamber, are constructed of fire-brick, set in Roman cement, with flagged floors, arched ceilings, and iron doors. The lower floor rests upon a bed of concrete, intervening between the flags and the arch of the crypt or vault underneath. The ceiling of the upper chamber will also have a thick layer of concrete between it and the roof of the wing in which it is situated. The whole will be thoroughly fire-proof. The apartment for the sittings of the Court of Probate will be spacious, and suitably fitted up; and there will be convenient waiting-rooms for persons having business there. The Registry Office of the Consistorial Court of the Diocese of Down and Connor has already been removed to the Ulster Chambers, Waring-street. The changes just noticed have rendered others requisite in the Customs and the Inland Revenue departments. The whole of the alterations are under the directions of persons appointed by the Board of Works.—*Belfast News-Letter.*

THE DISPUTE IN THE BUILDING TRADE.—No settlement of this unfortunate dispute has yet been effected. A postponement of the opening of the Horticultural Gardens has been necessitated owing to the scanty supply of skilled workmen yet obtained by the contractors, Messrs. Kelk & Lucas; and the Exhibition building, so far as bricklayers' and masons' work is concerned, is progressing but slowly. At the Grosvenor Hotel, Pimlico, about half-a-dozen plasterers are employed, while upwards of 300 are required; and the roof is suffering materially from the weather, owing to the plumbing work remaining undone—the plumbers being still "locked out" refusing to work under the hour system. The number of men originally locked out was about 600, but not more than 200 are now on the funds of the societies, at an average of 25s. per week per man, the rest having obtained employment in other yards under the old system of payment.

RAILWAYS IN ITALY.—The Italian Government is about to make a great effort to give to the whole of the kingdom the advantages of a system of railways. The first four and a-half miles of railway in the old State of Piedmont were only opened in August, 1848, and now that State has in operation 850 kilometres (the kilometre being two-thirds of an English mile), whilst there are 382 kilometres in progress of construction. Projects have now been prepared, and are shortly to be submitted to the Chamber of Deputies, by which, if approved, the Italian kingdom will have 1,779 kilometres of railway lines in operation, 1,704 kilometres in progress of construction, and 2,650 to be given out for private speculation. By adding to this the lines either in operation or in progress of construction in the Venetian and Roman, or present Pontifical provinces, the whole of the Italian railway lines will rise to 6,800 kilometres. In Naples the lines in work are only 142 kilometres, those in progress 96, and the projected lines 1,900 kilometres. The lines projected for Sicily, where as yet no railway exists, amount to 400 kilometres. Within six years the whole network is to be completed.

TO SUBSCRIBERS AND ADVERTISERS.

Subscribers and advertisers to whom frequent applications have been made by circular and otherwise for various amounts of accounts furnished, will have the goodness to remit same to the office, as directed. It must be obvious to all that the character of this journal entails more than ordinary expense for each publication, and judging from the good feeling manifested towards our mission by all classes, we are quite sure it is only necessary to remind those indebted that a multitude of individual items, however small, serve to form a very important aggregate.

NOTICE.

Post-office Orders and Remittances should be made payable to MR. PETER ROE, *Printer and Publisher,* 42, MABBOT-STREET, DUBLIN.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* DUBLIN BUILDER," 42, MABBOT-STREET. *All other Communications should be addressed to the "Proprietor and Editor,"* 17, LOWER GARDINER-STREET.

The Dublin Builder.

VOL. III.—No. 35.

HEALTH AND SEWERAGE CONSIDERATIONS.

MUCH more at this than at any other period of the year—though at all times to an extent—should attention be directed to such matters as affect the public health, and, if neglected, are fraught with fatal results. Our sanitary inspectors—but where are they?—however, those in authority—should look to the condition of certain portions of our city—the slums and purlieus of the Liberty and the Poddle, the open cesspools of Townsend, Patrick, Mecklenburgh, Purdon, and Bride Streets, &c., &c.—where filth and ashes, decomposed fish entrails and vegetables are heaped in the very roadway, and thousands revelling in uncleanliness dwell in cellars and garrets, tainting the atmosphere of the whole metropolis, which rich and poor alike must breathe. The Irish lower order are said to be proverbial for their dirty habits; but, though admitting the imputation, we by no means exempt therefrom either our English or Scotch neighbours, for in both their metropoli and principal cities is to be found, as ably illustrated by some of our cotemporaries, the most squalid filth and misery within a stone's throw of the lordly mansion of the millionaire. Such, however, is no justification for *our* falling into a similar error, but rather a forcible example for avoidance, and if not availed of, the greater the responsibility. Next to actual outward appearance of filth—which not unfrequently a thorough application of soap and water or whitewash might effectually remove—the main point for operations to be directed against is the sewage arrangement. We must intermediately note a surprise, that, independent of sanitary considerations altogether, such an inexhaustible source of wealth as is presented by the very offal and night soil from our habitations should not have been before now taken advantage of by our speculating economists, for in Dublin we must pay, and dearly too, for its removal, whereas in London and elsewhere the article is so eagerly sought for, that parties pay large sums for the privilege of removing it at their own expense. In another portion of this number we treat of the objectionable principle of making a river on which a city is built, the receptacle for its filth, and more especially so a tidal river, which with every flow brings back nearly to its original source that previously carried off by the ebb; but when we know that the avoidance of such a system will not only confer a local but a general benefit, at least the theory merits our consideration. A question naturally arises at the very onset as to the objects to be effected by proper drainage of any locality, and the primary one appears to be the removal of all refuse from a neighbourhood prejudical to the health of the inhabitants; the next as to how far such refuse may be employed to a useful purpose, or as a profitable article of commerce. In the former regard it is universally acknowledged that the accumulation of refuse matter is certain to *en*courage or generate various kinds of epidemic diseases, besides *dis*couraging habits of cleanliness, and as affecting the morals; and in the latter the substance so available is entitled to high claims for application to agricultural purposes as a manure. Nitrogen, in the form of ammonia, is the essential element of manure, being, as such, the promoter of vegetation; and of its successful application, in a liquid state especially, we have favourable evidence, from the practice adopted at Edinburgh, as also on the continent, in various parts of France and Germany, where pasture land has been made to produce crops considerably above the average. Practical objections are, however, occasionally urged: the first being the expense of distribution, the second the limited area to which such a manure could be advantageously applied; and again its deleteriousness to "public health" if allowed to remain on the surface, owing to its emission of offensive odours; these, or any of them, are, however, far from being insurmountable, and the advantageousness of the principle in its integrity encourages us to hope for its adoption. Our general object in alluding to these matters is to conduce to the sanitary welfare of the inhabitants of large cities and towns, by advocating an effective drainage system, which will both carry off all refuse speedily, and to such a distance as to save the inhalation of fœtid odours, at present emitted where rivers are converted into sewers; also, to reproduce and render valuable commercially the material comprised therein, but now valueless. The former consideration admits of being subdivided into house and surface drainage, or, in other words, the refuse of matters connected with the household, and that having reference to rainfall and storm waters; as the prudence of providing for both, the same system of drains would seem to be very questionable. We must, however, halt on the threshold of a subject admitting of much more comprehensive treatment than we are prepared to accord it at present, but we shall not fail to revert to it hereafter more in *extenso.*

ON PRODUCING ON GLASS, PHOTOGRAPHS OR OTHER PICTURES IN ENAMEL COLOURS.*

THE art of glass-making is certainly one of the most interesting and extraordinary inventions; at the same time it is doubtless one which has tended to increase our comforts and our enjoyments in a degree almost unequalled by any other discovery of modern civilization.

If we look back to the dark ages, and find that in those days even the rulers of the earth had no means of keeping rain and bad weather from their habitations, except by also shutting out the light; we shall be ready to acknowledge the astonishing results, as compared with the present state of things around us, which the persevering efforts of man have, under the guidance of an ever-merciful Providence, been able to accomplish.

We have no distinct evidence to show what nation first used glass, and we must therefore be satisfied with the various traditions transmitted to us, from age to age, on the subject. One fact, however, seems established beyond the possibility of a doubt, viz., that the greatest antiquity can be assigned to this invention, since the Egyptians and the Phœnicians had both vessels and ornaments made of glass, crude in form, but of a substance so perfect, by whatever means obtained, that it has stood the trial of several thousand years, and may be pronounced to have suffered no deterioration. Might we not, in consequence, assign to glass a place in the list of useful inventions far higher than that which it occupies? for in this we have a discovery, the first inventors of which seem to have attained at once the very condition—durability—which humankind is incessantly bent upon obtaining for any produce of its hands.

But still more remote is the mention of glass in the Holy Scripture; for, if the interpretation of the text be a correct one, in the 18th chapter of Job, as also in several other parts of the Bible, is found an allusion to a substance which we imagine must have been glass. Next to this, Alexander Aphrodisius amongst the ancient Greeks, Lucretius, Flavius Vopiscus, and other Latin authors, have left us a correct description of glass. Aristophanes also alludes to glass in one of his plays, and Aristotle brings out two problems on the subject; the first, why is it we see through glass? the second, why can we not bend glass?

Specimens of the potter's art in ancient times we have in plenty, and in a variety of forms and shapes, which for elegance have not been surpassed. We need only allude to the Etruscan vases in the collection of the British Museum.

Horn and skins were in use down to the third or fourth century of the Christian era, and oiled paper or mica was also used in lieu of window glass, nearly up to the time of the reign of Elizabeth. If we are to give credence to the narrative of Pliny, to accident alone, as in many other instances, are we indebted for the discovery of glass. Some traders, being weather-bound, landed on the banks of a river in Syria, and began to prepare a place in the sand for cooking their meals, after having gathered for fuel a great quantity of an herb known there by the name of *kali*, which plant must have contained a large proportion of carbonate of soda, and this being mixed with the sand yielded, through the agency of fire, a sort of vitreous substance. Such is one of the accredited versions of the origin of glass.

Glass has become with us an article so singularly cheap and common, that we are apt to lose sight of its immensely diversified qualities; but if only considered from a philosophical point of view, we shall find that few of the substances which we have in daily use, either in a simple or compound state, can be compared to glass in point of importance and of usefulnsss.

The applications of glass are now so numerous that it is difficult to imagine any one branch of industry or of manufacture which could be carried on for a single day without the use of glass in one shape or another. To some of the most important amongst the sciences, such as chemistry, physics, astronomy, the use of glass is a matter of absolute necessity; and, in proportion to the gradual and increasing requirements of these last-named sciences, especially astronomy, it will be found that the glass manufacturer has been obliged to perfect his mode of manipulation; and by the aid of chemistry, has of late years obtained such magnificent results that the field for astronomical observation has thereby been considerably enlarged.

It appears that, although vessels made of glass had been in use for a considerable time previously, it was only about the third century of our era that glass began to be used for glazing windows.

---

* From a paper read at the Society of Arts on the 22nd ult., by Mr. F. Joubert.

These consisted of an infinite number of small panes of various shapes, which were arranged so as to form certain designs for the ornamenting of windows in places of worship; glass having, on account of its rarety then, been almost, if not entirely, confined to that use.

St Jerome, who wrote in the fourth century, speaks of glass in church windows; and Grégoire de Tours relates, two hundred years later, in the year 525, that a soldier of the army of the King of the Visigoths, who had invaded Auvergne, entered a church through a window, of which he broke the glass. Fortunatus, Bishop of Poictiers, towards the end of the seventh century, describes with admiration the painted windows of the Cathedral of Paris. St. Philibert, also in the seventh century, had the windows of the celebrated Abbey of Jumièges, on the banks of the Seine, near Rouen, decorated with glass.

At the beginning of the eighth century glass was unknown in England; and it was Wilfrid, bishop of York, who died in 709, who first introduced glass into England, by sending for some glass-makers from France, according to a record kept to this day. A few years later, St. Bennet, Abbot of Wearmouth, wishing to decorate the windows of his monastery, sent for some glass-makers—also from France; for it appears, from some authentic records, that the art of decorating windows with glass was practised in several parts of France, especially in Normandy, long before it was adopted in other countries.

It would seem that the art of staining glass was very easily discovered, although no date can be correctly assigned to the period when stained glass for church windows was first used. The practice generally adopted was to make a sort of mosaic design, by placing an infinite number of small pieces of coloured glass together. This was in use for several centuries before the art of painting on glass, properly speaking, was discovered, which seems soon to have extensively spread, and to have been cultivated by many excellent artists, to judge by the numerous specimens still in existence on the Continent. But for the sixteenth century, so rich already in artistic talent, was reserved the glory of carrying glass painting to a degree of excellence which has never been equalled since; and the names of Jean Cousin and Bernard de Pallissy will be honoured for ever, amongst the large phalanx of glass painters in all countries. The most remarkable painted windows, perhaps, in this country, are the windows of the various colleges at Oxford, which were executed during the seventeenth century by Bernard Van Linge and his pupils. William Price also repaired some of the glass paintings in Queen's College, Oxford; and in Christ Church painted a remarkable composition from the designs of Sir James Thornhill. Besides these may be mentioned the windows of Lichfield Cathedral, and several other very ancient windows in Christ Church, and especially in the residence of the Dean of Westminster, near the Abbey.

In order that the process I propose may be very distinctly understood, I shall now describe it by reading that part of my specification which relates to the placing the image on the glass, fixing it, and passing it through the fire.

This invention has for its object improvements in reproducing photographic and other pictures, engravings, prints, devices, and designs, on the surfaces of glass, ceramic, and other substances requiring to be fired to fix the same thereon.

A piece of glass, which may be crown or flatted glass, being selected, as free from defect as possible, is firstly well cleaned, and held horizontally while a certain liquid is poured on it. This liquid is composed of a saturated solution of bichromate of ammonia in the proportion of five parts, honey and albumen three parts of each, well mixed together, and thinned with from twenty to thirty parts of distilled water, the whole carefully filtered before using it. The preparation of the solution, and the mixing up with other ingredients, should be conducted in a room from which light is partially excluded, or under yellow light, the same as in photographic operating-rooms, so that the sensitiveness of the solution may not be diminished or destroyed.

In order to obtain a perfect transfer of the image to be reproduced, the piece of glass coated with the solution, which has been properly dried by means of a gas stove (this will only occupy a few minutes), is placed, face downwards, on the subject to be copied, in an ordinary pressure frame, such as is used for printing photographs.

The subject must be a positive picture on glass, or else on paper rendered transparent by waxing, or other mode; and an exposure to the light will, in a few seconds, according to the state of the weather, show. on removing the coated glass from the pressure frame, a faintly indicated picture in a negative condition. To bring it out, an enamel colour, in a very finely divided powder, is gently rubbed over with a very soft brush, until the whole composition or subject appears in a perfect positive form. It is then fixed by alcohol, in which a small quantity of acid, either nitric or acetic, has been mixed, being poured over the whole surface, and drained off at one corner.

When the alcohol has completely evaporated, which will generally be the case in a very short time, the glass is quietly immersed, horizontally, in a large pan of clean water, and left until the chromic solution has dissolved off, and nothing remains besides the enamel colour on the glass: it is then allowed to dry by itself near a heated stove, and, when dry, is ready to be placed in the kiln for firing.

It may be stated that enamel of any colour can be used, and that, by careful registering, a variety of colours can be printed one after the other, so as to afford a perfect imitation of a picture; also, that borders of any description can be subsequently added, without any liability to remove or even diminish the intensity of the colour in the first firing.

It will be easy to perceive that this mode of obtaining an image on glass, in an absolutely permanent substance, and of any description, colour, or size, may prove of considerable advantage and utility for the decoration of private houses, and also for public buildings. Now that, by means of the photographic art, the most correct views of any object or of any building or scene—even portraits—can be faithfully and easily obtained; when we see every day the results of the labours of photographers in all parts of the world, in the shape of beautiful prints; when we can be made acquainted, without leaving home, with the actual costume, habitations, scenery, manners almost, of all countries—for instance, China and Japan, which have but recently opened their doors to European civilization; when, through the same means, we are able to see, for the first time, and the learned are able to translate from, the graphic reproduction with which photography furnishes us of those early inscriptions engraved on the rocks in Asia, and by the Egyptians on their splendid monuments; I need only point out the usefulness of the mode of fixing those images in an indelible manner, for ornamental as well as for scientific purposes.

In large cities, like London, where houses are built so close to one another; in how many places may not the process become available, by enabling any one to introduce, for a very moderate expense, pleasing or instructive images where common plain ground glass is now used. to shut out the sight of a disagreeable object, a dead wall, or an unpleasant neighbour, without diminishing the amount of light more than is convenient.

In the library, fitting subjects might be introduced on the windows by a judicious selection of the portraits of favourite authors, or of famous scenery at home or abroad. In the dining room, also, appropriate pictures could be selected, such as flowers, fruit, or game subjects, so disposed as to harmonize with the decoration of the room. Even for domestic purposes, for lamps, or screens, or any object in glass, the process will be found useful, especially on account of its rapidity, which will enable the manufacturer to execute and to deliver an order at a very few days' notice.

FOXROCK.—It is confidently expected that the new station at Foxrock, on the Dublin and Wicklow line, will be opened in June. An important feature in connection with this opening will be the plying of a stage car and an omnibus between the Stillorgan station, this new station, and Kingstown, by a new road, at present forming, to be called the Westminster-road. To persons residing at Rathmines and in that direction, desirous of visiting Kingstown, these conveniences and this new station will be found convenient. A somewhat extensive range of stabling is also at present erecting close to the Foxrock station, for the purpose of carrying out this cross-country traffic. Several new roads are being formed in this good building locality, which, from its picturesqueness, and from the beauty of the mountain scenery around, has already induced several gentlemen to erect villa residences and elegant mansions; indeed, although but two years have elapsed since these grounds were laid out as building sites, some 100 acres have been let, it being stated that about £30,000 will be expended on the ground thus laid out. A site for a new church has been very liberally granted by the Messrs. Bently, the proprietors of the ground, rent free, for ever. Mr. G. Murphy and Messrs. Crowe are at present engaged in building some mansions of a very superior character on the ground here noticed.—*Express.*

NEW PATENT FOR PHOTOGRAPHIC PRINTING.—Letter patent have passed the great seal on the 24th May, 1861, to Francis Stewart Beatty, of 16, College-green, Dublin, in the county of Dublin, Ireland, lithographer and photographer, and Thomas Alexander, of Killester House, in the same county, doctor of medicine, for an invention of "Improvements in the production of photographic proofs and their application to printing purposes.

THE JACOB MEDAL.—The friends and admirers of the distinguished oculist, Dr. Jacob, have had a medal struck in his honour, and propose to present it to him at a public dinner on the 3rd inst.

RAILS AND SLEEPERS.—Tenders for 2,000 tons of the former and 30,000 of the latter articles of Baltic timber are, up to 14th inst., desired by the Bunbridge, Lisburn, and Belfast Railway Company.

THE REVIVAL OF STYLES.

THE Rev. J. L. Petit, whose name is familiar to most of our readers, delivered a lecture recently at the Architectural Exhibition on this subject, from which we quote as follows:—

The questions we have to consider are these—"Have we at present any style of our own?" "Are we likely to work out a new style from our own resources, and from the materials we can command?" "Ought we to endeavour rather to revive some ancient style; and if so, in which of those before us are we most likely to be successful?" I assume, of course, that we are desirous of establishing a style applicable to all our purposes, capable of combinations of the highest beauty and grandeur, and opening a sufficient field to the genius of the architect, as well as to that of the sculptor, painter, and other artists who may contribute to the perfection of his work. I am not sure whether we are not apt to draw too nice a distinction between building and architecture, and to take away from the province of the latter such works as our ordinary dwelling-houses, cottages, street fronts, and the like, unless they claim a title to it by adopting the most prominent features of some ancient or Mediæval style. But in truth every structure is architectural which shows that thought, care, and skill have been bestowed upon its appearance. A very small amount of ornamental detail, if it be well designed or well chosen, and well applied, will often be sufficient to represent, as it were, a more elaborate system, while a careful study of forms and proportions, even if there be no ornament whatever, according to the common acceptation of the word, may give a building a high place among architectural compositions. And, therefore, I said it was no truism to assume a good national style to be necessary if we would have good national architecture. For a building may be architecturally good and yet have no feature which marks it as decidedly belonging to some recognised style, or the adoption of which would originate a new style. But though a few examples of this description may be imagined, and some perhaps are actually to be found, it is not likely that the taste of architects, unguided by rules, should concur in the production of such buildings throughout the land.

With regard to the first of these questions, it strikes me that any essential incongruity between our vernacular and monumental styles would be productive of great inconvenience, and probably offer a serious obstacle to the advancement of either. For a large class of buildings, public and private, will necessarily occupy a place between the two, being neither merely vernacular nor yet altogether monumental; and it is on these that the character and aspect of our great towns will depend. In such buildings something more may be allowed to ornament than in those of the simplest and cheapest class, and yet considerations of economy must not be altogether thrown aside. If there be that congruity between the highest and lowest class which makes their difference to consist in degree rather than in principle, then the architect of the middle class has merely to apportion to circumstances his amount of expenditure in ornament. There is no actual line or barrier by which he must be decidedly controlled, or which he must decidedly overleap, so as to attach his work to one or other of two distinct classes, the vernacular and the monumental.

We must inquire, then, if there be any style, we may call our own, perfectly suited to the wants of the present day, expressive, or capable of being made expressive of the spirit of the age, and sufficiently comprehensive to embrace both vernacular and monumental works, and that large class which partakes of both characters. If we would view the matter in its proper light, we must go back somewhat more than a century. So many of our cheaper structures are of an ephemeral character, and so many of our more expensive ones are built according to the fancy of the architect or his employer, that they cannot be said to represent any national or permanent style whatever. But if we look at several domestic structures, whether insulated mansions, or forming parts of streets, of about the date of Queen Anne's reign, we may find something not at all unworthy to be taken as a national style, combining many artistic qualities of no mean order, with dignity, durability, and convenience. There is a house, of about the period of which I speak, at the entrance of Camberwell, which I never pass without being struck with the beauty of its composition. It owes little or none of this beauty to ornament, for nothing can be plainer or more simple in this respect. Owing, however, to its detached position, it admits of a ground plan more favourable to variety of outline and a play of light and shade than can usually be obtained in houses forming part of a street. But, both in the metropolis and in country towns, we see houses which may be referred to the same type or style of architecture, more or less enriched, which give no small degree of grandeur, and some picturesqueness, to many of our street views.

The style, it is true, became unpopular when a more formal imitation of the Greek models was effected, and still more so, when as a natural consequence of this depressing formality, Classic architecture became less in fashion, and the fancy for Mediæval architecture began to prevail. Many fine specimens were consequently pulled down to make way for structures of more pretension, but less real merit, as for instance, the school at Birmingham; but this is no proof that the style is unsuited to the spirit of the age or of the English nation, and that it might not with advantage again occupy the position of a national style. To go no further, it harmonises with the character of the houses we build when we work without reference to style, and are guided solely by the consideration of our own requirements, the state of society, climate, and material.

We know that two styles are asserting rival claims to the architecture of the future. At present they seem to assume a hostile attitude towards each other, and show but little tendency to coalesce, though it is certain that any style likely to grow and flourish, and mark the character of the age, must combine elements possessed by each. At the same time it is equally certain that to secure that unity which is necessary to the very life and existence of a national style, one of them must occupy the superior position, and the other take a subordinate one. These two styles are the Classic and the Gothic or Mediæval. We will give each the broadest definition; considering the Classic to comprehend the Grecian, which its scanty remains present to us under rather a severe, if not monotonous, aspect, though a careful study of them show its artists to have been gifted with powers of imagination as vivid and fertile as those which have been developed in any era of human history; the Roman, which combined the Greek, with other elements; and the revived Italian, which was introduced about the fifteenth century, and has more or less steadily held its ground ever since. The Mediæval style may be considered to have commenced on the decline of the Roman in the fifth or sixth century or earlier; and we trace its principles through the Byzantine, Romanesque, Saxon, and Norman, till it culminates in that pointed or Gothic style, which sheds a lustre on the thirteenth, fourteenth, and fifteenth centuries.

With which, then, of these two styles does our vernacular architecture best harmonise? From which of them does it with most propriety borrow its decorations?

Let us suppose a house front, forming part of a street, to have two stories above the ground floor, each with four windows. This seems as likely an arrangement as any to suit general convenience. In the first place, we may pay attention to the proportions between the length and width of the windows, and to the breadth of the spaces which divide them. The probability is that we may satisfy the eye in this respect, without the least sacrifice of comfort. As to the form of the window opening, there can be little doubt the rectangular is the most convenient when woodwork is required, as it must be in dwelling-houses; and when the ceiling is flat and the height of the room limited. the contraction of breadth at the top which an arched window involves may cause an inconvenient diminution of light. But if stone lintels are not to be obtained, and brick or small stones are principally employed in construction, then the head of the window must be an arch. This ought not to form a perfectly horizontal line, both as being apt to sink, which produces an unpleasant effect, and as disguising the construction by giving an arch the form of a lintel. A decided curve should therefore be given, but the less it deviates from the straight line the less will be the sacrifice of those advantages which belong to the rectangular form. A segmental arch, comprising a very small arc of a circle, is satisfactory to the eye, is easily fitted up with woodwork, and unites the qualities of convenience and constructive truth. It is, accordingly, very commonly adopted, and is equally applicable to the palace, the mansion, and the cottage.

We have now obtained a front not unpleasing to the eye, but altogether devoid of ornament; although the care bestowed upon its proportions and arrangement entitles it to be classed as an architectural composition. How are we to begin if we want to enrich it? There is probably nothing in the internal arrangement to suggest a division by vertical lines, for the partitions between the several rooms may be arbitrary and irregular. The real lines of the building must be horizontal, as it is evidently divided by ceilings and floors into several stages. If the position of these be marked by good and effective string-courses, and the whole crowned by a rich cornice, we are at once in possession of a meaning and telling system of ornament, which will give the front an air of considerable richness, even if we go no further. As the Classical style is that in which the horizontal line predominates, we shall naturally be led to look to it for examples of such cornices and string-courses as we require; and we shall find that it furnishes them abundantly, presenting us with specimens which for clearness, brilliancy of effect, and the suggestion of constructive truth, are altogether unrivalled. The Roman mouldings, as applied to horizontal lines, form a most valuable study, and have, perhaps, more of effectiveness and variety than the Greek, besides being more generally applicable in a style where the Greek element is so much modified by the introduction of others. But the vertical line, though subordinate, need not be left wholly unrepresented. The termination of the building, where it joins the adjacent houses, may be marked by some kind of pilaster, or coigning. The windows, ranged one immediately over the other, leave vertical strips, which may also be marked by pilasters of small projection, in one or more of the stages. The addition of these is right in a constructive point of view, for they give the wall some apparent and a little real additional strength where the superstructure is heaviest. And although the introduction of these pilasters may seem a step in the direction of Gothic, which exhibits the predominance of the vertical line so as to carry out the principle to the verge of exaggeration, yet it is not at variance with the spirit of Classic architecture, in which indeed the same principle has sometimes been expressed a little too prominently. The frequent use of the engaged column is perhaps one of the least defensible features in the Classic, both ancient and revived.

Undoubtedly it is possible to Gothicise in a manner such a street front as I have imagined. We may divide it into bays of one or more windows, and mark the division by buttresses, or strongly predominating lines. We may choke the windows up by mullions and tracery, and give them pointed heads, or we may retain the square-headed or slightly segmental window, without mullions, placing over it a Gothic arch and canopy against the blank wall, so as to cut the floor line of the apartment above; but neither these nor any other devices by which modern requirements are made to conform to Mediæval architecture are suggested by this simple primitive arrangement, nor do they show any congruity with it: indeed, it requires some exercise of skill and contrivance to prevent Gothic details from interfering with the comfort of an arrangement which is really Italian.

We have now to consider the question, whether we ought to have two distinct and dissimilar styles, one for secular the other for ecclesiastical purposes. And here I think the advocates of the Gothic revival have taken a more advantageous stand than those who oppose its application to secular purposes. For the latter seem not unwilling to relinquish the Classic style in church building, so long as they retain it for civil uses; while the former contend that the Gothic is the best, not only for churches, but for all structures whatever. In fact they evidently feel how necessary is unity in a national style. I must confess that if they can establish Gothic as the only legitimate church architecture of the present day, I do not see how their opponents can long resist their claim upon secular architecture also. Churches must be classed among what we have referred to as monumental buildings; and it is clearly adverse to the progress of art that the architect should have to give up his mind to two sorts of composition, both of them of a high order, grounded on principles that in many respects are antagonistic to each other. The dissonance between buildings of different styles, like the irregularities in the same building that I have just spoken of, if they are clearly the result of accident or necessity, as when they actually belong to different periods, is valuable both as conducive to picturesqueness, and as forming a sort of historical record; but when it is no other than the result of caprice, waywardness of fancy, or want of unity among artists, it becomes unpleasing to the eye and perplexing to the mind. Nor can it be said that it is necessary to have one style for houses or secular buildings, and another for churches, in order that we may know a church when we see it. Of the thousands of churches that have been built at different times, whatever may be their style or date, how few are there that would be confounded with secular buildings, and *vice versa*. The ecclesiastical character depends very little indeed upon style, and it would be possible to build a church, perfectly unexceptionable in composition, form, aspect, expression, and general arrangement, without introducing any one characteristic of any recognised style whatever.

If it were not for the existence of structures which we are not likely again to require or reproduce—I mean cathedrals of the largest class—I doubt whether the Gothic movement would have proceeded with much spirit, even if it had been commenced at all. It is only by such structures that we can be impressed with a full admiration of the style, and any argument in favour of its revival, which rests on the impressiveness of such buildings, falls to the ground if it can be shown that such impressiveness is what we shall probably never again obtain, at least by similar means. If this were a cathedral-building age, it might be an age in which Gothic architecture could be revived. But it is not a cathedral-building age. We may require and build large churches, we may not grudge handsome and expensive ones, we may increase the number and force of choral establishments; but that pile of building which constituted the great cathedral of the middle ages, whose exterior expressed dominion over the adjacent district, whose interior suggested the idea of infinity, this we are not likely again to call into existence; not because we are as a nation wanting in the spirit of liberality, for large sums are continually expended in the restoration of our old cathedrals, and if any one were to be utterly destroyed I believe it would be rebuilt upon the same scale of magnificence, but because we are a practical nation, and feel that cathedral building in these days is not the only way, nor the most effective way, of securing and spreading abroad the blessings of our religion—that an almost unlimited expenditure in mere externals (for cathedral building amounts to this), however it might have been justified in some epochs of the church, is not so in the present, when other necessities and exigencies call for a different application of our means. It is, I suspect, because this is not a cathedral-building age (for this practical spirit is not confined to our own country and our own persuasion) that our genius seems to flag and languish when we attempt what is specially the architecture of cathedrals, while, in our engineering works we display a power, and, I will add, a perception of architectural propriety not surpassed in the greatest works of the Romans.

But I must not dwell too long upon abstract points; we will take a more material view of the subject. The difference between the constructive principles of Classic and Gothic architecture is, that the former professedly uses the beam or lintel, employing the arch rather as an expedient than as a predominant feature, while the latter may be said to be purely the architecture of the arch, admitting the lintel at rare intervals and on a small scale. But the artistical principles of the styles may be enunciated in a still broader and more summary manner. The Classic gives expression to the solids—Gothic to the voids. Take a Greek colonnade. The columns, capitals, and entablatures are carefully elaborated in their form and proportion, while the opening between them is left to itself, or its breadth determined upon with a view to the columns themselves, not to its own shape. In Gothic work, on the contrary, it is the form of the opening that engages the attention of the architect, the spandrels being the parts that in point of shape are left to shift for themselves. Hence, the greater portion of Classic ornament finds its place on the surface of the wall, while the soffits and jambs, unless the depths of the arch is such as to give it the character of a vault, are comparatively plain. In Gothic work the decoration is mainly in the soffits, sometimes in the form of delicate and complicated mouldings, sometimes of flowers and foliage occupying the hollows, while the mouldings themselves branch out into foliation and tracery, filling the arch with beautiful patterns and figures. Even in the decoration of the surface the forms of the openings are repeated in blank arcades and panelling; and the enrichment of the piers themselves has reference rather to arches they support, than to their own importanca as solid masses, or to the actual wall above them. The tendency of the Gothic system, as carried out in its works of the highest order, that is, in its cathedrals, is to the construction, or at least the suggestion of a lantern of open-work, a vast frame of stone, in which the portions of flat wall are reduced to the smallest amount possible, such as the choir of Tournay Cathedral, which is so tender, that it has been found necessary to connect every part together by ties of iron. Now, in Roman work the pier or the wall itself is made to attract attention, while the arch or opening, whatever it may be, is a secondary and subordinate feature. Change all the arches of the Coliseum into square-headed openings, as those in the upper stage, as well as at Pola, actually are, and I suspect the change in its character would be much less than we are apt to imagine.

ORIGINALITY.*

THE word "originality" is generally used as a term of praise, and in selecting it for my present purpose I intend it to mean "the healthy exercise of invention in architecture." We are likely to misapprehend the nature of originality from a wrong idea of the terms, "change" and "permanence," and to imagine that it is natural for things to be fixed, and exceptional for them to vary; so far is this from being the fact, that one might almost say that change is the only fixed principle, and anything pretending to permanence is an innovation and an anomaly. It is not wonderful that the revival of Classical architecture should have led men to suppose they could extract out of it or compose from it certain perfect specimens, which, being acknowledged to be the best that could be contrived, should be received contentedly as precedents for the rest of time; that was, perhaps, the first false application of the principle of finality that was quite unconnected with superstitious motives. We are generally of opinion now that the results have been such as to make us thankful that the efforts which have been made to introduce it into the Gothic styles have not met with success.

There is no question more important than that of the constitution of our perceptions with reference to impressions from without. We should consider how much of antiquity and how much of novelty is good for us, and whether we are constituted for a system of torpor, or progress, or revolution. We have certain propensities towards change, and certain powers which enable us to produce it. The power of producing novelty is one of those which we most value, as distinguishing us from the lower orders of animals and bringing us nearer to the Producer of all things. Without inquiring how applicable the term "creative," and some others of like kind, which we don't understand, is to so short a step in such a long journey, it will be useful to take lower ground, and see the order of things amongst which we live, from which we receive our impressions, and of which we form a part. We are so little accustomed to anything fixed that our travellers are startled, and almost horrified, on entering the tombs of Egypt, which have stood during all these centuries that the world has been moving. The poetry of everything is in its motion; the charm of astronomy is in the orderly progression of the heavenly bodies and their intimate union and sympathy with each other; the charm of geology is in its gradual succession of events and evidence of life and action. There is a fine analogy in this science which we ought not to miss, because it shows how little of shock, comparatively, and how much of quiet progress have assisted at the building of this great work upon which we build our little works. Down in the foundations of the world we find a state of things that has been changing continually since the commencement of vegetable and animal life. The whole system of creation has been renewed again and again through long periods of progress and rare periods of catastrophe; there have been dark ages, and then renaissance, but it was renewing of life only, not of the lost style. New things arose under the new conditions, and we see in that history, as clearly as in any I know, the true type of our own originality.

---

* From a paper read by Mr. T. Blashill at Architectural Association.

The idea of starting from a particular period of art is, I fear, no less fallacious, though more plausible. We have tried most honestly during many years to carry on the pure and beautiful style of the thirteenth century, with a result which nobody calls success. We are all now, perhaps, more or less pleased with many of the details which are being introduced into our own style from the early Gothic of France; it would have an effect upon our minds similar to that which would be produced by original conceptions, if we could forget that the store from which it is being drawn must soon be exhausted. There is no class of buildings which better deserves study than those of the Romanesque period; it is the Gothic architecture in youth, and although we are very apt to talk about the vigour and freshness of anything that happens to be comparatively new to us, I am much mistaken if we do not draw much that is valuable from study of works of that period; but it is easy to see, I think, that some of the more advanced Gothic school are running headlong into the same experiment that has failed so often before—this time under slightly different conditions. Satisfied of the hopelessness of the attempt to improve on the best period of the Gothic, the idea now is to take up a style confessedly inferior, in the hope of refining it into a better kind of Gothic. I fear very much that this is a new version of the short and slovenly formula for providing scope for improvement—viz., to begin badly.

This question of the starting point is really the most important of any that arises just now; it lies at the very foundation of originality. I hope that nothing I say can be taken as advocating the idea that we can hope to be entirely new. We may as well expect to see some day new a creation rise up around us. The contest now to be decided is one between principles which are of far more importance than Gothic or Classic. We know perfectly well that every attempt to twist an old style into our modern ways has failed entirely. The style is not elastic, and it is only owing to the accident that our forms of worship have changed less than we ourselves have, that the Gothic style succeeds so well in that exceptional case. I ought to make partial exception of the Italian style, which, while it answers very well the demands of a wide range of purposes, has been very far from successful in exciting that sympathy and warmth of feeling which is necessary to raise the work of utilitarianism to the rank of art. If the question were, shall we continue sacrificing real convenience and utility as we notoriously do daily in deference to the demands of style, or shall we take convenience of construction and arrangement as our basis, and sacrifice, at whatever cost, everything that cannot be modified so as to accord with it—we should be compelled to adopt the latter alternative. And, indeed, we must ultimately come to something as near to this as the ancients did, if we wish to equal them in the end. For the present we may be content to light the lamp of sacrifice more liberally than some of the extreme advocates of constructional reform seem to admit.

The extreme picturesque school can hardly be accused of this error. Originality in their language often means the introduction of as many features as possible of styles in which we feel interest, with no superfluity of care in arrangement into one design under the mistaken notion that we shall transfer our admiration for the old buildings to such as have surpassed them in irregularity. Amateurs who care for art at all are almost certainly of this school. We were advised in these rooms the other night to design each building in our streets as in itself, a unit standing by itself. I feel convinced we had better construct it designedly for the position in which it will really stand, not more to do it justice than to give its neighbours fair play. This is more courteous, and, I think, more artistic, if less picturesque. Time will bring those gaps, and additions, and patchings, and rebuildings which we admire so much in old buildings, quite as soon as we can give them historical interest, and after all is said, these things are in themselves blemishes, and we only take pleasure in them because they are the marks by which we have known old friends.

Whether these marked and unstudied irregularities appear in plan or details of old buildings, do not let us mistake them for beauties. Imperfections are always easiest to copy, and most liable to be taken as characteristic of style. It would be as reasonable to imitate the peculiarities of people we meet in order to catch the tone of good society. One may see any night for a shilling one or more of those performers who profess to mimic our well-known public characters; there are the familiar peculiarities of voice, gait, and manner, and more of them crowded into half a minute than the original would show in an hour; the effect is most comic and amusing. But all these points are really such as distinguish the man from the true central type of a gentleman; to attempt that type would deprive the performance of its personal and imitative character and its interest; but if he can do it he is a gentleman and no mimic.

We are seeking novelty in the direction of science also, and disregarding both old forms and beautiful forms in favour of forms which are intended to express very naked—indelicately naked—truth. All possible colours are introduced to give emphasis to important features, and destroy breadth and repose. The beauty of the exterior of a house is the gift of the owner to those whom he does not ask into his house, and the sensations these things excite are of the kindred of those felt at an entertainment where every bit of trouble taken to accommodate and please are exhibited and magnified, and one usually feels that a mild neglect would be more tolerable.

None of these things are necessary to true originality; there is abundance of variety possible in right ways: nobody ever exhausted all the manners of doing well. True originality I have endeavoured to exhibit to you as a thing of slow growth, and not a spasm. It was so small in all ages when art was flourishing, and will be so now. I feel confident that progress is to be made in this way, and not by waiting for a heaven-born genius. What we want is true vigour and life, and not the alternation of luxury and coarseness that used to lead men from drawing-rooms to the prize-ring and the cock-pit. In good times of Gothic art, men were given to be in earnest, for good or evil; they did not mince matters then. People are fond of voyaging and exploring and mountain climbing now, who a century since would have rather climbed the back-stairs of palaces — they are more manly, and not less loyal and true. A thin-blooded race may be minute and careful, but is not likely to be very original; so as constitution is an element in originality, it is well that in our summer tours we should get sky-ward sometimes, and take pleasure in looking down on the life of villagers, and the life of field and forest and winding river, with a dozen counties lying blue in the distance—a healthier blue at most times than that into which people pitch stones at Brighton.

It seems likely that the tendency will be to form a very liberal kind of what one must call Italian for want of another name, out of the Classical styles with a tendency towards the Gothic type, and in a similar way the various phases of Gothic art are being united into one style; every addition from the source of our own originality will bring these two classes nearer together; but if we are to make any progress towards the formation of a united style, the professor of architecture must not confine his studies to the works of any particular period. We may tolerate in the well-intentioned amateur ideas that are less the result of narrow-mindedness than of narrowness of information, but the architect who neglects to study any of the styles of his predecessors can hardly hope to produce designs worthy of the praise of posterity.

We may step any day from between English hedgerows into the wreck of a Roman city, and tread amongst the confused relics of a bygone time. We look with curiosity now on the ruined baths and the deeply worn steps at the door of the market. Will any age ever look with such interest on our works in ruin, waste good steel in shovel and pickaxe, and to give up to excavation their beans and barley? They will respect our classicality and antiquarianism, as we do all honest learning, but in those far-off times, when the world is older, and wiser, and busier, if they are to trouble their heads further about us, we must, besides being honest and learned, be original.

THE LIVERPOOL ARCHITECTURAL SOCIETY.—At a meeting on the 15th ult. of this body it was unanimously resolved—"That this society fully concurs in the views expressed in the resolutions adopted by the Architectural Association, and will be happy to co-operate in promoting the due representation of the art of architecture in the proposed Exhibition of 1862; and will gratefully accept the good offices of the Architectural Association as a medium of communication with the commissioners for the Exhibition." The following resolution was also carried, though after some discussion—"That this meeting cordially concurs in the general desirableness of forming an architectural alliance on the basis sketched in the proposals of the Northern Architectural Association."

THE GUINNESS PARK.

Such is the suggested title for the new park, popularly known as the Coburg Gardens, in proximity with Harcourt-street, and purchased by that public benefactor, Benjamin Lee Guinness, Esq., for presentation to the citizens of Dublin, and we heartily endorse it as a most suitable tribute of respect to the munificence of the donor. It may well be said of Mr. Guinness that he does not "hide his light under a bushel," that if Providence has bestowed on him a more than ordinary share of worldly goods, he does not grasp his brimful coffers with Jewish tenacity, but has learned to feel for his fellows less happily circumstanced, and moreover directs the distribution of his gifts with a gracefulness truly admirable. In private life we are informed that a worthy object never in vain sought for aid from this excellent man, and in public life the frequent records of his substantial acts of charity and donations to every project tending to the general good, are sufficiently patent to render further comment thereon superfluous. In a recent number we had occasion to note specially the particulars of the great work voluntarily undertaken at his own personal cost in the restoration of our ancient national cathedral of St. Patrick, and—though, perhaps, feebly, in comparison with the meritorious character of the enterprise—we sought to render to him all due honour, and to set at rest previously conflicting opinions; however now we experience a two-fold pleasure in chronicling this *second* boon so speedily granted in the wake of that alluded to, and have no doubt that that feeling is universally experienced. Pleasure grounds are amongst the many wants of our citizens, for, excepting the Phœnix Park and the Botanic Gardens—the latter with certain restrictions—Dublin has none in which the working classes may freely enjoy themselves, hence the compliment so bestowed by Mr. Guinness is more appropriate and the more to be appreciated. We believe we are correct in stating—though we do not speak authoritatively—that Mr. Guinness was also identified some time since in negociations with a similar object in view as regards a much neglected northern suburb, and rumour has again revived the project as probable of accomplishment.

THE AUTHORSHIP OF A BAS RELIEF ON THE WELLINGTON TESTIMONIAL.

A correspondence on this subject has taken place through one of our daily contemporaries, which, in an editorial paragraph, asserted that the bronze reliefs are by Kirk, Farrell, and Benzoni, to which statement exception is taken in the following terms:—"Now, there is *no* bas relief by Benzoni. The work you have attributed to him was done by the greatest sculptor Ireland ever produced, the late John Hogan. When he died his son took over the completed cast to Rome, and was assisted in arranging it for casting by a *scarpelline* of Benzoni's, that artist never having put his hand to it. It would be something like attributing Handel's Messiah to the organ-blower, or Sir C. Barry's Palace of Westminster to the builder, to assign the grand conception of 'Civil and Religious Liberty,' by Hogan, to the manipulator of the cast, even if Benzoni had had anything to do with it. When these bas reliefs are exposed to public view the noble work by Hogan will vindicate his fame, and will prove him to have been one of the greatest of modern sculptors." To this Dr. Wilde, who was, with Mr. Bianconi, a co-trustee for the carrying out of the work, thus replies:—"To the late John Hogan was allotted the task of representing in one of the bas reliefs a passage in the career of Wellington as a statesman, and he selected that of granting Catholic Emancipation. He completed and delivered to the government the sketch model of his subject before his death, and in his last moments I promised, so far as in me lay, to see that great work carried out. Signor Benzoni, a distinguished sculptor at Rome, and the intimate friend of Hogan, was employed to model the bas relief from the sketch model of our late eminent sculptor. The sketch was carried to Rome by young Hogan, now the pupil of Benzoni; and the plaster cast of the enlarged model was paid for by us on the part of Mrs. Hogan. What adds especial interest to this work of art is the fact, that all the figures thereon are likenesses modelled from either photographs, drawings, or busts forwarded to Rome for that purpose. As, however, the details of this special memento of one of the most remarkable incidents of modern Irish history—by undoubtedly the first Irish sculptor of his day—will, no doubt, come before your readers at another and most fitting occasion, I think it unnecessary to say more upon the subject."

NATIONAL GALLERY OF IRELAND.

Her Majesty the Queen has been graciously pleased to subscribe the sum of £100 to the fund for the purchase of works of art for our National Gallery, now erecting on Leinster lawn, and H.R.H. the Prince Consort has subscribed the sum of £50 for the same object.

AMELIORATION OF THE LABOURER'S CONDITION.

If "the labourer be worthy of his hire" he is also entitled to occupy a suitable position in the social scale, and to enjoy to a comparative extent with his fellow mortals the blessings which the Almighty has provided; but unfortunately, as a general rule, he who lives "by the sweat of his brow," who ministers by his toil to the luxury of the rich man, is regarded as a mere living thing—a sort of appendage to humanity—too insignificant for consideration. Wherever, therefore, a philanthropic exception is to be found, it merits special consideration; and foremost amongst those entitled to national gratitude for amelioration of the labourer's condition is the Royal Agricultural Society of Ireland, which independently of its energetic pursuit of a peculiar mission, viz., the improvement of agriculture, voluntarily extended its operations to the very home of the labourer, with the view of conducing to his health and comforts by securing for him properly constructed dwellings, where good ventilation, sewerage, and appropriate arrangements should supersede the confined, unhealthy, unclean, and heterogeneous structures hitherto inhabited by him. We need not now review all the encouragement that has been afforded by this society—all that actually has been done to this purpose, it being universally known that a certain sum is annually apportioned from its funds to promote the building of labourers' cottages throughout Ireland, after an approved model, sought after from the best professional authorities, but we invite the special attention of our readers to the inducements held out at present in the shape of prizes, for those who distinguish themselves in this regard during the year preceding the approaching show at Belfast next August. The society proposes to award the Leinster Challenge Cup, value £140, to the person who during the period above named shall have built *the greatest number of the most approved cottages for labourers in any part of Ireland;* again, one of the larger gold medals, or the value in money, is offered for each province, to the proprietor or landholder who shall have completed on his property in such province the *greatest number* (not less than four) *of the most approved cottages,* with *not less than half a statute rood of land,* or *more than half an acre, attached.* Without professing to be an authority as regards the restriction herein named, we must express a doubt as to its desirability. However, pursuing our subject we find that to encourage the improvement of *existing* dwellings a gold medal, value £10, is to be allotted to the *greatest number* (not less than ten) *in the occupation of farm labourers, and so improved,* and that some of the society's medals are likewise to be placed at the disposal of the local societies to award for similar purposes. A more than ordinarily notable feature is that upwards of *one hundred ladies* have associated themselves with the central society for the special object of improving the labourer's condition domestically. To stimulate the farming classes to the erection of suitable buildings for the carrying on of agricultural operations—an improvement on the present mud and thatch structures being very palpably and generally needed—the Talbot de Malahide Challenge Cup is this year set apart. We have great hopes that the future of Ireland will be materially and beneficially effected by such energetic operations, and we feel great pleasure in adding our humble voice in the chorus of praise to this estimable national benefactor.

PRESIDENCY OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Mr. Tite, M.P., has been declared the victor for the Presidency of the Institute by a majority of fourteen votes above his rival candidate, Mr. Beresford Hope. At first Mr. Tite consented to be put in nomination for the office on condition that he should be elected without opposition, but subsequently he determined to contest the field with the gentleman above-named, who, though not a professional architect, is much distinguished as a votary of architecture and art generally. The proportion of the votes was as follows:—

For Mr. Tite, ...	65
For Mr. Hope, ...	51
Majority,...	14

MEMORIAL TO THE LATE SIR CHARLES BARRY, R.A.

A graceful tribute is about to be paid to the memory of the late distinguished architect to the Palace at Westminster by the erection of a marble statue in a suitable position in that building—the *chef-d'œuvre* of his professional career. We have no doubt that the high estimation in which all who were capable of appreciating pre-eminent artistic talents must have held the lamented deceased, will stimulate them to contribute their mites to the object in view; and we desire to note, as an example worthy of being followed specially by our friends at this side of the channel, that our much-respected Viceroy, in his usual devotion to the cause of art, is foremost among the subscribers.

THE RIGHT TO MANUFACTURE BRICKS IN A POPULOUS LOCALITY.

THIS question came before the Master of the Rolls recently, on the application of Mr. Smith, to restrain by injunction a well-known enterprising gentleman and owner of considerable property, Mr. Alexander Edie, from erecting a brick kiln, and from burning bricks, on a piece of ground close to the town of Blackrock, near this city.

Counsel (Mr. Brewster, Q.C.), in opening the case for the petitioner, stated that last term his lordship granted an injunction to restrain same party from brick-burning near Monkstown, and notwithstanding that gentleman's appearance personally in court, and his assurance that the ammonia exhaled was beneficial to the people of the neighbourhood, the public generally were unscientific enough to dislike taking ammonia in this way, and the people of Blackrock were of opinion that if they were not speedily relieved from this brick-burning process in their town they would be poisoned. The respondent had men employed in burning tens of thousands of bricks, with his own coal, brought over for the purpose in his own ship. The ground in which the kiln was in course of erection was taken from another respondent, named Mooney, also in Mr. Edie's employment as a day labourer, and was almost in the town. It was close to the National School, and to the house of the petitioner, a member of whose family was sworn to be ill, and to be most injuriously affected by this most disagreeable process. Although the kiln was not completed, the respondents, J. and P. Hughes, as alleged by counsel, upon hearing that there was a movement against having it where it was, resolved to violate the order of the court by anticipation, and accordingly lighted the fire and put on some two hundred thousand bricks, which were then, to the great injury and annoyance of the neighbourhood, being burnt in the usual way. The town commissioners and a number of the inhabitants had presented to these respondents written protests, but to no purpose.

Mr. Purcell, on behalf of the respondents, asked till Monday following for them to state their case on affidavits, as notice of the application was served upon them only the day before.

The Master of the Rolls said he would grant until Monday, but it should be on the distinct understanding that no bricks would be put on the kiln. These parties might be assured that the law would be enforced, and proper steps taken to enforce the order of the court if it were not obeyed. With respect to the alleged impossibility of extinguishing at once the fire at present burning, a couple of fire engines brought down from Dublin would if necessary soon accomplish that purpose. The court had no wish to interfere with the enterprise of Mr. Edie if he carried on this brick-burning in a suitable place, instead of selecting sites close to thickly-inhabited localities.

Subsequently, the court granted an injunction.

[Without prejudicing the merits of the case, we must allow, that unless "a nuisance" be very clearly proved, the prevention of the manufacture would, after the respondent's considerable outlay, be a great hardship.—ED.]

AN OLD PROJECT REVIVED.

REFERRING to the desirability of altering Carlisle-bridge, to suit the increasing traffic of the city, the *Packet* has the following, which our readers will perceive is substantially similar to the original suggestion so long under discussion. We are, however, very much disposed to question the applicability of sculpture to the work, which is the only feature of novelty in the idea:—" It is proposed to construct iron gangways for foot passengers, on each side of the existing structure, formed to harmonise with its architectural character, supported in like manner with house balconies, by projecting stags, and firmly fixed, with adequate strength to sustain any weight by which their safety may be tested. The lowering of the present parapets and the application of the path flagstones to trams, for vehicles crossing the same length of line are the only further alterations required. Suitable pedestals should be erected at the four separate ends of the curves, terminating the space included in the design, and be reserved to receive the statues of 'illustrious Irishmen,' for which distribution a more eligible site could not be selected, and quite in accordance with the examples of antiquity—first Moore's, a reality (removed from College-street), Goldsmith's, Burke's, and Grattan's—memorials of native genius yet in embryo. This brief sketch is respectfully submitted for consideration, and in case the subject is favourably entertained, little difficulty will be experienced in its achievement on the score of expense. The inhabitants of Dublin have been always distinguished for liberality in providing ample funds to promote any undertaking calculated to prove useful, or conducive to the welfare of the city—a spirit creditably exhibited in the chaste beauty and striking grandeur of the magnificent squares, public buildings, and private edifices by which it is adorned—noble monuments of national taste and artistic skill, worthy of any age or country."

THE PROJECTS FOR EMBANKMENT OF THE THAMES.

OUR readers are aware, through other sources, that the commissioners appointed to inquire into the best mode of effecting this great desideratum have had several important plans laid before them, and amongst those which have occupied their attention was one by our respected and enterprising fellow-citizen, Mr. Richard Turner, of Hammersmith Works, who suggests an embankment with open wharves under a capacious roadway for the through traffic, and a low level street to communicate with the wharves; also, a low level sewer, streets, and a railway, at a total cost of £560,000.

MARY'S-ABBEY PRESBYTERIAN CONGREGATION.

THIS committee having for some time contemplated making extensive alterations, including new lecture-room, schools, &c., invited a report upon the buildings from Messrs. Lanyon, Lynn, and Lanyon, and from Mr. W. J. Barre, and having considered each as submitted, have determined upon carrying out the works recommended by the latter, and under his personal supervision, Working plans are now being prepared, and the outlay is estimated at about £4,000.

THE INAUGURATION OF THE DUBLIN EXHIBITION.

ON the 24th ult., after a previous adjournment, the Exhibition of Fine and Ornamental Art in connection with the Royal Dublin Society, was duly inaugurated by his Excellency the Lord Lieutenant, in presence of a crowded and fashionable assemblage, such a one indeed as has not been collected together in any building in this city since the occasion of her Majesty's and the Prince Consort's visit to the Great Exhibition of 1853. Like all ceremonials of this character, there was some attendant formality; and a musical display, at which some of the chief instrumental and vocal artistes assisted, was not the least interesting feature. We must confess to being somewhat agreeably disappointed at the general effect of the building and its arrangement, though we still adhere to the previously expressed opinion, that some additional height to the whole would have been a great desideratum, and that the form of girders —viz., the fish belly adopted for sustaining the galleries—is most objectionable in a perspective view. As we purpose noting the principal works in the several departments, and can scarcely do justice to them generally without the aid of a catalogue—which is a very great and unpardonable want—we defer entering upon a description until the latter is obtainable; but hereafter we reprint the address of the committee to the Lord Lieutenant on the occasion, and his Excellency's reply.

ADDRESS.

MAY IT PLEASE YOUR EXCELLENCY—We, the Vice-Presidents and Council of the Royal Dublin Society, and the Exhibition Committee, desire to express our thanks to your Excellency for consenting, as her Majesty's representative, and as President of the Society, to inaugurate the Exhibition of Fine Arts and Ornamental Art of 1861. Exhibitions of this kind, as tending to reform and enlighten the public judgment, and affording to the leisure hours of the people entertainment of a most rational and instructive description, may now be regarded as legitimate and established auxiliaries to the great cause of national education. The humanizing influence of the fine arts must be proportioned to our appreciation of the beautiful and the true; and this faculty, like all our other faculties, grows and improves by exercise and training. Having before our eyes some of the best examples of what the rarest genius can accomplish in the highest walks of art, we cannot fail to discern something of those fixed principles of taste, the knowledge of which so largely increases our sympathy with, and our enjoyment of, whatsoever is fair and glorious in art and nature. Believing, therefore, that familiarity with the fine arts cannot be otherwise than beneficial, the Royal Dublin Society readily entertained the proposal to hold an Exhibition in the present year, with which should be combined, so far as the limited space would permit, those branches of manufacture in which the fine arts become the willing handmaids of utility and convenience. Here, in this city of Dublin, where the National Gallery is still in its infancy, the people have no means of access to the works of the ancient masters; and the Royal Hibernian Academy's annual exposition of contemporary pictures, is the only available collection of modern artists. Were it not for occasional exhibitions like those of 1853 and 1858, and such as this present one, the citizens and the people of Ireland generally would have few opportunities of seeing meritorious works of art. The occasion was not to be neglected; a committee was appointed, a guarantee fund, which amounts to nearly double the sum originally named, was subscribed, and the result of our joint labours is now before your Excellency. Her Majesty the Queen has favoured our undertaking with her usual consideration for the well-being of her people, contributing many pictures from the palaces and other national collections, as well as from her Majesty's private cabinet. His Royal Highness the Prince

Consort and the King of the Belgians have also lent paintings from their private collections. And we take this opportunity also of thanking your Excellency for the valuable contributions you have so cheerfully made to our Exhibition. May we express the hope that the Exhibition will be honoured during the summer by a visit from his Royal Highness the Prince of Wales, whereby another opportunity may be afforded of testifying the warm feelings of loyalty and attachment which the people of this country entertain towards her Majesty's person and family. It only remains for us to offer our congratulations that while wars and rumours of wars resound from either hemisphere, this country, blessed with calm, and full of prosperous hopes for the future, under the mild constitutional rule of our gracious Sovereign, pursues its course of industry and peace, of which, we trust, our Exhibition may be deemed the fitting and significant emblem.

RKPLY.

I have found myself associated with your respected and spirited society in promoting the high interests of science and of agriculture. I will not seek to establish distinctive grades of usefulness between the different branches of mental and social attainments, but we shall surely seek in vain for more elevating and refining developments of them than in the domain of the fine arts. You have, therefore, done well to add to those important realities of life with which it is generally your province to deal, the grace and the charm which the fine arts generally, and, perhaps, the art of painting especially, are calculated to impart. Before I actually make the inspection by which I am about to be gratified, it would be premature to express an opinion upon the precise merits of the exhibition, I have little doubt, however, that a close inspection of the details will only confirm the effect of the rich and glowing spectacle, which, as I stand here, I see before and around me (applause). I congratulate the society on the gracious co-operation with which they have been honoured from the crowned heads, especially from our own beloved Queen (applause); and I think there is every reason to hope that we may be gratified by seeing among the spectators of this exhibition his Royal Highness the Prince of Wales, during his auspicious residence in Ireland (loud applause). The collection now about to be opened to the public gaze, besides its illustrations of ancient and modern art, will trace some of the manifold connections between art and manufacturing skill, and will thus add point to the pleasing contrast adverted to in your address—that while in other regions and communities, either the baleful blight of war is ravaging the fair face of nature, or discord is summoning brothers to more than warlike strife, we, the loyal subjects of our common Sovereign, the tranquil citizens of one united empire, the peaceful friends of the whole family of nations, are in new temples celebrating the high festivals of industry, art, and concord (loud and continued applause).

RELIEF OF THE THOROUGHFARES.

SIR,—As the advocate of every project tending either to municipal improvement or to public convenience, allow me to draw your attention to a suggestion which would surely considerably relieve one of the most crowded thoroughfares in this city, as also materially benefit in every respect one of the most important establishments therein. Judging from the present overcrowded state of Grafton-street at certain hours of the day, say from 1 to 5 o'clock p.m., we can easily fancy what it would be were it not that the *vis-a-vis* monster houses, Brown, Thomas, & Co., and Switzer, Ferguson, & Co., respectively, had adopted the very capital plan of partially diverting the stream of vehicles and pedestrians into Duke and Wicklow-streets by the provision of side entrances and exits therein. Now, Henry-street, although somewhat wider than that portion of Grafton-street alluded to, is at times almost as impassable, and it occurs to me that if Messrs. Cannock, White, & Co. adopted a similar arrangement, and extended their evergrowing concerns to Middle Abbey-street,* which is one of the most spacious and centrally situated in the city, a great public and private benefit would be effected. I can from personal knowledge testify that, owing to the crowded state of Henry-street, the narrowness of some of the pathway approaches, especially about Ball's Bank, and the necessity of passing the objectionable localities of Off-lane and Moore-street, where disreputable characters are usually congregated, several members of my family, and some of my friends, who would otherwise be purchasers at that establishment, direct their steps elsewhere. I noticed some time since your suggestion of "an extension of Lower Dominick-street to Henry-street," opening up a wide approach from the latter to the Midland Terminus, and this would exactly front Messrs. Cannock's establishment; but however desirous I might be to see that work accomplished, I confess that I think the public would have more reason to be indebted to you if you succeed in effecting the other now suggested. PEDESTRIAN.

---

* We presume that our correspondent is aware that Prince's-street intervenes, and that unless that were bridged over—for which admittedly we have precedents even in this city—his suggestion would be impracticable.

PRIZES TO ARTIST WORKMEN.

As may be seen by reference to advertisement elsewhere in this journal, the council of the South Kensington Museum have just issued the programme of prizes proposed to be given to workmen for the year 1862; and to admit of the fullest publicity being given to particulars thereof, we reprint it *in extenso*, trusting that very many Irish competitors—whom, we believe, in any of the departments hereafter mentioned, are fully qualified to contest the palm with their fellows in the kingdom—may be induced to enter the list:—

The competitions are open to all workmen, whether members of the Architectural Museum or not. All competitors will be treated as members of the museum, and will as such be presented with cards of admission to the whole of the South Kensington Museum for the year 1862.

In addition to the prizes specified, the council of the Architectural Museum will, at its discretion, award the sum of £1 1s. to specimens showing particular merit, although it be not sufficient to secure a prize, and, through the liberality of Mr. S. C. Hall, F.S.A., ten illustrated books will be given, at the discretion of the council, to competitors who do not obtain prizes, but whose works are specially meritorious. These books relate chiefly to the practice of the fine arts, and are, independently of considerable pecuulary worth, highly valuable to artist workmen.

The prizes offered this year considerably exceed in value the sum of £100, and are, therefore, sufficient, as the council hope, to induce the artist workmen to compete more vigorously than in former years for such rewards. The council would, however, prefer to hold out as inducements the honourable distinction of gaining a prize and the accompanying certificate of merit.

The council request that employers will kindly make known to their workmen the encouragement offered by the Architectural Museum, and also give them every facility to compete for the prizes, and that workmen will themselves communicate the intelligence to each other, the more especially as the prize specimens will, it is hoped, form a worthy contribution towards the International Exhibition of 1862, in which it is very probable that the most meritorious may be exhibited.

Prizes for Stone Carving.—The council offer two prizes of £10 10s. and £5 5s. as first and second premiums to the competitors who shall most successfully design and execute in high relief a carved stone panel 2 feet by 2 feet (outside measurement), representing Queen Eleanor watching over Edward the First when wounded.

The council also offer two prizes of £5 5s. and £3 3s. as first and second premiums to the competitors who shall most successfully design and execute a carved and moulded stone capital, suitable for a column 9 in. in diameter, showing the best arrangement of hawthorn and ash foliage, which may be conventionally rendered.

Prizes for Modelling in Clay.—Two prizes of £3 3s. and £2 2s. as first and second premiums to the competitors who shall most successfully execute in the Architectural Museum a model from a cast, representing one of the "angelic choir" from the north transept of Westminster Abbey. The cast to be copied will be placed at the north end of the gallery of the Architectural Museum, and distinguished by a label and memorandum affixed thereto.

Competitors will be furnished with cards of admission to the museum for students' days or evenings on application to the honorary secretary.

Prizes for Wood Carving.—Two prizes of £10 10s. and £5 5s. as first and second premiums to the competitors who shall most successfully design and execute in lime or other soft wood, a door panel, with pierced tracery and foliage of not less than 2 ft. by 1 ft. 4 in. in extent.

Prizes for Metal Work.—Two prizes of £10 10s. and £6 6s. as first and second premiums for the competitors who shall most successfully execute in hammered iron a copy of a portion of the scroll work (about 2 ft. 6 in. high by 2 ft. broad), in St. Paul's Cathedral. The specimens must be of the size of the original, but in order to give more time for finish, need only be finished on one side, the remaining portion being beaten out, but left unfinished.*

The council also offer a prize of £10 10s., and Sir Francis Scott, Bart., a prize of £5 5s., as first and second premiums, for the competitors who shall most successfully design and execute a wrought-iron door-handle, either Gothic or Renaissance in style, and not less than 6 in. over.†

Prize for Painted Glass.—The council offer a prize of £5 5s. for the competitor who shall most successfully design and execute a glass roundel or disc 9 in. in diameter, painted with any floriated design which the artist workman may prefer.‡

---

* Competitors may have the particular pattern pointed out to them, and receive permission to prepare drawings therefrom, by applying to F. C. Penrose, Esq., at the office of the cathedral surveyor, St. Paul's churchyard, who has kindly offered to render every assistance.

† The ornamental workmanship of any specimen must not interfere with its convenient use.

‡ The texture of the glass and the burning will be taken into especial consideration.

Prizes for Coloured Decoration.—The committee of the Ecclesiological Society offer through the council of the museum a prize of £5 5s. for the competitor who shall most successfully colour according to his own judgment a cast of one of the "angelic choir" in the north transept of Westminster Abbey.

Mr. Beresford Hope will give £8 8s. in one or more extra prizes, if any other works appear deserving of reward.

This being specially a colour prize, the same cast for competitive colouration is proposed to all the competitors. Each candidate may adopt that medium for applying his colours which he prefers, but he is expected to treat the panel as forming a portion of an architectural composition, and not as a cabinet piece. The original is in stone.[*]

Prizes for portions or the whole of Works.—The council of the museum will award prizes of £1 1s. and upwards, with certificates in cases specially deserving, for the whole or a portion of any actual work, whether finished or not, in stone, wood, metal, glass, or colour, or for specimens of tracery, flat surface work, or masonry for mouldings, without ornament of any kind, which may be tendered to them, and may appear deserving of the reward. For the sake of convenience in exhibiting, these specimens should not exceed a size of 2 or 3 square feet, and it must be distinctly understood that in this particular competition the artist workman must point out the part of the work which he has himself executed with his own hands, and state whether it be his own idea or not. Unsuccessful competitors under this head will not as such enjoy the privilege of members of the museum.

GENERAL CONDITIONS OF ALL THE COMPETITIONS.

All specimens sent in competition for the prizes must be deposited in the Architectural Museum free of cost by the 1st of January, 1862 (excepting in the colour competition, where the limit is December 2, 1861), with a mark or motto only attached, accompanied by a letter sealed with a blank seal, and having on the outside the same mark or motto as that attached to the specimen, with the title of the particular competition, thus, "Stone Carving Competition, Colour Competition," &c., and enclosing the name and address of the competitor in full, with those of his employer, if any. The letter to be addressed to "The Honorary Secretary of the Architectural Museum." The specimens will remain the property of the artist workmen or their employers, and will be exhibited in the Architectural Museum until after the day of the distribution of the prizes, and such specimens as may be thought especially deserving will be sent to the International Exhibition of 1862 also. The remaining specimens must, after their exhibition in the Architectural Museum be removed by and at the expense of the respective competitors. It must be distinctly understood that the prizes will not be awarded unless there appear sufficient merit in any of the specimens to entitle them to such distinction, and certificates of merit in addition to the prizes will be given in such cases as may be considered deserving.

TOWN SEWERAGE AND MANURES.[†]

THERE is presented for exertion the *present* general, almost total, loss—for the *future*, the almost total gain of town manures. In places where what I will call the waste of manure (such as is going on by the evaporation in nearly a thousand miles of sewers of deposit and cesspools in this great metropolis), where this waste has been prevented by the abolition of cesspools, there the sickness and death rates have been reduced one-third. But what has happened? though the atmospheres of houses have been purified, and men, women and children have been saved from premature and wasteful debility and mortality, rivers have been polluted, and fish it is feared have perished. I have been denounced in Parliament as an instigator of such doings as the pollution of rivers; but as to the pollution of the Thames, I bore with equanimity these reproaches and sufferings of hon. members (when subjected for a short time to stenches, which the poor in the worst districts have to bear always), for those sufferings may be proved to have been from their own default, in not consulting the evidence laid before them, and in not regarding the conclusions from that evidence, by which it was shown how the evil and the annoyance might have been prevented. In my report of 1842 I represented it as an enormity that manure which at that time was equivalent to the annual feed of 218,000 head of cattle, should be thrown into the river. To those whose concern is greater for the population of rivers than of towns, I will stay to offer this advice:—That they should direct their exertions to getting the sewerage discharged fresh by means of self-cleansing pipe, house, and street drains and water-closets, until it can be provided for agriculturally, rather than as in the common method by the putrid overflow of cesspools and sewers, and drains of deposit, like that discharged from most old town districts. I have to inform them, as also *engineers*, *chemists*, and others who have undertaken to advise on the sanitary improvements of towns, that there is a wide difference, of which they have as yet taken no practical account, between sewerage which is fresh (*i.e.*, which has not entered into advanced stages of decomposition), and sewage which has been kept to advanced stages of decomposition, and which is putrid; for it now appears that where, by means of self-cleansing pipe drains, the sewerage is discharged fresh, the fish are increased in quantity and improved in quality.

In France trial works were on my advice adopted by the Imperial Government for the application of sewerage; and whensoever other circumstances, such as the improvement of the water supply and the house drainage, allow of the application of the principle, data have there been gained for applying it confidently and correctly. We have the development of another principle, highly important for the future of agriculture—namely, the saving of roads, of fences, the saving of space, or rent, the reduction of the space requisite for food manufacture, or the principle of intensive and high cultivation on small areas, instead of diffused and low cultivation over wide areas. It may yet be doubted whether even they have laid down too much of pipage for an improved agriculture, which shall follow garden culture, and apply the machinery which enables them to distribute plain water equal to a thunder shower at a rate of from 6d. to 1s. per acre; which on the large scale enabled 100 tons to be put on in an hour at a working rate of 1s. 8d. per acre. I have been informed of a number of farms on which the principle is applied successfully; but unfortunately it is those who are known to be most successful who are the least disposed to give any account of their process or the particular means of their success. In one case an interruption occurred with the first occupier of a leading liquid manure farm; in another a merchant who set up an exemplary model farm, displaying unequalled rates of production in a small area, became a bankrupt from other speculations, and loud was the shout upon these occurrences as failures of the principle. That is to say, according to the notions of the objectors he had failed because he saved instead of wasting his liquid manure—had failed because he applied the manure of his farm with an economy of money and time, and a productive result beyond anything that had before been done, just as it might be shouted that the railway principle was ruinous in conveying goods at working expenses of pence instead of shillings—in hours instead of days!

ROYAL PALACES.

WITH the single exception of Windsor, none of our royal palaces are stamped with architectural magnificence; both in extent and style they are surpassed by several of the country seats of our nobility. Throughout the whole of Europe very few royal palaces, whatever may be their magnitude, are at all distinguished by superior architectural taste. In the French capital, it is only the eastern façade of the Louvre, the river-front, and the inner court, which can lay claim to beauty or richness—the Tulleries being only a mass of quaint grotesqueness. The Vatican at Rome is merely a huge irregular pile; and Versailles and the Escurial, notwithstanding the millions they cost, are both monuments of exceedingly bad taste. Though far from beautiful, the royal palace at Madrid, begun in 1737, from the designs of Giambattista Sachetti, an Italian architect, is a stately and regular pile, it being 470 feet square, and 100 in height, but the effect such a mass would otherwise produce is greatly impaired by the number of mezzanines. The same remark applies to the celebrated palace erected by the King of Naples, about the middle of the last century, at Caserta, of which Vanvitelli was the architect. This building is certainly characterized by magnitude, for it extends 731 feet from east to west, and 569 from north to south; yet of either grandeur of conception, or majesty of style, there is very little, certainly not enough, to reconcile us to the prodigal execution of so very indifferent a design. The royal palace at Stockholm is a stately edifice in the Italian style, although the original design, by Count Tessin, was considerably curtailed. The original imperial winter palace at St. Petersburgh was a vast pile erected by the Italian architect Rastrelli, in the reign of the empress Elizabeth, of most imposing aspect towards the quay of the Neva, but exceedingly heavy and grotesque as to style.

Enormous as have been the sums expended upon many of these edifices, every one of them falls very short of the ideal of a royal palace, in which, if anywhere, not only all the luxury and pomp of architecture, but a certain colossal dignity of aspect, should present itself. This can never be accomplished where storeys above storeys are allowed to display themselves externally. That is but a vulgar species of architectural grandeur which is produced by a numerical multiplication of little parts and features. All the rooms required for the accommodation of an extensive household should be turned towards inner courts, and the whole exterior, having only a single range of lofty windows above the ground floor, should be left for the unrestrained display of architecture and sculpture on a noble scale, without any intermixture of littleness. By such a disposition, too, convenience would perhaps be found far better consulted than at present, because, while all the apartments for official and state receptions and court entertainments could be connected together, the whole of the vast number of subordinate rooms required in such a habitation would be concentrated within the general plan, and at the same time might be kept entirely apart, by means of galleries between the outer and inner range, communicating at intervals with lesser vestibules and staircases attached to the suites of lesser rooms and private apartments of every description.

---

[*] Casts from this panel will be supplied on application to the honorary secretary of the Architectural Museum at 5s. each at the museum, or by payment of 2s. extra for packing and case. Duplicate casts will be allowed. The committee of the Ecclesiological Society will themselves adjudicate.

All specimens for the colour prizes must be sent in by December 2, 1861. See general conditions.

[†] From a paper read by Mr. Chadwick at Royal Agricultural Society of England.

PALMYRA.

With respect to the ruins, they appear to be of two distinct periods; the oldest are so far decayed as not to admit of mensuration, and seem to have been reduced to that state by the hand of time; the others appear to have been broken into fragments by violence. Of the inscriptions none are earlier than the birth of Christ, nor are any later than the destruction of the city by Aurelian, except one, which mentions Dioclesian. It is scarcely less difficult to account for the situation of this city than for its magnificence; the most probable conjecture is, that as soon as the springs of Palmyra were discovered by those who first traversed the desert in which it is situated, a settlement was made there for the purpose of carrying on the trade to India, and preserving an intercourse between the Mediterranean and the Red Sea. This trade, which flourished long before the Christian era, accounts not only for its situation but also for its wealth. As it lay between Egypt, Persia, and Greece, it was natural to expect that traces of the manners and sciences of those nations should be discovered among the Palmyrenes; who accordingly appear to have imitated the Egyptians in their funeral rites, the Persians in their luxury, and the Greeks in their buildings; and therefore the buildings, which now lie in ruins, were probably neither the works of Solomon nor of the Seleucidæ, nor, few excepted, by the Roman Emperors, but of the Palmyrenes themselves.

Palmyra was formerly encompassed by palms and fig-trees, and covered an area, according to the Arabs, of nearly ten miles in circumference; and might probably have been reduced to its present confined and ruined state by the quantities of sand driven over it by whirlwinds. The walls of the city are flanked with square towers; and it is probable, from their general direction, that they included the great temple, and are three miles in circumference. But, of all the monuments of art and magnificence in this city, the most considerable is the temple of the sun. The whole space containing its ruins is a square of 220 yards, encompassed with a stately wall, and adorned with pilasters within and without, to the number of sixty-two on a side. Within the court are the remains of two rows of very noble marble pillars, thirty-seven feet high; the temple was encompassed with another row of pillars 50 feet high; but the temple itself was only 33 yards in length, and 13 or 14 in breadth. This is now converted into a mosque, and ornamented after the Turkish manner. North of this place is an obelisk, consisting of seven large stones, besides its capital and the wreathed work about it, about 50 feet high, and, just above the pedestal, 12 in circumference. Upon this there was probably a statue, which the Turks have destroyed. At a small distance there are two others, and a fragment of a third, which gives reason for concluding that they were once a continued row. There is also a piazza 40 feet broad, and more than half a mile in length, enclosed with two rows of marble pillars, 26 feet high, and 8 or 9 feet in compass; and the number of these, it is computed, could not have been less than 560. Near this piazza appear the ruins of a stately building, supposed to have been a banqueting house, elegantly finished with the best sort of marble. In the west side of the piazza there are several apertures for gates into the court of the palace, each adorned with four porphyry pillars, 30 feet long and 9 in circumference. There are several other marble pillars differently arranged, on the pedestals of which there appear to have been inscriptions both in the Greek and Palmyrene languages, which are now altogether illegible. Among these ruins there are also many sepulchres, which are square towers, four or five stories high, and varying in size and splendour.

Liebeg, the well-known chemist, has been elected a foreign member of the Academy of Sciences in Paris, in place of the late M. Tiedmann.

An equestrian statue of King Charles Albert, executed by Baron Marochetti, at London, has arrived at Turin.

ODE TO SACRED ART.

O beautiful, soul-lifting Angel of Art!
Thou hast strength for the *spirit* and grace for the *heart:*
So in heaven, when unclouded and balmy the weather,
Glow the sun and the moon in grand union together.

Thou dost look o'er creation, and straightway it glows
On the bosom of Mind as an opulent rose
That the Deity fashioned when leaning, of old,
O'er the dark sea of Chaos, His glory He rolled.

Thou art coronaled Priest for the fair of mankind
By thy mission in beauty immortal enshrined:
At thy touch, all of matter is ever our own,
And the Universe turns to Humanity's throne.

But a triumph still holier, grander is thine,
In whose light thou art clothed in a mantle divine,
When thou wav'st beyond planets thy heavenly rod,
And the soul walks on high in the temple of God.

This thy acolytes knew in the great olden time
When a Raphael, a Rubens illumined their clime
With the angelic forms and the sweet seraph looks
That are sung on the harp of the Book-of-all-books.

How immortal their canvas reflecting that zone!
Over centuries past it has deathlessly shone:
Over ages to come it will glow with the light
That the Merciful gives to Humanity's night.

On the grand page[*] before me their glories appear,
Twined with others that flame in the same sacred sphere.
Yea, beautiful, soul-lifting Angel of Art!
Thou hast strength for the *spirit* and grace for the *heart*.

Wm. R. Wallace.—*Household Journal.*

CHURCH BUILDING INTELLIGENCE.

Considerable progress has been made with the new church of Newtownmountkennedy, and the building, which promises to be a handsome one, will be completed within a very limited period.

The new Roman Catholic Church, for some time in course of erection at Arklow, is now nearly completed, and will be dedicated on the 18th of August. The plan is cruciform, comprising nave, transepts, portico, bell tower, collateral porches, &c., and is in length externally 140 feet, by 47 feet in width—which is of chiselled granite—except at the front, where it is 53 feet wide. The bell tower will be 100 feet in height.

St. Bridget's new church at Clogherinkoe, county Kildare, being erected under the direction of Mr. Butler, architect, and comprises on plan nave, chancel, south porch, and tower at western end, which will be surmounted by a spire. The style is early decorated, and external buttresses between crisped-headed oblong windows, and open timber roof, stained and varnished, are amongst the principal features in the design. The estimated cost is about £3,000.

A handsome marble altar has been fitted up in the parish church of Blarney by Mr. Scannell, of Cork.

A new church is to be built in the town of Dingle, and Miss Hussey has already contributed £8,000. The site is that of the old church.

A new church is to be built at Lower Falls, Belfast, according to plans by the architects to the Ecclesiastical Commissioners, and the same body are also about erecting a district church at Clanabogan, Co. Tyrone.

The new church of Clenor, Kilavullen, will be consecrated on the 1st Sunday in June, and was erected after the designs of Sir John Benson, C.E. and architect, whose services were gratuitous. It is thus described by the *Cork Examiner:*—It is Gothic, oblong in shape, with a high-pitched roof, the side walls flanked by strong buttresses, and having at the western end a gable surmounted by a handsome belfry. Its length in the clear is 100 feet, and it is 36 wide. Upon the northern side it has four windows, and a beautifully moulded porch; on the southern side it has five windows corresponding with those on the opposite side. Each window is 11 feet high by 5 broad, and has two lights, divided by a stone mullion and headed by tracery. The jambs and mullions are all of cut stone, executed in the yard of our fellow-citizen, Mr. Egan; they are each furnished with ventilators, around which, as around the whole windows, a ruby border has been disposed. In the western gable there is a noble stained glass window 24 feet by 12; and in the chancel at the opposite end there is a trefoil window, 8 feet in diameter, also of stained glass. At the chancel end there are two sacristy rooms, lit by three windows similar to those in the main building, and also distinguished by the ruby border. There are six buttresses at either side, which may be regarded as models of strength, combined with lightness. The effect of the interior is excellent. It has an open timber roof, the principals of which are supported on stone corbels, carried down considerably below the eaves. It is calculated to hold 2,000 persons at once. Mr. P. Coleman, of Mallow, the builder, has executed his work in a most creditable manner. The glazing has been done by the well-known house of Maurice Brooks, of Dublin. The cost has not, we believe, exceeded £2,000.

---

[*] Of an Illustrated Family Bible.

Extensive improvements in connection with St. Mary's Catholic Church at Navan are projected. The building is 72 feet wide, and yet found inadequate for the requirements of the congregation. The *Freeman* gives the following particulars of the proposed works:—It is intended to divide the church interiorly into nave and aisles by lofty arcades, crowned with entablatures, and supporting a deeply panelled elliptic ceiling, rising into the vast expanse of the present roof. The design also includes a circular apse or chancel for the high altar, crowned by an elliptic semi-dome. These additions will make the interior second to scarcely any interior in this country. Externally it is intended to decorate the principal front with two campanili in the Italian style, each rising to a height of over 100 feet, and crowned with an open lantern and massive gilt cross. Between the campanili will be an open piazza, forming an extensive covered entrance to the staircases, nave, and aisles. The piazza will support a new front decorated with arcades of window openings, covered by a figure of the patron saint. The new front enclosed between the massive and lofty bell towers will present an imposing appearance. A commencement will be made by erecting one of the bell towers. The design and superintendence of the improvements have been intrusted to Mr. Bourke, the architect of the Mater Misericordiæ Hospital.

Cathedral of St. Mel, Longford.—This great church extends in exterior length over two hundred and fifty feet, its breadth across the transepts is over 130 feet, across the nave and aisles 87 feet, and 60 feet to the crown of the ceiling. Ionic columns, in native limestone, divide the nave from the aisles and the aisles from the transepts. The columns support a lofty arcade, which is ornamented with devotional figures of demi-colossal size, all crowned by a rich entablature, from which springs a deeply-coffered dome ceiling, pierced by lenette windows. The building was designed and the erection of the walls superintended by the late Mr. J. B. Kane The design and superintendence of the completion were entrusted to Mr. Bourke, who was permitted to modify the design so far as to considerably improve and beautify the interior. Over the great centre vestibule has been commenced the erection of a cupola, or campanile, which will consist of three stages, each stage forming a temple, and richly decorated with pilasters, cornices, and niches for statues. The centre stage will be decorated with coupled Ionic columns, pilasters, and pediments supporting inverted trusses. The entire will be surmounted by a dome, which will terminate in an open lantern, finishing with a rich scroll cross of gilt bronze, 166 feet from the surface. The campanile is being erected from an original design by Mr. Bourke, and after its completion nothing will remain wanting to the perfection of this splendid Christian temple but the great portico of six columns, extending across the front ninety-four feet, which has yet to be erected. The sum already expended on this building is between thirty and forty thousand pounds.

The foundation-stone of a new Catholic cathedral will be laid at Monaghan on the 18th inst.

The want of a second church for the neighbourhood of Clontarf, Dollymount, &c., has been long felt, but we learn that it will shortly be supplied by the erection of a suitable building, the funds for which will be subscribed for, and a gentleman is ready to undertake the immediate commencement of the work. A difficulty may arise as to the site, but we hope that too will be speedily surmounted.

The time for sending in tenders for the erection of St. Andrew's Church is extended to the 29th inst.

A new district church is to be built at Clanabogan, county Tyrone, according to plans by the architects to Ecclesiastical Commissioners.

The church of Carberry, county Kildare, is to be enlarged under similar directions.

Notes of New Works.

A new harbour, according to plans by the district county surveyor, Mr. Frith, is proposed to be constructed at Bray, and preliminary arrangements have been commenced.

A new infant school is proposed to be built, and tenders are being taken for same, at Loughgall, county Armagh. Mr. W. J. Barre, architect.

Plans have been prepared by the same architect for the superintendent's house of the Dublin and Belfast Junction Railway at Dundalk, to be immediately carried out. Outlay about £900.

A stand-house, principally constructed of stone, but the upper portion of timber, and in the Swiss style of architecture, has been built on the race course, about two miles from Loughrea.

The houses at the corner of Dame-street and Eustace-street, recently purchased by the proprietor of *Saunder's Newsletter*, are to be taken down and rebuilt; the shop, or wareroom façade, will be of a highly ornate character, from designs by Mr. Charles Papworth. Mr. William Hughes has been declared the contractor.

Additions and alterations are about to be made to New Brighton House, at Shankhill, for H. W. Smith, Esq., under the directions of Mr. J. J Lyons, architect. The present structure is a commodious cottage of neat but unpretensious architectural character, with about 47 feet frontage, and 36 feet depth, and it is proposed to convert it into a villa residence, by raising it an additional storey, for bed and bath-rooms, &c., forming a principal staircase, and remodelling the halls, which will be decorated with new Corinthian columns, &c., and entablature, and be floored with encaustic tiles. A conspicuous feature on principal front will be two handsome oriel windows, fitted with plate glass, and carried up two storeys in height, equidistant from centre about 12 ft. 6 in., but connected together on principal floor by a long glass passage, serving as an outer porch, and on the first floor by an open verandah, with curvilinear roof supported on handsome cast-iron brackets, ensuring during summer a pleasant lounge to enjoy the magnificent views of the bay and coast, which the position commands, and also serving as a receptacle for exotics and other plants, and in winter affording much additional protection from inclement weather. A cantilever roof projecting two feet or thereabouts, and having blocks and brackets underneath, will surmount the entire house, and contribute to the general architectural effect.

The Dundalk Steam Packet Company are about erecting a house and offices, two storeys high, and with about 40 feet frontage. Tenders to 5th inst.

The Dublin and Meath Railway is so far advanced that an engine can travel on portions of it. Overseers and plate layers are night and day engaged with the permanent way, and about 1,200 men are constantly at work. Messrs. Moore are the contractors.

It is confidently hoped that some nine miles of the Dublin, Wicklow, and Wexford extension line will be opened between the town of Wicklow and Rathdrum about the middle of July. The rails are laid down over a portion of the new line, over which the contractor's engine will pass in a day or two. The permanent way is solidly constructed, some eight or nine fine stone bridges spanning the various roads crossed in its way.

ROYAL IRISH ACADEMY.

At a meeting of this body on the 27th ult. a letter was read from Sir Thomas Larcom, stating that he was directed by his Excellency to inform the academy that the Lords Commissioners of her Majesty's treasury had sanctioned an expenditure of £100 per annum in the recovery of antiquities, to be carried out through the instrumentality of the constabulary of the various counties. The letter stated that his Excellency felt assured that he might count on the assistance of the academy in a measure so useful and so much calculated to add to the valuable collection in the museum of the academy.

The Chairman said the method adopted for the collection of the "treasure trove" was very simple and satisfactory. Notices had been issued and published to the effect that his Excellency the Lord Lieutenant having been informed by the Lords Commissioners of her Majesty's Treasury that they will purchase native coin or other antiquities on same being given up, intimation was thereby given to all who might find such articles that on delivering them up to the sub-inspector, or some other member of the constabulary of the district, they will receive, through that department, rewards equal in amount to the full value of the articles. This plan was already producing very considerable effects, for several articles of interest had been recently forwarded to the academy for valuation, and he had no doubt that by the means of this scheme the academy would receive a great number of articles which would otherwise be lost to it. He thought the warm thanks of the academy were due to the government for this additional act of prompt liberality.

Thanks were voted to the government accordingly.

The Rev. Dr. Todd communicated some interesting particulars relative to the battle of Clontarf, from a series of volumes entitled the "Wars of the Irish and Danes," with the editing of which he had been intrusted by the Master of the Rolls in England, and which were said to have been written by the poet of Brian Boroihme He referred to portions of the contents of the manuscript as proving that it must have been written by one who had been an eye-witness of the battle, and he then alluded, at some length, to the historical facts of the battle.

Dr. Petrie said it was a general opinion amongst the people of the country, that Brian Boroihme was a great man, but he thought he was quite the reverse—that he was a man with military power and skill, but had done the greatest injury to the country. He made use of the Danes, and broke through the legitimate succession of the kings of Ireland. The popular belief that he banished the Danes was quite a fallacy.

Professor Haughton read an interesting paper "On the true height of the tide at Ireland's Eye on the night of the murder of Mrs. Kirwan."

New Organ.—The Messrs. Telford have just completed a handsome and powerful instrument, for the new church of Ballybricken, Waterford.

COLUMN FOR CRAFTSMEN.

MASONRY AND BRICKLAYING.

Next to the crafts of carpentery and joinery, the mason and bricklayer, either conjointly or independently, occupy the most important position in building construction, though unless in extensive works their skill is hardly ever called into more than ordinary requisition. We need not go farther than our own island, in some instances our own metropolis, for most excellent specimens of the mason's handicraft, though it must be conceded that our English brethren are infinitely before us in brick construction, that material being chiefly indigenous to their soil, and stone to ours. It is sometimes a matter of surprise to English tourists to see our one-storey houses reared with stone walls from eighteen inches to two feet, and exceeding in thickness, while those in certain parts of London, Liverpool, Manchester, and elsewhere, are not unfrequently, for whole streets, but *nine inches*, single brick, in thickness even for outer walls three storeys in height, producing to the inmates intolerable cold in winter, and at all periods of the year being, as may be inferred, most insecure and weak in construction. The art of masonry admits of as many gradations in point of excellence as any of the others, though it is more frequently practised after amateur fashion by a class who rejoice in the title of "handy-men," and who undertake to build a wall "as well as the best," but whose work, sooner or later, convinces him who has to pay for it that after all the *real* best is the cheapest. Of masonry, that most ordinarily in vogue is known by the term "rubble," and this too is subdivided into other classes; for instance, ashlar, when the courses are regularly or irregularly laid, the joints horizontal and vertical, horizontal and *not* vertical, random, angular, &c., respectively. For a better class of work it is usual to carry up the walls in courses averaging from 12 to 14 inches in height, each stone laid horizontally on its quarry bed, and its sides vertical, or nearly so, thorough bond stones being introduced at every 4 or 5 feet in length, the hearting filled in with spalls and grouted, the quoins, tail bonds, and opens (where brickwork is not employed) squared and rough, punched or hammered. The best class, however, and next to stonecutters' work, is that in which the above system is adopted, but each stone is separately and neatly dressed on its face, and the joints accurately fitted and breaking irregularly, the interstices between the larger blocks being filled in with smaller ones of same class of workmanship. Among the best specimens of this character of masonry within view of our local readers are the Church of St. Laurence O'Toole, Seville-place, and the enclosure wall of the Jesuit's house in Upper Gardiner-street. It is not unusual for some workmen to build what appears to the eye a very excellent wall, but which on examination is found to consist of two faces, the space between being hollow, or nearly so, owing to the hearting not being properly filled in, which is so requisite to ensure a compact mass. In constructing foundation walls, on which it is intended to erect a heavy superstructure, a very important addition of strength is obtained by introducing inverted arches the full width of the wall, and varying in depth according to circumstances, thereby distributing the weight more uniformly over the surface, and lessening the probability of settlements, and in all cases it adds to the stability to lay therein the largest and flattest stones procurable. For excessive strength and massiveness the ancients generally excelled in masonry construction;—witness the stupendous Egyptian pyramids, the great Roman aqueducts, the cathedrals of the middle ages, &c., and their secret of composing a mortar or concrete of extraordinary adhesive properties, hardening more and more with each century of its age, still remains unrevealed, though we must note as an exception to a general rule that recently during the removal of a portion of the south transept original wall of St. Patrick's Cathedral, we happened to be present, and could scarcely have imagined to exist, even in our modern buildings, constructed on the most economical principles—the common order of the day—a more heterogeneous mass of rubbish, of paving-stones and clayey mortar. It is unjust to suppose that the mason's art is confined to mere construction, and does not admit of architectural treatment, for by judicious adaptation of mere stones much imposing effect may be obtained for almost every known class of structure, but more especially in that of a domestic character. In ordinary masonry, mortar composed of *two* parts of sharp pit or fresh water sand to *one* part of best slaked lime is employed, and where additional stability is desirable, a liquid composition called grout is poured over the work at certain stages. Oil putty cement is also sometimes used, and if properly composed, will stand longer than most stones. For masonry construction the materials found in Ireland are peculiarly favourable, granite being unquestionably the best and the *driest*, not requiring, where a good quality is obtainable, any brick lining to render dwellings or other buildings free from damp. The Boyne viaduct piers and abutments —a most stupendous work—are constructed of a very excellent limestone, which answers the purpose admirably; but where this class of stone, or the calp black stone found in the vicinity of Dublin, is used for habitable buildings, brick lining is indispensable.

EFFLUVIA FROM THE LIFFEY.

The summer heat invariably superinduces the exhalation of noxious effluvia from any river used as the sewerage medium for the inhabitants of a populous city, and we are very early reminded this year through our nasal organs of the innoxious atmosphere circulated from the bed of Anna Liffey. Poisonous gases, to an almost unlimited extent, are emitted at certain stages of the tide from flowing, as well as stagnant water, when fœtid deposits from main sewers and cesspools exist therein; and of course in the same ratio as the filth increases, so does the stench and the consequent deleterious effects. Compared with other rivers in the kingdom on which chief cities are built, ours is but "a mere ditch," yet, comparatively speaking, the inconvenience experienced from its exhalation has been trifling until recently; but we must remember that, as with each succeeding year, the city and its population are increasing in magnitude, so also are the numbers of sewers emptying themselves into the river, and therefore the effect is becoming more and more perceptible. What person who has ever stood on the ferry steps—where, through some very questionable wisdom, the main sewers from north and south sides respectively are made to discharge — but has not been nearly stifled by the emissions therefrom, and by the bubbling gases from the inky stream? On one of those many hot days which have recently prevailed, we were forcibly struck with the insufferable effluvia exhaled, and which is in proportion to the narrowness of the river, it being generally greatest along the line of quays from Carlisle to King's-bridge, and more especially so in proximity to the former, the most important thoroughfare and most densely populated. A forcible and practical argument is here presented for the adoption of a different principle of sewerage, and though heartily wishing for the application of a remedy, we might be accused of chimerical speculation to suggest one in the *present* state of corporate finances, and which, in short, would be the total annihilation of the present sewers and the construction of new, emptying themselves, as at Paris, into a reservoir many miles from the city. There seems to be no remedy, therefore, but for our citizens to take the consequences, and *if* they be as we have reason to apprehend they *will* be, the *sooner* those who can afford it seek the unadulterated air of the suburbs *the better*.

FREQUENCY OF FIRES.

The popular remark that "misfortunes never come alone," would seem equally to apply to the casualty of fire, which for lengthened periods is happily unknown, but as soon as one breaks out, a series is sure to follow, as if the demon of destruction had been aroused from his slumbers, and in revenge for the disturbance applied his flaming torch to every available object within his reach. Never, perhaps, has the coincidence—or fatality, or whatever we may term it—been more apparent, at least as regards this city, than during the past month, when no less than *six* fires of greater or lesser importance occurred, providentially, however, unattended with loss of life. The three most important were those at O'Neill's, Corn Market (a builder's premises); Fitzsimon's, Bridgefoot-street (an extensive timber yard); and Melmer's, Grafton-street (a silversmith's); but in the former instance both the amount of property consumed and misfortune inflicted was considerably in advance of the others, while *all* serve in some degree to illustrate the necessity for greater precautionary measures against the extension of the evil than at present. The "fatal half hour" is so hackneyed a concomitant to every casualty of the kind, that we need only allude to it, and express a hope that, sooner or later, means may be adopted to save that most precious period; but the disorganization of the body to apply an opposing power to the destructive element is so unpardonable as to demand the severest censure and the most speedy remedy. When a fire is announced, instead of each man hurrying systematically to his post under the direction of a conductor, all is scrambling and confusion, searching for the fire-plug, and fumbling with the hose, running to and fro, each in the other's way, and undoing what the other does to facilitate the suppression of the calamity, while in the interim the insidious demon is effectually doing his work, and more firmly ingratiating himself in the doomed premises. As a body, both the brigade men and the constables are earnest and efficient, but like an army fighting without a general, their capabilities are not fairly brought into play. The city ought to be divided into at least two districts—north and south—each under the charge of a "fire captain," who, on the alarm being given, should adopt prompt steps to bring the brigade to the spot, direct their operations, obtain a supply of water, &c., &c. Until this course is adopted, it is wasting speech to talk about "the fatal half hour," which is an indispensable attendant on the present want of system.

M. Joubert has perfected a process of transferring photographs to glass. The *Athenæum* speaks of the beauty and cheapness of the process. Portraits, views of localities, &c., are indelibly fixed on the glass, defying time and weather in the open air.

LAW NOTE.—COMMON PLEAS.

Kempston v. *Butler*.—A motion has been made in this well-known case to amend the postea. The arguments were altogether of a technical nature. The court refused the motion.

Sergeant Armstrong, Mr. Heron, Q.C., and Mr. O'Driscoll, appeared for the plaintiff. Mr. Exham for the defendant.

VILLA SKETCHES.

ONE of the illustrations accompanying the current number is the first of a series which we propose to give from time to time of designs for suburban villas, and which may probably be reproduced hereafter in another form, with the corresponding plans, sections, details, and specifications. Professional gentlemen practising in Ireland are invited to forward to the editor of this journal, for publication, drawings of their works, which may be comprehended under this head, and may present architectural features of an uncommon and meritorious character; such drawings to be—whether perspective or geometrical—of the suitable size for our page, and to be subject to approval.

Miscellaneous.

TIMBER.—At Messrs. John Martin and Son's periodical sale, on the 16th ult., the following goods were disposed of:—

14 hd., second quality Quebec deals, £15 5s. to £15 10s. per standard hundred.

57 hd. St. John's deals, £13 15s. to £16 10s., average £15 2s. 6d., per standard hundred.
2 hd. second quality pine deals, £21 5s. do.
3 hd. first quality do., £28 2s. 6d. do.
2 hd. first quality spruce deals, £19 2s. 6d. do.
3 hd. Memel plank, £21 5s. to £22 10s. do.
13 hd. red deals and battens, £22 to £27 2s. 6d.
131 pieces Memel timber, 70s. to 80s., average 75s. per ton.
54 do. red pine timber, 60s. to 70s. do., average 67s. 6d. do.
38 do. yellow pine timber, 55s. to 57s. 6d. do.
2 fathoms Dantzic lathwood, at 90s.

TRAMWAY TO THE PHŒNIX PARK.—This splendid regal domain, situated in the vicinity of a large town, presents advantages unequalled in any other part of the empire; but the benefits are almost exclusively confined to the affluent ranks of society, owing to its distance from the central point of the municipal boundaries. A tramway running from Carlisle-bridge, along the quays, to a spot near the great entrance, would remedy this defect, rendering the gifts bestowed by nature, and the privileges granted by the State available for all classes of the community. Extended opportunities will be afforded to the people for indulging innocent recreation and healthful enjoyment, by means of a cheap and regular species of conveyance, the value of which it is expedient should be generally known in order to become generally appreciated.—*Packet.*

THE HOUR PAYMENT SYSTEM.—The masters in the building trade who have adopted this system have nearly all their complement of men, and some who have their shops full are obliged to turn away numbers of good hands seeking employment under the new regulations. The opposition of the Trades' Union is becoming more outrageous. Men who might be in full employment at good wages, spend the day on picket, and in hooting and jeering the men who have accepted a system of payment which in many instances has raised their earnings to thirty-nine shillings per week.

HISTORY OF WATER COLOUR PAINTING.—An exhibition, illustrating the history of this art and of works by female students, opens this date at the Society of Arts, London.

INSECURE PALING AT KINGSTOWN PIER.—The inhabitants consider the paling along the side of the footway leading from the East Pier to the Victoria Baths as unsafe, particularly for children and restive horses. If (says the correspondent of the *Freeman)* the latter are startled by the railway whistle, there is nothing to prevent another lamentable affair, similar to the Portobello Lock, taking place. It is to be hoped the Board of Works will see to it ere it be too late.

THE WELLINGTON TESTIMONIAL, PHŒNIX PARK.—The *Freeman*, referring to the above, says:—The bronze bas reliefs by Kirk, Farrell, and Benzoni are now being erected on the base of this monument, and the public will soon have an opportunity of judging of their effect. They are admirable works of art, and will be a decided improvement to the huge obelisk, which was too long left in an unfinished state. The bas relief representing the Duke at Seringapatam, which was designed by W. Kirk, is the only one completed. At present, however, it is not visible, having been covered over by direction of his Excellency until the four sides have been filled in, when they will be simultaneously exposed to view, on which occasion we believe some public ceremonial will take place. We shall then enter into a detailed criticism of these works of art. The fourth side of the base contains an inscription both in Latin and in English, composed by the Marquis of Wellesley; and the panel is ornamented with a ducal crown and a wreath of oak leaves. The large pedestal in front, originally intended for an equestrian statue, has been removed. This we think most judicious, as in our opinion it has the effect of improving considerably the appearance of the testimonial.

BRAY COMMONS.—From the same source we learn that to-day (Tuesday) the Bray Commons Commissioners, John Ball Greene, Esq., and J. B. Orpen, Esq., visited the Common with the contractor, Mr. Byrne, of Dublin, with a view to inspecting the works so far as they are carried out, and also to arrange for having the pleasure ground portion of the Common laid out so as to be available during the present season. This portion will consist of the south-western section of the Common, lying between the new road and the river. A fine fountain will play in the centre, and well arranged grass plots will be exhibited, intersected with smooth gravel walks—the views of the leafy valley down which Bray river winds, and the mountains in the distance, giving an unrivalled brilliancy to the scene.

RAILWAY ARBITRATION.—Messrs. Watkin & Broughton, the referees of the Midland Great Western and Meath Companies respectively, met recently in Dublin to consider the arrangements proper to be made between the two companies. The period within which their award is to be made has been enlarged to the 1st prox.

THE SUNDAY OPENING OF THE BOTANIC GARDENS.—At a general meeting of the members of the Royal Dublin Society on the 27th ult., the proposal to open the Gardens to the working classes on Sundays was negatived by 207 votes to 40. Lord Talbot De Malahide voted in the minority.

GAS LIGHT AT PAKENHAM HALL.—The Right Hon. the Earl of Longford having a short time since employed Messrs. Edmundson & Co., of Capel-street, to erect one of their patent gas apparatus at Pakenham Hall, the work has been brought to a successful termination.

MUSGRAVE'S PATENT STOVE.

This Stove is the nearest approach to warming by hot water.

It will burn in churches from Saturday till Sunday evening, avoiding attention during the hours of worship. In halls will burn day and night for weeks, with little care.

Capable of warming a large apartment for 24 hours, at a cost of Threepence; and deserving of special attention, because of its safety, healthfulness, durability, and extreme simplicity.

MUSGRAVE'S PATENT STABLE FITTINGS.

MUSGRAVE'S PATENT IRON COW-HOUSE FITTINGS,

As approved by the Board of Works, adopted in the Ulster Model Farm, and by many of the most eminent Stock Breeders in the Kingdom, are made wholly of iron, very durable, cleanly, and attractive in appearance. The fodder is always fresh, being exposed to the air, removed from the breath of the animal, and separated from the roots or damp food. The range of troughs can be quickly filled with water for the use of the Cows, or for washing out in case of epidemic; and the cost is very moderate.

THESE INVENTIONS, BEING REAL IMPROVEMENTS, DISTINGUISHED FOR STRENGTH, SIMPLICITY, AND PRACTICAL USEFULNESS, WILL REPAY INQUIRY.

MUSGRAVE, BROTHERS, are also Makers of Wire Fencing, Hurdles, Field and Entrance Gates, Corn Rick Stands, Conservatories, Hot-water Apparatus, Verandahs, Rural Bridges, &c.; and their Works being favourably placed fo rcheap labour and materials, they can offer corresponding advantages in price.

MUSGRAVE'S PATENT FIELD GATES HAVE GAINED THE FIRST PRIZE FROM THE R. I. A. SOCIETY, FOR STRENGTH, DURABILITY, & CHEAPNESS.

FOR PARTICULARS, ADDRESS

MUSGRAVE, BROTHERS, ANN-STREET IRON WORKS, BELFAST.

Mr. John J. Lyons, Architect, &c.,

17, LR. GARDINER-STREET,

PROPRIETOR AND EDITOR OF

"THE DUBLIN BUILDER."

OAK TIMBER.—500 Superior Oak Trees, of very ancient growth, ready marked, will be Sold standing in OAK PARK WOOD, either by measure, or in bulk, and either with or without bark; the Timber will be felled and drawn out of the Wood by the Proprietor. Oak Park is close to the town of Carlow, through which both Railway and Canal from Dublin to Waterford pass daily. Apply, by letter, to Geo W. Bolton, Coolbaun, Enniscorthy. Mr. John Healy, Forester, Oak Park, will show the Timber.—15th April, 1861.

THOMAS HENSHAW & CO.,

WHOLESALE & RETAIL FURNISHING AND BUILDERS' IRONMONGERS,

AND GENERAL HARDWARE MERCHANTS,

5, CHRIST CHURCH PLACE, and 15 and 16, KENNEDY'S--LANE,

BEG to call attention to their extensive, varied, and well-selected Stock of Ironmongery in all its different branches. It consists of Parlour, Drawing-room, and Bed-room Grates; Kitchen Ranges, Sash Weights; Iron Rim, Mortise, and Stock Locks; Hinges of all descriptions; Wrought and Cut Nails, O. G. Gutters, Down Pipes and Fittings, Metal Skylights, Ventilating Bricks; Cast-iron Chimney-pieces, with and without Grates; Rabbit Traps, Fox Traps, Galvanized Wire Netting, Sheet and Perforated Zinc, Sink Traps, Furnace Doors and Frames, Hot Air and Plain Stoves, Cast-steel Digging and Manure Forks, Slashing Hooks, Rakes, Spades, Shovels and Hoes.

Manufacturing and General Ironmongers and Tool Warehouse—81, MIDDLE ABBEY-STREET.

Spade, Shovel, and Tool Works—CLONSKEAGH.

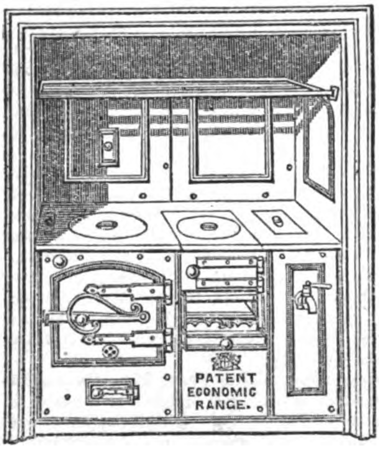
Agents for Perry's Patent Fire-proof Safes; quality considered, they are *the* cheapest in the market. Builders are invited to inspect our Stock previous to purchasing, at

5, CHRIST CHURCH PLACE.

Kitchen Ranges, with high pressure Boilers for Steaming or Bath purposes; Galvanized Iron Roofing, and Fencing Wire, best quality.

CLARK AND HUNT,

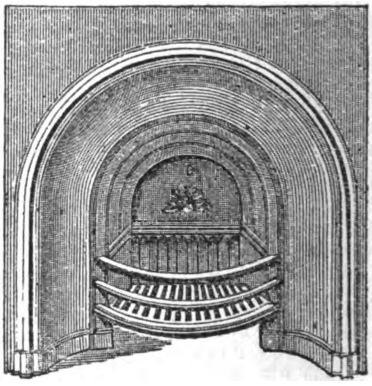
IRONMONGERS, FACTORS, & GENERAL MERCHANTS, 159, SHOREDITCH.



A LARGE ASSORTMENT OF BAR, SHEET, AND HOOP IRON,
RANGE AND STOVE METAL.

Also a great variety of Elliptic, Register, Cottage, and other Ranges, fitted, always in Stock.

Register Stoves, with Solid Bars, per inch, 4½d.
Improved New Pattern Circular Check Register, with strong Bars and Trivets, 5d. per inch.
Best Solar ditto, with Fire-brick Back, per inch, 10d.
Bright Stoves, with Two Fires, 40s. to 100s. each.
Best Cut Clasp and Rose Nails.
1½-inch—15s. 1¾-in.—15s 2-in.—14s. 2½ in.—13s. 3-in.—12s. per cwt.
Best Sheet Cut Floor Brads, 12s. Best Cut Lath Nails, 15s. per cwt.
Cast Rain-water Pipe, 2-inch—9d.; 2½-inch—11d.; 3-inch—1s. 1d. per yard.
Cast Gutters, 4-in.—8d. O G Gutters, clip on, 4-in.—11d. 4½-in.—1s. 1d. per yard.
Patent Line, Nos. 2—3s. 6d; 3—4s.; 4—5s.; 5—7s.; 6—9s. per gross.
6-inch Rd. Ward Mortise, with best Furniture and Patent Spindles, 2s. 9d. each.
Light Elliptic and Register Metal, 13s. per cwt.
Dr. Arnott's Ventilators, 4s. each.
Brick Moulds kept in stock. Any size made to order.
BLACK ANNEALED FENCING WIRE, 12s. per cwt.



BEST BERLIN BLACK REGISTER.

Best Self-acting, with Bright Wought Bars.

34 inches	54s
36 "	56s.
38 "	58s.
42 "	60s.

Self-acting Cottage, with Oven and Back Boiler.

30 inches	24s.
32 "	26s.
34 "	28s.
36 "	30s.

Best Japanned Registers, 40s.; Berlin Black, with Bright Mouldings, 60.; Bright Fronts, with Ormolu Ornaments and Two Sets of Bars 90s.; Improved Cast Mangers, with Wought Hay-rack and Water Trough, fitted, 45s.

AN ILLUSTRATED BOOK OF PATTERNS WILL BE SENT ON RECEIPT OF POSTAGE STAMP.

TO ARCHITECTS AND BUILDERS.

Stained Glass.

FLAT LEAD, WINDOW, AND PATENT METAL SASH MANUFACTORY,

107 & 108, **MIDDLE ABBEY-STREET, DUBLIN.**

M. & R. SILLERY

Beg to inform parties requiring the above, that they have erected EXTENSIVE MACHINERY for facilitating the execution of STAINED GLASS, and are now prepared to furnish all descriptions of Work fully 30 per Cent. lower than any other House in Dublin, also of superior Designs and Finish, and respectfully invite an inspection of their Patterns.

PANES, per Foot super.	s.	d
White Enamelled Ground and Clear Ornament	0	8
Ditto, richly coloured	1	6
Enamelled Flocked Patterns for obscuring the view, suited for Water-closets	1	4
Ornamental Enamelled White Panelled	0	10

BORDERS, per Foot Lineal.	s.	d.
White Enamelled Ground & Clear Ornament from	0	3
Ditto, coloured	0	7
Ruby Ground, with Bright Ornament	1	3
Ditto, Blue	1	6
Rosettes, from	0	1

Embossed Patterns on Ruby and Blue, with Bright Ornaments—a new and beautiful Description of Work for Panels in Doors. Quarries and all other Descriptions of Ornamental Stained Glass, suited for Ecclesiastical and Domestic use. Ruby and Green Signal Lights, and all descriptions of Bent Glasses for Carriage and Car Lamps, in Stock and to order.

The Dublin Builder.

Vol. III.—No. 36.

LONDON.

VISIT as often as one may this vast metropolis, in which upwards of *two millions eight hundred thousand* of the human kind are congregated, there is always a something new to be learned, some additional subjects for reflection and conversation presented. Where will its extent terminate? when be clipped its ever-growing wings? are questions of universal and frequent submission; and indeed assuming *future* growth to be proportionate to the *past*, the most astute calculator would experience difficulty even in hazarding an approximate answer. Old London is gradually paling before the requirements of a progressive age, and its quaint timber and brick gabled structures, with storey over storey projecting, and other antiquated features, give place to palatial *commercial* and palatial *domestic* structures. Each succeeding year brings to this focus some forty-four thousand newly ushered beings into "this breathing world," to be housed, fed, and otherwise provided for; hence the ever increasing character of its suburbs. And yet withal, except for its vastness, London cannot, in the ordinary acceptation of the word, be styled *a great city*. Its thoroughfares are distributed without system, and inconveniently narrow where most required to be the reverse; its public buildings—some of which are rich in merit—apparently studiously placed to the greatest disadvantage, and architectural *morceaux* mingled in a heterogeneous medley with dilapidations and monstrosities. The Londoners, however—or rather the custodians of the public purse in their behalf—are gradually repairing their mistakes in the former regards at least, and the two most favourite projects at present on the *tapis* are "the embankment of the Thames and the metropolitan underground railway," which latter is at certain points already far advanced—and along the New Road and at King's Cross, where a large block of buildings has been raised, is truly a stupendous work. It is a matter of much surprise that the characteristic acumen of the Englishman should have so long remained in abeyance as not to have realized before this the long talked of "line of quays" for which their river Thames presents such a magnificent site. Wren originated the idea; its desirability never could be questioned; it would immensely relieve that densely crowded route from Charing Cross to the Bank, and contribute largely to the beautification of the city; yet still the embryo condition has not been exceeded. For instruction or amusement respectively, or for both combined, how endless are the sources presented in London; the Great Exhibition at Kensington Gore Gardens happening to be the chief event of the week in which we last visited it, we mingled in the streams of visitors that poured to that point where all the incomparable beauty, fashion, and wealth of the West End seemed to have been congregated. The Crystal Palace at Sydenham—excepting the repulsive feats thereat of the audacious Blondin, to view which a morbid curiosity attracts tens of thousands of visitors—the Floral Hall in Covent Garden, recently opened free to the public, and a host of other "lions" of the metropolis, are all subjects as familiar to our readers as "household words," so we need not stop to comment on them; but we must note an experience of much gratification at the Conduit-street exhibitions of "Architectural Designs" and "Building Inventions" respectively, to which we would suggest the desirability of an *immediate* visit by those who can spare time and the needful. Probably having imbibed some of the public distaste so unanimously felt towards the National Gallery as an architectural work, we invariably express a hope in passing by Trafalgar-square, that sooner or later that building may be demolished, and the area of the square extended and improved, so as to approximate to that of the Place de la Concorde, in Paris, of which it is now but a very paltry imitation. "Excursion trips" are, as usual at this season, the order of the day, and every available space is placarded with huge characters announcing "8 hours at Brighton and back for *half-a-crown*," "Liverpool, Manchester, &c., and back for 12s. 6d.," "to the Lakes of Killarney," &c.; and we may, perhaps, here appropriately remind our English readers that there *is* an exhibition of art and art manufactures at *present* open in this city, a visit to which, independent of the other local attractions—which are by no means few or insignificant—would "amply repay." We hope also that as a natural consequence of that enterprising spirit which distinguishes the arrangements of Mr. Marcus, the Excursion Manager of the London and North Western Railway, the principle will speedily be extended to Dublin. Out-door amusement is most palatable to the Londoner, especially to him who is compelled to live in town, and his usual routine is from his bed to his counting-house, and thence to his coffee-house, saloon, or tea gardens, and back again to *bon repos*. Some of the refreshment saloons so frequented are no mean architectural works as here and elsewhere, but are spacious and handsomely decorated, and, moreover, artists of considerable talent are engaged, the principal being Weston's, in Holborn, the Canterbury, at Lambeth, the Alhambra—formerly the Panopticon, in Leicester-square—Evans', Covent Garden, and the Oxford—a new establishment—in Oxford-street, near Tottenham Court Road. A loss is just now felt by the pleasure seekers in the magnificent hall of the Surrey Gardens, designed by Owen Jones, and destroyed last week by fire; however, we presume that this will be but temporary, as a grander and more spacious one is sure soon to be raised instead, verifying the proverb that it is "an ill wind that blows nobody good."

OUR EXHIBITION.

The public have become so much accustomed of late years to "great" exhibitions, that any new enterprise of that character, unless promising to be distinguished at once for its vastness and its excellence, is not likely to command general favour. There are, however, many degrees of merit, and it does not follow that if circumstances prevent the attainment of the superlative, the positive should be ungenerously criticised, and with that view we must regard the subject of our notice—viz., the Exhibition of Art and Art Manufactures, as already announced to be open at Kildare-street. Though pre-eminently excellent in the picture department, both of ancient and modern artists, it is, as regards the latter, almost purely a local affair, a fact greatly to be regretted; but as such, is to an extent creditable to the exhibitors, who comprise, in certain departments of trade, the leading firms in the city. We had recently, during a short visit to London, an opportunity of hearing at some of the first establishments there in the church ornament and building material manufacture line expressions of regret that greater publicity was not given to the project; in fact, many were not aware of its existence even since the inauguration, and this may account for the absence of contributions of the class alluded to, which would undoubtedly have been great acquisitions. To say the least, this seems to have been an oversight, and a serious one for more reasons than one, not the least important of which is, that numerous parties who would surely otherwise have been both visitors and exhibitors are precluded therefrom; and even in a financial point of view, the result must prove detrimental. The central hall is arranged with as much taste as the resources of the committee enabled them to bring into requisition, several handsome glass cases, containing the manufactures of Messrs. Elkington, Mason, & Co., Waterhouse, Acheson, Brunker, &c., and the collection from the South Kensington Museum, being amongst the most conspicuous objects in the middle of the passage, at either side of which are ranged some exquisite sculptural works from the chisels of John Hogan, J. E. Jones, Joseph Kirk, the Messrs. Farrell, H. Weekes, and other eminent artists; a great organ on a raised orchestra, and by Bevington & Sons, of London—built for the Paris Exposition of 1855—occuping an extremity of the nave opposite to the entrance porch, and a small, but well designed fountain, exhibited by Messrs. Edmundson & Co., immediately opposite the doorway leading to north saloon. Various banners, comprising the arms of Dublin, and those of the provinces of Ulster, Munster, Leinster, and Connaught, decorate this apartment, and to the right and left, under the galleries, are stalls in which Messrs. Edmundson & Co., ironmongers, &c., &c., John Maguire (ironmonger to Royal Dublin Society), Hodges & Sons, ironmongers, Gregg & Son, glass importers, &c., Austin & Co., dressing-case, &c., manufacturers, display goods of peculiar excellence in their respective lines. As usual on such occasions, the musical instrument depots are thronged with fair visitors, and in this branch of art Messrs. Gunn & Sons, & Scates have a goodly collection. Irish manufactures in the poplin department especially maintain their usual famed position at the stalls of Messrs. Fry & Co., and O'Reilly, Dunne, & Co, and some superbly executed cabinet furniture specimens are exhibited by the former firm, as also by Messrs. Young & Groves, and P. Browne, such indeed as may fairly compete with manufactures of a similar character in any part of Great Britain. Amongst the building materials are chimney pieces from the noted establishment of Maurice Brooks, and one of pure Carrara marble, in the Italian style, very admirably wrought by Mr. Hibson, together with a sleeping boy in statuary and pedestal, by same manufacturer. Mr. Lavender's collection comprises Sir Walter Scott's, and the Warwick vase, in Terra Cotta, &c. Limerick and other lace specimens are exhibited by Messrs. Allen & Co., & Forrest & Co.; and Mrs. Crawford, of Killashee, displays some Maltese and English lace, which, however, does not stand the comparative test. Passing hence to the south aisle—or "saloon," as it is termed—we find one of the choicest collections of the works of ancient artists perhaps ever brought together, and comprising the works of Rubens, Rembrandt, Hogarth, Paul Veronese, Salvator Rosa, Vandervelde, Sirs Joshua Reynolds, Thomas Lawrence, William Beechey, Peter Lely, Godfrey Kneller, Vandyke, the Caracci, Claude Lorraine, Poussin, Carlo Dolci, Domenichino Correggio, Wilkie, and a host of others, in all some 500 pictures, and in the corresponding or north wing are the modern artists' works, amongst which we have only to mention the names of P. Van Schendel, Mulready, Eastlake, Redgrave, Maclise, Landseer, Hasenpflug, &c., &c., to convey an idea of their excellence. Though we do not pretend to submit this as a critical disquisition on the merits of the several works exhibited, we cannot refrain from pausing, and, without prejudice to others, to note No. 82, the ruins of the cloisters of Walkenrind, "snow at the entrance, with gleam of winter sunset in the interior," by Hasenpflug, as a marvellously effective picture. But the chief attractions are a colossal picture, by Schlingeneer, contributed by the King of the Belgians, occupying one extremity of the south saloon, a battle piece being at the other, and "The Sisters of Mercy," by Miss Brown, a recent acquisition. The architectural contributions, though not as numerous as might be desired, are nevertheless, in many instances, highly meritorious, especially those by Mr. Goldie, for the interior of Phibsboro' Roman Catholic Church, St. Patrick's, Bandon, SS. Peter and Paul's, Berne, and a collection of architectural designs, all very beautifully designed and handled. Mr. Ashlin (Pugin & Ashlin) exhibits his designs for the proposed Augustinian Church and Monastery, Dublin (illustrated in our number for May 15), for the cathedral church of S. Thomas, Northampton, in which considerable professional talent and beauty of manipulation is displayed. Mr. Lynn's (Lanyon, Lynn, & Lanyon) design for St. Andrew's Parochial Church (two views of which have appeared in this journal) is seen in a photograph, the original drawings being in the Royal Hibernian Academy Exhibition, and of same building are designs by Mr. Atkins, Cork, and by Mr. M'Curdy. Amongst the other architectural contributors are Mr. Rawson Carroll, who has a beautifully executed card model of the Molyneux Church and Asylum; Mr. C. Geoghegan, a drawing of St. Mary's Institution for Catholic Blind Females (the subject of our present illustration); Mr. M. B. Moran of St. Augustine's, Drogheda; Mr. O. T. Healy, west front of a church, &c. Besides Mr. Bedford, a London gentleman of the highest eminence as a photographer, Prof. Glukman, Simonton & Millard, and other of our local photographers have several important cases of portraits, views of buildings, stereoscopic subjects, &c.; and in the lithographic art Mr. Harty and Messrs. Forster's productions claim special attention. The eminent firm of Hardman & Co., mediæval metal and brass manufacturers and sculptors, as usual sustain their well acquired reputation for beauty of design in ecclesiastical furniture, monumental structures, &c., and not less in the execution of the work, which is all that can be desired. Somewhat in the same style—and with merit too—is the old and respectable house of Messrs. Curtis & Co., and we should be much pleased to be able to add to the list of this important branch of art, which is every day coming into greater requisition, owing to the immense impetus given of late years to church building. Mr. Arrowsmith, of New Bond-street, London, manufacturer of Parquetrie for flooring, dados, &c., and in which patent material he is executing, or has done so, numerous important orders in Ireland, including those for Mr. Phineas Ryall's mansion at Old Connaught, the Marquis of Sligo's, &c., has sent some very handsome specimens, but in justice to the exhibitor we must remark that they are most disadvantageously placed on the *lobby* leading to the north gallery. Hereafter we must ramble again through and note more minutely the contents of the several departments, which, "take them for all in all," are worthy of more than a cursory inspection.

THE BOTANIC GARDENS QUESTION.

As already announced, the council of the Royal Dublin Society negatived by a large majority the proposed opening of the gardens at Glasnevin on Sundays, and since that decision the following circular has been issued by the hon. secs. to the Glasnevin Garden Committee, addressed to the representatives of the people of Ireland in Parliament:—

"SIR—We cannot regret the course taken by the government in placing the decision of the question of the freer opening of Glasnevin Gardens unreservedly in the hands of the House of Commons, as thereby our friends will be, not even in appearance, partizans only in a squabble between a department and the Dublin Society, but as the leading and chief parties in asserting the rights of the people of Dublin and of Ireland in the matter. The Royal Dublin Society appeal to you to sustain their 'independence.' It is our duty to point out what is meant by this high sounding term. This is pretty clearly indicated in their official letter of the 19th ult., taken in connexion with the circumstances under which it was written. This reply to the strongly expressed recommendation of the Lords of the Committee of Council on Education was written, we may remind you, in presence of the fact, that eight days previously, on the 10th, seventeen Irish members had presented a memorial to Lord Granville, signed by 49 (since increased to 58) representatives of Ireland, in favour of the course taken by the Committee of Education. In the letter of the 18th May, after asserting that in refusing to open the Botanic Garden on Sunday they are the exponents of Irish opinion, the Royal Dublin Society go on to claim, under a Council Minute of 1854, perfect freedom from supervision in their administration of public money—that is to say, they are to be 'independent' in this fashion:—1. The government is to be, as expressed by one of their organs (the *Packet* of the 14th ult.) 'clerks,' one of whose duties is to collect and pay over the quota or royalty of the Royal Dublin Society out of the public taxes. 2. The representatives of the people of Ireland are to have their deliberately expressed opinions ignored, and their legal character by implication denied, the Royal Dublin Society claiming to be the true exponent of our public opinion. 3. And as the Irish people cannot be made out as opponents to Sunday recreations by any other process than the one by which South Carolina is made to go for slavery, viz., by counting the nigger portion of the population as voting for their masters, we cannot for an instant doubt that the opinions prevailing at the Royal Dublin Society are quite as venerable as the institution itself. The necessity for placing all who administer public money, or perform public functions, under due and efficient control is obvious, when we consider that otherwise it is equally impossible to have the intentions of the government and legislature carried into effect, or prevent corporate monopoly being established. What we call upon parliament to do in the case of the Royal Dublin Society is no more than what is done in analagous cases: that is, by either parliamentary legislation or by departmental regulation, settle specifically the precise return the Royal Dublin Society is to afford the public for its grants and subsidies. Let parliament, not the society, dictate the terms, and when these terms are accepted by the society, let the department have ample powers to enforce their observance. If you concur with us in thinking that only by the present suspension of the Royal Dublin Society grant can a satisfactory solution of the question be arrived at, we hope you will not hesitate to vote for that suspension; requiring at the same time that assurance from the minister that in any future arrangements that may be made that our people shall not lose the sums annually granted for Museums and Botanic Gardens.—Your obedient servants,

JOHN M'EVOY,
NUGENT ROBINSON.

FINE ARTS COMMITTEE OF THE INTERNATIONAL EXHIBITION.

WE are informed that, in addition to the general committee in connexion with the fine art section of the international Exhibition of 1862, her Majesty's Commissioners have requested the following gentlemen to form committees of advice and selection for the several classes of that department.

Class 37.—Architecture.—William Tite, Esq., M.P., F.R.S., President of the Institute of British Architects; A. J. Beresford-Hope, Esq., Honorary Fellow, R.I.B.A., and President of the Architectural Museum; Thomas L. Donaldson, Esq., Professor of Architecture at the London University College, and Vice-President R.I.B.A.; G. G. Scott, Esq., Vice-President R.B.A.; M. Digby Wyatt, Esq., Vice-President R.I.B.A.; Sydney Smirke, Esq., R.A., F.R.I.B.A.; James Fergusson, Esq., F.R.I.B.A., Honorary Secretary to Architectural Exhibition; and Arthur Ashpitel, Esq., F.S.A., F.R I.B.A., Treasurer to Architectural Exhibition. Mr. J. B. Waring has been appointed superintendent of this class.

Class 38.—Paintings in Oil and Water Colours and Drawings.—Sir Charles Eastlake, President Royal Academy; Sir J. W. Gordon, President Royal Scottish Academy; Catterson Smith, Esq, President Royal Hibernian Academy; F. Y. Hurlstone, Esq., President Society of British Artists; F. Tayler, Esq., President Society of Painters in Water Colours; H. Warren, Esq., President New Society of Painters in Water Colours; and R. S. Lauder, R.S.A., President National Institute of Fine Arts. Mr. R. Redgrave, R.A., has been requested to act as professional assistant in respect to this class.

Class 39.—Sculpture, Models, Die-sinking, and Intaglios.—The Marquis of Lansdowne, K.G.; the Earl of Gifford, M.P.; A. H. Layard, Esq., M.P.; J. H. Foley, Esq., R.A.; and R. Westmacott, Esq., R.A.

Class 40.—Etchings and Engravings.—W. H. Carpenter, Esq., British Museum; D. Colnaghi, Esq.; G. T. Doo, Esq., R.A.; R. J. Lane, Esq., A.R.A., and W. Smith, Esq.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of this body was held on the evening of the 10th inst., Mr. Digby Wyatt, V.P., occupying the chair. The chairman announced that the first conversazione would be held on the 10th of July, and referred to a circular issued to architects by a certain gas-fitting firm, offering to share their profits, averaging 30 per cent., with such professional gentlemen as should favour them with orders, and which he denounced in very strong terms. Mr. J. P. Seddon read a paper "On the Dark Ages of Architecture," a portion of which we reprint elsewhere.

THE DARK AGES OF ARCHITECTURE.*

THE "dark ages" to which I am about to refer are quite other than mediæval, as far at any rate as architecture and the other arts are concerned. They are those, the central or midnight century of which, if we may credit the historian, Carlyle, lacked light in other senses besides the artistic; being as regards political and moral honesty also "bankrupt;" certainly in all matters of taste they were steeped in the deepest gloom.

The picture I cannot promise to make inviting, but it may, nevertheless, be in some degree instructive and show us what to avoid, a lesson not less valuable than that which teaches us what to study and adopt.

As the dark ages of architecture do not then date from the birth of the art, they do not include, nor do they necessitate any inquiry into the probable form of the wigwam of the "Pre-Adamite" man, if any such existed, and more fortunate than Mr. Wallis' stone-breaker, had such a shelter while chipping his flint hatchets; nor need I trouble you with any speculations as to the early efforts of *pre* or *post* Noahites, which, perhaps, some millions of years later, may have preceded or followed the fabled transition of the type of the timber hut into that of the stone temple; for such essays in building cannot claim a title to the name of architecture at all: or if any be inclined to concede it to them, it could be but as architecture in infancy, and, therefore, even if only babbling by the light of nature, not altogether dark nor dead; its glimmerings, if but the first of the dawn, are surely, though slowly perhaps, about to broaden into daylight; the men who wrought it were looking forwards and not backward; they were gaining step by step in advance, never pausing; one nation taking it up where its predecessor left it, each meanwhile giving it some individual impress and adding some new thoughts to the general stock, and fusing them into a consistent and intelligent whole.

Thus we may trace art from age to age until the "dark ages," and find that it was ever a language wherein men simply and naturally expressed what there was in them to tell, and which we may read with an assurance greater than even that we can give to their written records, seeing that there is less likelihood of their having been tampered with.

As from the bowels of the earth, our geologists are digging new fossil facts which explain or correct our misreadings of sacred writ; so our Layards and Newtons are excavating from more recent strata, actual fragments of buried Assyrian cities and Mausoli in Asia Minor, which in like manner throw new light upon profane history and convict half our cherished traditions of being mere fables, putting us, as it were, face with the kings, priests, and warriors of those ancient days, which had become to us almost as obscure as the "mornings and evenings" of the creation with their wondrous intervals. So it is with the kings of Egypt; their acts and all that they did are chronicled on the walls of granite and sarcophagi of basalt, lately visited and ably described by Professor Donaldson, and in these days of railways we can quickly re-unite in the mind at least the sculptures of the Parthenon, housed in our museum, to their empty sockets in the ruins of the temple on the Acropolis of Athens, and so gain a glimpse of that perfectly beautiful art in which the polished Greek sought to represent his ideal of the divine.

Then the Roman has left us his notions of architectural showiness in his versions of the five orders, which, whatever they may be worth, were his own, until eclectism in the "dark ages" confounded all nationality and propriety in such matters.

Even the Byzantine, in whose hands art seemed to stagnate for a season, wrought out in his unmistakable manner the types tradition handed down to him, and set the dome as his sign-manual over the crux and each arm of the churches, which he built on that plan of his, the "Greek Cross."

The Arab, again, had his slim minarets and fretted domes, with an array of pointed and stilted arches whose curves seem to have been fashioned after that of his own falchion.

The Barbarians, also, who overturned the Roman Empire and settled down upon its lees, gave sense and nerve to the effete nonsense which they found in the shape of decorative art in that classic land, and thought out for themselves a better (being the proper) way of using the archivolt, and wreathed the tame foliage of the Corinthian capital into something like the grace and freedom of nature, and told, in their sculptures without reserve, what they themselves believed in, loved, and were amused by.

Then followed, surpassing all previous efforts, the Gothic or mediæval development of art, the grandest, noblest, and most scientific which the world has seen; for even if in its restless strivings after conceptions of beauty, seemingly as infinite in their variety as in the number of its works and its schemes for realising them, it sometimes over-shot its powers, and making not sufficiently sure of its substructure in haste to soar upwards, prepared for itself such catastrophes as those recorded of the Towers of Winchester and Ely, by Professor Willis, and that just witnessed at Chichester, we have yet hundreds of other examples, equally fine, which have lasted for centuries and may last as many more. We may, therefore, still be more thankful for its lofty and noble aims, despite such occasional failures, than for the lower if safer aim of styles content to grovel near the ground, and whose superior science consists in poising huge stones upon columns, in ignorance of the principal arch, whereby the space could be well spanned, and in avoiding every chance of thrust, in order to escape a difficulty which they knew not how to deal with.

Throughout all these several styles not one link in the chain of art was lost—not one lying phase had yet appeared. We may approve one more than another, we may find errors and backslidings, but no systematic and deliberate falsehood and betrayal of the spirit of the age can be found in the whole history of art until we come to the "dark ages." The Greeks seem to have been gifted rather with consummate refinement than with much originality. We can well see that they admired and borrowed from the ornament of Persia and Egypt; but we have no proof of their having attempted to build Egyptian halls in the streets of Athens or sham caves of Ellora about its Acropolis. The Christians, when freed by Constantine from the persecution which had repressed all their previous efforts, boldly adopted the pagan basilicæ for their churches, and built others of the same type, yet we do not find that they attempted to compose them out of porticos copied from the antique or plied Grecian monuments one above another to serve for belfries or campanili.

It is a question of the greatest moment to us, but one which I have not time now to discuss, how it was that the Mediæval or Gothic phase of art should, after its brilliant and rapid growth, have rested so short a time at the height of development which it reached, and thence declined with almost equal rapidity, till it fizzed itself away in France in the luxury of "Flamboyant" tracery, and in England was strangled in its strait-jacket array of the rigid "Perpendicular." It suffices for our present purpose to know that it died from inherent decay, and not from any assault from without.

That this, as every other style that preceded it, should have gone the way of all things of earth, may be a matter of regret, yet not of surprise, and its having done so is not the question which I have proposed to consider on the present occasion, but rather how it happened that after it came "the deluge?" We have seen that all previous styles successively rose, caluminated, and fell, only to be followed by others still more comprehensive, and that each yielded up gracefully all that it had added to the general stock of ideas, to be grafted into the newer plant, to bud and flourish again with fresh vigour and increase of power under a different regime.

What, then, necessitated the artistic chaos which reigned when Mediæval art vanished? What was the Gorgon's head which turned into stone the natural love for and power to originate beauty, which mankind had hitherto shown in all ages and countries? These are the questions to which I am anxious to find a solution.

The complete quenching of the lamp of art, which sooner or later in the period of the dark ages ensued in every quarter of the globe—save where, among the less civilised Oriental nations, it has stagnated until now in considerable decorative purity—is one of the strangest phenomena I am acquainted with in the history of the world, and this I desire to invite you to consider, in the hope that we may be able to discover the rocks upon which it was shipwrecked, and that in our efforts to float it again we may be able to steer clear of them.

The "dark ages," however, or, at least, the gloom of them, did not come on all at once. The night, unlike that of the tropics, did not follow suddenly the light of the mediæval day. Nay, the sun of art set so gorgeously that men were dazzled by the glory thereof, and believed that it was a sunrise, heralding a new, better phase of art, instead of its being a sunset, preluding the loss of the best the world had seen.

It behoves me, therefore, to linger over this threshold of my subject (and not unwilling am I to do so, seeing that is by far the pleasantest part thereof), and to endeavour to trace the lines of it several changes as successively they grew fainter and fainter, together with the brightness of the evening stars of genius, which beamed like a galaxy through its twilight, and even occasionally long after the nightfall, until, clouded over at last, utter darkness ensued, enlivening only by the false will-o'-the-wisp phantoms of *rococo* which have been misleading men ever since.

(To be continued.)

An invention of some interest to all employment, in which an engine is used, has been tried in Liverpool. The novelty consists in applying gas to the generation of steam, and the experiment is said to have been successful. It is particularly recommended for "hoists" in warehouses.

On Wednesday, 13th inst., one thousand and sixty-three persons visited the Art Exhibition, the price of admission being one shilling.

---

* From a Paper read by Mr. Seddon at Royal Institute of British Architects.

THE REVIVAL OF STYLES.

(Continued from page 524.)

Now, I am for pronouncing the Gothic system to be wrong; and it is undoubtedly productive of great elegance, force, and spirit. But I would maintain that the classic principle of giving expression to the walls themselves, rather than to the openings by which they are pierced, is architecturally sound. We build for the sake of what we get by the walls and the roofs they support—namely, seclusion and shelter—not for the sake of light and air, which we have in abundance without them. It is indeed necessary that we provide a sufficient supply of light and air, as well as means of access; but these are contingent necessities, not the main object of the building.

Again, the tendency of Classic is to breadth of effect; of Gothic to minute subdivisions, and an almost fantastic variety of outline. The traveller on the continent will probably be struck, as he proceeds southwards, with the increasing breadth which characterizes the towns, villages, and groups of buildings. He cannot fail to notice the preponderance, so to speak, of mass over outline. In a Mediæval town in the north of France, and in the greatest part of Germany, his attention will be caught by the number and variety of towers, spires, pinnacles, peaked gables, and the like; on which great powers of design, as well as care, in the execution of detail are bestowed, while the mass itself is as much broken up, as may be by openings and projections which cause a constant play of light and shadow. In the south he will have presented to him large and comparatively unbroken masses, marked by few openings or projections, with just a sufficient number of towers and spires to relieve the monotony of the outline, and these not displaying that architectural care, or elaborate variety, which would make it suppose they were intended to catch the eye, or form principal features in the group. In sketching an Italian village, or monastery with its church, we need not care about marking out all its windows or putting them in their right places, or even giving to a nicety the form and proportions of the belfry, still less its details; in fact, the more slightly we define these, the more truly we shall give the character of the scene. Now though these southern buildings and groups may be really in date just as Mediæval as the northern ones of which I have just spoken, they have more of the Classical character, which in Italy was retained in great measure through the whole of the Middle Ages: in fact, the composition of a large majority of Italian Gothic buildings is such as to suggest no definite reason why Gothic details should have been employed in preference to Classical ones, so much does the horizontal line predominate. We may therefore fairly speak of this character of breadth as belonging to the Classic, and that of variety of outline and intricacy, or minute subdivision, as appertaining to the Gothic.

But although the Classical style does not peremptorily demand that variety of outline which is so necessary a part of Gothic, it by no means discards it as incompatible with its principles. Many steeples of the revived Italian are as fine in proportion, and as elaborate in detail as any Gothic composition. I may instance the upper part of the tower of Seville cathedral, and many of Sir Christopher Wren's steeples, which show both the fertility of his imagination, and the comprehensive nature of the style he employed. I have, on a former occasion, adverted to the liability to decay incurred by the intricate and minute workmanship of Gothic ornament; and I understand that the condition of the ornamental details on the new houses of Parliament is not such as to induce me to retract what I then said. But I would further remark that, although the constructive principles of the style are sound and good, so that, in many cases, the greatest amount of strength is obtained by a given quantity of material, yet the tendency on the part of the architect to make a display of mechanical science has been the cause of much real, as well as apparent, weakness in important buildings. The lamentable fall of the Chichester steeple is probably to be attributed to the fault, not of construction, but of material. Yet, it is certain that the perilous boldness of many Gothic designs ensures more fearful results from the introduction of a defective piece of masonry, or unsound material, than are apt to occur in Classical buildings.

It may be said that the Gothic style can be worked in a broad and massive manner, as it was in castellated architecture; and to such an extent that in adapting a Gothic castle, or an imitation of one, to domestic purposes, the difficulty is to avoid making the walls too solid, and the windows too few and contracted, for comfort. But this mode of building was forced upon the architect by necessity, not adopted by choice. The requirements of military architecture rendered necessary this expansion of wall, and contraction of window, and the builder dealt with it as he best could. The harmony which exists between the dark heavy fortress and the light open cathedral is a proof that both were designed in the natural style of the day, while the difficulty we feel in preserving the expression of the style in our domestic buildings, which require larger. and consequently more truly Gothic windows than the Mediæval castles, is a proof that it is not the natural style of our own period. But the less display the Gothic makes of constructive science, and the less aid it borrows from such additions as pinnacles, tracery, and the like, and the greater the breadth and solidity of its masses, by so much the further does it recede from its own principles, and approach nearer to Classic architecture. An adaptation of the style to our own exigencies is not a development of it in its own proper direction, but an appropriation of some of the elements and characteristics of the rival style. We shall never develop Gothic further than it has already been developed, except by erecting buildings far less suited to our wants than Mediæval ones of the most exaggerated character. As it is, we seem to fancy that we can attain the life and vigour which constitutes the charm of the true Gothic, while we can only adapt it to our purposes by curtailing and cutting off the growth of many generations.

On the argument in favour of Gothic which rests on the superiority of decorated construction over constructed decoration, I cannot say much till I find myself better able than I am to comprehend the distinction. Is construction a term applied only to the more subtle contrivances of the architect, and not to a plain solid wall or pier, so that a mere wall enriched with surface ornaments is not a decorated construction? Are such pinnacles as those of Gloucester Cathedral and the Somersetshire churches, which are extremely beautiful in themselves, but in no way contribute to the strength or convenience of the building, decorated constructions, or constructed decorations? Which term should we apply to pinnacles engaged in the sides of towers, or to blank arcades and panelling? If a square-headed window in a classical front has over it a projecting ledge supported by brackets, and covered by a pediment forming a tympanum, I suppose this would be called a constructed decoration; at least, I should call it so. How, then, if a Gothic window has over it a label resting on heads or bosses, and crowned with an angular canopy, crocketed and terminated by a finial, a composition of constant occurrence in the finest work of the fourteenth century? Observe, the two compositions are perfectly analogous: it may be that the one is heavy and ugly, the other light and beautiful; but the principle is the same in both. I do not condemn surface ornament or constructed decoration in Gothic; only when it does occur, let it be called by its right name, and not ignored for the sake of a plausible, but somewhat fallacious argument.

We will now consider what ancient buildings are in existence, belonging to recognized styles, which suggest a mode of construction and arrangement applicable to our wants, and of decoration suitable to our best views of art.

If we look at the Parthenon of Athens, or the Temple of Neptune at Pæstum, we are impressed with its wonderful beauty, majesty, and sublimity; and as we acknowledge this to be the result of careful arrangement and adjustment of proportions, together with exquisite design shown in the simplest and smallest details, we cannot but treat with a certain degree of reverence the rules and principles which led to such a result; and, although we consider the plan of the building itself unsuitable to our purposes, yet we feel that it is well worth our while to study it diligently, and think how we may turn to account the lesson we cannot fail to learn.

If we look at the Coliseum at Rome, and endeavour to forget the purpose for which it was erected, and the scenes which were enacted within its area, we must regard it as a work of almost unexampled magnificence, and at the same time admit that it presents a type of arrangement and ornamentation applicable to all tabulated structures whatever.

If, again, we look at a large Gothic cathedral—say, for instance, Amiens, Chartres, or Rheims, or, in our own country, York, Lincoln, or Salisbury, we cannot but be astonished by the grandeur of its design, the mechanical skill displayed in its construction, the richness of ornament which is profusely spread over it, and the character of religious solemnity which pervades the whole. Yet we cannot help feeling that it is not a structure likely to be called for or produced in the present day. Its associations belong to an age more sharply and distinctly separated from our own than are even those of Pagan antiquity. Its principles of composition are not adapted, without some modification, even to the large churches we demand, and are rather opposed than otherwise to the conditions required by secular architecture. As records of one of the most interesting phases of art and social progress that it is possible to conceive, the Mediæval buildings of Europe are invaluable, independently of the practical lessons to be derived from them; and to preserve them we must keep them in repair, which we are not likely to do unless we make what use of them we can. Fortunately, most of them can be made available to our purposes to a certain extent, though in large towns it has often been found expedient to destroy the old church and build a new one of more commodious arrangement; while how to make the most of our cathedrals is a problem that has more than once puzzled their restorers.

The architects of the Classical revival, seeing that their style must necessarily prevail in secular buildings, wisely and rightly adapted it also to their ecclesiastical buildings, still without making any material alteration in their plan or structure. They cut off, indeed, some of their superfluous ornament, and reduced them to an aspect resembling the Romanesque, to which style, indeed, we might easily attribute many churches of the revival, if we see them at a distance, and with some we might fall into the mistake even on a closer inspection.

This leads us to enter a little more fully upon the subject of general outline. That the Greeks were keenly alive to the picturesque, and probably had a more refined notion of it than any race of men before or after, we have good reason to suppose. The instinct with which they selected the finest sites for their buildings, and the scrupulous care with which they avoided interfering witn the natural features of their scenery, as though hardly a rock could be cut away without offending some deity who presided over it, shows with how deep a feeling they were actuated on this point: a glance at the Acropolis of Athens, and the surrounding locality convinces us of this quality of the Greek mind, even if we did not infer it from their love of country, or had not learnt it from Homer, Æschylus, and Sophocles. It is most likely their buildings were designed not only to harmonize with, but to illustrate, as it were, the character of their scenery. Certainly the rock of the Acropolis and the Parthenon seem made for each other: we could not fancy the temple in any other spot; and the rock without the temple would be imperfect. But it is likely that their feeling of the picturesque was of too refined a nature to suggest that they should aim at what we call a striking outline: it may have taught them to prefer one that might have been chargeable with monotony but for some exquisite tact in its composition; and that such buildings as the Choragic monument, formerly known as the lantern of Demosthenes, ought to occupy some low and secluded spot, instead of contributing ostentatiously to the variety of the sky-line. Of course, I can only speak from conjecture, for we have not sufficient data on which to ground any theory on this subject. The massive forms, however, and long horizontal lines of their temples, indicate that they aimed at the expression of repose rather than violent action, and this is confirmed by the character of their sculpture.

Neither have we the means of judging what views, with regard to outline, influenced the Roman architect. The beautiful monument of St. Remy, in Provence, shows that the power of producing good form existed: the monuments at Vienne, on the Rhone, and Igel, near Treves, are less remarkable for their beauty, though the latter is not wholly destitute of grace. The triumphal arches of the Romans hardly, I think, show the elegance of which such structures might be capable; that, however, of Trajan, on the pier of Ancona, is an exception. The magnificent arch at Orange is more remarkable for the profusion and delicate execution of its ornament, than for any excellence in its architectural design. At Athens there is an arch of Roman construction, I believe of Hadrian's date, of a lighter and more elegant design that the triumphal arches of Rome, but still of no very great beauty. Some of the Roman circular temples may have had a good outline, if the assumed restorations are at all true; and one at least we know to occupy as fine a site as can be imagined, and in its present ruinous condition to be well worthy of it; I mean the Sibyl's temple at Tivoli. The Pantheon at Rome can never have been a picturesque building. As antiquaries, we may regret the addition of the modern turrets flanking the porch, but in an artistic point of view they could be ill spared. The temple of Minerva Medica forms a very picturesque ruin, and may have been no less so when perfect, but I cannot help looking at this as a transitional specimen. In its use of buttresses, it forestalls one of the great principles of Gothic construction. On the whole, if we were to assume that the general outline of ancient Rome was less varied and interesting than that of modern Rome, and that the effect produced on the spectator would depend rather on masses of building occupying sites of different elevation, than on prominent architectural features, no one could easily find grounds on which to contradict the assumption. But the revivers of the style have taught us that it is fitted for an outline of the greatest beauty and sublimity, and capable of a picturesqueness of composition not surpassed in the best Mediæval period. And this shows that their work was really a revival, and not a mere formal reproduction. In tracing the development and progress of taste in the composition of outline, we shall advert chiefly to ecclesiastical architecture, because it affords us examples in greater number and in better preservation than any other kind; and also because it has less restricted art by mere economical or utilitarian considerations.

I am inclined to think that the circular churches, derived from Roman temples of the same form, are the first which exhibit that kind of outline which is produced by the central tower or dome, and which has characterised churches of the highest class ever since. The Eastern form, however, of the Greek cross, with the dome or tower at the intersection, is evidently a very early one, perhaps the earliest original form of a church that exists; for it does not appear to have been derived, like the basilica and round church, from Pagan structures.

The solution of the problem, how to adapt a spherical dome to a square area must have introduced a new era in architectural composition. The value of the dome had long been recognized as a method of roofing at once firm, permanent, economical, and beautiful; but, so far as we have means of knowing, it had hitherto been used only to cover buildings of a corresponding form, as the Pantheon. The cruciform plan seems also to have been introduced, to a certain degree, for the sake of convenience, into the Roman basilica, and its symbolical meaning would give it an additional recommendation in the eyes of the early Christians; but the roof throughout being generally flat, the square of intersection would be treated in the same way as the arms or aisles of the building, and neither receive nor suggest any additional height, externally or internally. When, however, it was resolved to take advantage of the domical method in roofing the square of intersection, making the other roofs of the building cylindrical or semidomical, according as the limbs of the cross were rectangular or apsidal, then, since the base of the dome had to rest by means of pendentives on the crown of the four arches, its apex necessarily exceeded them in height, and consequently rose above the vaulting, supposing them to correspond with the arches of intersection. This is true not only when the dome is a complete hemisphere supported by pendentives, but also where it is a part of the same hemisphere to which the pendentives themselves belong, or any other segment of a sphere whatever. Hence the adaptation of a dome to the square of intersection in a cross church requires a superstructure raised higher than the arches, and consequently suggests one raised higher than the walls and roofs, both externally and internally.

Probably S. Sophia in Constantinople was not the first example of a dome resting on four arches; so bold an experiment could hardly have been tried on so large a scale for the first time. Many of the domical churches in the eastern parts of Europe are small in their dimensions, and have no architectural detail but what might be of considerable antiquity. If we cannot confidently pronounce any particular specimen to be of a date earlier than the reign of Justinian, we cannot positively deny the existence of such at the present day, and I think we may at least assume that those to which we now have access are fair representatives of some of the earliest original Christian structures ever designed.

S. Sophia is somewhat unique among Byzantine churches, and has rather the character of the mosques which surround it, and which were built after its pattern, than of the churches generally erected in the east at that time and for many succeeding centuries. S. Irene, now converted into an armoury, is the next in size to S. Sophia of those in Constantinople, but very much inferior in dimensions, the diameter of the dome being, if I remember right, less than one-third. I cannot tell how far the present outline is original; it is perhaps the more pleasing of the two. The outlines of some of the old Greek churches in Constantinople, and in and about Athens, are extremely graceful, I may say noble, as giving to structures small in actual scale an air of dignity and importance. The central dome assumes the form of a circular or polygonal tower, of some elevation, and there is a certain breadth about the composition which prevents any idea of meaness. The actual ground-plan is square, but the upper stage from which the dome or tower rises, is a Greek cross. To the westward is a narthex or porch, which is sometimes covered with another dome lower than the principal one. The pendentives supporting the dome required themselves the support, abutment, and protection of the walls above the springs and haunches of the arches on which they rested, and by raising these walls above the crown of the arches additional strength was given, and the whole fabric consolidated. Hence the round or polygonal drum of the dome mostly stands upon a square base, slightly raised above the level of the other walls; and when the central dome was adopted, as it soon was, in the western church, at the intersection of a Latin cross, the square base often became a square tower, enclosing within itself a circular or polygonal dome, which then formed only an internal feature. This is an arrangement which prevails through the whole of the south of France, and in parts of the central and more northern provinces. In Italy the central tower is generally a low octagon. As a satisfactory outline was thus obtained, the central tower was used even when no dome or lantern was shown internally.

If a campanile was required, this was provided, not by raising the central lantern to the requisite height, but by building an independent tower, as in the basilican churches. The combination of the central lantern with the belfry tower produces some of the finest and most picturesque effects of outline in ecclesiastical architecture. Such combinations are mostly to be found in the Romanesque period. I think we meet with them more often in Italy than in France, where the central tower first attained sufficient height to cover the lantern, and afterwards grew still higher, and became the highest and principal steeple in the church. Whether this was an improvement, is a matter of taste. For my own part, I am very partial to a fine central tower or spire, but I am not certain whether, on true architectural principles, we ought not to prefer the low massive lantern of the Italian Romanesque, combined with the taller and more slender campanile; the central lantern giving by its breadth dignity to the most important part of the building, namely, the the intersection of the cross,and the lofty tower giving the same feature value by its contrast, and breaking the monotony of outline. Add to which, the arrangement is evidently a good one as regards convenience, by detaching the belfry from the area of the church, and allowing walls of any degree of massiveness that may be required. The cathedrals of Piacenza and Parma, the cathedral and another church at Asti, many of the churches in and near Pavia and Milan, and the cathedral of Monza, present fine examples of the above arrangement: some of these are later than the Romanesque era, but retain in great measure the general character of the style. In England we have unfortunately so little unmixed and unaltered Romanesque, or as I would rather call it, Norman, that it is difficult even to imagine a typical example, and such buildings as Tewkesbury, Southwell, and Romsey show how grand must have been the outline of a perfect English church of the first class in that period. But Normandy furnishes us with better preserved examples of the style from which we may form an estimate of its general aspect and character. The well-known church of St. George, Bocherville is, I believe, as pure a specimen as can be found, and its outline, simple as it is, seems to admit of no improvement. It may be questioned whether the present wooden spire agrees with the original design; I am, however, speaking of the building so far as the actual masonry and the necessary roofs are concerned. I question whether the development of the Pointed Gothic really improved upon the best outlines exhibited in the Romanesque. We certainly gave greater height, and varied, perhaps confused, the general outline of the building by pinnacles and buttresses. Where the central tower was retained, it was frequently raised to a much greater height than its use as a lantern rendered necessary. The central tower of York, which is open nearly to the top, is an exceptional instance, rather than a type of Gothic central towers, and it is unquestionably one of the finest, if not the very finest, in existence. And it is certainly one of those that are least removed from the Romanesque model.

Again, on the continent, the central tower was altogether sacrificed to the attainment of height in the whole building itself, which, in consequence, often appeared rather a shapeless mass than a fine architectural composition. The profusion of pinnacles employed seems rather, intended to disguise the want of design than to mark, as they ought to do, important points and divisions. Some of the best outlines in Normandy, comprehending the low central tower, and loftier, but less massive western ones, though Gothic in detail, as that of Lisieux, are wholly Romanesque in character, and those which assume more of the Gothic are not improvements: the heightening of the English central steeple, though the effect resulting from it is sometimes extremely beautiful, as at Salisbury, is seldom carried out without some sacrifice as regards internal arrangement or actual security. I am quite aware that we find many ugly buildings, and many buildings of a fantastic outline, that belong to the Romanesque period. In Germany, and even in France, I could point out both one and the other; but it is certain that in that period a very beautiful type of composition appeared, the simplicity of which, and its independence of additional ornament, stamps it with a degree of refinement which is scarcely preserved in the more advanced stages of Mediæval architecture, when features of mere decoration became abundant. The best architects of the *renaissance* evidently felt this, and in their ecclesiastical structures, for which they found no available precedent in ancient classical architecture, they returned to this Romanesque type, and in a short space of time a large number of churches were erected, showing a full appreciation of those early models. Many would at a short distance be taken for buildings of a date anterior to the thirteenth century. The cathedral of Dax, south of Bordeaux, would at first sight be pronounced Romanesque: it is, in fact, Revived Italian, except an incomplete Gothic tower at the west end. At a village between Epernay and Reims I noticed a church at a distance, which I made sure of as a fine Romanesque specimen. On examining it I found it clearly post-Gothic. I may have been disappointed at the time, but it now proves valuable to me as an example.

When I had the honour of reading a paper at the South Kensington Museum, rather more than a year ago, I showed some drawings of Spanish churches in the Revived Italian style, whose general outline had altogher a Romanesque character. I am still of opinion that these churches might be studied to advantage in the present day, as securing really fine architectural features at little or no sacrifice of convenience, and at no exorbitant expense. In Italy the combination of the low lantern tower with the lofty campanile, was continually reproduced; and still further grandeur was obtained by expanding the central lantern into a spacious dome, which became the predominant feature both externally and internally. Such domes had indeed been more than suggested by the early Byzantine and circular churches, but the revivers of classic art worked them out with an elaborate care in regard to proportion, and often with a success which almost reminds us of the elaboration of the column in Greece. That of St. Peter's, as it is the largest, is, to my mind the finest example that can be brought forward. I have endeavoured to procure a tolerably true outline, comparing my own sketch with an engraving that appeared to me a very exact architectural elevation, and making corrections accordingly. Many prints and drawings make it too round and heavy, and most of the photographs I have seen are taken from a point that does not show it to the best advantage. But though St. Peter's is the finest example, it is but one out of vast number, which exhibit a great variety of forms and proportions, nearly all of them pleasing to the eye, and giving quite as much character to the Italian landscape as the Gothic tower or spire does to the English.

Had the dome been congenial to the Gothic, it would surely have been introduced in that style, a style which certainly is not chargeable with timidity in adopting new forms and combinations. The arrangement of the central part of Ely Cathedral offered opportunity for its adoption. Yet we find an octagon, with a Gothic vaulting adapted to it, in the best way the architect could devise, and that architect was one of more than ordinary fertility of resource.

Without for a moment depreciating the grandeur of a fine Gothic interior, I must observe that the Classic style contains elements of at least equal grandeur, if not greater. The churches of St. Andrea in Mantua, St. Justina, and the cathedral in Padua, are not inferior in solemnity of effect to any Gothic edifice whatever. Had St. Paul's been carried out according to the design preserved by the model, I can conceive no interior that would have been equal to it. An impression of vastness would have been produced by means totally opposite to those employed in Gothic; and, to judge from the model, even more effective, while the variety of perspective views, and the fine alternation of light and shade in broad masses, would have given a picturesqueness scarcely rivalled in the eminently picturesque Mediæval styles. If I am right in believing that there is a picturesqueness of repose as well as of action, a picturesqueness depending rather on breadth and mass than on intricacy and multiplicity of parts, then I cannot be wrong in asserting that the Classic may meet the Gothic even on its own ground, on at least equal terms.

Still, if constructive considerations should render a pointed arch desirable under any circumstances, its admission does not necessarily involve that of the whole Gothic system. The pointed arch was used before Gothic was developed, and in localities which were the last to receive the Gothic style. Saracenic architecture has the pointed arch, but it is not Gothic, neither are those domical buildings in Aquitania which employ the pointed arch, without an approach to Gothic mouldings, in the support of their pendentives. But even supposing the pointed arch to have belonged exclusively to the Gothic, we may borrow it if we really want it, without professing to revive the style. It is not an architecture to pass away without influencing any succeeding style; we are not obliged to choose between accepting all or none. There is one very important element of Gothic which we should be foolish to reject, and of which, if I mistake not, the Renaissance architects saw the value, and by its means considerably modified the rigidity which might have resulted from a strict imitation of the ancient Classic: I mean the oblique surface of decoration. The use of this much facilitates the enrichments of our buildings, while we exclude heavy and incongruous ornament, and enables us to retain such beauties of Gothic sculpture as are not inconsistent with a more severe and refined style.

As, in advocating the revived Classical style, I would not urge the rejection of everything which belongs to the Gothic, still less am I anxious to defend the glaring defects which characterise so many specimens of the Classic. I would not perpetuate the cold formality of most of our professed imitations of the Greek, nor the feeble, unmeaning, uninteresting character which prevails in so much of our work that claims a derivation from the Roman. But a discussion upon the defects that may be enumerated in Classical buildings, and upon the causes which, independently of Mediæval sentiment, have tended to bring the Classical style into disrepute, would occupy a great length of time, and I am not sufficiently master of the subject to enter fully into it. I believe, however, the greatest defects in the style are of a superficial character, and admit of removal. By clearing them away we shall give it a vitality and vigour which its evident congruity with the practical spirit of the age cannot fail to preserve; while the consistent stability of its nature, the very reverse of that restless tendency to change which is one of the essential elements of Gothic, will make it a permanently effective style, at least till the present conditions of society become altogether changed.

SUSPENSION BRIDGES.

THESE bridges were not constructed to any great extent until the commencement of the present century; up to that period they were of rather a primitive character. We hear, indeed, of one built in China about the year 65 A.D., and of several suspended bridges in South America and the Indies, in which the chains were formed of ropes and barks of trees, plaited or interwoven together, so that the roadway was in the form of a caternary curve; still, even in those countries, we have instances of the roadway or platform being placed horizontally, and suspended from the ropes or chains by intermediate rods. Among the first iron suspension bridges put up in this country was the Winch Bridge crossing the river Tees near Middleton. It was merely intended for foot passengers, being only 2 feet in width, although 70 feet long. In 1816, a wire suspension bridge was built over the Gala Water, of upwards of 100 feet span, at a cost of only £40; and another over the Tweed at Peebles in the following year, also of iron wire, and about the same span, for £160.

In 1820, Captain Sir Samuel Brown built a suspension bridge over the Tweed in an ingenious novel and manner, for which he had obtained a patent in 1817. Instead of making the main iron chains, intended for the support of the bridge, in the form of ropes, as had been hithtrto done, he constructed those chains by links of iron several feet in length, with holes formed at either end, through which he joined them together by means of bolts. This bridge, called the Union, is situate close to Berwick-on-Tweed, and has a span of 449 feet. It is supported upon 12 chains disposed in pairs, and placed one above the other 3 deep, formed by links of round iron 2 inches in diameter, and each 15 feet long, connected with one another by intermediate short links also of iron. The suspending rods are of an oval section, and are placed five feet apart, every one being attached to a joint of one of the three main chains, which are made to break joint, so as to admit of this arrangement. These suspension rods support the roadway, which is formed of timber. This bridge cost £50,000. In the following year this engineer built the Newhaven Pier, which is constructed on the same principle, having three openings, each 209 feet span; and afterwards the Chain Pier at Brighton, which runs out into the sea a distance of upwards of 1,000 feet, having four openings, 225 feet span. In the year 1823, a bridge of the kind was erected by Sir Isambert Brunel, with two spans, each 122 feet; and the year after (1824) Tierny Clarke constructed the much admired Suspension Bridge over the Thames, at Hammersmith, spanning the river by an opening of 422 feet, which has stood remarkably well.

Next in order of time is the far-famed suspension bridge erected by Telford over the Menai Straits, for the purpose of carrying the Holyhead road, and thus connecting the Island of Anglesea with the mainland. This splendid work of art was completed in the year 1825, having been about six years in the course of construction. It consists of one opening of 570 feet span. The roadway being 100 feet above the level of high water. The chains are formed of flat bars of iron 10 feet long, 3½ inches deep, and nearly an inch thick. There are four rows of chains, each consisting of four tiers of bars, ranged one above the other, so that in all there are 16 chains: to these, which are passed over the tops of two lofty towers placed at either side of the straits, and fastened at either shore into the solid rock, bars an inch square are attached, 5 feet apart, for the purpose of supporting the roadway, which has two carriage-ways, each 12 feet wide, and a central footway of 4 feet in width. The entire weight of this suspended platform, including the 16 chains, is about 2,186 tons. The Conway bridge, over the river Dee, is also a suspension bridge, and was built by Telford about the same time; it has a span of 327 feet, and likewise carries the great Holyhead road. Sir Samuel Brown then erected, in the year 1829, the Montrose Suspension Bridge over the Esk, in Scotland, with a span of 412 feet, and a roadway 12 feet wide. This bridge was all but destroyed during the great storm which took place in 1838; the platform not having sufficient rigidity to withstand the unequal force of the wind. The engineer, Rendel, however, has restored the bridge, and it is thought that such a disaster cannot again take place.

In the year 1829, M. Navier, an able French engineer, to whom we are indebted for a valuable work on suspension bridges, constructed the Pont des Invalides on the suspension principle, over the Seine at Paris, with a span of 236 feet, and a deflection in the catenary formed by its chains, of about 26 feet. The Fribourg Bridge, which spans the valley of the Sarine in Switzerland, is one of the most splendid wire bridges ever built. It was constructed by Mr. Challey between the years 1832 and '34. It has a span of 870 feet, and the platform is 167 feet above the surface of the water, which runs at the bottom of the valley. This platform is suspended from four iron-wire ropes, two on each side of the bridge. The ropes are composed of 80 wires, each one-twefth of an inch diameter, tied up by coils of wire at regular intervals; these chain ropes are made fast to the rock on either side, after passing over the tops of the towers. Suspension rods are then hung upon the chain-ropes, to which the joists forming the roadway are fixed; the cost of this magnificent and truly wonderful structure did not amount to more than £24,000.

CLIMATE IN RELATION TO HEALTH.

AT the school of medicine of the Catholic University, the first of a series of Lectures on this subject was delivered recently by Professor H. Hennessy, F.R.S.

The nature of the physical influences which act on the human system was briefly pointed out, and those conditions of the atmosphere called climate were defined as the special object of the lecture. After describing the physical and chemical constitution of the atmosphere in its normal state, the lecturer proceeded to refer to its variable conditions. He dwelt at considerable length upon the laws of distribution of temperature, and showed that a paramount influence was exercised by the water which covers three-fourths of the earth's surface. The conclusions to which he had been led in his scientific researches, whereby it appears that the water exercises upon the whole a warming influence compared to the land, had recently received fresh confirmation from the results of observation in the southern hemisphere. As an illustration of this influence during winter, he contrasted our climate with that of Central Asia under the same parallel of latitude, whereby it appears that Barnaul, which is situate nearly on the parallel of Dublin, has a colder winter temperature by 42½ degrees of Fahrenheit. The general laws of distribution of temperature over islands and continents were illustrated from the shapes of the isothermals in Ireland and on the west of Europe. The lecturer's *a priori* law of correlation of isothermals with the coast, and of transportation of their centres towards the pole, was shown to be in strict harmony with observations. The connection of the distribution of temperature in time with its distribution in space was noticed, and the general rule was shown to hold good, that wherever the mean temperature is raised by oceanic influences, the diurnal and annual ranges of the thermometer are diminished. Illustrations were adduced from tropical and temperate climates, and the lecture concluded by remarks relative to the moisture of the atmosphere and the circumstances which govern its existence.

THE GREAT POSTAL AND PASSENGER COMMUNICATION BETWEEN LONDON AND DUBLIN.—Of all the routes, that *via* Chester and Holyhead is the most important, as by it all the correspondence between the two countries is conveyed, and it has been specially organized with a view not only to postal requirements, but also to insure for passengers the utmost comfort and despatch that the present state of science and of railway experience can afford. The present service commenced October 1st, 1860, under a contract entered into by the Postmaster-General with the London and North-Western Railway Company and the City of Dublin Steam Packet Company. By the stipulations of this contract, the distance (330 miles, of which 66 are by sea) between London and Kingstown (the packet port for Dublin, with which it is connected by a railway 6½ miles long) must be accomplished in eleven hours, mean time. The trains leave Euston-square at 7.25 a.m. (except on Sundays) and 8.25 p.m., stopping only at Rugby, 83 miles from London, Stafford 133 miles, and Chester 177 miles; thence to Holyhead station, 86 miles, making the total distance 263 miles, which is performed in six hours and forty minutes. The time for conveying the passengers and mails from the station to the pier, and transferring them to the steamer, is about half an hour, which leaves three hours and three-quarters for the transit to Kingstown—equal to a speed of nearly nineteen miles an hour. The steamers which perform this service are the finest mail packets afloat. They are named after the four provinces of Ireland—Leinster, Ulster, Connaught, and Munster. The first-named vessel was built by Messrs. Samuda, Brothers, London; the others by Messrs. J. Laird & Sons, Birkenhead. The engines of the Leinster and Connaught were made by Messrs. Ravenhill, Salkeld, & Co., London; those for the other vessels by Messrs. James Watt & Co., of London, and Soho, near Birmingham. The nominal power of each pair of engines is 700 horses. The length of each vessel is 360 feet, and their measurement is 2,000 tons.—*Sir Cusack Roney's "Month in Ireland."*

INSTITUTIONS FOR INDUSTRIOUS FEMALE BLIND.

Amongst the many afflictions with which it pleases the Almighty in His mysterious wisdom to visit poor humanity, perhaps that which excites the liveliest sympathy is "the deprivation of sight"; and we learn that in Ireland alone are to be found some *six thousand* sufferers from total blindness, independent of the many partially afflicted. To provide a house for, to instruct in religion and industrial pursuits those in humble circumstances so afflicted have been the objects of a certain philanthropic few of the Roman Catholic and Protestant persuasions respectively, and our readers are already aware that the female section of the former have occupied for about the last two years the large building at Portobello-bridge, previously used as a hotel, and the latter the establishment in Peter-street, known as the Molyneux Asylum. Increasing demands for the reception of these poor creatures have, however, necessitated more suitable and extensive buildings for their accommodation, and in each case steps have been taken to secure that end. For the inmates of the Molyneux a handsome and spacious structure is now in course of erection at Leeson-street (as illustrated, together with the new church in connection therewith, in our number for April, 1860), and the committee of St. Mary's Catholic Asylum—the other institution alluded to—have commenced the preliminaries for a similar undertaking at Harold's Cross. Totally irrespective of sectarian considerations, which under all circumstances are quite outside our province, we have to express a hope that humanity will prompt a generous public of every creed to respond to the appeal made to achieve so desirable an object, and we are pleased to note that so far the financial department promises satisfactorily. The subject of our accompanying illustration is the design for the building so proposed, and which according to the particulars furnished by the architect, Mr. Charles Geoghegan, is thus described:—

"The entire range of new buildings presents a frontage to the south of 274 feet by 70 feet in depth, and comprises on the ground floor, which is 16 feet in height, a spacious entrance hall, having reception hall and porter's apartments on either side; class rooms for adults and children; ample space for trades, music, recreation, refectory, baths, and kitchen, offices, schools, and ambulatories. The dormitories, lavatories, infirmary, &c., are situate on the first and second floors, each storey being 15 feet in height. The central portion of the general composition affording accommodation for 300 inmates. The convent, which is connected with the main building by means of the chapel and central corridors on each floor, contains cells for twelve nuns, with community rooms, refectory, reception room, oratory, and sacristy adjoining the chapel, the choir of which has been arranged to form a private chapel to the convent, which can be shut off from the central building at pleasure. The tower and steeple forming a picturesque feature at the external angle of the chancel. Ample provision for heating and ventilation has been provided by means of heated chambers for the admission of warm air, and flues for conducting same into all the apartments and corridors, with numerous shafts for the extraction of foul air therefrom. The building has been designed in the Gothic style, of the plainest and most economical character, with due regard to pictorial effect in the selection of the various materials employed; the walls being built of rubble masonry coated with white pebble dashing, blue limestone dressings to all window and door openings, quoins, strings, bases, &c., contrasting forcibly with the colourless tone of the main body of the structure. The roofs are to be covered with tile slating, having alternate plain scalloped courses, surmounted by an ornamental crested ridge of fire-clay against the sky line."

Before quitting this subject we may perhaps appropriately submit the following paragraphs, quoted from a recently published report of the committee, and which will serve to show on what grounds claims for assistance in the undertaking are put forward:—

"The Institution commenced in Lower Dominick-street, in August, 1858, with two pupils: in October, 1860, it was removed hither, and then numbered 40; at present we maintain and instruct upwards of 100, many of whom would otherwise be languishing in the wards of a workhouse, a permanent burden alike to society and to themselves. Although possessing great capabilities for instruction, including a perception by the senses of hearing and touch, never attained by those enjoying the blessing of sight, the blind are, in regard to personal wants, almost helpless. Their wardrobe must be attended to, their food prepared, and, when out walking, they must be led; all which circumstances entail an outlay in the maintenance of servants unknown in other charitable institutions. In addition to this, our poor charge require a very generous diet, inasmuch as nearly all of them have lost their sight in consequence of various scrofulous diseases affecting the eye.

"You will naturally be anxious to know how we progress in the two important branches of the education and employment of our pupils. Many of them, you are aware, possess considerable talent for music, both vocal and instrumental; and for the cultivation of it every facility is afforded them. They perform very creditably several pieces of church music, and have given great satisfaction to those who have heard them. We encourage as much as possible the taste for music, as calculated to soothe and refine the mind, and perhaps enable those who possess it to earn their livelihood as organists. In the important branch of manual employment much progress has been made, so much in fact as to encourage us in the hope of being able to render numbers of our inmates capable of assisting in earning their bread. They are at present engaged in making plain and fancy baskets, cocoa-nut fibre mats, and every kind of knitting and netting. A loom also has been recently erected, and is now in active operation. In the commencement, owing to the expense of instruction, the unavoidable slowness of beginners, and the inevitable waste of material in first attempts, these works could not be expected to prove remunerative. A steady improvement, however, is manifesting itself in these respects; so much so, that we thought it advisable to establish a shop, six months since, on the premises, which is now most respectably stocked by the industry of the blind, and which is gradually but surely beginning to prove remunerative."

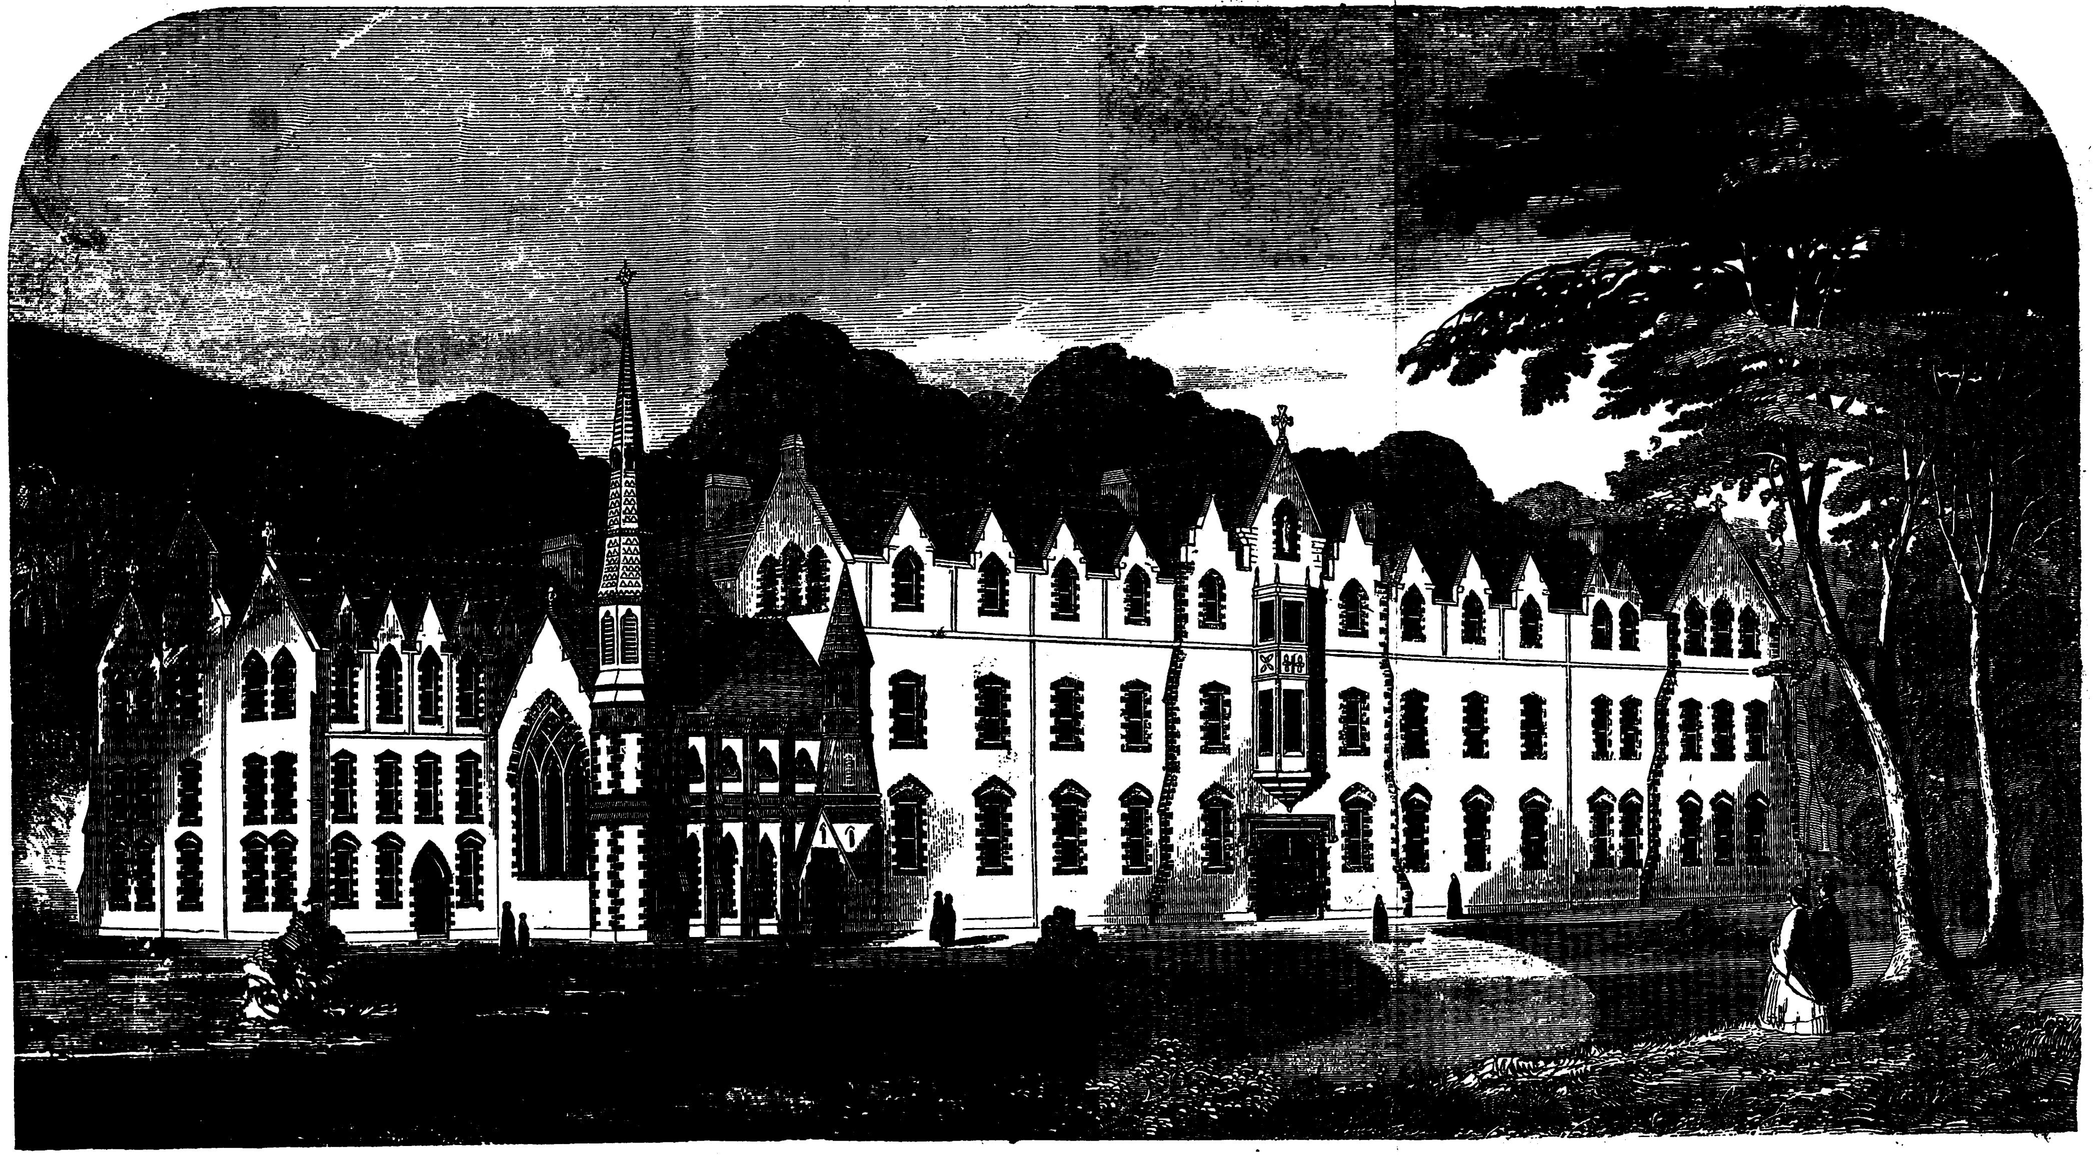
THE VISIT OF THE PRINCE OF WALES.

A Royal visit on the *tapis!* unhappily, as regards us "Irish," but few and far between; however, right welcome, and with that warmth too which the Irish alone can impart to a greeting, will be received the illustrious scion of our beloved Queen, the—according to the ordinary course of nature—future king of Great Britain and Ireland. Triumphal arches, banquets—in which the hospitality of the liberal and most worthy present occupier of the civic chair is sure to be foremost—addresses, memorials, and other complimentary distinctions will doubtless be the order of the day. In plain truth, however, we hope for more than *tinsel:* Ireland and her institutions merit more "Royal" consideration than a passing glance, a smile of approbation, an expression of pleasing reminiscences, &c. His Royal Highness is endowed by nature with an aptitude to appreciate her merits, despite invidious representations elsewhere disseminated; moreover his education, imparted under the auspices of his most excellent Queen mother, a pattern in all the relations of life, his experience of the world, too, furnishes him with an independence of judgment unfettered by prejudices, and his illustrious position enables him—or shortly will—to "suit the action to the word," and put good wishes into practical application. The exhibitions, viz., the Art and Art Manufactures in Kildare-street, and of the Royal Hibernian Academy; our institutions, viz., the Alma Mater, the Royal Irish Academy, the Royal Dublin Society, National Gallery and Museum, the Museum of Irish Industry, National Model Schools, Law Courts, and other public buildings, will be, *as usual to all strangers*, objects of temporary interest, but as a history of Ireland's past and future may be read in each and every of the foregoing, we court from a "Royal" eye—from the future ruler of the soil—more than *ordinary* study.

TURN OUT AGAINST A RAILWAY COMPANY.

The inhabitants of Kingstown and neighbouring localities have long complained of the illiberality of the Dublin and Wicklow Railway Company, the leaseholders of the line, and they are now taking practical steps to remedy their grievances by starting opposition steamers and omnibuses. The former will ply between the Custom-house Quay and Kingstown and Bray, and be capable of carrying 400 passengers each way, besides merchandize, parcels, &c., and are after the American fashion, with deck over deck. The cost of the steamer "Dublin" is about £4,400, and that of the "Kingstown" £3,600, for the purchase of which and the provision of other funds a company has been formed, in which the inhabitants of Kingstown are the principal shareholders. We admire the enterprising spirit of the promoters, which fully illustrates that there is some independent blood to be found in this country yet; and, irrespective of all considerations as regards the question in dispute, we wish the undertaking every success, a result which, for various reasons, would seem to be certain, at least when stormy or foggy weather does not cause a cessation, as no doubt must be at periods of the year. Thousands, possibly tens of thousands, are conveyed daily to and fro London and Kew, Richmond, Greenwich, Woolwich, &c., by steamers on the Thames, and the same principle of locomotion ought to be just as acceptable on the Liffey. The committee of management state their determination to go hand in hand with the omnibus promoters, and an amalgamation is proposed, so that either routes might be adopted according to choice. It is to be surmised that great local benefits will result to Kingstown.

According to the latest accounts, the railway company, at the eleventh hour, and possibly yielding to the pressure from without, have signified a desire for a conference with the inhabitants of the localities above-named.



ST. MARY'S INSTITUTE FOR CATHOLIC BLIND FEMALES, HAROLD'S CROSS, DUBLIN.

MR. CHARLES GEOGHEGAN, ARCHITECT.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE DUBLIN WATERWORKS BILL.

AT a recent meeting of the board of guardians of the South Dublin Union Mr. Austin gave notice that he would bring forward the following motion :—

"That having regard to the great increase which must take place in the taxation of the citizens of Dublin if the proposed water works bill should pass into law, this board do petition Parliament against the said bill, inasmuch as there is no necessity for immediate legislation on the subject, and as great doubts exist respecting the sufficiency of the proposed water supply from the river Vartry."

DEATH OF MR. B. WOODWARD, ARCHITECT.

WITH much regret we have to record the death of this highly accomplished and talented gentleman, so well known as one of the firm of Sir Thomas Deane, Son, & Woodward in this city, and the author of some of their most important works.

ON THE RESTORATION OF ANCIENT BUILDINGS.—ARCHITECTURAL EXHIBITION.

ON the 28th ult., a lecture on the "Restoration of Ancient Buildings" was delivered by Mr. Street, from which we collect the following :—

You have no more moral right to touch up or patch the work on which an ancient sculptor bestowed his art, than you have to touch up, finish, and repaint the work of a Giotto or a Fra Angelico. They are all works of individual artists ; and, because their names happen to be unknown, we are not relieved from the duty of preserving them exactly as they have been handed down to us.

The mason must be attentively watched in his mode of doing his work : he should (if the old work be good) attempt, as far as possible, to assimilate his own to it in every way—in the bond of the masonry, in the mode of dressing or working the stones, and in the general character of the works. He should be allowed to indulge in no such ingenious devices for spoiling masonry as black mortar or ruled joints ; and whether the work be new or restored, he should be compelled to do it at least as solidly and substantially in all respects as the old work.

Where old buildings are so decayed as to be capable of repair only by propping or by rebuilding, the former is generally the better of the two plans, as still leaving most of the old work intact. When rebuilding is decided upon, if the stone is not decayed, and the work very good in its character, every stone of the old work should be marked as it comes down, and should be reerected in its old place, and with as little disturbance as possible to the old work : this is the true conservative course ; but I am not sure that any good example can be given for the course (so often taken now) of rebuilding entirely new work in imitation of old work which has been completely destroyed.

In matters of detail conservative restoration is often possible when it is not practised. In stained glass, for instance, Mr. Ward gave an example some time ago in an old window which he restored for a church in Berkshire which I was restoring, of the best mode. A good deal of the glass had been destroyed : the leading still in the main remained ; and he releaded the whole of the glass, filling in the vacant places with plain glass opaquely painted ; and the result was that, at a small expense, we had the whole work, and nothing more, permanently preserved, with nothing conjectural, and with a good effect which I should, I confess, scarcely have anticipated. This work was done under Mr. Winston's supervision.

There are many other points on which a restorer should take epecial pains to conform to the old example. Wherever old levels of floors can be discovered, they should be most carefully copied. Old levels are generally well arranged, and not unfrequently with great peculiarities. As, for instance, the laying a floor on a gradual slope up from west to east. Then again the local fashion as to such seats, &c., in churches, is generally preferable to any other, especially where any example exists in the building under restoration which is at all worth repetition.

Painting on walls should, generally speaking, be carefully cleaned ; and, where it consists of figures and subjects, should not be restored. If the work be rude, it can hardly be restored in a rude fashion without being absurd : if its character be good, then it is, as I have said elsewhere in reference to sculpture, a pity to touch it, lest we destroy any of the characteristic touches and fire of the old artist. I have the authority of Mr. Layard—than whom no one has more zealously exerted himself in the cause of Early Italian art—for saying that the greater portion of the damage which is done to the old Italian frescoes is inflicted by their restorers, who recklessly paint and repair every damaged work for which they can induce any one to pay. And the fact is the more startling when we consider that the existing Government of Italy is engaged in putting down the religious orders, turning them out of their houses, and converting the convents and churches, which contain the most glorious works of art in the world, into stables, barracks, and schools ; so that the restorers must be actively vicious indeed who outdo such a Government in destructiveness !

There is one common reproach in the mouths of those who have no feeling for our national antiquities, to which a few words of answer are necessary. They assert that all this work of restoration is unreal and untrue, inasmuch as both our religious life and our civil life are quite unlike what they were : they say that the old buildings of each class are consequently quite unfitted for our use on religious and utilitarian grounds. In short, Lord Palmerston's "Civis Romanus sum" is interpreted literally by them, as it is by his lordship, to mean that Roman architecture is the only art fit for English citizens, and that we ought no longer to put up with any revival of English art. The charge is ingenious, but untrue. Take our churches, and in what respect is it necessary to alter them materially for modern use ? As far as the church is herself concerned, I may safely answer, hardly in any single respect need they be altered ; for, whilst Ely and Sherborne, and a host of smaller restored churches show the perfect liberty which she enjoys and allows in their restoration on the most gorgeous scale ; we hear now, week after week, of gatherings in our cathedral naves, either in Westminster or Exeter, to hear sermons ; or, as last week, at Ely and Peterborough, to join in choral practice ; so large, that even their spacious areas are not ample enough to hold the crowd that throng through their doors. And is it possible that this English nation, which prides itself so much upon its practical character, should be so unpractical as to go on year after year ever more and more actively at work, restoring and refitting old churches, if those old churches are not the most convenient and the most suitable buildings that could be devised for their sacred purposes ? . . . .

No work, perhaps, affords better training for an architect than the study which is involved in the attempt to become a thoroughly good restorer of ancient buildings. He cannot do his work even passably well without a hearty love and reverence for them : this love and reverence cannot be mere abstracting, but must be followed up by active work, active study, sketching, measuring, making notes, and thinking well upon and among them. This can never be done so well at any time as at first ; and yet I grieve to say that a large majority of young architects go on year after year without apparently even so much as thinking of the necessity of studying old buildings for themselves, or taking the slightest active interest in any work beyond that which is put before them in their office. Now what must be the fate of buildings restored by a class such as this ? Is it possible that they can be well, scientifically, or in any respect, properly done ? Obviously not. Yet I am within the facts in what I say : I have over and over again had applications from assistants in want of employment ; and it is a most painful fact that a very large majority of them have never studied or sketched any old building, or if they have once done so have done it once or twice only in their lives in a way so disgracefully careless as to make the hair stand on one's head at the idea of its being called study at all. Yet every one of them would undertake to restore a church with as much *sung froid* as it has been said one of our statesmen would display in taking the command of the Channel fleet. We want, also, educated clerks of the works and educated builders ; and let me say, without any lack of respect for the class, that, generally speaking, it is much safer to entrust works of restoration to local builders in only a moderate way of business than to large contractors, who seldom themselves see the work which is being executed, and who do not find it worth their while to enter carefully into those minutiæ which every restorer of an old building is bound to attend to. Our educated architects must educate themselves, not in continental examples or from continental books, but from English examples and English books. Whatever may be the value of foreign study to the architect (and from some points of view it cannot be overrated), nothing is more certain than it will be of no help whatever in finding out the meaning or intention of ninety-nine out of every hundred of our old English churches and houses. They are thoroughly national, and all their peculiarities are national peculiarities. They have also provincial peculiarities, so that none can expect to understand them thoroughly, without mastering all their provincial as well as all their broader national peculiarities.

The Pugin travelling fund will, I hope, soon be in existence to encourage men in this branch of their studies ; though, if the entire truth must be told, our art will not prosper as long as our students require a premium to induce them to study it. For myself, I should be ashamed of any young student of architecture who is content to waste his time and his holidays in indolent and selfish amusements, when he might, knapsack on back, be at work from day to day, for a month or two in every year at least, walking from one spot to another of this glorious country; gathering as he goes the information which will enable him in time to distinguish himself in his art; whilst the act of obtaining it is as full of real pleasure as deer-stalking, climbing Alps, or any other athletic work.

This, then is the sum of what I have to urge; that only after diligent study of our old buildings should we ever venture upon undertaking the charge of their restoration; and that the great end and object of all our restorations should be to preserve the old fabrics in all their old beauty of colour and design for our children's enjoyment. In our new works we have plenty of scope for the most ample originality, if we are capable of it. But we don't want to see Venetian Gothic windows introduced into our cathedrals or our castles, where they would be out of all harmony with everything that surrounds them, and standing evidences, not of our knowledge and our skill, but of our childish conceit and affectation of superiority to the men whose work we so obviously despise though we pretend to restore it.

A SKETCH OF THE SCIENCE OF CARPENTRY.*

THE art of carpentry is defined by Robison Tredgold and others as the art of framing timber for the purposes of architecture, machinery, &c., and in general for all considerable structures. Considered as a branch of the art of building, it embraces the construction of the framing of partitions, floors, roofs, &c.

It is needless here to enter into a description of the various kinds of timber used for building purposes, the red and yellow fir from the north of Europe being that most generally used in this country. It is easily worked, and very stiff for its comparative lightness, and for durability some authors consider it under certain circumstances to last as long sound as oak.

With this slight introduction, I will endeavour to condense the very extensive science of carpentry into as small a space as is consistent with clearness, confining myself to practical remarks only, and observing some sort of connection in the arrangement of the several contrivances. I will commence with the ordinary wood lintel. It is a horizontal piece of timber over a door, window, or any other opening built in the wall so as to discharge the superincumbent weight. If the wall is very thick more than one piece of timber will be required in the thickness of the wall. The general dimension is 3 inches thick for an opening of 3 feet, increasing 1 inch in thickness for every foot or part of a foot over the 3 feet opening. When the opening extends to about 12 feet or more, the same beam is more commonly called a bres-summer, and brings at once into operation the skill of the carpenter by strengthening the piece of timber by mechanical means, so that it will be able to sustain not only its own weight, but the superstructure it has to carry. All horizontal beams supported at their ends have a tendency, more or less, to what carpenters technically term "sag," that is, to drop in the middle by the force of their own weight. To counteract this influence, and also to gain the greatest effect with the smallest amount of material, recourse is had to several expedients, all tending more or less to strengthen the beams. The simplest form I know of is to cut down a timber, say a foot square, in the centre, reverse the grain or fibres of the wood, and screw-bolt them together. The additional strength gained by this is certainly not much. The next in order would be inserting between the pieces so cut a piece of oak or wrought iron, which certainly strengthens the beam considerably, and is frequently resorted to, but the most scientific manner of strengthening a beam is by trussing it, an operation which at once introduces us to two very important mechanical influences, namely, compression and tension, which may be readily seen by the following illustration:—If two inflexible bars be inclined to an angle, and the other extremities secured to another bar, in an horizontal position, and a weight be placed on the angle (or a screw will answer the same purpose), the inclined bars will be in a state of compression while the horizontal bar exhibits a state of tension.

The simplest form of trussing a girder is to divide it into two halves, in the direction of its depth and length, and insert between them bolts, having properly formed skew-backs to receive the ends of the struts, which may be of oak or any other material harder than the beam, and when fitted the centre bolt or bolts are screwed tight.

An extra force, you will perceive, is now added to the beam, which must be overcome ere the strength of the same, untrussed, can be acted upon.

For scantling of girders of various spans, see girders for floors hereafter, which are copied from "Gwilt's Encyclopædia," as are many of the scantlings for other timbers here mentioned.

Floors.—The assemblage of timbers used in the formation of a floor may be classed under three heads—first, single flooring; second, double flooring; and thirdly, double framed flooring. Before proceeding further, a few words as to plates. A wall-plate is a horizontal piece of timber laid on the walls of a building to receive the timbers of a floor or roof. Templates are short pieces of timber, sometimes laid under the ends of girders or other timbers, when no wall-plate is required; it should never be less than three feet long. Wall-plates and templates must be proportionately larger as the length and weight of the floor increases; their scantlings will in this respect vary from 4½ by 3 to 7½ by 5.

1st. Single Flooring.—Is formed with joists reaching from wall to wall, where they rest on the plates, in common work they are simply spiked to the plate, in better work, they are notched to the plate and spiked.

The intervention of flues, &c., will frequently prevent the ends of joists resting on the wall-plate. In such cases a piece of timber called a *trimmer* is framed and secured with a wedge into the nearest joist, which is then called a trimming joist. The other end of the trimmer frequently rests on the wall only, but it should be properly notched or secured to an iron corbel, and not go in the wall (this corbelling would also serve very well, for corbelling of wall-plates but a brick corbelling more equally distributes the bearing.) All trimmers and trimming joists, on account of being weakened by mortices, should be half an inch thicker than the other joists. Herring-bone strutting is introduced in single floors when the bearing is over ten feet, and when well fitted and secured, it stiffens the floor considerably. Single floors should not be used for floors beyond a bearing of 15 feet.

The following table of scantlings for joist will be found useful:

Length	6 feet	... ...	6 by 2
„	8 „	... ...	2½ „ 7
„	10 „	... ...	2½ „ 7½
„	12 „	... ...	2½ „ 8
„	14 „	... ...	2½ „ 9
„	18 „	... ...	2½ „ 12
„	20 „	... ...	3 „ 12

2nd. A Double Floor.—This floor is formed of three bearing timbers, a binding joist (which is in reality a girder); a bridging joist notched to the binder, and a ceiling joist also notched to the binder. (The manner of notching was shown in a sketch.) There are two or three ways of notching the ceiling joists. They are plainly notched and spiked to the under side of the binder, or they are notched to a fillet nailed on the binder, and they may be what is called "pulley morticed" into them; that is, there is a chase cut in the binder long enough to allow of the tenons of the ceiling joists being obliquely introduced into them and driven up to their places.

The scantling for timbers of this kind of floor will be the same as given for double framed flooring, of which it is a species.

Double Framed Flooring.—In double framed flooring the binders instead of resting on the walls are generally framed into girders reaching from wall to wall. Bridging joists are the same as described for single flooring.

In a single joisted floor, the whole weight of the floor being equally distributed along the whole line of the wall, it certainly has the advantage of a girder framed floor where the weight is transmitted by the girder on a portion of the wall only, and it is also usually considered that a single joisted floor is, in proportion to the cubical quantity of wood it contains, stronger than a framed floor. But, as Tredgold observes, when the bearings of the joists become considerable, the ceilings of the single joisted floors are liable to be affected by the natural movements of the timber, and at all times it is easier to execute the works required to prevent the transmission of sound in a framed than in a single joisted floor.

Practically the limit for the bearings of a single joisted floor seems to be fixed at from 20 to 24 feet; for although it is possible to obtain timbers deep enough to carry the loads of floors of larger spans; yet the depth becomes so considerable as to render the use of framed floors preferable, even without reference to the danger and inconvenience from the shrinking and warping of the joists.

A span of more than 24 feet can rarely be accomplished with ordinary timber girders, and it therefore becomes necessary to resort to the use of trussed cast-iron or wrought-iron girders. Of these the wrought-iron girder, from its lightness and elasticity, is very much used.

Partitions.—The framework of timber used for dividing the internal parts of a house into rooms is called a partition or quartered partition, so named from the use of small timbers called quarterings; and when having a solid basis throughout its whole length, it requires little skill in the formation, and is generally constructed of quartering which rarely exceeds 4½ inches by 3 inches, unless required for very large partitions. A piece of timber is fixed upon the wall which is denominated a cill, and a corresponding piece above called a head, into which the ends of the quartering are framed; occasionally an oblique timber is inserted in the form of a strutt, which gives additional strength to the partition. When the partition is to be lathed and plastered only, the door and end posts for an ordinary dwelling-house are generally made 4 inches by 3 inches, the heads and cills the same, the filling-in timbers being 4 inches by 2 inches, and about 1 foot apart. When the partition is to be what is termed brick-nogged, that is the interspaces of timbers filled in with brickwork, the thickness of the partition will require to be half-brick thick, and the interspaces of timbers arranged so as to take two or three bricks.

---

* From a paper read by Mr. R. O. Harris at the Architectural Association.

When a partition has to be formed where it is not desirable to support it from below, it must not be allowed to give any of its weight to the floor, but assist in supporting and carrying the floor above if required. To do this the partition is formed into a truss, the ends of which are supported upon the main walls of the building.

The principal objects to be remembered in the construction of framed partitions are to throw the whole weight of the partition and what it has to carry upon some principal wall or part of the building. The simplest form of accomplishing this is where the head and cill is secured with iron straps to the angle posts, a king post is framed in the centre to receive the ends of the braces; the bottom ends being well secured to the cill, the quartering is then filled in, and materially tends to stiffen the framing.

The use of iron rods with king and queen heads is much used now, and has the same advantage here as in the roof of screwing the joints of trusses firmly into their position. With these few remarks, which are necessarily incomplete, I will pass on to the next division, which is roofs, where I will more particularly describe the several ways of connecting the ends of timbers together.

I have not given any scantling of timbers for trussed partitions on account of the variety of circumstances that influence their construction, for what would answer in one case would not in another.

Roofs.—There is nothing in the whole system of carpentry requiring more careful consideration than the construction of the roof, for upon its proper formation depends the stability of the building and the safety of those for whose shelter it is designed. The first thing I would call your attention to will be "the pitch" required, and that most consistent with the covering employed and the vicissitudes of this climate. It should never be hidden from view like an unworthy object not fit to be looked upon, nor ornamented with useless decoration that cannot be seen. A very lively writer of the day observes—"It seems, therefore, a gross violation of the principles of taste in architecture to take away or hide the roof of a house; and it must be ascribed to that rage for novelty which is so powerful in the minds of the rich. Our ancestors seemed to be of a very different opinion, and turned their attention to the ornamenting of their roofs as much as any other part of the building. They showed them in the most conspicuous manner, running them up to a great height, broke them into a thousand fanciful shapes, and stuck them full of highly-dressed windows. We laugh at this, and call it Gothic and clumsy; and our great architects conceal the roofs altogether by parapets, balustrades, and other contrivances. Our forefathers certainly did offend against the maxims of true taste when they enriched a part of a house with marks of elegant habitation which every spectator must know to be a cumbersome garret; but their successors no less offend who take off the cover of the house altogether, and make it impossible to know whether it is not a mere screen or colonnade we are looking at." He further says—"A house without a visible roof is like a man abroad without his hat; and we may add that the whim of concealing the chimneys, once so fashionable, changes a house to a barn or storehouse. A house should not be a copy of anything. It has a title to be an original; and a screen-like house and a pillar-like candlestick are alike solecisms of taste." Referring again to the inclination of a roof. I will here mention the angle of inclination with the horizon adopted in different countries:—In Greece it was from 12 degrees to 16 degrees; in Rome usually 23 degrees or 24 degrees. In England high-pitched Gothic roofs are seldom more than 6 degrees, or equilateral; a very good inclination, and one very commonly used, is to make the height of the roof two-thirds the span. A high-pitched roof will undoubtedly shoot off the rains and snows better than one of a lower pitch. The wind will not so easily blow the rain in between the slates, nor will it have so much power to strip them off. Taking roofs generally we may divide them into three kinds—1. The gable-ended roof; 2. The truncated roof; 3. The curb or Mansard roof. Each of these may have their ends cut off. If the same inclination as their sides, which in a square building would form a pyramid, in an oblong roof, the angle formed at the top is called the ridge, and that formed by the meeting of the sides the hips.

1st. *The Gable-ended Roof.*—This is the simplest form of roof for buildings of small span. They are formed of wall-plates, bedded upon the wall, to which the common rafters are notched and spiked. In Gothic roofs they are mostly continued to the exterior of the wall, to which a trough gutter is fixed; the upper end is cut so as to abut to the ridge piece to which it is spiked. There is generally a space of 1 foot between each rafter, and to every fourth or fifth rafter is attached a tie generally termed a collar; it is halved and dovetailed to the rafters, and secured with oak pins or screws. If it were required to hip this roof, the wall-plate would be continued round the wall, and secured where they lap over each other at their ends by being halved and firmly screwed together. They are further secured by the angle-tie, which is also halved and dovetailed to the wall-plate, and a small timber called a dragon-beam receive the foot of the hip rafters. The angle-tie and dragon-piece are not used in Gothic roofs; being seldom or never hipped, there is no occasion for it. When the ceiling is required, say half way up the roof, the ceiling joists may perform the office of collars, and be attached to each pair of common rafters; and when the rafters are plastered to the whole height, the collars or ties may be about 5 feet apart. It is not advisable to use this roof for spans exceeding 18 feet or 20 feet at most. The bearings of the rafters may be further shortened by using a purlin notched to the top of the collars.

When the span of the roof exceeds 20 feet, it should be formed of trusses, quite independent of the rafters. The simplest form of truss is that with a single king-post, tie-beam, a pair of principal rafters, a pair of strutts, purlins, common rafters, &c.

The tie-beam extends from wall-plate to wall-plate, to which it is cogged, so it ties the wall in at the top, and receives the outward thrust of the principal rafters, and so converts it into a vertical pressure. There are many ways of connecting the principal rafters with the tie-beam. I will give but one, which is called in carpentry the *true joint* for a rafter foot, and is used by the best London carpenters for all oblique thrusts. It is secured by a wrought-iron strap with wedges, or by a screw-bolt going through the two timbers. It becomes necessary to provide for what is termed the sag or sinking of the beam in the centre, and for this purpose the king-post is introduced, which is suspended, as shown from the apex of the P rafters, and from this is suspended the tie-beam; it is further secured with a wrought-iron strap and wedges at the lower end, which is framed into the tie-beam. The head and foot of the king-post, you will observe, has abutments for securing the ends of the principals, and for strutts which divide the bearing of the principals; these projections are termed joggels, into which the rafters and strutts are firmly framed and bound with an iron strap, having three branches to secure the rafters and king-post. Sometimes the king-post is exchanged for two queen-posts, when the span of the roof is increased, and the tie-beam requires suspension from more than one point, this introduces the collar-beam to retain the queen-posts in their position, and another timber at the bottom, called a straining-cill. The auxiliary, or cushion-rafters, to which the purlins are fixed, have been used by some architects for additional strength.

This mode of trussing answers well for a truncated roof, where the collars may be cambered to a fall for the lead covering.

The next form of roof I will draw your attention to is the curb roof—that invented by Mansard, sometimes called the Mansard roof, after the name of its inventor—essentially a French roof, and a very good one it is. When sleeping apartments are required in the roof it certainly affords more space than any other form: its construction in every way meets the requirements of science. It forms ample means by its dormer, windows, &c., for appropriate decoration, and well contrived to bear the vicissitudes of this climate, and deserves to be more generally used.

It is formed of two pair of inclined planes, not unsimilar to four sides of a regular octagon. The upper rafters are called curb rafters, and a plate receives their ends, and is called the curb plate. When the bearing of the top inclines are long, they may be formed into a king-post truss, the space between the two ties being the height of the storey, and in large roofs would form the partition dividing the rooms. And the system of trussing explained, described for partitions, can be well practised in this form of roof. I will conclude these very incomplete remarks on this class of roof by calling your attention to one or two specimens of the finest roof carpentry in this country.

One is the roof of the Birmingham Theatre, constructed by Mr. George Saunders. The span is 80 feet and the trusses are 10 feet apart. It is one of the boldest and lightest roofs in Europe. The contrivance for taking double hold of the wall, which is very thin, is excellent.

Similar this in span, and probably a finer specimen of carpentry and appropriation of the roof space, is that of Drury Lane Theatre—80 feet 3 inches span, and the trusses 15 feet apart, constructed by Mr. E. G. Saunders. "It is probable," says Tredgold, "that this roof has not its equal in the world for lightness, stiffness, and strength. (The scantlings of the timbers, &c., are given in Tredgold and Gwilt.) The main is so judiciously framed that each of them will safely bearly a load of nearly 300 tons.

In Gothic roofs the general principles of framing are somewhat different to what I have described; in those the timbers are generally unwrought and hidden from view. In the Gothic roof it is different; the timbers are carefully wrought, sometimes beautifully moulded and carved. They exhibit also a system of trussing of the highest order; and the roofs of Westminster Hall, Hampton Court Palace, and Eltham Palace, Kent, are among the finest opened timbered roofs in Europe.

Taking Gothic open roofs generally, they have a tendency—from their construction—to exert an outward thrust on the wall, to counteract which the walls require to be made thicker, and further strengthened by buttresses where the trusses rest upon the wall; hence the roof with a tie-beam and a medium pitch has the advantage of a high-pitched Gothic roof, in having greater strength with a smaller quantity of material.

I will here introduce one or two of the principles of Gothic roof as executed at the present day. The simplest form is putting a collar about half up about every fifth pair of rafters, or to each pair if the cush will admit. It is a common form for old chancel roofs in small parish churches. It may be considerably improved by using a pair of strutts, which brings the tie of the roof nearer the wall-plate. These may also form trusses upon which to bridge the purlins, and they receive the common rafters as in other roofs. The first of these examples may be further strengthened by the introduction of a circular brace, which takes the form of a Gothic arch, and is firmly screwed to the collar and principal rafter, and frequently has a bearing much below the wall-plate. Hence the wall above acts as a dead weight to counteract the thrust common to its construction. It will be readily seen what an important part this circular brace performs. Upon their stiffness depends the proper tying-in of the walls of the top. This bracing may be used in many forms, but the result must be the same, or it does not fulfil its office. It affords ample scope also for ornamentation, which our ancestors appear to have well appreciated.

To give you anything like an account of the complicated ingenuity displayed in the different ages of Gothic carpentry, is far beyond the limits of this introduction to the science generally; in fact, a large volume, and a very popular one too, on Gothic carpentry, as worked at the present day, I think is much needed.

Before quitting this subject I will mention the hammer-beam roof and the low pitched roofs common to late work. These were often formed (I may say generally) without any truss, an assemblage of girders, purlins, and rafters of sufficient scantling to bear their own weight and what they had to carry. Frequently the ceiling of these roofs are beautifully panelled and very effective.

The hammer-beam truss consists in its simplest form of a pair of principal rafters and collar, with two beams projecting from the wall at right angles to the wall-plate, and from which the truss is braced, as before described. With these passing notes I must conclude my brief sketch. I could have written much more on the subject had space permitted; and in endeavouring to simplify my subject I fear I have been tedious to our senior friends. However, I trust it may elicit some discussion for our mutual benefit.

I have purposely omitted a very beautiful system of carpentry practised by the French engineers, De Lorme and Eny, &c., thinking it a subject worthy of a separate paper.

LAW NOTES.

Kempston v. *Butler*.—In this case, the particulars of which have been so repeatedly before the public that it is unnecessary to recapitulate them here,

The Chief Justice delivered the judgment of the court. His Lordship having gone very fully into the facts and the law, said that, so far as the court could see, upon the present count at common law, there was no liability upon the owner of the party wall, which, in the event of taking down the adjoining house, threw upon him solely and exclusively the expense of maintaining, propping up, and supporting that party wall. The question was, notwithstanding that the custom which had been set up, and which had existed in the city of Dublin, was the court at liberty to hold that the custom, as laid in the declaration, was a reasonable one. There was no doubt that the reasonableness of the custom was a matter of law. There was no allegation whatever in the present pleading that this was a custom in Dublin binding the owners of property. It was alleged to be a custom binding on the builder only, and, if it was valid, it should be one as far as the court had any means of seeing on the present pleading, confined to the care of a builder taking down a house for the purpose of erecting another. Assuming, then, as he was bound to assume, that no obligation existed at common law on the owner, no statement had been made of the custom in terms binding the owner. Was it therefore a reasonable custom that a builder, who was merely employed for the purpose of taking down a house to build another, had thrown upon him the onus which did not exist at common law, and which the owner of that house must have had in himself? The court had come to the conclusion that such a custom was not a reasonable one, and could not find any sufficient reason that would justify them in holding that it was so. Upon the whole of the case they were of opinion that that custom was contrary to the rights of property and to the common law of the land, and, therefore, notwithstanding the finding of the jury, they should act upon that opinion, and, the second count being good, order a trial "de novo."

Judge Christian delivered an able judgment, and concurred, as did the rest of the court, in the decision of the Chief Justice.

COURT OF BANKRUPTCY AND INSOLVENCY.

In re J. A. Bergin.—The court passed the final examination, and granted an immediate certificate.

In re Noble Talbot.—The insolvent was a carpenter and builder in Clanbrassil-street. His discharge was opposed on behalf of a Mr. Johnston and of John Ouseley Bonsall, who applied for possession of the house and premises in Clanbrassil-street. The insolvent alleged that Mr. Bonsall had made an illegal seizure on his chattles, and that an action was pending against him.

His Lordship adjourned the case till November next, in order that the insolvent, in the mean time, might make any arrangement he could.

Notes of New Works.

A new church is to be erected in the town of Augher according to plans and specifications furnished by the architects to the Ecclesiastical Commissioners.

A new building for the Christian Brothers' schools has been recently completed at Tuam.

A new model national school is to be erected at Lurgan by the Board of Public Works, and the same body are also receiving tenders for extensive gas works at the College of Maynooth, and for an infirmary at same establishment.

The first stone of a new Wesleyan Methodist Chapel has been laid at Salt-hill, Galway. Style geometric decorated Gothic. Mr. Tarleton architect; Mr. Geo. Glanville, of Ballinasloe, the builder.

A new Wesleyan Chapel is also to be built at Rathdowney, Queen's County. Style Tudor Gothic. Same architect and builder.

Sundry works are to be executed at the churches of Larne, Layde, and Portglenone county Antrim; Moyntaghs, county Armagh; Ballyhalbert, county Down; Clifden and Killeroran, county Galway; Omeath and Termonfeckin, county Louth; Ballyoive, county Mayo; and Achonry, county Sligo, under the directions of the architects to the Ecclesiastical Commissioners, and tenders will be received till 22nd inst.

Additions are to be made to the women's dining hall of the North Dublin Union Workhouse. Tenders to 19th inst.

The new Catholic church of St. Mary, at Granard, is progressing under the direction of the architect, Mr. John Bourke. The site, which is said to be most advantageously circumstanced, was presented gratuitously by the uncle of Col. Greville, M.P. The style is transitional—between the first and second periods of pointed architecture; the plan cruciform, containing nave, aisles, transepts, side chapels, chancel, baptistry, sacristy, tower and spire, porches, &c. The internal length is 120 feet, and 82 feet across transepts; breadth across nave and aisles 54 feet; height to apex of roof about 58 feet; the tower and spire will stand at the angle of one of the transepts facing the main street of Granard, and will rise to a height of 170 feet from the surface, crowned by a rich mediæval cross, and decorated with spire lights, niches, &c. Rich traceried windows will light the chancel and side chapels, triple lancet windows will light the aisles, and double lancet winwill light the aisles and clerestory. Cylindrical stone columns, supporting lofty, pointed arches, will divide the nave from the aisles. The roof will be of open timber work.

The foundation-stone of the new cathedral church of Clogher will be laid on Tuesday next.

A handsome organ has been erected by Messrs. White, of Bishop-street, in the chapel of the convent of St. Mary, Kingstown.

Messrs. Moore, Brothers, have been declared contractors for the Finn Valley Railway, a distance of fourteen miles, connecting the village of Finn, in the county of Donegal, with the Derry line at Strabane. The same contractors are at present engaged laying the line from Navan to Clonsilla, and the Liffey branch from Midland Great Western Railway. In the latter case we can bear personal testimony to the spirit with which the work is being pushed forward.

The works connected with the new hotel at Bray, on several occasions noticed in this journal, are progressing rapidly, upwards of 100 artizans and labourers being employed thereon. The third storey is already far advanced.

Very extensive additions are about to be commenced at Messrs. Berry's, Arran-quay. The adjoining houses will be taken down and rebuilt uniform with their present frontage, and a long range of stores will be erected in the rere, extending into Church-street. Mr J. S. Butler, architect; Mr. Wm. Hughes, builder.

Estimates will be received up to the 22nd inst. for works to be executed at the church of Holy Cross, Tramore. Mr. M'Carthy, architect.

Mr. Richard Allen, the extensive merchant tailor and draper, is having the front of his establishment in Sackville-street attractively decorated, under the direction of Mr. Gibson, of Mary-street, painter, &c. Imitations of various marbles—in which Connemara green forms an important proportion — are introduced, and the Caryatic figures over the Corinthian columns, which flank the great window on the first floor, are being highly bronzed. As yet we cannot speak with confidence of the effect, as the scaffolding is not yet removed, but may probably do so by-and-bye.

It is expected that the second line of rails now being laid on the Dublin and Wicklow line, between the metropolis and Bray, will be ready for traffic on the 1st prox.; also that the portion of the line to Rathdrum will be opened likewise.

The preliminaries for constructing a line of railway between Killyleagh and Crossgar are progressing satisfactorily. The former town is said to be becoming a prosperous place.

The preamble of the Cork and Macroom Railway Bill has been declared proved. The Cork, Blarney, and Macroom Railway Bill was thrown out.

LIGHTNING CONDUCTORS FOR HOUSE-TOP TELEGRAPHS.

It is stated that, yielding to the earnest representations of the occupiers of houses in this city upon which rest telegraphic poles connecting the various railway termini, the Castle, &c., the company have consented in each case to place lightning conductors. A writer in a recent number of the *Daily Express* says, "That in a very heavy storm the lightning played with picturesque, but alarming fitfulness along the wires, darting from house to house and street to street, to the consternation not only of the occupiers, but the passengers." The *Building News*, however, points out the danger of the improper application of such supposed precautions in the following terms:—

"The lightning-conductors supposed to be so great a source of safety will prove only the means of increasing the danger, unless they are composed of ½-inch copper rod carried down 60 or 70 feet into the earth to insure constant moisture. If that precaution be not taken, human life and household property in the neighbourhood of inefficient conductors will be in more danger than before, owing to the severity with which the 'lateral discharge' always takes place. In considering this matter, so serious to the public generally, it should be recollected that the ordinary telegraph wires at the regular stations are always connected with the earth, and yet they fail to carry off more than an insignificant portion of a flash of lightning. The public must, therefore, be on its guard against any make-believe conductors, because telegraph companies will be ready enough to escape the necessary expense, if they find that any sham will prove satisfactory, until the 'avenging fluid'—as Mr. Wreed, in his letter, more profanely than logically termed the dangerous flash—causes not only consternation, but actual destruction.

"In the provinces a telegraph wire passed near a gas-pipe, and a few feet further on was connected to the earth. The lightning struck the wire, the lateral discharge entered the leaden gas-pipe, made a hole through it and lighted the gas, fortunately, it was immediately extinguished by those present, or the pipe must have been melted and the house probably burned to the ground. This, we understand, is not a solitary instance of the past, and it is just as likely to happen again in the future, for if the lightning strike a pole on the top of a house it would to a certainty make for the gas-pipes, and should they be of lead, as we have already suggested, the most destructive consequences may ensue.

"As this is a question possessing great and general interest, and as 'everybody's business is nobody's,' under these circumstances, perhaps, we may be excused in asking Dr. Faraday to favor us with his opinion on the subject for publication, in order to set the public mind at rest by explaining the nature of 'lateral discharge' in this respect, and enabling householders to test the assurances of telegraph agents and the experience of engineers employed by telegraph companies."

Mr. E. P. Gribbon, architect, has removed his offices from 57, Lower Gardiner-street, to his residence, 72, Stephen's-green.

COLUMN FOR CRAFTSMEN.

MASONRY AND BRICKLAYING.

(Continued from page 532.)

The antiquity of bricks seems to be coeval with the first edifices after the deluge—the tower and city of Babel, and most of the early structures of Egypt, being built of them. The sizes varied in a greater proportion than those of modern manufacture, but according to Pliny, those most in use were a foot and a half long and a foot broad. There are also evidences of bricks being shaped in circular and other moulds for the formation of columns, &c. The bricklayer's art has attained great perfection, and his work in regard to permanency, and not unfrequently architectural beauty, may compete with that of the stonecutter and the mason. In laying bricks there are four kinds of bond—viz., English, Flemish, herring, and garden wall—the first consisting of a row laid lengthwise, called *stretchers*, crossed transversely and alternately by other rows called *headers*, the second where header and stretcher are placed alternately in the *same* course. The standard thickness of a brick wall is in reality 13½ inches, or a brick and a half, but is most commonly assumed to be 14 inches, being on the surface 16½ feet square, and producing, according to the practice in England, a rod of 272¼ square feet, or 306 cubic feet. To construct a rod of brickwork about 4,500 bricks (varying, however, with the sizes manufactured in different localities), and mortar composed of 1 cwt. of stone lime and 2½ loads of sand will be necessary. Throughout Ireland, the ordinary measure adopted is a perch of 21 feet in length, 1 foot in height, and 9 inches in thickness; the custom also is—as in several provincial places throughout the kingdom—to include the openings as solids. A 4-inch wall is reckoned two-thirds of a 9-inch wall, and a 3-inch half a 9-inch wall. In the centering of sewer vaulting half the arch is allowed, and in groin vaulting the whole arches are usually done at so much per, according to their class, splayed jambs, cant quoins, &c., by the running foot. In some parts of Ireland a very superior material of brick is produced, about the best being that manufactured in the county Dublin, the next that of Athy—the sizes of the moulds, however, are smaller—Tullamore, &c., &c., all of which are of a grayish colour. Belfast yields bricks of an excellent quality, and of reddish colour chiefly, which contributes an appearance of warmth to the buildings erected therewith, also, when judiciously disposed with those of other colours, admirable architectural effect. Terra Cotta may be regarded as a species of "brick" material, and has been adapted as a substitute for brick dressings in many public buildings in England; but we are only aware of a single instance in or near this metropolis—viz., a church at Kingstown, designed by Messrs. Barry & Brown (Raffles Brown)—in which it has been employed. We may perhaps appropriately remark here that the manufacture of this article has been brought to a high state of excellence by some English and Scotch firms, and we were greatly pleased both with the character of the designs and the quality of various articles in that line during a recent visit to the establishment of Mr. Blashfield, at Great Marlborough-street, London, a fact with which we desire to acquaint our professional readers specially. About the most stupendous and at the same time the most admirably executed piece of brickwork in the three kingdoms is the metropolitan terminus, of the Great Northern Railway, at King's Cross, which comprises a lofty central tower, with two great semicircular arches of, we believe, 70 feet span, each abutting against smaller side towers projecting beyond the face of the building, and producing a whole, which for suitability of character and meritorious combination of architectural arrangement to an engineering requirement is unsurpassed. The system of building brick walls either by leaving spaces between the external and internal faces, or perforating each brick separately, has of late years come greatly into favour; the advantages it would seem to present being much saving of material, and though rendering the mass lighter, adding greatly to its stability, as has been proved by experiment; moreover, as a preventive against damp, the principle is considered to be effectual. The prices of bricks, like every other article employed in building construction, vary—the best county Dublin stocks being sometimes as high as 30s. per thousand and as low as 26s., the *place*, or worst burned portions of the kiln being, however, much cheaper, but these latter are unsuitable, except for inside linings, partitions, &c., &c., and even then are of a very perishable character.

THE GEOLOGICAL SOCIETY.

A general meeting of the above society was held in the Museum Building, Trinity College, on the evening of the 12th inst.

The chair was occupied by the President.

Mr. Bateman read a paper, by himself and Messrs. Barton and Dopping "On the Chair of Kildare."

The Chairman observed that Mr. Bateman and his colleagues were deserving of great credit for the valuable information they had afforded on this interesting subject.

The President read a communication "On the occurrence of Oligoclase in the Gneissose Granite of Castle-Caldwell, in Fermanagh."

Mr. J. B. Jukes, M.A., read "Notes on some points in the Geology of the County Antrim."

A vote of thanks was passed to the learned professor for his interesting paper.

"THE BUILDING NEWS."

It seems somewhat like a formal introduction by a *third* party of two *old* friends, for us to draw public attention to a periodical thoroughly established, and the excellence of which has placed it beyond the reach of critical disquisition; however, adhering to the maxim that "a good thing cannot be done too often," we claim permission to endorse an approving sentiment universally and unexceptionally felt of the ability and spirit with which this professional organ has been and is being conducted. Perhaps we were amongst the first in this city, or country either, to whom the earliest numbers of the *Land and Building News* found their way, but since then the proprietors, changing their tactics with "the spirit of the times"—and wisely too, as circumstances have proved—determined on the pursuit of a course less divided, and omitting the former department, launched *The Building News* in its integrity. With *hand, head*, and *heart* all combined, they have skilfully, energetically, and honestly pushed the undertaking, relying for public approval on genuine merit alone, and disdaining the courting of popularity by pandering to the tastes of a section, or sacrificing independence of principle at the shrines of other objects. The path presenting itself to be trodden by this journal *ab initio*, was by no means a smooth one, and was disputed at every step in its course by that host of opponents which prejudice—as *we* know well—continually raises up; however, spurred on by extraordinary energy of purpose, and determining never to cry "hold, enough," *The Building News* was pushed from one degree of excellence to a higher and a higher, until it reached "the goal of success" most triumphantly. Whether we regard it in the editorial or illustrative departments, the award of merit is perhaps equally applicable, it being evident from the character of its contents—original, independent, and racy as they are—that a galaxy of talent must be present on the staff, and in the latter we may without invidiousness chronicle a *fact* which *must* be conceded, that under the auspices of its conductors the art of wood engraving has been brought to a degree of perfection as yet unattained by any other journal *in the world*. As a general rule, too, it may be assumed that wherever first-class ability and enterprising spirit are to be found, so also is the nobility of nature—"generosity of purpose"—usually present; and this characteristic we have personally experienced to be one of the distinguishing *traits* of our cotemporary in question. Creeping in our own infancy, and before we attained our *second* age, a helping hand from an adult friend was most acceptable; and this we desire specially to record was on *more than one occasion*, in the shape of friendly notice and quotations, cordially extended by *The Building News*. When kind spirit is manifested, it would be ungracious not to openly acknowledge and reciprocate it, and the opportunity is in this instance doubly gratifying, as it can be done without an error of judgment. We shall always regard *The Building News* as an esteemed friend—a senior in every respect—in whose well-being we experience a lively interest.

Miscellaneous.

The following brief account of Ernest Slingeneyer's picture has been received from the architect of his Majesty King Leopold:—"This grand historical painting, by one of the most eminent artists of Belgium, represents the heroic death of Jean Jacobson, of Ostend, at the siege of that city in 1622. Jean Jacobson, a celebrated mariner, sprung from an ancient and noble Belgian family, was captain of a Spanish vessel, in which alone for sixteen hours he maintained a fight with nine Dutch ships. He sinks three of them, then, seeing his deck in possession of the Dutch boarders, he sets fire to the magazine and blows up his ship rather than surrender."

The whole of the masons in London, and a large number of the bricklayers, plasterers, painters, and carpenters, struck work on Monday morning last, the masons' committee withdrawing their men from every firm within the postal district who refused to pay on the terms of the compromise offered by them, viz., 6s. per day for five days, with 3s. for the half day on Saturday.

Monument to the Earl of Glengall.—A massive monument, sarcophagus-shaped, and composed of Aberdeen granite, has been placed in Caher church-yard, close to the vault where repose the ashes of the three members of the Glengall family there interred. The mausoleum stands opposite the old castle of the Barons of Caher, a title that afterwards lapsed into the higher distinction, the earldom of Glengall.—*Clonmel Chronicle.*

Exhibition of 1862.—This building progresses with rapidity, the question raised by Mr. Donaldson, district surveyor, having been satisfactorily settled. The bills of quantities include 5,000 tons of concrete, 60,000 tons of bricks, 22,000 tons of mortar, 10,000 tons of iron-work, and 600 miles length of painting, 500 tons of sheet glass, and 600 tons of plain glass.

Art Union of Great Britain.—The drawing of prizes, numbering upwards of one thousand, and comprising several purchases at the Royal Hibernian Academy Exhibition, is announced to take place in the Free Trade Hall, Manchester, on the 29th inst.

William Dargan.—The name of an Irishman of whom his country may well be proud, cannot be more appropriately introduced than in connection with the locality of Bray. Although the works of William Dargan may be seen in almost every part of Ireland, it is here that he has of late years concentrated all his energies, now removed almost entirely from the active pursuits in which he was engaged for upwards of thirty years. Under his guiding eye, and by the judicious investment of his abundant capital, a small and comparatively obscure village has been rapidly converted into a charming marine outskirt of Dublin. Although Mr. Dargan's operations only commenced in 1856, Bray already abounds with well built villas and terraces, and possesses a population which promises to increase as rapidly as that which flowed into Kingstown after the completion of Mr. Dargan's first great work in Ireland—the Dublin and Kingstown Railway. Mr. Dargan, now in his sixtieth year, is in the enjoyment of vigorous health, and we are sure that all who know him, whether personally or only by fame, unite in the earnest hope that he may, with his clear head and warm heart, for many years to come, co-operate in advancing the material development, as well as the intellectual improvement, of his country.—*Sir Cusack Roney's "Month in Ireland."*

The Private Telegraph.—Recently in Edinburgh Mr. Bartholomew, telegraphic engineer, exhibited Wheatestone's private telegraph in the police board-room, before the Lord Provost, magistrates, and several other gentlemen, with a view to the adaptation of the system to the police stations. Its advantages lie in the facts that anyone who can spell may send or receive a message; that the source of the electric power is permanent; and that the operation is certain. The apparatus is divided into three parts—the communicator, the indicator, and the alarum. The communicator, generating the current by magneto-electric induction, exhibits a series of keys representing each letter of the alphabet, with the numerals. By depressing those keys the signals are communicated to the distant station. The indicator, or "receiving apparatus," is a handle like that of a clock, pointing to any letter which may be represented, whilst the alarum is an ingenious arrangement for calling attention. The experiments gave great satisfaction, the superintendent of police having found that even on the first trial he could telegraph with unerring accuracy.

New Main Sewers.—Various works of sewerage improvement in this city are at present in progress, or in contemplation, some of the most recently authorized being in connection with Chancery Place, Mountrath, and neighbouring streets, Great Britain, Marlborough, Cumberland, Wicklow, Duke, Dawson, and Dominick-streets, Bayview Avenue, &c., &c.

Curragh of Kildare.—Return of all expenses connected with the erection of permanent and temporary barracks, huts, stabling, &c., on the Curragh of Kildare, and for all other works and services in the formation of the camp there, including cost of draining, paving, and supply of water, to the 31st March, 1861:—Barracks, £5,829 9s. 6d.; huts, £152,428 3s. 8d.; schools and churches, £5,427 1s. 9d.; supply of water, £12,303 9s. 10d.; drains, &c, £8,555 7s. 9d.; forming roads, &c., £5,856 4s. 8d.; rifle ranges, £2,121 17s. 5d. Total, £192,821 14s. 2d.

Excavations in Derry Cathedral—Relics of the Siege.—In the course of the excavations which have been going forward in the cathedral of Derry for the purpose of effecting architectural repairs, a great variety of remains connected with the siege of 1688-89 were discovered by the workmen employed. In addition to some coins of James II. and William III., a large quantity of human bones were turned out, evidently those of parties who had been buried inside the edifice during and after the siege. The graves of Baker and Browning were uncovered, but closed up again, and several other coffins were found, particularly one, bearing on its centre the letters "M. S." and beneath this inscription a representation of a human heart, with four darts striking out from it in a diagonal position. Below this point were the figures 1729, formed of round topped brass nails, and the whole quite distinct. Numerous other remains were disinterred, and carried out into the churchyard, to the place known as the stranger's burying ground, where they have been lying ever since, exposed to public view, and are, it is said, to be reinterred in this undistinguished locality. Other reports, which we forbear to notice, are in circulation, and the public feeling has been a good deal excited by the more than unceremonious manner in which these memorials of the defenders of Derry have been treated by the parties in temporary charge of the cathedral, of course under the superintendence of the ecclesiastical "powers that be."

A glass steam engine is on exhibition by the Bohemian troupe of glass blowers at the Cooper Institute, New York. It is a complete transparent, low pressure, working engine, with all the inner parts, valves, &c., of course, visible.—*Scientific American.*

The Dublin Builder.

VOL. III.—NO. 37.

DEATH IN THE BARRACKS.

REVELATIONS startling and of considerable moment, as simultaneously affecting the existence of an important section of the community, and the vital element of our national strength, have just issued from that instructive oracle, the "Blue Book." Great Britain glorifies her soldiers who bleed and die in the cause of loyal devotion; she perpetuates their memories by marble monuments, and decks with laurels the brows of the survivors. Yet she compels these brave defenders of Queen and country to endure at home, during their period of comparative rest, that which is of more constitutional detriment than the snow-filled trenches of Sebastopol or the burning plains of India. "Grim-visaged death" hovers in the homes of the stalwart, and, laying his fatal hand on his victims, prematurely hurries them one by one into eternity, and this too under the—assumed to be—improved *regime* which modern science has secured in the construction of barracks. It needed no great exploration of the buildings so appropriated, in the salubrious localities of Ship-street and Linenhall-street, respectively, in this city, to become convinced of the fact that in every respect are they unsuitable as human habitations, and more especially so for those who, more than others, require the invigorating influence of good air and plenty of it. Of the former, the commissioners appointed to make a thorough inspection of all the barracks say in their report, "They overlook a street of filthy houses, behind which pigs are kept, and nuisance is experienced when the sties are cleaned;" and of the latter, that they are "enclosed among civil buildings in one of the worst districts of Dublin, and consist of a number of small closed courts, obstructing the external ventilation. It can only excite surprise that such a building was *selected* for such a purpose." Even irrespective of sanitary considerations altogether, what conclusions as to demoralizing tendencies may be drawn from the recorded sentence "*in one of the worst districts of Dublin?*"—a fact too notorious to require further comment. The same strictures might not seem to a casual visitor to apply to other barracks, for instance the "Royal," which are far more happily circumstanced as regards site, yet a peep into the interior seems to justify the commissioners in reporting that "the buildings are crowded together, and are inferior in sanitary arrangement. There are narrow dark lanes between lofty three and four storey buildings, without any outlet sufficient to prevent *stagnation of air.* Tho men's rooms on three sides of the cavalry square are *over the stables.* The barrack rooms in the Royal and Palatine squares have windows *only at the back.* There are rooms in the corners and lower flats of the squares, *dark and incapable of ventilation*, and which are hardly *fit for human habitation.*" In the case, however, of the Linenhall and Aldboro' Barracks it is but fair to remove from professional officials the stigma which so justly applies in the other cases, by reminding the public that they were designed for totally different purposes—one for commerce, and the other a baronial mansion—their adaptation for homes for the soldier being a matter of temporary necessity consequent on an increase in the garrison during troublesome times. We have no desire, however, to exonerate the higher officials from censure for not —after those troublesome times had passed away—adopting measures for the removal of defects, if practicable, and if not, for not either abandoning the buildings altogether or reconstructing them on orthodox principles. The latter alternative would seem not quite altogether to harmonize with the opinion of the commissioners as to to the skill of our modern architects, for they say that "the best barracks are *not* those of *recent* construction, but they are to be found among the Irish barracks built in the *end of the last century*, or in the beginning of the present one." But again they admit that "some of the plans, especially those of certain Irish barracks, are *good*, *convenient*, and well-adapted for securing the *healthiness* of the buildings." Considerable additions have been recently made to Beggar's-bush Barracks, which are situated in a decidedly healthy locality—almost a suburb; and in alluding to them the commissioners remark, that "they afford an excellent example of a good arrangement of ablution accommodation, but that the distance between the opposite windows, 32 feet, is too great for the height of the room."

A local contemporary, treating of this subject, makes a sweeping assertion as to the source of blame for the causes above enumerated, and, evidently misinformed, puts the saddle on the *wrong* horse; we quote the following paragraphs:—

> "Every page proves either that *Government architects* of modern times know nothing of *sanitary laws*, however glibly they might lecture on them, or that Government inspectors were singularly careless in the performance of their duty.
>
> The *unwholesome* barracks are those erected in modern times, since the *Irish Board of Works has been made subordinate to a London Department.*"

Neither Government *architects* nor the Board of Works officials have had anything to do with the construction of the buildings in question, which is exclusively provided for by the *Engineers* of Her Majesty's War Department, and for the defects therein the latter is, therefore, wholly responsible; but now that attention has been aroused, we hope to see the most energetic measures adopted for the expulsion of the evil demon that has been so long invisibly, but surely, completing his destructive work.

We shall have much more to say on this and kindred subjects anon.

THE CENTRAL HALL OF THE EXHIBITION.

NO. I.

OUR previous notice of the Exhibition of Art and Art Manufactures, now open at Kildare-street, in this city, being—as intended —only a *resumé* of its principal features, we propose to detail the contents of each department more minutely in a series of articles commencing herewith, but previously a few particulars relative to the history of the project and the building itself may prove desirable. The yard—in which were formerly held, under "the open canopy of heaven," the Royal Dublin Society's periodical shows of cattle, and situated to the right of the entrance to their premises in Kildare-street—having been recently covered in, it became the Agricultural Hall, and with certain restrictions as regards height, already expressed, is a suitable apartment for the purpose. When, however, the question of holding an exhibition of art manufacture was first suggested, about this time twelve-months, after the arrangements of preliminaries as to a minimum guarantee fund of £5,000—but which subsequently exceeded £9,000—it became necessary to add galleries and refreshment rooms to the original building, and this has been accordingly done under the direction of the architect, Mr. Clarendon. The Royal Dublin Society are trustees of the funds connected with this exhibition, and reserve to themselves the right of disposing as they may think proper of the surplus receipts over all expenditure; but their committee of manufactures was authorised to vote a sum of £300 towards the project. It will be seen that the society's position was clearly defined, and judging from the success so far attendant, there can be no reasonable doubt but that a large increase to their coffers will be acquired at the conclusion. On Friday, the 24th of May last,—her Majesty's birth-day—the exhibition was inaugurated by his Excellency the Lord Lieutenant, and has since been open every day—except Tuesdays and Fridays, when the charge is *half-a-crown*, and a musical performance is given—and occasionally in the evening, by gas light, at *one shilling* admission. The building occupies an area of about 236 feet by 107, and comprises nave and aisles, with spaces between in which the galleries are formed above, and underneath are afforded stalls for exhibitors, the roofs having semicircular ribs springing from corbels cast on the metal columns, and all the timber work in connexion therewith is decorated in gay and appropriate colouring. The systems adopted for lighting by through lanterns at the top of nave and aisles, though the lowness of the galleries causes some darkness, and for ventilation by a series of louvres above, are effective. We now proceed first to examine

THE CENTRAL HALL.

This apartment is in point of size the principal, and is the first attained from entrance doorways. All the heavier class of goods are arranged therein; numerous glass-cases occupy the centre, together with a fountain of tasteful design, exhibited by Messrs. Edmundson and Co. (manufactured by Messrs. George Smith and Co., of Glasgow, and illustrated in this journal for March and May, 1860), perpetually playing its jets, which are received below in a basin containing some fancy-coloured fish, and a variety of charming specimens of sculpture are introduced at regular distances at the sides of each passage or aisle so formed, the spaces to right and left respectively under galleries being amply filled with a very choice collection of miscellaneous articles. On entering, the first object presenting a subject for critical examination is the South Kensington Museum collection, comprising works in metal, Damascene, and niello, watches, jewellery, coins, and gems (amongst which is a Queen Anne's farthing), medallions, goldsmith's and electro work, exquisitely wrought, a variety of magnificent pottery, Wedgwood ware, old Sevres porcelain (amongst which is a vase valued at £1,000, and lent by her Majesty), glass, sculptures in ivory and wood, leather work and bookbinding, lacquered work, textile fabrics, &c., &c., in fact constituting an interesting exhibition in itself. The goods displayed by Messrs. Edmundson and Co. (No. 54) occupy a most prominent position to the left of the hall, and are distinguished for great excellence both in design and manufacture, the bronzed furniture especially, which we believe to be from the eminent Colebrook Dale Company. In the corresponding stall at opposite side Messrs. Gunn and Sons, of Westland-row, have a large collection of musical instruments, including a grand square pianoforte, by a New York manufacturer, and several by Kerkman and Son, Hopkinson, &c.; and adjoining the latter is also an extensive variety of ironmongery goods from the establishment of Mr. J. Maguire of Dawson-street. The superiority of Irish hosiery manufacture is well illustrated in the specimens contributed by Mr. Appleyard, and a very beautiful selection of Irish poplins, together with lace, embroidery, fancy needlework, &c., is to be seen in the case of the Commercial Hall Company. Passing again to the right of the Hall we notice a crowd of eager admirers congregated round stall 81, where Mr. Brunker, in addition to a collection of electro and silver plate, modern and antique jewellery, &c., exhibits some highly ingenious mechanical clocks; in one case several birds of beautiful plumage, warbling sweet notes, and hopping dexterously from bough to bough, and in another a violoncellist of the monkey tribe performing, as may be judged from his grimaces, evidently to his own intense delight, both remarkable for their fidelity to nature. In the furniture department, Messrs. P. Brown (59) and Fry (72) are respectively preeminent, the collection of the former in marquetrie, buhl, ebony, satin and tulip woods, carved oak, antique beaufets, &c., being such as we have never seen surpassed, and of the latter, especially the carved oak cabinet, for Sir C. W. Domville, Bart., and the chimney-piece for Sir John Carden, Bart., displaying high artistic taste and delicacy of design combined with great manipulatory skill. The public are invited to witness the progress of the manufacture at Messrs. Fry's factory at Kevin-street, and we shall pay an early visit. Messrs. Young and Groves are also highly creditable exhibitors in this line. A beautiful assortment of ironmongery goods, Roman and Grecian marbled baths, &c., is on view at the stall of Messrs. Hodges and Son—a very old and respectable establishment; and in the next compartment Mr. Scates exhibits a variety of musical instruments, including "a family of concertinas." Messrs. Austin have an important display of dressing and travelling cases and various works, both in wood, leather, and bog oak, bijouterie, &c.. executed in the characteristic style of that eminent firm, perhaps, without prejudice, *the first* in their peculiar line in the city. In building materials the exhibition is by no means as important as we should have wished, but we notice that the extensive importer, Maurice Brooks, contributes a goodly stock of marble chimney-pieces, as also do Mr. Colles, of Kilkenny, and Mr. Hibson, similar articles of very choice manufacture; and Mr. Lavender (although admittedly in a very disadvantageous position) has some terra cotta vases and pedestals, which are well worthy of inspection. In the manufacture of glass, the well-known Worcester and Dublin house of Kerr and Co., has a magnificent collection; and Messrs. Gregg and Son, both here and in the gallery, display on their stands the manufactures of France, Bohemia, Dresden, England, &c., and which attract much admiration. The electro-plate of Messrs. Elkington, and Co., and the jewellery and silver articles from the establishment of Mr. Wm. Acheson, T.C.—an active member of the committee—are remarkable for their excellence. Except to note that lace in all its beauty and unapproachable in excellence by any other country but poor Ireland, that from Limerick especially is seen to perfection in Messrs. Forrest and Co's case, and that the specimens from the Ladies' Industrial Depository are highly commendable, we shall not tarry further at present in this apartment, but will resume with consideration of the sculpture and other features in next number.

WHERE TO BUY A WATCH.—"The practical utility of a good watch—the habits of regularity it generates, and the advantages of the punctuality it assists in securing—are facts proved beyond a doubt. The establishment, then, where, at a reasonable charge, these advantages can be obtained, must be worthy of attention. At Mr. Benson's, 33 and 34, Ludgate Hill, and 46 and 47, Cornhill, E.C., may be purchased the chronometer for sixty guineas, the mechanic's watch for two guineas, and the various other kinds of watches (duplex. lever, horizontal, or vertical) at various prices—all displaying the utmost finish and superiority of manufacture."—*Daily Telegraph*.

Benson's Illustrated Pamphlet, post free for two stamps, is descriptive of every construction of watch now made. Watches safe by post to all parts of the globe.

CLONTARF.

THE retrogradation of this suburb, whether comprehended under the Howth or the Vernon estates, becomes more apparent with each succeeding season, as numerous structures—for years tottering and nodding obeisance to "mother earth"—at length become wholly uninhabitable for man or beast. Glancing along the main road, which is flanked by a vast expanse of sea, and commands magnificent views of the coast and Dublin and Wicklow mountains, Killiney, Sandymount, &c., what a series of wrecks is presented to view? the first of importance being the block of cabins between M'Knight's, the grocers, and St. Edmund's, the residence of Mr. Graham Lemon (who, by the way, we learn is desirous of extending his enterprise to this locality); again, between Beachfield and the chapel-house square, in many instances roofless, and all more or less in ruins; again, between the latter and the police barrack, *ditto repeated;* and again, between Rutland-terrace and Mr. Gaussen's houses, all in the very perfection of dilapidation, and not to be equalled by the most wretched hovels in the Liberties. We have no desire generally to question the right of estate owners to act as they please, and as may appear most conducive to their interests; but in this instance interference on the part the press is justifiable, as there is a strong public feeling in favour of improving this suburb, and even since we first called attention to certain "restrictions," overtures have been made, but ineffectually, to build on and improve the very ruinous sites above alluded to. For the misguided principle prevailing we are at a loss to account, as it requires no force of logic to prove that the annual value of the estate would be doubled—nay, trebled or quadrupled—within a very short time, if an opposite course to that now adopted were pursued; and as long as the same state of things exists we shall not fail to recur to the subject again and again. Some years ago it was contemplated to build a boat slip, which is very much wanting, but it never was executed; and along the entire shore, up to the Bull-bridge, some two miles in length, there is not a single landing place for the purpose, except opposite Fort-view-avenue, where a narrow platform for bathers is fixed after a rough and ready fashion. How strangers stare when they see the hangers-on about Dollymount plunge up to their middle in the tide on the arrival of each row boat from Ringsend! How characteristic of Irish customs say they! And that within three miles of the metropolis! The bathing boxes and *their appointments*, at the Crescent, are an outrage on common decency, and ought to be suppressed by the police, or new ones of more suitable character substituted; and the general accommodation in that regard for *both* sexes is notoriously defective, and presenting a marked contrast to that at the south side. Other portions—viz., "Bachelor's-walk," and what we understand is ostentatiously styled "the flower of the property" (the *blighted* flower interpose we), beyond the moat field; and again, the rookeries termed "Snugboro"—happy appellation that—off Vernon-avenue—are almost reprehensible in their sanitary *dis*-arrangements, the human kind living promiscuously in cabins with pigs and horses, and all revelling, as it were, in squalid filth. Experience has shown that where encouragement is afforded to the Irish to be cleanly in their habits and dwellings they can be and are so; but here, indeed, is a palpable pretext for indulgence in their besetting sin. We have not yet completed our survey of this outlet, and, acting on the suggestion of a correspondent, it is quite possible we may accompany our next chapter with *illustrations* of *its antiquities*.

LAW NOTE.—COMMON PLEAS.

Bentley v. O'Rorke.—Messrs. Bentley, the proprietors of extensive property at Foxrock, and the well-known house and land agents, auctioneers, &c., of Grafton-street, in this city, sought to recover from Mr. O'Rorke—a gentleman who had recently completed a dwelling-house at Dalkey, for the erection of which he had contracted with Mr. Robinson, a builder, since become a bankrupt. A sum of £78 5s. 3d., the value of bricks manufactured on the land and supplied by plaintiffs to the bankrupt, and for which, as alleged by them, defendant had undertaken to pay out of the moneys of the bankrupt, held in defendant's hand during the progress of the work. Defendant denied any undertaking whatever, which was the main point at issue, and had paid the bankrupt in full for the amount of his contract.

On behalf of the defendant, Mr. Rawson Carroll, architect, and Mr. Patterson, building surveyor, together with other witnesses were called to prove the value of the work executed by the bankrupt for the defendant. The jury found a verdict for the plaintiffs.

Benson. v Craig.—This case, which was an action for slander against Mr. John Craig, of Cork, against Sir John Benson has been amicably settled, Mr. Craig having expressed his regret that in the heat of the moment he should have used any expressions reflecting on the plaintiff, of whose conduct and honour he always had the highest respect.

THE DARK AGES OF ARCHITECTURE.*

(Continued from page 537.)

THIS period, then, upon which I would now dwell, this twilight of the "dark ages" which I have taken for my subject, is that generally known as the Renaissance or the revival of Classic art. It is true that in Italy, the whole surface of which was strewn with fragments of Roman work, Classic tradition seems always to have sat like a nightmare upon its architecture. The mighty flood of life which seems to have throbbed through the arteries of Northern Europe appears to have been checked in its passage through the gorges of the Alps, and to have exercised but slight effect below them, and never entirely to have succeeded in supplanting the influence of the antique; it succeeded in doing so to the greatest extent in the thirteenth century, and with much grace for a time fused the two styles, but soon it began to hanker again after its old love, and we begin to find the mouldings of its Gothic buildings becoming poor and weak, and its parts and proportions betraying more of the Classic elements. In Venice, which, from its position, was not so strongly exposed to this influence, and which was greatly under that of both the Gothic and the Byzantine, we find in the Doge's Palace a most valuable and nervous example of mediæval building, unsurpassed in the boldness of its mouldings and detail; yet, if we consider the general aspect of the domestic architecture of that city, we shall find little of the variety which was so marked a characteristic of Northern Gothic, it being similar detail to that of the Doge's Palace that we find repeated everywhere, while that of the churches of the Frari and those of the same date are strikingly inferior. In Verona we find another most valuable local development of Gothic, particularly artistic in its treatment of coloured material and sculpture, still an under-current of Classicism, is evident throughout Italian work. In the Cathedral of Milan it has debased it so far as to render it only worthy of being a model for confectionary.

In Florence and in Pisa we are so entranced by the wealth displayed in their buildings, of painting, and sculpture, and precious coloured materials, that we are consoled for the want of pure mediæval feeling and boldness in the handling of the architectural detail in such works that pretend to be Gothic, and in the host of false façades to the churches in the other towns, such as we see figured in the plates of the works of Hope, Gally Knight, and Street, we see foreshadowed the childish shamelessness of sham which mainly characterises the later works of the Renaissance, and those of the "dark ages," which ignores the certainty of being found out the instant the spectator turns the corner of the building. In the Loggin de Lanzi, by Orcagna, we find distant traces of the Roman impost between the columns of the arches; while his San Michele, in the tabernacle and the tracery of the windows, presents us with work we might almost mistake for that of Batty Langley.

In the pulpit by Andrew Pisano, in the cathedral of Pisa, we see in the figures and draperies of the bas-reliefs, evidences of an already too absorbing study of the antique, in contrast with the vigour shown in the beasts upon which the alternate columns rest, where the sculptor has evidently treated them *con amore*, and rather with the traditional mediæval feeling, while the capitals of the columns are almost as bad as the Roman composite, and the weedy apologies for cusped trefoil arches are the only and fading traces of Gothic forms.

About the middle of the fourteenth century there arose a furor for the study of classic literature (which, indeed, had been more studied during the middle ages than we generally credit, but then in a healthy way as food to be digested, and not so insanely bolted after the manner of bookworms as afterwards), antique manuscripts became eagerly searched for and pored over by the literati; fragments of sarcophagi and every productions of Rome's New-road masons' shops were studied by sculptors, and voted to be admirable precedents; the ruins of the Coliseum, of the temples of the Forum, and of the triumphal arches, were diligently examined, and their proportions measured, and admired out of all proportion with their merits, and, as ill-luck would have it, a somewhat dogmatical treatise upon architecture, by an old gentleman who lived during the unpropitious days when Augustus had just strangled the Roman Republic, and who was, doubtless, a highly respectable member of a very worthy professional body at that time, was just then brought into fashion, and a number of suggestions that he had made for the guidance of his pupils and professional brethren, whom he had the sense to see (for he was a very sensible man) were not to be trusted to think for themselves, were propounded as a code of laws to regulate architectural practice, and to serve as canons of taste. The works of Vitruvius have since passed through many, perhaps too highly valued, editions, while a cotemporary architectural romance, "The Dream of Polypholus," which is replete with artistic suggestions, has passed through too few. Most fortunately the painters were not so successful as the sculptors and architects in their researches after the antique, and thoroughly can we sympathize with Rio, who, in his "Poetry of Christian Art," rejoices that no picture by one of the celebrated masters of antiquity was brought to light. "For," says he, "had this been the case, modern art would have been in possession of a model, from which an unalterable rule of taste, and an unerring theory of the beautiful, might have been deduced and applied to painting." It was owing to this want of success on the part of the painters, and to their being forced to trust somewhat to their own resources, that their art flourished longer than its sister arts, and that in dying it shone, as the dolphin is said to do, with brighter lines than during its life, casting not inconsiderable radiance over the decay of the rest.

It was then the unfortunate discovery, galvanising and deification of the exhumed bones of Classic, or, to speak strictly, Roman art, which was the veritable Gorgon's head that paralyzed true and healthy art. Its influence was doubly fatal; first, by substituting precedent for thought, and, secondly, by substituting second-hand paganism for Christianity. One result of the undue regard for precedent was, that the people (for whom artists ought to paint, sculptors to carve, and architects to build, rather than for their own compeers) caring comparatively little for the defaced bas-reliefs and broken columns, whose stories had become obsolete and whose purpose was unintelligible to them—and the subtile mysteries of proportion being beyond their comprehension, or, at any rate, but a small compensation for the loss of the human interest and phonetic power of the class of buildings to which from mediæval times they had been accustomed—began to lose all interest in the works which they saw rising around them. They found that these very learned architects shot completely over their heads, and that when they asked for artistic bread, they got nought from them but stones. Certainly we do not hear of bed-ridden old men asking to be brought daily to look upon any of the masterpieces of the Renaissance, as had been the case with the Campanile of Giotto, at Florence; for in truth theirs are not "bright, smooth, sunny surfaces of glowing jasper;" they have no "spiral shafts and fairy traceries" for the eye to delight in, but rather uncouth, rugged, prison-like rusticated walls and flowering cornices, such as those of the Palaces of the Strozzi and Ricardi, at Florence, and of the Farnese, at Rome, which plainly told them "we were built to keep you out." And even if any, from the love of novelty, should in those days, as some I am aware from the force of prejudice have been in these days turned from the Doge's Palace and St. Mark's, at Venice, to the contemplation of the Library, by Sansovino, on the opposite side of the Piazetta, one would think that when the natural surprise at seeing so many almost identical females, angelic by virtue of wings alone, somewhat awkwardly cramped into every pair of spandrels throughout the building, had subsided, and when sufficient pity had been bestowed upon the Cupids in the frieze, each condemned to bear in symmetrical balance, on either side of him, a swag of flowers altogether too heavy for his size, that the proportions of the building, admirable though they may be, would not detain a spectator long after he had exhausted the iconography which is so happily suggestive of its literary destination.

The consequence of all this was that the public ceased to ask for pleasure or instruction at the hands of architects, and the latter forgot that it was their duty to tender it, and, as if in revenge, hedged themselves about with a set of rules (the observance of which could, of course, only be appreciated by the initiated)? in oblivion that art should "pierce directly to the simple and the true."

But the substitution of second-hand Paganism for Christianity was even more fatal than the slavish adherence to precedent. It is absolutely impossible to produce good work without faith in what one is attempting to realise. In such faith had lain the strength of the early painters, in whom we can excuse shortcoming in their powers of execution for the sake of the purity and earnestness of their aim, for while men wrought in the spirit of the statement of Buffalmacco, recorded by Vasari, viz.:—"We painters occupy ourselves entirely in tracing saints upon the walls and on the altars, in order that by these means men may, to the great despite of the demons, be drawn to virtue and piety," and so long as the intention of works of art remained the same as that named in an inscription over the doorway of S. Nixier, at Troyes—viz, that three windows had been painted from "servie de catechisme et instruction du peuple"—we may foretell their success, and that, step by step, they will overcome the difficulties and technicalities of their profession without the aid of infallible precedents from the antique; but when they began to pander their art at the bidding of princely patrons to the representation of the labours and loves of Hercules and Venus and other of the gods and goddesses of Pagan mythology, we may as easily prophecy that notwithstanding such splendid genius and wondrous powers as those of the artists who congregated about the corrupt courts of Leo X. and the Medicis; the system has become rotten to the core, the lamp is flickering with an unhealthy excitement, which but preludes the speedy extinguishing of the light altogether. Such was the fact which ensued, the very prowess of Raffaelle and Michel Angelo seemed to prevent their successors from making use of the powers they undoubtedly possessed. They prated of the composition, the drawing, the coloring, and the chiaroscuro of their great masters, and humbly strove to follow them with such success as they were able to command in these particulars, but they seemed in their struggle after the means of art to forget the true object and the end of it, and one may commend their diligence so long as they confined themselves to the representation of subjects from profane history or mythology, seeing that it is of comparatively slight importance whether Alexander or Darius be caricatured or not in a picture which pretends to no accuracy even in costume, or whether Juno or Venus appear questionable in point of character if not of beauty, seeing that no one is called upon to believe in either their existence or their virtue; but we cannot but regret the misapplication of their efforts to represent the persons or scenes of sacred history. Thus Caracci was far better employed upon his famed "Butcher's Shop" than upon his "Three Maries" weeping their crocodile tears, and "Guido upon his Aurora amidst the Clouds," for the future admiration of the dozen or so of devoted students who may be always found copying the same, to the not very evident advantage of modern art, than upon his sentimental "Madonnas" and "Ecce Homos."

---

* From a paper read by Mr. Seddon at Royal Institute of British Architects.

I have dwelt longer upon the effects of the Renaissance upon the painters than upon their brother artists, because, as I have said, from their fortunate failure in finding classic models, and the consummate excellence of some of their craft, the meteoric brilliancy of their fall was the more striking, and the warning it conveys necessarily the more patent; nevertheless, the same fate befell all the other arts, including that with which we are more nearly concerned, and to which my wasting space warns me I must now confine myself.

Let any one who would question what I have advanced, or desires to study Italian architecture, and the end to which it led, in a simple spirit of common-sense, take up Quincy's "Histoire des Architects," and turn over the plates in their sequence; the first, representing the Cathedral at Pisa, the work of Buschetto in 1063, and the few next in order, he would find, clearly demonstrating what I have stated, as to the trammels by which, during even the mediæval period, the attempt to introduce into Italy the architecture which was then flourishing beyond the Alps, was restrained by the natural predilections for the antique. The plan of this cathedral, that of the Latin cross, its apsidal ends reminiscences of the fatherland of its architect, its clerestory and ranges of arcades, and the Byzantine feature of the dome over the crux, are insufficient to conceal the preference for the horizontality of the classic school, or to excuse the mesalliance of the Roman order with the arch; this latter is seen still more uncouthly in the baptistery of Dioti Salvi, in 1152, where gables and crockets parodied from the Gothic were added. However, the fusion of the two elements with greater skill, and so much beauty of proportion and treatment of precious coloured materials, as to demand admiration of a style *per se*, are represented by the works of Arnolfo di Lapo and Burnelleschi in the cathedral, and of Giotti in the Campanile at Florence.

In the palaces of the Medici, by Michelozzo, and of the Strozzi, by Cronaca, at Florence, we seem to lose sight of the desire to please which the other buildings I have named show by their unsparing luxury of marbles and mosaic, and thoughtful delicacy of detail throughout, and are made acquainted with the stern grandeur and air of shrug-the-shoulder affected by the turbulent and selfish Italian nobles of the fifteenth century, in their fortress palaces, which, however, still depend for no small nor inferior portion of their effect upon their almost Gothic treatment of the windows, together with, to my mind, exaggerated frown of their heavy cornices of Classic type.

Then painfully evident is the study of the antique in the correct proportions, but tiresome monotony of the arcaded side of the Church of St. Francesco, at Rimini, by Alberti, each arch with its precisely similar sarcophagus, and each pier with its rectangular tablet, like a picture-frame, each spandrel with its circular panel like an immortelle, strangely commemorative, but hardly symbolical, of the career of the restless Sigismond Malatesta and his generals, who were probably not all cast in the same mould. How differently would such a theme have been treated in Gothic hands, let the monuments of Aymer de Valence, and its neighbours in the choir of Westminster suggest, or the tombs ranged along the aisles of the church of the Frari, at Venice.

In the Palazzo Pandolphini at Florence we must needs bow to the consummate feeling for proportion wherein the genius of Raffaelle is pourtrayed, though I think we cannot but regret that he did not, as he might so well have done, give reins to his imagination, and treat us to something a little more phonetic than alternate segmental and triangular empty pediments. Yet if we dare not do other than confess their perfection, we may plead that sufficient changes have since been rung upon this slender theme with, alas! too seldom the same plea of admirable proportion for an apology which this building and that of the Palazza Farnese at Rome can undoubtedly put forward. The distinctions and merits of this Florentine and the Roman and Venetian types of the Renaissance have been so well explained by Mr. Garbett in his "Rudimentary Treatise on the Principles of Design in Architecture," as to render it unnecessary for me to do more than refer an inquirer to his remarks on the subject, and simply to note, in following our present author, that we find as examples of the second class the works of Giulo Romano at Mantua and of Michel Angelo at St. Peter's, honourable, of course, to a greater or less degree for proportion but generally contradictory of truth in ignoring the necessity of floors in buildings by the use of single gigantic orders of pillasters for their exteriors, and for the method of veneering the same to their façades; tryglyphs from the examples I find in the plates under examination seem to be the main if not the single idea of the decoration, and for the pertinacity with which so happy a feature is kept before the mind we ought, no doubt, though I own my inability to be truly grateful. Of the Venetian type, by which I understand the decoration of each floor by an exterior order, we have the Library of St. Mark by Sansovino at Venice of which I have already spoken, the Villa of Caprarola, and the Palazzo Della Ragoine at Vicenza; but though we have not the noble Palazzo Grimani at Venice by San-Michele nor any of the picturesque painter-like conceptions of Longhena, such as the Palais Pesaro at Venice, which if not so pure in detail, commend themselves to me for artistic grouping and conception before most of the ordinarily idolized Italian buildings. These Venetian works with their pomp and luxury of effect, their successive orders of columns, constant use of coupled columns, depth of recess and richness of detail, seem to typify the vanity and love of parade of the age which gave them birth, and which preluded the fall of the city they adorned.

I do not remember ever to have been struck more forcibly with the character that architecture can present, than by the puerile vanity shown in many of these façades in Venice; for while the old Moorish and Gothic palaces, marred as they almost all are by later incongruous additions and insertions, though comparatively modest and ineffective, have sensible fronts, more richly arcaded and decorated of course than the sides, yet in harmony therewith, so that they are one in conception and structure; these fronts of the Renaissance buildings are all separate, show façades, stuck as it were before a building of totally inferior and distinct character, just returned round the angle a few feet to save appearances, which of course is found out as soon as one has turned the corner. Such are the three grand types of the Renaissance architecture of Italy as developed principally in Florence, Rome, and Venice, and whence sprung the architecture of the dark ages to which the plates of second volume of Quincy introduces us, but all the series of which I have neither time nor patience to follow.

From Italy the Renaissance spread into France—a result doubtless hastened by means of the Italian wars of Charles VIII., and Louis XII., and Francis I., but at first the native workmen merely applied the more ornamental parts to their own Gothic work, as in the Chateau de Blois.

Subsequently they developed it into a style of their own, of which Chambord and Chenonceaux are among the most favourable specimens. It may be described as consisting of the application of pilasters more or less enriched as surface decoration, and these are in fact made to do the duty of the buttresses which were so profusely employed in Flamboyant. There is much beauty in this style, which was the work of French architects and became naturalised in their land. It is very artistic, and less insolent in its display of barren proportion: it gives something more than that husk of art, at the same time it is like all Renaissance work, radically wrong and inconsistent as architecture compared with the real styles; its very notion of ornament is something added to and independent of the construction; it is highly picturesque but generally exaggerated in its grouping and skyline, and combination of turrets and high roofs, its best features, which it borrowed from the Gothic.

In the latter years of Francis I., Italian workmen and architects were imported into France, and were employed at Fontainebleau. They introduced a great modification into the styles, partaking more of the Classic feeling, after which, as was natural, it rapidly deteriorated and passed through the phases of the style of Louis XIV., set forth in the pages of Le Pautre, redolent of gilding and parade; thence it sank in the times of Louis XV. into that vicious and emasculated style which has earned the soubriquet of "Rococo," in which all the grandeur, manly, if somewhat heavy and impure, of its predecessor gave place to an elaborate trifling with florescent knucklebones, in curious combination with a species of shell-work; altogether an idiotic piece of business, which we might dismiss without a single thought, save of scorn, were it not that this, in the depth of the dark ages, was the very will-o'-the-wisp which architects and decorators danced after, and upon which, even so late as in the Great Exhibition of 1851, most of the productions of *civilised* nations were based, so that one had to turn to the works of the *barbarians* of the East, as to an oasis of true art, to refresh one's eyes with. Whether or not, in the interval, our effort to imitate these on the one hand, and to teach the Chinese Palladian plaster-work, and to smash palaces in Pekin, and to loot at Delhi on the other, may have turned the tables, we shall shortly learn.

(To be continued.)

MR. RUSKIN ON THE DESTRUCTIVE CHARACTER OF MODERN FRENCH RESTORATION.*

Mr. J. Ruskin said he should hardly venture to accept the invitation to address the meeting, for almost every member of the society knew better than he did what was going on both in France and England, many of them from personal knowledge, and some from professional engagements. He felt the difficulty all architects and other persons were placed in who had any connection with the restoration of ancient buildings. They ought not to throw stones at anybody, but what they should do was to suggest what should be done to ancient buildings under the most difficult circumstances. He himself for long had been utterly hopeless respecting the state of architecture in France—hopeless especially because he felt that the line taken there was, that what was determined by the leading public men there would be carried out, and that any suggestions which might be made to those engaged in that course was likely to wound their vanity, and was likely to come ungracefully from us, who had not altogether shown ourselves prudent or sufficiently cautious, perhaps, in the restorations we had undertaken at home. He felt it was a great difficulty to interfere, and one great difficulty was the weakness of the French, which he supposed they would confess to themselves, which all nations shared with them, but which, perhaps, they would admit they possessed, at all events, and which frequently led them to nobleness of action, as at Magenta and Solferino—he meant national vanity. So it might be in reference to the restoration of French architecture. He was afraid they would do harm if they brought forward any memorial on the subject to be presented to the French, unless they could show that they had a good ground for doing so. Ten years ago he made a tour of the cathedral towns of France. He should have remarked, however, that twenty years ago the cathedrals of France were all safe as far as modern work was concerned; and, as a lover of architecture, he mourned over the restorations now being made in France of her ecclesiastical buildings. There was, twenty years ago, nothing of importance undertaken in the way of restoration, but ten years after that things were changed, and the traveller at Amiens, Chartres, Notre Dame, and other places, in fact, wherever he went, he had to get out of the way of horses and carts filled with stone and other building materials to carry on alterations then being proceeded with, but none of them finished, and the structures being full of scaffolding. Although he deprecated the adoption of any memorial to the French authorities on the subject of restoration, yet he thought they might wisely and courteously suggest that when restoration had been commenced it should be carried on and gone through, instead of scaffolding being kept up at the buildings under restoration for so great a length of time. If he wished to send a pupil to study a French cathedral, at present he hardly knew where to send him, the buildings being enveloped in so much scaffolding. Then an important matter for them in England was certainly for them to settle their own code of restoration. Could they go to France and give neighbours their advice, while they were not agreed themselves as to what should be done in the way of the restoration of a building. They, many of them, differed in opinion as to the mode of restoration, and he referred particularly to the difference of opinion as to what should be done with sculpture. What he had proposed was considered extravagant and impracticable. The whole ecclesiastical architecture of France, however, was likely to be destroyed by one perpetual scrape, and thus would be removed the power of making an architectural history of the country. He wanted to know something of the thirteenth century, because it was his intention to write a history of the thirteenth-century architecture; and ten years ago he set to work on the French churches, and found that all his important documents were then in part destroyed, and that in five years more they would be destroyed. He accordingly gave the thing up, and not only that, but he gave up architecture—he never cared about architecture since. It was a hopeless thing he thought. He stood forward honestly and earnestly that night as an advocate against the destruction of buildings under the name of restoring them: but at the same time deprecated any over zeal in the way of sending a memorial to the French until they had come to some decided opinion on the subject themselves. What it seemed, therefore, they had to do was to determine, first, whether they at present as architects generally had the power of restoring effectually to its former appearance any great ecclesiastical building, and whether, if they had the power of doing so, it was expedient to do so, and to what degree. That it was right to put a stone in here and a stone in there to take care that no indolence or carelessness shall interfere with the stability of a building, and that no unauthorised person shall interfere with it, he supposed they were all agreed upon. An important question was whether a cathedral could be properly restored. Not that there was any want of capacity on the part of our architects of the present day, for he believed that there was as much genius and talent amongst architects now as there ever was. After referring to the importance of the *ecclesia*, the speaker said they should see whether they could get the sympathy of their own people before they attempted to influence the actions of the people of France. What power had they as copyists—what power had any man as a copyist? Supposing they had the best architects in the world, could they rebuild a cathedral as it had been built? Whatever good work there was in a cathedral was the result of a good strong hand and mind. All good art was the expression of the whole man—of his soul and heart, of his intellect, and of the whole power of his body. The whole personal power and energy of the body were required, as well as the power and energy of the soul. This was certain, that no great work of art existed which did not give some expression of the mind of the man at work; it was the handwriting of the thing. Now, he was not prepared to say how far that handwriting could be put upon art. He was much attached to the thirteenth-century buildings; in some thirteenth-century work there was the expression of as tender a feeling, and of as high genius, as was ever put upon stone or canvas. And he believed the peculiar characteristic of the thirteenth century was not its severity, plainness, nor its soul stiffness or persistence, but its tenderness. Some people called Dante a monster, while Dante was simply the most tender of all poets. So they had also thought the thirteenth-century architecture might be carried out by rule, instead of looking at the infinitely far more precious thing, the mark of the real tenderness and glory of the human soul in every touch. So it was in poetry of the age of Dante. They would see how general the character of the tenderness was. The thirteenth-century sculpture had in its touch that which nothing could replace unless the same tenderness were shown. Could one man follow out the thoughts of another, and put the thoughts of the same mind and depth in the restoration of a building as he who made the building? They might copy the autographs of their friends or of all the great men in England, in the British Museum, or elsewhere, but assuredly they could not do anything of that kind in sculpture. The necessity of restoration involved the impossibility of restoration; they might put a head on a figure if the head was off; they put on a new one, and that was not a restoration, but it was a substitution of the nineteenth-century impression. They might talk of restoration, but it was an impossibility in sculpture, they might as well talk of raising the dead. As he understood, what they were to do that night was to determine what should be done in respect of French restoration. After some observations on this point, the speaker proceeded to say that the whole question was how they were to recover the vitality of architecture and lose as little as possible of its impression. They could get a municipality to restore a cathedral, but they could not get a municipality to build a new one. The great matter was to replace a decayed stone by a good sound stone, but they ought not to put in a single stone with sculpture upon it; let every bit of old sculpture be retained, but not a bit of new stone put in with sculpture upon it. He disapproved of their taking any step in the way of finding fault with what their French neighbours were doing, and thought they should determine rather what they should themselves set as a wholesome example.

The prospectus has been issued of the National Company for Boat Building Machinery, under the patents of Mr. Thompson, of New York. The proposed capital is £200,000.

The Right Hon. Henry Herbert, M.P., has given over an English acre, in one of the most picturesque portions of Glenflesk, as a site for a Roman Catholic Church, also a subscription of £50. Mr. Daniel Cronin Coltsmann, one of the principal landlords of the locality, has subscribed £100.

---

* Meeting of the Ecclesiological Society.

AMERICAN ARCHITECTURE.

OUR illustrations for this number comprise a perspective view of the Public City Building, or Town Hall, erected at Portland, Maine, U.S., after designs by Mr. J. S. Rand, architect, Boston; also a geometrical view of the chief elevation of the Fine Art Gallery at Washington, Messrs. Renwich and Auchmuty, architects, New York. The engravings were executed in New York, and we are indebted for the privilege of publication to the conductors of an excellent local cotemporary, the *Architects and Mechanics' Magazine*, N.Y., with whom we have exchanged some courtesies.

FIRES IN DUBLIN.

AN important document on this all-important subject, and enumerating particulars connected with fire-brigade establishments in the chief towns of Great Britain, the necessities for application to Dublin of more complete precautionary measures than hitherto existing, the provisions of suitable engines and escapes, &c., has just been issued from the office of the Police Commisioners, and therefrom we collect the following:—

"The average number of fires in Dublin yearly is twenty-nine (there were forty-eight fires in 1859), about one-third the number in Edinburgh. In estimating what the strength of the Dublin brigade should be, and in the altered circumstances attending the high pressure system, we think twenty-one firemen and a superintendent would be amply sufficient. We should think that the whole expense would not exceed £1,000 a year; and this would be much reduced if insurance offices, in the case of fires in insured premises, pay for the services of the brigade. In Manchester, it would appear, some of the insurance offices subscribe; those that do not, if the property is insured, being charged £1 per hour for each engine; if not insured, no charge is made. In Liverpool, beyond the borough, a charge according to distance of from one to three guineas for each engine is made—the offices, as already stated, contribute £350 annually. In London no charge is ever made for the services of the fire brigade, no matter whether the property is insured or not, save in the case of ships afloat covered by marine insurance companies that do not subscribe to the brigade, and then only the extra expenses are charged. In London there are about seventy fire-escapes, not in any way in connexion with the fire brigade, but under the direction of the Society for Protection of Life from Fire. The most complete fire-escape in use there consists of a ladder of thirty-two feet, 'fitted on the underside with a canvas trough, in which persons may slide with ease from a window to the ground,' and to this ladder a second one of twenty-two feet may be jointed, &c. It is mounted on a light carriage, with springs and high wheels, and can be easily moved by two men. The price is £52. This is the fire-escape kept in the streets, and so well known in London. In Liverpool there are eleven fire-escapes—long ladders with a pulley or block attached to the top spar, to which is run up a circular canvas bag; in Manchester, two; Birmingham, one; Edinburgh, none—*the stone staircases to the houses rendering them unnecessary*; Glasgow, none also—long ladders carried by the brigade, but they are seldom used, for the same reason as in Edinburgh—namely, stone stairs. It is not necessary to pursue the subject further, as it is now, we believe, under the consideration of the corporation, with a view to the introduction of them here. The advantages of the new steam fire-engine, lately added to the London brigade, and its superiority over the hand-power engines will be apparent from the following particulars:—The steam fire-engine is of 15 horse-power (nominal), and is capable of throwing water continuously to a height of 130 feet, horizontally 170 feet, and the quantity of water it can throw per minute is 266 gallons; the consumption of coal is 113lbs. per hour, and steam may be got up the rate of 30lbs. in ten minutes, everything being cold. It requires one engineer, one assistant do., and for the hose and branch four firemen; it weighs not quite three tons, is drawn by three horses abreast, in charge of one driver, and may be turned round in a space 13 feet wide; it will do the work of 100 men, and the cost is £700. The practical working height of the best hand-engine is only from 40 to 50 feet; the advantage of 90 feet additional, and the undiminished continuity of the motive power, fully warrants the merits ascribed to the steam-engine, and of being equal to four of the most powerful ordinary engines, whilst all the crowding and confusion attending the working of the latter is avoided, and a clear space is secured for the firemen to carry on their operations in. Presuming, then, that the Water Bill will be re-introduced next session, *under which the high pressure is to be developed*, we do not think the fire brigade can assume a permanent form until then; we would therefore suggest, that one steam fire-engine should be now ordered from the makers, Messrs. Shand and Mason, Blackfriars-road, London, for service in Dublin. We may state in conclusion the desirableness of placing the principal city police stations in communication with each other, and with the pipe-water offices and engine depot, by means of the telegraph, by which a considerable sum now expended for car hire in giving notice on the occasion of fires will be saved."

ECCLESIASTICAL ARCHITECTURE.

ST. JOHN'S CHURCH, ARDAMINE, COUNTY WEXFORD.

SIR—We are living in times in which Church Architecture, like all great national undertakings, is progressing to a state of something like the zeal and energy that actuated the architects of the mediæval period. For more than thirty years an unceasing and obstructive policy has been followed by certain architects in England, not only to exclude the best examples of the middle ages, but to introduce, as far as an obtuse taste could suggest, a sort of mongrel Italian, unsuited to the requirements of the country or its climate. The principal personage at the head of the retrograde movement is fortunately *only a professor* of architecture in one of the London universities. England is happily denuded of examples in constructive building to hand down to future ages *Professor* Donaldson's abilities in the arrangement of stone and brick.

A pleasing example in the early English style has been recently erected at Ardamine, on an elevated site, only a few perches from the ancient *Tumulus* on the south, the north side abutting close to the old burial ground. The church was built from the designs of Mr. George Edmund Street, of London. The walls rest on a foundation of concrete, 7 ft. 6 in. wide, at a depth of 8 ft. from the ground line. The external and internal façes are of Ardamine limestone, built in irregular masonry; the dressings, south porch, turret, and sedilia, are of Knockavoca stone, same as used in the old cathedral and ancient abbeys of Ferns, Dunbrody, and New Ross; bands of red brick are introduced inside and outside, contrasting favourably with the sober grey tint of the limestone. The church is provided for future extension by an arcade constructed in the north wall of the nave. The floors are laid in Godwin's encaustic tiles, some of the patterns presenting *all the colours*[*] that can be used in the manufacture of this beautiful pavement. The pulpit and font are of Caen stone, the latter having a low shaft of Irish marble between the base and the bowl. The west end is pierced with two tall lancet windows, the south wall of nave has two double-light windows, with trefoil heads, and the north side three single light windows. The chancel, which is 20 ft. in length, is lighted by four stained glass windows. The windows of the apse show double colnmns on the inside; these slender columns are of Irish marble—two of Connemara green, two of Cork red, and two of Clonmacnoise; the capitals are carved in the mediæval style of foliage, connected by a notched and moulded abacus. The reflection from a clear sun on the stained glass window, throwing its rich, varied, and mellow tints on the opposite walls, is parted with with regret as our fleeting luminary proceeds on his course to the west. The sittings are open benches, and may accommodate about 120 persons; should the majority, however, be ladies, a heavy per-centage may be taken off to the credit of crinoline. The roof is of open timber work, *all the rafters* are framed as principals. Such examples are very rare, and, if my memory is correct, the only roof constructed on a similar principle in England (until very recently) was the ancient church of Sompting in Sussex. The octagonal turret springs off corbelled piers, and is, I believe, original in design. The turret terminates with a finial of elaborate workmanship in wrought iron, richly gilt and painted. The stained glass windows in the chancel are from the well-known artists, Clayton & Co., of London, and are arranged in the ancient mosaic style, which has the effect of giving all the figures a greater depth of shadowing; each window is under 6 ft. superficial, and in that small space upwards of *three hundred* pieces of glass are used.

Two of the windows are memorial, to the memory of the late Mr. and Mrs. Richards. In the bands forming the medallions are Scriptural texts. The central window commemorates the building of the church. In the middle compartment is a fine portrait of the Redeemer blessing the bread and wine, with the text: "Do this in remembrance of me." The lower medallion encloses a portrait of St. John, to whom the church is dedicated. The next division contains the inscription: "This church is built to the glory of God, and is dedicated to his beloved servant, St. John the Evangelist; A.D. 1860."

Gorey, 25th June, 1861.

---

[*] The beautiful blue now used in some of the patterns was first suggested to Minton by Pugin, and opposed by Butterfield as having no precedent. Pugin's characteristic reply appears to have silenced all opposition:—"If the old fellows had known that colour they would have jumped out of their skins with joy."—See Scott's "Half-hour Lectures on the Fine Arts," &c., page 216.—J. THE RATEPAYERS OF THE COUNTY DUBLIN AND THE COUNTY SURVEYORS.

A MEETING, comprising a few gentlemen styling themselves "the Reform Committee of the Grand Jury Laws," was held on the 20th ult., at Bachelor's-walk—Mr. John P. Byrne, Ballybohill House, presiding—for the purpose of *protesting against* the bill now before Parliament to increase the comparatively paltry remuneration of those most efficient public servants, the county surveyors; and with that view the following high-sounding resolution is said to have been passed unanimously:—

> "That this committee and the ratepayers of the County Dublin regard with great apprehension the bill at present before Parliament to enable grand juries in Ireland to increase the remuneration of county surveyors, and for other purposes, prepared and brought in by Mr. Cardwell and Mr. Bagwell.
>
> "That the committee feel confident that the fullest expression of surprise and dissatisfaction would be expressed by the cesspayers of every county in Ireland at any power vested in the grand juries of Ireland of further increasing salaries of county surveyors, or granting them any SUPERANNUATION allowances, there being but one feeling existing as to the injustice of the authority already vested in so irresponsible a body. This committee, therefore, does not hesitate, on behalf of the County Dublin, to protest in the strongest manner against a bill calculated to increase the burden which is already so oppressive, and this committee trusts that the promoters will pause before passing such a measure."

Now, we can hardly reconcile with consistency the motives which induce such an agitation, and which, we are proud to learn, has even so far proved abortive; for it has been for many years a patent fact, that the professional gentlemen holding the appointments of surveyors for the various counties in Ireland are the worst paid pûblic officials, considering the onerous character of their duties and their position in society, of any in the kingdom. In this age of political economy it is admittedly fair to draw reasonably tight the strings of the public purse, but discretion should accompany the act; and we really do experience a surprise that even a very indifferent minority of the ratepayers in the metropolitan county should be so misguided as to lend themselves to a hostile agitation as regards these gentlemen. To become qualified for the office of county surveyor a severe educational ordeal is necessary, and even when installed—which may be after years of anxious expectation—no mean ability, practical experience, and business aptitude are required for its maintenance; but the theory promulgated by this little band of reformers is, that it should be the object of the public to secure as long as it can, and at the *lowest possible cost*, the *most competent* professional services to guide the operations permanently necessary on the roads, bridges, harbours, &c., throughout each county, and, when infirmity or old age overtake the faithful and efficient servant, to turn him adrift on the world without a retiring allowance. Such a doctrine will not meet with a ready endorsement by the estate holders of Ireland generally, who usually are gentlemen of independent spirit, and know how to feel for ill-requited *employées*, especially for those with whom their interests are so much identified as the county surveyors; and we have no doubt but that its originators will have the mortification, and very speedily, of seeing their progeny consigned to ignominious oblivion.

NOTES ON THE HIGHWAYS.

ROAD-MAKING, like all other arts, must be perfected by degrees, and time and experience alone will remove the asperities which act as obstacles to its perfection. Consequently, the improvements which have lately been made in our leading thoroughfares give the strongest proof of what we are about to enjoy to a limited extent.

Of course we are perfectly aware that the funds requisite to carry out so great a work as the entire repavement of our streets must be extended over a series of years, and even during the period the progress of so extensive an undertaking must be necessarily tedious, coupled with the proper provision to be made in consolidating the strata to receive it; so that it may happen that our descendants alone may reap the benefits of a general paving. Under those circumstances, it may not be out of place to lay before our readers a few remarks upon rendering the repair of our macadamized carriage-ways less objectionable than the present practice.

It is usual to distribute a quantity of broken stone upon the surface requiring repair, and sometimes it happens that the shingling is varied in depth from five inches to that of a single tier of stones, according to the quantity required to form a fair upper surface. No provision is made prior to spreading the broken stone to ensure a rapid consolidation, and it is only after a considerable lapse of time, accompanied with an enormous waste of animal labor, together with serious injury to the feet of the animals as well as the wheels of vehicles, that anything like a proper surface appears to be found.

If we observe the compact surface of a macadamized carriage-way after a fall of rain, we find that the stones originally laid down are united by lesser particles, varying much in size, so as to fill the interstices of the concrete surface. These particles were not laid down with the shingling, but were produced by the constant traffic and the process of pounding and pulverizing the larger stones. Now, would it not be well if we could supply a mixture of clean, durable material of the consistence of gravel, in imitation of the foregoing, in the first application of our shingling, and save both time and labor in effecting a process so necessary for a consolidation? It is most necessary in every case to prepare the surface of the carriage-way by loosening it to receive the new metal.

It has been suggested that a heavy iron roller, drawn by 4 or more horses, would be effective in binding together the materials. All this is quite true; but the expense of such a process would be very considerable, and not likely to be adopted in an over-taxed city like Dublin.

In the repair of our footways (we refer to those in the suburbs and in many of our streets of lesser note) a material is employed totally unsuited to the purpose. If clean fine gravel were employed it would quickly become a compact mass, and form a good even surface in a very short time; instead of which a coarse material is spread upon them, consisting of stones from the size of wallnuts to hazel-nuts, and one of the consequences is, that the greater part of the materials find their way into the watercourse, until they are thrown back again by scavengers to undergo the same process, or until they finally disappear with the road scrapings, leaving behind any finer particles the mixture may have originally contained.

It is needless to dwell upon a matter so palpable and at the same time so very objectionable as the practice referred to. We may hope that it will be avoided.

Lastly, while on the subject of our ways, foot and carriage, it has often occurred to us that the cleansing of our crowded thoroughfares could be much better effected during the nights, by lamp or moonlight, when the traffic had ceased. It is painful to witness the endeavours of those unfortunate men who, after a fall of rain, set about cleansing such streets as Dame-street and Grafton-street during the busiest hours of the day. Surely they cannot perform one tithe of the work they otherwise should, if the vigilance necessary to prevent their being run over every instant could be dispensed with.

PROPOSED TIMBER COMPANY.

AN announcement of a project to form a joint-stock company, with limited liability, for importing and trading in timber appears in our advertisement columns, to which we are only in a position at present simply to direct attention, as requested, though we shall probably, when in possession of particulars, hereafter revert to the subject.

SANITARY MATTERS.

THE Committee of the Corporation having charge of the sanitary arrangements of our city held their usual meeting on the 21st ult. Present—Michael Egan, Esq., T.C., in the chair; Councillors Draper, Jude, O'Beirne, and Alderman Mackey. Proceedings of last meeting being read and approved, the weekly dsbursements were passed and ordered for payment. The hospital returns were read, showing a slight diminution in the admission for the week ended 14th ult. The sanitary returns of the police were submitted. The slaughter houses, knackers' yards, and public lodging houses were reported as being in a cleanly state. Lists of cattle slaughtered were read, showing for the week ended 17th June the following result:—Oxen, 51; cows, 148; heifers, 165; calves, 46; sheep, 1,139; lambs, 643; swine, 129; total, 2,321. Several parties were ordered to be summoned for neglecting proper observance of sanitary regulations, and the committee adjourned.

We would strongly urge on these gentlemen the desirability of looking minutely, and the sooner the better, to localities particularized in recent numbers of the DUBLIN BUILDER as in great need of improvement.

FRENCH DOMESTIC ARCHITECTURE.

THE enormous amount of building which has for some years now gone on in France, and especially in Paris, has made that city peculiarly attractive to English architects and builders, who have there a school of study, where they may find examples and warnings *ad infinitum* and *ad nauseam*. To read these examples aright, however, it is necessary to be well informed with respect to the habits of the people, for it is necessary to remember, trite as the remark is, that houses are made to live in as well as to look at, and that the requirements of one nation are almost as different from those of another, as the flat dish and the long bottle in the fable of the fox and the crane. To a certain degree a foreigner is likely to overlook some of these differences, and it is no more safe, therefore, to criticise a French house from an English point of view, than to adopt and transplant it bodily without considering its fitness for its new locality. To judge fairly of French domestic architecture we must use our ears as well as our eyes; we must know the objects in view, and also many collateral circumstances, before we can decide on the fitness of the habitations for the people for whom they have been erected, or on the ability of the designers and builders. To learn all this directly is a long process, too long for the great majority of students, and therefore it is useful to draw all the information that presents itself in an indirect manner; and one of these modes is the consideration of what the French themselves say about their own houses. In reading the criticisms, and listening to the opinions, or mere remarks on the subject, we have naturally to cast a vast deal aside as mere chaff or dross; and it must be admitted that the grain or the pure metal is mixed up with a very large amount of what may well enough be termed filling-in.

M. Ferdinand de Lasterie, a non-professional writer, does not hesitate to brand the architects of the present day in France with entire want of originality as regards great public edifices, and says that to know how to reproduce a Greek temple, a Gothic church, or a Louis XIV. palace, is generally a sufficient acquirement; he tells an anecdote of the famous sculptor David d'Angers, which is worth recording:—"As regards public monuments, perfectly adapted for their purpose, and of a style original and entirely of our own time, I know none but the abattoirs." And there is a great truth hidden under this sneer; all true styles originated like these slaughter-houses in that manner, which should at once serve the purpose intended, and meet all the circumstances of the case in the best, most durable, and cheapest manner; while we modern copyists generally have adopted the very opposite principle, and, having selected a style that was admirably adapted to its purpose in its own country, set to work to pare it, and clip it, and twist it to serve another purpose, and under different circumstances. With respect, however, to domestic architecture, the writer above mentioned thinks that the present day has its style totally distinct from that of any other period; that, in fact, the changes which have taken place in the manners and habits of the people have become, as it were, embedded in the stones of the new houses. It would be strange were it otherwise, and the study of the changes referred to will alone enable us to judge of the fitness of the new habitations. The necessity for wide roads and uninterrupted lines, and the increased price of land, have made a total change in the general outline and disposition of the streets, and have made picturesqueness dependent on ornament, frequently extraneous, instead of upon broken lines and varied forms. In old times the nobility built themselves sumptuous hotels, and the poor were huddled together in the old neglected houses of the great. The middle class had scarcely attained to a separate rank, it hid its wealth to avoid inconvenience; but now it has come forth into the full blaze of the sun, and is as exaggerated at present in its luxury as it was formerly in its modesty. Formerly the mercantile and legal classes lodged in very quiet, unpretending streets; the houses were approached often by a mere alley or a low gate, the staircases were remarkable for anything but brilliancy, and the outer door of the apartments frequently opened directly into one large room, that in many cases served for dining and drawing room, which was, in fact, the only general sitting-room, the furniture of which was perfectly simple and massive; the chief bed-room was generally of large proportions, and the kitchen was a vast apartment, with a large chimney, and a great collection of culinary utensils of all kinds. The *comfortable* home was then not uncommon in Paris. You must have the taste of an antiquary to find out such houses now. The same classes now inhabit very different places; the exterior must be noble looking, or, at any rate, pretentious; there must be a magnificent entrance for horse as well as foot; the staircase must be spacious, light, and highly decorated; the rails must be of an elegant pattern, painted of a delicate chocolate, and tipped with gold, if, indeed, they be not gilt half over. As to the interior—the *salon* must be large and lofty, its walls covered with paper of the most delicate tint, or divided into panels enriched with all kinds of elegant work, from a papier maché ornament to a charming design by a skilful painter, and on the ceiling, the doors, everywhere, is gold leaf applied in profusion, and often in great excess. Huge looking-glasses reach from the low mantel-piece almost to the lofty ceiling, the floor is covered partially or entirely with a velvet carpet, and all the fittings and furniture are on the same magnificent or gaudy scale. The dining-room is fitted with great taste, the prevailing mode at the present moment being modern, old oak furniture, with a great deal of sculpture, and much of it atrociously bad, but generally applied with taste; the furniture is generally in good keeping, but the whole on a very small scale, a room in which the parties should never exceed eight persons or so at the utmost, and in this particular the regular *gourmet* will doubtless say that the French exhibit a high sagacity and a deep knowledge of the *savoir-vivre*. The lady of the house has her own exquisite retreat—her boudoir, her bed-room also, generally, be it whispered—this chamber is generally just large enough for a bed, a few chairs, and a small table for the fair occupant's own labors, literary or otherwise, on ordinary occasions, and which will accommodate four whist-players on company nights, when the bed is a perfect bijou of satin, lace, and embroidery. Everything is on the smallest possible scale, and of the most luxurious description as regards ornamentation, and thus looks like a cell fitted up for a fairy; the master of the house has a small room to match, also fitted up with as much luxury as he can afford, or determinne on possessing for some time at any rate. In one corner, or in a recess covered by a handsome curtain, is his close, unhealthy bed, and he as well as the lady has, if possible, a dressing-room about the size of a box for four at a theatre; the kitchen is about the size of a small pantry in an English house, but it serves the purposes of kitchen, scullery, and pantry combined, only obtaining a slight increase of area by the meat-safe being hung outside the window when the aspect is not sunny, which might prove inconvenient for the *gigot;* the servant spends most of her life in this cupboard or laboratory, and generally quits the apartments of her employer to go to sleep with her compeers, in the complicated hive beneath the slates of the mansion. The smallness of the kitchen would send an English cook out of her wits; but the system accounts for the difference. Everything is carried on in the small way, and at the same time with great economy, and when anything extra is required it may be obtained readily from a restaurant or *cuisine bourgeoise* a few doors off; and the same remark applies to wines, to plates and dishes, knives and forks, table linen, lamps, glass, which, with almost every imaginable thing, may be hired for the occasion at a moderate rate. With such habits generally diffused, the task of the architect is in a great measure marked out beforehand. He has to sacrifice almost everything to appearance; he must decorate the exterior and give it an appearance of grandeur, no matter at what cost. He must have an inner court; but as ground is about the price of gold, he must arrange for a carriage to be able to turn round in the smallest possible space. Within he must give up half his space to the *salon*, and is thus compelled to reduce the bed-rooms to closets, and all the offices to cupboards. Balconies occupy an amount of space that it is next to impossible to spare in most cases, and the consequence is that half the new houses have the lower portions of the windows covered with elegant ironwork in chocolate and gold, with an advance varying from one to six inches from the wall. It has been calculated that to give a balcony to each floor of an average house would be equivalent to adding £60 to £80 a year to the rent, on account of the necessary diminution of space in the interior. The following may stand as a fair type of the modern street house of Paris at the present time. A grand front to the street, an elegant carriage entrance in the centre, and one, two, or more shops on each side of it; an *entresol* in which you may stand upright if you are not much more than six feet high; a first floor with a balcony, windows with large panes of plate glass, and gilt shutters inside plainly visible from the street; two or three other floors pretty much alike, a fifth in the roof with a balcony, and some twenty cupboards, for as many servants' bed-rooms, up amongst the chimneys—these are not generally considered as requiring light or air except in homœopathic proportions. These necessities have reduced house plans to such a monotony that, with the single exception of mere ornamentation, the architect can scarcely achieve any originality unless he makes his windows round, oval, or of a lozenge shape.

Houses inhabited by a single family are called *hotels*, and these were formerly almost exclusively the dwellings of people of large fortune, such as are still to be found in the Faubourg St. Honore—noble mansions, with a large court-yard in front, a garden behind, and roomy coach-houses and stables in the former, with a porter's residence in a screen giving on the street; of these few are now erected except by Imperial ministers, or the lords of the financial world; but a new race of small *hotels* has grown up, and these afford good scope to the architect, and well deserve study. They generally stand on a very small space of ground; they are often far too pretentious, and lose in comfort what they gain in outer grandeur; but a very large proportion are remarkable for elegance, and for the admirable distribution of the interiors. The style adopted is strikingly different to the grand *hotels* above referred to, and the modern mansion has not inaptly been said to present the appearance of a country villa dropped within the walls of the city—you must, however, imagine the large garden at the back. These *hotels*, like everything French of the present day, are too much after a set pattern. There is a kind of official type that is rarely departed from; here and there you may find a pure Italian or Classic building, never anything at once Gothic and decent, but the great mass belong to that wide-spread order of architecture and art in general—the Rococo. The way in which the details are carried out is deserving of all praise and of careful study; and, as regards the interiors, making allowance for the fact that the French generally require that all the bed-rooms on the principal floor should form a part of the suite of apartments for gala days, it is very difficult to speak too highly; in these elegant little mansions the French architect seems to be unapproachable.

It has been well observed that if the modern Paris *hotel* resembles a villa, the country houses of France generally look too much like town residences out of place, and it is generally admitted that the English understand the construction of villas far better than the French. The former use the old styles in a far more picturesque manner; they are not wedded as the French are to any one plan which may happen to be in fashion. "They know," says the writer I have already mentioned, "how to mingle the picturesque and the comfortable better than we do; they have the art of making nature herself aid the charm of their domestic buildings, to make the vegetable world contribute to the effect of their fresh and pretty decoration. Their style is less pretentious and less noble perhaps than ours, but it is economic and charming to the eye." The same writer says that the *chateau* is essentially French, and the cottage English, and he remarks, with great truth, that this is only a reflection of the fact that the chief life of the former is that of the city, while that of the latter is of the country. The difficulties which stand in the way of a proper appreciation of art or anything else in another country are curiously illustrated by the same writer. He says that England, otherwise a charming country, has the misfortune to be very much alike from end to end, and that France, on the contrary, is, of all the countries in the world, the most varied, both in nature and aspect! It would be difficult to find a more extraordinary error than this in the whole course of French literature, considering that the animus is perfectly friendly, and the whole tenor of the remarks thoroughly impartial. It is inconceivable that any one should be unaware of the fact, that nothing is so remarkable in France as the general uniformity; it is true that she has several districts of peculiar character, but throughout the great extent of the country nothing is so striking as the similarity of the scenery, the roads, the towns, and the houses. Such a strange error in the comparison of the two countries may be of some use in warning young architects how they judge of French buildings without having acquired a considerable knowledge of the usages of the society and the habits of the inhabitants, and how they criticise the character of the street architecture without inquiring into the strategetical or fanciful regulations, by which, like everything in France, it is bound as in fetters of steel.—*Building News.*

FARMSTEADINGS UNDER SCOTCH AUSPICES IN THE COUNTY OF KILDARE.

OUR Caledonian neighbours have been drafting themselves of late years, as "regenerators of the soil," into Ireland, and on more than one occasion we noted the particulars and progress of certain farmsteadings erected on recently acquired estates, of which, however, those of Mr. Allan Pollock, in the county of Galway, are the most important. In a late number of the *Agricultural Review* attention is directed in the following terms to an establishment of this class in the county of Kildare:—

"The numerous and extensive farmsteadings scattered over the level country surrounding Athy—the large and uniform appearance of the fields, furnished with piers and gates, and the peculiarities of the holdings generally, will naturally attract the attention of the tourist and traveller; and if he should be curious enough to enquire who the occupier is, he will be readily enlightened, that 'it is the residence of a Scotchman.' The entire district appears to be regularly colonized by such, and to those who may be desirous of examining the relative merits of Irish and Scotch husbandry, the above affords a most suitable field for the examination of both sides of the question. Previous to the Scotch settlements in this country, unexceptionable, and we may add, successful farming flourished; but the many drawbacks besetting the prosperity of the Irish farming community, during the years 1846-7, so blighted agricultural enterprise, and damped the energies of the farming classes, that some stimulating element was loudly called for, and which gradually resulted in the steady importation of Scotch land-stewards amongst the gentry whose farms had become vacant by the impoverished condition of the original holders—a course which subsequently led to the introduction of Scotch farmers, and the investment of Scotch capital. By this course a powerful impulse was, no doubt, given to the advancement of improved tillage in the remote districts where farming was most defective.

"By far the most superior description of farm management appears to us to be pursued at Levitstown farm, near Mageney, on the Great Southern and Western Railway, and nearly midway between Athy and Carlow. This extensive holding, of 500 Irish acres, is in the hands of Mr. Anderson, a gentleman whose name is favorably associated with improved husbandry, and who, manifestly, has expended a vast deal of capital in bringing the Levitstown farm, offices, &c., to assume their present appearance. No less than 106 acres of this holding have been devoted to green crop culture; 200 are under grain, of which 70 are under wheat; about 70 more under meadow, and the remainder under pasture for a large stock of sheep, in which there are 300 ewes, young stock; with orchard, paddock, nursery, &c. The box-feeding principle of stock fattening has been largely carried into effect by Mr. Anderson, and scarcely ever are there less than 130 head in the byres at a time. Owing to the great facility there is for supplying abundant quantities of straw, for bedding and feeding purposes, a vast supply of manure is manufactured, which, of course, tells for itself in restoring the fertility of the farm. The byres or boxes are cleaned out once a month, a period sufficiently long for the accumulation of the manure without interfering with the comfort of the animals, and also of sufficient duration to admit of decomposition setting in through the bedding by the trampling of, and absorbing the voidings of the cattle. The barn is furnished with a large threshing-machine, worked by water-power, and capable of turning out 80 barrels of grain per hour; and, simultaneously with the threshing of the corn, the power is available for working the machines for straw and hay cutting, oat and bean bruising, sawing timber, &c. Burgess and Key's combined mowing and reaping machine is employed for facilitating harvest operations; and twenty excellent farm horses, of the Clydesdale breed, are kept for the working of the farm.

"Mr. Anderson's staff of laborers is composed of an equal number of Scotch and Irish workmen, all of whom are housed and fed on the premises, in accordance with the Scotch usage of hiring and treating the agricultural laborer. We were curious enough to enquire whether either section claimed an ascendancy over the other in regard to efficiency of labor, and we were much pleased to hear the steward willingly admit that he *never saw* better workmen than the Irish laborers now in his employment, after being duly initiated into his method of executing approved farm operations. No one will deny but that the Irish labourer, when well fed, properly housed, and suitably clothed, is just as willing and as able to perform the maximum amount of labor which any English, Scotch, or Welsh man is capable of executing.

"On another excellent farm at Sayer's-wood, the property of Mr. J. M'Cullagh, we were also afforded an opportunity of examining the nature and extent of his principles of husbandry. Mr. M'Cullagh farms 300 Irish acres of the most stubborn land that could possibly be worked, and if ever the steam-plough gets into favor in Ireland, we know of no farm where its application would be so likely to suit as on the farm at Sayer's-wood.

"The farmsteading is on the covered principle, but Mr. M'Cullagh has deviated from the objects contemplated at its erection, inasmuch as the manure is removed to an outer yard, according as the byres require cleaning. By this practice the manure has been found to be better fermented, better prepared for application, and, on the whole, is the course which Mr. M'Cullagh is in future disposed to adopt. The entire farm-yard and offices are extensive and substantially built, and include every arrangement and structure to be met with on a well-regulated concern. A fixed six-horse power steam engine, for threshing the grain, cutting chaff, hay, and straw, bruising oats, beans, &c., has been erected quite convenient to the stack-yard, and the barn is sufficiently large to accommodate any amount of straw and grain that may be turned out of hands at a time.

"The only other concern to which we purpose devoting any space for the present is the holding of Mr. John Pennycook, known as the 'Quarry farm.' Mr. Pennycook is one of the class of Scotchmen who farm cautiously and successfully. We knew the general character of his land previous to his renting it from his Grace the Duke of Leinster, and we have no hesitation in admitting that its present appearance contrasts favorably with its uninviting aspect some years ago. The rent per Irish acre is 18s. 4d., a fact quite suggestive of the neglected state of the land at the time of his becoming the tenant. The entire farm is now thoroughly reclaimed—the crops forward and healthy, and the general character of the farm operations all that a well-wisher of improved husbandry could desire."

The new projects for steam-packet communication between Dublin, Kingstown, and Bray, and for omnibus communication between Dublin, Booterstown, Blackrock, Monkstown, and Kingstown, are being pushed forward energetically by their respective promoters.

NEW SYSTEM OF CONDENSING PEAT FUEL.

Referring to this amongst other matters calculated to conduce to Ireland's prosperity, and illustrating her progressive strides in the present age, *Saunders'* has the following :—

"There has, however, lain dormant for years a large and unprofitable portion of Ireland—the turf bogs—estimated at more than 2,830,000 acres, or nearly one-seventh of the surface of the island. Of this 1,576,000 acres are all flat bog, spread over the central portion of the great limestone plain. The remaining 1,254,000 acres are mountain bog, chiefly scattered over the hilly districts near the coast. Lignite, and intermediate species of fuel, between wood and coal, is found in dense strata, comprising the southern portion of Lough Neagh. The subject which is here intended to be treated of refers to the adaptation of all bogs for the manufacture of condensed peat, applicable to innumerable useful purposes, and which hitherto—in consequence of the many projects to manufacture it having to a certain extent failed—all attempts to bring peat into general use have hitherto proved unsuccessful. A bright light now appears likely to shine upon these dark tracts of country, for a new system of condensing peat fuel has been patented for Great Britain and Ireland and foreign countries, and from the perfect specimens which have been produced there can be no doubt that peat is now brought to an extraordinary state of perfection, and if extensively followed up, as it is supposed it will be, by a public company, the advantage to Ireland will be incalculable. Here it would be premature to state all that has been said by practical engineers of this new system of preparing peat; but it is sufficient to notice that they are of opinion, by its introduction into the manufacture of gas, a considerable saving will be effected; that its properties, when made into charcoal, are superior to wood charcoal; and the belief is entertained by the most competent persons, that if the project is sufficiently supported and efficiently carried out, it will at no distant period materially influence the gas manufacture of the present day. It may also be stated that it is suitable to locomotive marine, and stationary engines, besides being applicable to various useful purposes quite beyond what peat could hitherto be supposed to be made available for, and necessarily very profitable to the owners of the large tracts of moor in all parts of the United Kingdom. The few specimens which have reached Ireland may be seen at Mr. White's, bookseller and law stationer, Church-lane, College-green; but we hope to announce in our impression tomorrow the arrival of samples of much larger dimensions. It is proper to add that there is no chemical process introduced into the making of this condensed peat."

WARMING.*

The application of air heated directly or indirectly by fuel in combustion to churches, hospitals, prisons, dwellings, &c., is generally termed warming; directly, by contact with fuel in combustion, which is hurtful and dangerous; by contact with and radiation from a fire grate as usual in our dwellings, by similar means with stoves, and by flues; indirectly, by the intervention of water at a moderate temperature, a high temperature, or in a state of steam. In fire grates and stoves, the body of air in immediate contact with the sides of the stove becoming lighter by expansion, flies to the upper part of the room, and is successively followed by all the air in the apartment, until the whole of it is warmed to a temperature, which it would not only retain, but exceed, were it not for the continual access of cold air from without, either through windows, or from doors opening on colder apartments; in heating any space by these means, we have to consider this space, that for the combustion of fuel, and the chimney, which must have a free communication with the air above and below, and whose sectional area should bear a certain proportion to the fire beneath, or rather, to be theoretical, with the interstices between the bars of the grate, and the area of these interstices should be to the sectional area of the chimney as 1 to 4. The opening of the fire-place should be proportionate to the space of the apartment, and the form, as well as the sectional area of the chimney flue, should be such as to command a draught, which should overcome the gravity of the external air, and oppose its ingress into the chimney, the certain result of which is smoke. An opening of from 9 to 14 inches for moderate sized or large rooms will be found ample; one of the greatest improvements in our fire-places is the splaying off of the corners, which improvement, however, is too much neglected in farm buildings and cottages. The dissemination of foul air and soot, through an apartment occasioned by downward draught, is one of the greatest inconveniences of the open fire-place. Sylvester's stoves are, amongst the many improvements of late date, the greatest we have for open fire-hearths; in these the grate is even with the floor, and the cold air reaches it from an ash-pit below, connected with passages formed of iron bars, arranged in an ornamental manner, and forming the hearth; by this plan greater comfort is added to economy in fuel, the hearth being heated as well as the air before reaching the grate; by opening or closing louvres at the back, the combustion may be regulated according to the heat required, and by closing sliding doors the opening into the flue may be entirely closed when the fire is not in use.

Of stoves there are two kinds, the one of cast iron, and the other of earthenware, and if only on the score of insalubrity, the first must be considered distinct from the other; the nauseating smell of cast-iron stoves, and the continual headaches which they occasion, can leave no real doubt upon the subject: a cast-iron stove is much more quickly heated than one of earthenware, and cools as readily on the lowering or extinction of the fire. The diameter of the pipes connected with stoves may vary from 6 to 12 in., according to the quantity of fuel to be consumed, these dimensions, though great with regard to draught, are necessary when the pipes are employed as heating surface, besides which, if made of too small a diameter, they soon get choked with soot; moreover, a register always affords the means of regulating the draught; these pipes may also rise or fall in their length, without any ill effect being produced on the power of draught, and a much greater quantity of heat is also made available by the means of stoves; these last considerations are sufficient to denote the utility of stoves and pipes under particular circumstances, the greater regard to ventilation becoming, however, more indispensable. The subject of warming by flues, and by hot water, if only glanced over, would be useless; and, connected as it is with ventilation, its import would require a development far exceeding the extent of these pages; we refer both the practical man and the student to Peclet, "*Sur la Chaleur,*" where either will find the matter treated in a manner from which he must unavoidably receive the most valuable information upon at least one of the most important features connected with the architecture of the present day.

NOTES ON RUSTICATION.

The Italians made much of that kind of masonry, which, though it is termed *Rustication*, so far from being necessarily *rude*, is capable of expressing no small degree of ornateness and carefully-finished execution. There are, in fact, several varieties of it decidedly different in character; from that of bold, unpolished energy, nearly up to that of elaborate embellishment. The first is in its place in prisons, the last not out of its place in the façade of a palace. Rustication, however treated, prevents baldness and insipidity, inasmuch as, at all events, it produces richness of surface, and what in architectural language is called *color*.

To mention here briefly the several modes of rustication, there are, besides the coarsely rude and rough, or what may be called the primitive mode, those in which the face of the stones is either *vermiculated* or *frosted* (*i.e.*, tooled to produce a crispy surface); or else made quite smooth. Of either vermiculated or frosted rustics varieties may be obtained by giving a smooth border to each stone. After these, there is what may be called a fifth order of rustication, in which the stones are *facetted*. Another legitimate source of variety is, that the course of masonry may be alternately wide and narrow. Moreover, and besides all which, two if not more of these several modes may be employed conjunctively, yet how far successfully or not, must depend entirely upon the taste of the designer; for could architecture be reduced to mere matter of method and rule, it would no longer be art. Certain it is that almost innumerable combinations may be produced; and that what is called rustication might be rendered a most abundant source of mural embellishment externally.

With respect to columns, the rustic blocks upon them ought to be few, and if square in plan, ought not to exceed the diameter of the shaft, because they define themselves distinctly without projecting at all beyond the diameter of the shaft, and wherefore, it may be asked, should not occasionally the entire shaft be rusticated—that is, be left merely rough-dressed, or else roughened afterwards by "tooling?"

NEW CATHOLIC CATHEDRAL, CLOGHER.

The foundation-stone of this important work was laid on the 18th ult., and it will be completed after the designs and under the direction of Mr. M'Carthy, architect. The site is said to be most eligible for the purpose, and the building will comprise nave, aisles, transepts, choir, with apsidal termination, an eastern chapel and sacristies. There will also be a chapter house, which will be on the northern side. A tower and spire will be raised on the west flank of the south transept to a height of 210 feet. The entire length of the cathedral will be 177 feet. The nave and aisles will be 72 feet wide, and the total width across the transepts will be 110 feet. The style of architecture will be the Gothic of the fourteenth century.

---

* New Office Book for Architects, &c. London: Atchley and Co.

MEMOIR OF THE LATE MR. WOODWARD, ARCHITECT.[*]

MR. WOODWARD was a native of Ireland, and received his professional education there, being articled to a civil engineer. He, however, zealously cultivated an acquaintance with the artistic department of architecture, particularly with the branches of Mediæval art. In the walk in which he has become distinguished, he was,therefore, self-taught. The first important building with which he was connected was the Queen's College, at Cork, finished in 1848. Sir Thomas Deane, the architect to whom the work was entrusted, associated Mr. Woodward with himself in its execution. It is a very successful adaptation of the late period of Gothic architecture, and forms a dignified and picturesque group, enhanced by and enhancing a beautifully-wooded site on a rocky eminence at the side of the river Lea. With Sir Thomas Deane, Mr. Woodward was similarly associated in the construction of the Killarney Lunatic Asylum, another important and successful building, in the same style as the last. In 1853, these architects, uniting the son of Sir Thomas Deane in partnership, settled in Dublin, and henceforward a different type of art, chiefly due to Mr. Woodward's inspiration, appears in their works. He had imbibed an ardent admiration for the maxims and line of study indicated in Mr. Ruskin's books; his firm faith in the authority of that writer is notorious. The high standing and experience of his elder partner must have facilitated in a very important degree the success which attended his new efforts, and also largely contributed to the opportunities for the exercise of his talents. In April, 1853, the design submitted by the united architects for the New Library of Trinity College, Dublin, was selected in a limited competition, and, under their auspices, the building rose to completion during the next four years. It follows the style of Venetian Cinque-Cento, with some eclecticism in the form of the mouldings and the style of the carving, the latter being applied with careful moderation and yet achieving great richness of effect. The building very happily unites breadth of effect and strength of form with graceful proportions and ornament, and picturesque dispositions of the parts. The next successful results to which Mr. Woodward contributed was the Oxford Museum. The competition which yielded this honor was decided in favor of himself and his coadjutors at the end of 1854. The ceremony of laying the foundation stone by the Chancellor of the University, the Earl of Derby, took place on June 20th, 1855.

The building having now some time since reached completion, its merits are so well known as to render any description superfluous. During its progress Mr. Woodward devoted his solicitude for half of each year mainly to this work, but at the same time designed and completed the University Reading-rooms, near the corn market, a work of less importance, but highly creditable to his talent. In the great Government offices competition of 1857, the fourth premium for the Foreign-office was awarded to the design of Sir Thomas Deane, Son, and Woodward, being the second premiated design of the Gothic school. The bias of Mr. Woodward's mind was strongly impressed upon these designs. The general disposition admitted of an unusual extent of sculptured ornament, which powerfully marked the whole with original thought, supported by other qualities of the highest order. Rumor attributed some control over the design to Mr. Ruskin. It is almost needless to say now that personally Mr. Ruskin had no connexion with the matter, and the only ground for the supposition is to be found in the vigor and beauty with which Mr. Woodward realised his own ideas, based on the principles advocated by the author. The latest important building of Mr. Woodward and his friends is the Kildare-street Club, in Dublin, now almost completed. Before this work had much advanced, however, Mr. Woodward's constitution had been seriously impaired by consumption, and he was compelled to relinquish the path which had so rapidly brought him into honorable distinction. After some partial relaxations, he retired to the islands of Hyires, on the shore of the Mediterranean, about half-way between Marseilles and Nice. Here, during several months, his health continued to decline; he commenced a journey homewards, but was unable to proceed further than Lyons. He died in that city, in the 46th year of his age.

Referring to the same event, the President, at a late meeting of the British Architects, took occasion "to direct attention to the death of one of their own body, Mr. Benjamin Woodward, the architect of the new Museum at Oxford. They had all, no doubt, seen that building; although there might be differences of opinion as to manner, there could be no doubt that the author was a man of singular skill, deep study, and great industry. He had passed away at an early period of life; and the profession to which he belonged had to deplore the loss of a talented and zealous member."

---

[*] Read by Mr. James Bell, Honorary Secretary, at a meeting of the Royal Institute of British Architects, on Monday evening last.

MUSEUM OF IRISH INDUSTRY.

FROM the recently published report for the year 1860, by Sir Robert Kane, F.R.S., director of this Institution, we collect that amongst the additions have been several foreign woods used in building and cabinet work, and fabrics manufactured from wood, foreign and Irish; various illustrations of the uses of palms, stalks, leaves, and fibres in tropical countries. This branch of economic botany may be considered as now very completely represented in the Museum. Also that in the division illustrating the manufacture of glass and enamel, a series of glass, enamel, and porcelain ornamental beads, and also imitations of coral, jet, amber &c., have been added. A series of copper ores and other associated rocks and minerals. from the Dhurode mine, County Cork, presented by the Rev. M. Cash, has been added to the metalurgic collection. A series of beryls, fluors, garnets, and other minerals which possesss very great value as mineralogical and geological illustrations, has been procured, and also a highly interesting specimen of native gold in quartz, from Mount Alexander, Australia, in which the geological relations of the gold-bearing lode are usefully illustrated. The arrangement and labelling of the mineral collection is still in progress, but the determination of mineral specimens is necessarily a long and laborious work, when effected with that accuracy which alone can give scientific value to the results, or render the collection worthy of its place in the Government School of Science applied to Mining and the Arts. A collection of Neapolitan cameos, and of the rocks from which they are produced, has been obtained, which illustrates a very interesting branch of industrial art, and also throws light on the origin of those materials; those objects usually, though incorrectly, described as formed from lavas, being really cut from rocks of the cretaceous and jurassic formation, and which are popularly confounded with adjacent rocks of volcanic origin. It is stated that in the *Chemical Department* very satisfactory progress has been made during the past year, under the direction of Mr. Galloway. Five of the most important coals employed in gas lighting have been analysed, and analyses of various varieties of Irish and British coals, together with determinations of their heating powers, have been made for illustration of the gallery collections. Twenty-seven analyses of waters have been made for the Corporation of Dublin in reference to the important question of the supply of water to this city, and many other analytical investigations of industrial and scientific interest have been carried out. And in the *Government School of Science applied to Mining and the Arts*, the systematic and popular courses of instruction in the sciences applied to industry have been conducted by the professors during the past year with satisfactory results, in accordance with the arrangements described in the programmes for the sessions 1859–60 and 1860–61.

Prizes and certificates were awarded after each class examination to the students who had manifested suitable proficiency, and the examining professors having reported very favourably on the results, my lords were pleased to award bronze medals of the department to each of the candidates who had obtained first places, and who had been recommended by the examiners for that distinction.

The session was closed on the 25th June by the distribution of the several medals and prizes by his Excellency the Lord Lieutenant, who was pleased to express his satisfaction with the arrangements and with the progress which the system of industrial instruction had made.

CHURCH BUILDING NEWS.

Our readers have been already acquainted, through these pages, of the progress of a large building in connection with the Diocesan Seminary at Clonliffe (Jones'-road); but the following, with some additional particulors of the structure, has lately appeared in the *Freeman*:—"This great building, which was commenced only this present year, has already advanced as far as the third floor. It is nearly 270 feet in length, and will be four lofty storeys in height. The first storey, which is half sunk, will contain the culinary offices and stores, together with refectory and prayer hall, each 72 feet in length, and 22 feet wide; a noble corridor, 12 feet wide, will traverse the entire length of the first and second storeys. The second or principal storey will be approached by spacious steps leading through a rustic portico to the entrance hall, 20 feet wide; opposite the entrance hall are the principal stairs, and on either side are the reception rooms, with library and study hall, each 72 feet in length. Class rooms of different sizes occupy the remaining portion of this floor. The two top storeys will contain each a central corridor traversing the entire length, together with suites of apartments for a stuff of professors, private rooms for advanced students, four large sitting rooms, and 72 bedrooms for junior students. Projections at the rere will contain closets and baths, which will be supplied from iron tanks on the roof. The exterior of the building will be divided into four compartments by large projections, finished in the angles by quoins of cut limestone; moulded strings and cornices will mark the separation of the different storeys; massive limestone cornices will surmount the entire building and also the principal floor; the surface of the walls wil be plain; the style of the building will be Italian, of a grave and massive character. It is said that it will not be perfect until there shall be erected in connection with it a great hall and chapel, the latter to serve also as a place of worship for the inhabitants of Drumcondra and the surrounding district. The design and superintendence of the great building have been entrusted to Mr. Bourke. Mr. John Connolly, of Coolock, is the contractor for the erection.

The foundation stone of the new Catholic Church of St. Patrick, at Bloomwood, has been blessed by Archbishop Cullen.

It is in contemplation immediately to complete the tower and spire of the Church of St. Laurence O'Toole in this city; also to erect a parochial house in connection therewith. Mr. John Bourke, architect.

The foundation stone of the new Catholic Church of St. Paul, at Emo, was laid on the 18th ult. The internal arrangement consists of nave, chancel, side chapels, and vestries, and measures about 110 feet by 37 feet. At the south side of the western entrance is a tower aad spire, and the chancel gable has a very handsome five-light window, of handsome proportions. The side walls have buttresses, between each of which are decorated windows to give light to the nave. The timbers of the roof are to be of exposed and stained oak colour, and the cost will be about £3,000; style, decorated Gothic. Mr. J. S. Butler, architect.

A manse for the Rev. Mr. Burns, resident minister of the Scots' Free Church, is about being built in Wexford from designs by Mr. Richard Pierce. The site is a fine one, having a commanding view of the beautiful Slaney and the surrounding scenery.

The Dominican fathers propose to erect a new church in Tralee.

The Roman Catholic church of Donabate is to be re-floored, seated, and three new porches in connection therewith to be built.

The church of Balbriggan, County Dublin, is to be enlarged; Messrs. Welland and Gillespie, architects.

The house No. 23, Nassau-street (Mr. Rosenthal's) is about to be newly fronted and internal improvements effected, according to the plans of Mr. Duncan Ferguson, architect. The style of architecture adopted is very peculiar, being somewhat "Moorish." The opens on each storey having horse-shoe arch-headed windows, and varions-coloured brickwork is likewise introduced throughout. Close by, the house occupied by Messrs. Browne & Nolan is also to have a new façade, in the Byzantine style; Mr. J. M'Curdy, architect.

The houses 81 and 82, Grafton street, recently destroyed by fire, are about being rebuilt under the direction of Mr. Burne.

A new stone bridge is to be built over the river Nore, according to plans by the County Surveyor of Kilkenny.

The construction of the railway between Clara and Streamstown has been commenced by Mr. Bagwell, who has upwards of 200 men at work.

It is expected that the works on the West Cork Railway will shortly be commenced.

The Newry and Armagh Railway Company are about nine miles of a line between Gorah Wood and Market Hill.

Amongst the applicants for loans under the Landed Property Improvement Act are Messrs. Magill (Westmeath). Hewson (Limerick), William Sullivan (Cork), and Peter Blake (Galway), for erection of farm-buildings; and for labourers' dwellings—Lord Lifford (Donegal), John Lyle (Derry), and George Le Hunte (Wexford).

THE ART EXHIBITION.—The committee met at the Royal Dublin Society's House on Monday last, Gilbert Sanders, Esq, in the chair. The deputation which, pursuant to arrangement, had waited on the Lord Lieutenant, reported that his Excellency had received them on that day, and had informed them that his Royal Highness the Prince of Wales would honour the exhibition by a visit at four o'clock on (this) Monday, the 1st inst. The executive committee were directed to make the necessary preparations; and it was referred to the musical committee to make arrangements for the choruses and orchestra. In order to obviate undue pressure, and bearing in mind the very large number of ladies and gentlemen who are already entitled to admission, it was resolved that none but season ticket-holders should be admitted on the occasion; and that all special admissions, such as those granted to art pupils and exhibitors (the Press, of course, excepted), should be suspended. During the week ended 22nd June, the total number of visitors was 6,609, of whom 457 paid half a-crown; 3,441 paid a shilling, and the remainder were season ticket holders and members of the society. The demand for season tickets still continues.

Review.

Office Book for Architects, Engineers, Builders, Clerks of Works, &c. London: Atchley and Co.

HOWEVER great may be the affinity in some respects of the classes comprehended under the above titles, it is in others so very wide asunder, that to embrace in a single book a quantity of matter which should prove interesting and instructive to *all*, was in itself a task requiring no ordinary courage to undertake, and skill to accomplish, yet as far as we can judge by a somewhat hasty examination of the book before us, and without requiring at present in practice to seek its assistance, the author deserves congratulation for the successful attainment of his object. Curiosity—we trust a laudable one—prompts us to enquire to whom are we indebted for the authorship, which is recorded on the title-page after the anonymous fashion of "An Architect and Building Surveyor?" and perhaps without infringing on the privacy evidently desired to be observed, as to the identification, we may note a supposition—which as such will be taken by our readers—that it is not the work of a *junior* hand, but of one already extensively known as an author, and moreover an old and respected member of the architectural profession Besides a very comprehensive reprint of the Metropolitan Building Act, the contents embraces a chronological list of the most remarkable architects from the beginning of the 16th century down to the 19th, Sir Charles Barry being last on the list; tabular dimensions in feet of the orders of architecture, and of the principal English cathedrals, scantlings of floors, roofs, &c., a highly valuable series of experiments by George Rennie, Esq., C.E.,—never before published; various tables conveying information relative to building materials and land; lists of the members of the Institutes of Architects and Civil Engineers; likewise original chapters on the writing of specifications, and various other subjects. Embracing such a fund of ready referential and instructive matter in a very portable compass—which for such a character of work is undoubtedly an advantage—we infer with confidence that the classes for whom it is intended will, by a liberal patronage, amply reward the enterprise of the publishers and the ability of the author.

DEATH OF A DUBLIN EDITOR.—In the following terms is deservedly recorded the death of John William King, Esq., in the 57th year of his age, for upwards of thirty years Editor of *Saunders's News-Letter*, and which took place on the 23rd ult., at his residence, 9, Upper Camden-street:—"He was esteemed by all classes of society for his great personal and mental qualities, unswerving integrity, unblemished honor, a cultivated and gifted intellect, a generous and affectionate heart, and a steadfast and kind friend to all who merited his friendship. An honorable man, in constant intercourse with the public, and daily standing the tests by which human integrity is tried, he gained and retained the friendship of every rank, and, it may be added, he never lost a friend or made an enemy."

BRAY.—As previously noticed (in the *Irish Times*), a cutting has been made, in a straight direction, from the river down to the sea, whereby small vessels may approach the docks without incurring the delay and risk which previously attended their passage through the shallow course which the river naturally took previously to emptying itself into the sea. It is also stated that Mr. O'Reilly Dease has munificently offered to spend the sum of £10,000 on building a small pier and harbour, if the remaining portion of the sum required to carry out this most desirable object is subscribed by one or more gentlemen connected with property in Bray. The newly-erected bathing-place, belonging to Mr. Kelly, is now nearly completed, and will, doubtless, afford great facilities for sea bathing. It is, however, to be regretted that by the erection of a wooden paling for the purpose of screening the bathers from public view, an encroachment upon the right of the public to walk along the sea shore is thereby effected, and it may be remarked that, although the prescribed portions ot the strand within this enclosure is comparatively small, yet, as a principle, it must be considered objectionable, as it may act as a precedent for others to do likewise. It might also be stated that when the railing round the Dargan esplanade was first erected, several of the residents, fearing that they were going to be deprived of their access to the sea shore, broke down the railing in several places, and accordingly, by the wise directions and considerate thoughtfulness of Mr. William Dargan, who reclaimed this ground, directed that gates should be placed in each of these breaches, by which the public are now fully and freely admitted upon the sea shore.

PAVING THE STREETS OF CORK.—Block pavement is being adopted in the capital of the South; the experiment being first tried on St. Patrick's-quay to the Steam-Packet Office, and now at Winthrop-street. It is said, however, that, owing to a defective substratum, the former has presented inequalities. Our Cork friends, like ourselves, must profit by experience, and do better the next time.

The Dublin Builder.

VOL. III.—No. 38.

SCULPTURE AND ARCHITECTURE AT THE DUBLIN EXHIBITION.

RESUMING our notice of the works in the central hall, sculpture claims premier attention, the specimens contributed being peculiarly excellent, and, moreover, the mode of distribution adopted very judicious and proving a great acquisition to the general effect of this apartment. At the left of the entrance porch, a marble figure of a shepherd boy in recumbent attitude, and the last work of poor Hogan's hand, attracts a crowd of admirers, the pose of the figure being distinguished for that gracefulness and truthfulness to nature which were the great Irish sculptor's characteristics, and every feature is replete with beauty and sharpness of finish. "The youthful Saviour disputing with the Doctors" (No. 4), by Mr. James Farrell," and "Sleeping Youth' (No. 6), by Mr. John Farrell, aro both in marble also, and entitled to high commendation. Mr. Joseph Kirk, R.H.A., has plaster casts of his well-known "Children and dog;" a figure of "Sappho" (No. 18); "Boy and shell" (No 20); and marble group of "St. John and the Virgin" (No. 19); all of which may be ranked amongst the most excellent of that eminent artist's works. The same contributor has busts of Lady Langford, Dr. Bellingham, Sir Philip Crampton, Rev. Mortimer O'Sullivan, Sir Leopold M'Clintock, and Drs. Carlisle, Williams and Jacob, which, to the extent of our personal knowledge, are most faithful likenesses, and finished in artistic style. We may pause here to note, that "busts" form a large proportion of the sculptural subjects, those most attractive being—in addition to the above—of the Queen, Prince Consort, Earls of Carlisle, Clarendon, St. Germains, and Eglinton (Lord Lieutenants of Ireland), Mr. and Mrs. Dargan, all contributed by Mr. Dargan, and from the chisel of Mr. J. E. Jones; Lords Palmerston and Brougham by same artist, Dean Meyler by John Hogan; Sir R. Griffith, Bart., by C. Moore; Lady Eastlake and E. H. Baily, R.A., by the latter, &c. Alderman Roe, D.L., one of the committee, exhibits a very pleasing group of "Children and goat", by Bartolini of Florence. The plaster casts of a "Young Naturalist" (No. 31), and "Sleeping child and dog" (No. 49), by H. Weekes, A.R.A.; a colossal statue in plaster of the late Dr. Murray (Roman Catholic Archbishop of Dublin), by T. Farrell, and a group representing the death of Procuis, by Charles Papworth, London, with a few others, may be said nearly to comprise the remaining features of interest in this department. Previous to passing to the south gallery where the architectural drawings are arranged, we must not omit to mention, that "the great organ" at eastern extremity of nave, and built by Bevington and Sons of London, for the Paris Exposition of 1855, is a remarkably fine instrument, and its mellow tones on certain days and evenings of the week are diffused throughout the building to great advantage; also, that at the entrance to staircase are sundry casts of stone carvings, and a statue in Caen stone of the Virgin, very beautifully designed and executed by Hardman and Co. of Upper Camden-street.

Architecture essayed to hold her court with compatible dignity, but the arrangements for her reception are unpardonably deficient. Some of the *best* drawings contributed are placed in the *worst* positions, being either at the feet of visitors along the inner trellis-work of the south gallery and under a projecting shelf, or so high up that it is impossible, without the aid of a step-ladder, to view their features. Again, others, including designs by Messrs. Pugin and Ashlin, and Mr. Atkins of Cork, are literally set aside next the external trellis-work with *their backs* turned to the visitors, thereby rendering useless the labour bestowed by those gentlemen in their production. In the earlier period of the exhibition, consequent confusion and hurry might have been reasonably pleaded as an excuse for such, but it cannot *now*, seven weeks after the date of opening, and it is quite time that the committee should look to this, which we are willing to concede appears to be the *only* defect in the arrangement. Amongst the foremost exhibitors in this department are Messrs. Pugin and Ashlin, and Mr. G. Goldie respectively, whose drawings, though exhibiting widely different peculiarities, both in design and draughtsmanship, are remarkably excellent; and in conjunction with their names we may, perhaps, appropriately mention that of Mr. Lynn (Lanyon, Lynn, and Lanyon), another rising star in the Gothic hemisphere, whose design for St. Andrew's church, also exhibited here, and illustrated in this journal for October, 1860, deservedly elicited the highest admiration even from disappointed competitors. With the assistance of these gentlemen and other professionals who have made "Gothic" their particular study, we hope to see within a few years a complete revolution in the ecclesiastical architecture of Ireland. Mr. Ashlin, though associated with a gentleman of very high attainments, and, moreover, the son of the late A. Welby Pugin, is, as we learn, entitled to the exclusive merit for the design of the Irish works of that firm; for instance, SS. Peter and Paul's church, Cork, and the Augustinian church and monastery about to be erected at John-street in this city, with views of each of which we have already presented our readers. These, with photographs of various other works by the same gentleman, may be found at No. 268 in the south gallery, and those who appreciate effective outline drawing of designs exhibiting much gracefulness of contour and richness yet striking lightness of detail, should study the collection minutely, which embrace, to all intents and purposes, the works of a genuine and original artist. Mr. Goldie's adopted school is much broader and bolder, but his general grouping—especially in the design for additions to SS. Peter and Paul's, Phibsborough, which displays numerous chapels polygonally attached to the chancel, and somewhat after the manner of Linz cathedral, illustrated in present number—is exceedingly meritorious; nor is it less so in the drawings for church at Berne, of the same title, by this gentleman, which were awarded a gold medal in 1856. From the studio of Mr. Lane of Great Brunswick-street, architectural sculptor, is a recent acquisition of a Gothic monument designed by Mr. Goldie, executed in Caen stone and coloured marbles, and intended to commemorate the late Right Rev. Dr. Browne; which, with another in partly similar material to the memory of the late Rev. J. Mahony, P.P., and designed and executed by Messrs. Hardman and Co., are two of the most noteworthy features in the combined architectural and sculptural department. Returning to the gallery, the competition designs for St. Andrew's church by Messrs. William Atkins (who has judiciously amended the proportions of his spire), Rawson Carroll, and J. M'Curdy, architects, (of which we spoke previous to the decision), are all more or less distinguished for their excellence and their style of finish. Mr. M. B. Moran exhibits coloured drawings of interior of St. Patrick's (two views), evidently executed during that gentleman's studentship; also his designs for the churches of St. Augustine's, Drogheda, and Ballyvaughan, both of which, we believe, are in course of erection. The method of shoring adopted in the recent alterations at the Royal Bank, by Messrs. Courtney and Stephens, under the directions of Mr. Geoghegan, architect, is shown in an intelligible, isometrical view, and the latter gentleman also contributes his design for the extensive structure, about to be erected at Harold's Cross, for Blind Females, as already announced. Mr. Nicholl, of London, has some effectively-executed sketches of a cemetery chapel. Various architectural subjects are illustrated in numerous photographs; those by Mr. Grubb, Messrs. Nelson and Marshall, and Simonton and Millard, being fully equal to any we have seen elsewhere. Before closing this notice we may mention that the carved timber screen, executed by Mr. Boyle of Marlborough-street, for the new R. C. church of St. James, is a fair specimen of workmanship, and the rubbings of monumental brasses, selections of ancient metals, cartoons of stained glass windows and other articles, comprised in the collection of Messrs. Hardman and Co. are most creditable to the taste of that eminent firm. The card models of the new Molyneux church and contiguous buildings in course of erection at Leeson-street, after designs by Mr. Carroll, also of the clock-tower at Ardagh, by the same architect, are about the best we have seen executed in that material, and are very advantageously placed in proximity with the nave and under the south gallery. On the whole, the architectural department is rather better in this Exhibition, than it was in 1853.

THE CURRICULUM.

As proposed by the Institute of British Architects.

AFTER reciting that the examinations shall be arranged in two classes of "*ordinary proficiency*" and "*honourable distinction*" respectively, also the minor detailed regulations connected with the examination, the programme of the course is thus given :—

CLASS OF ORDINARY PROFICIENCY.—PRELIMINARY.

A measured sketch of some existing building, or portion of a building; a perspective sketch of some existing building, or portion of a building; a drawing of some ornament from the round or relief; and a perspective view with working plan, section, and elevation, of a design by the candidate for some building, together with its whole specification, and a portion of working details at full size.

Work to be done in the presence of the Moderators.

	Number of Marks.
Drawing and Design.—A design for some building, or portion of a building, in the style named by the candidate, the subject being given by the examiners	1,750
Mathematics.—Arithmetic, including the square root; algebra, including simple equations; Euclid, books 1 and 2; mensuration	500
Physics.—The elements of mechanical philosophy, and specially heat, light, and ventilation; the composition and resolution of forces	500
Professional Practice.—The principles of estimating; the laws relating to accident, agency, contracts, and dilapidations	500
Materials.—The general natures and properties of building materials, including their decay, preservation, quality, and strength	750
Construction.—The detail drawings and specification for such branches of the work suggested in the above-named design (including drainage), as the examiner may indicate	750
History and Literature.—An outline of the characteristics of the principal styles of architecture in Europe; the particular characteristics and history of any one style named by the candidate	1,250
	6,000

CLASS OF HONOURABLE DISTINCTION.—PRELIMINARY.

Original details at full size of work for wood, stone, marble, mosaic, glass, iron, brass, precious metals, textile fabrics, or embroidery; sketches or measured drawings of existing buildings or other subjects of design; a drawing of the human figure from the round or from memory; a subject of landscape gardening; an architectural subject in colours; a subject of decoration, in colour or otherwise; and some specimen of skill in modelling, or in carving, either in stone or in wood; specimens in four at least of these branches being necessary for the admission of the candidate.

Work to be done in the presence of the Moderators.

	Number of Marks.
Drawing and Design.—Such designs, drawings, and specimens of skill, in the style or styles named by the candidate, as may be thought needful to test his skill with regard to such preliminary work as may have been attached to his declaration: the subjects to be given by the examiners	600
Mathematics.—Algebra, including quadratic equations; Euclid, books 3, 4, and 6; plane trigonometry; conic sections. The candidate to name the extent of the examination that he thinks himself capable of passing	600
Mathematics and Physics applied to Practical Purposes. — Mechanics, statics, dynamics, hydrostatics, hydraulics, land surveying, acoustics, chemistry, electricity, galvanism, geology, and theory of colour. The candidate to name the portions chosen by him	400
Languages. — Translation from Greek or Latin, and translation from or composition in one or more living foreign language. The candidate to name the languages	300
Professional Practice.—Laws of property relating to buildings, including fixtures and rights of adjoining owners; arbitration	500
Materials.—Detail of the natures and properties of building materials, including materials which are not in ordinary use	400
Construction. — Complex construction in scaffolding, shoring, securing dangerous structures, pulling down work, alteration of buildings, foundations, walls, partitions, floors, roofs, arches and vaults, formulas for calculating the strength of materials	500
History and Literature.—The structures, architects, writers on practice and theory, and works illustrating styles or structures, in any style or styles named by the candidate	700
	4,000

The number of marks to be allotted by the examiners to their questions shall be 10,000; of which 6,000 shall be in the ordinary and 4,000 in the honourable class of the above programme, and also shall be as above noted,—Drawing and Design, ord. 1,750, hon. 600; Mathematics, ord. 500, hon. 600; Physics, ord. 500, hon. 400; Languages, hon. 300; Professional Practice, ord. 500, hon. 500; Materials, ord. 750, hon. 400; Construction, ord. 750, hon. 500; History and Literature, ord. 1,250, hon. 700.

Of these marks 3,000 in the ordinary class shall gain an acknowledgment of ordinary proficiency; if increased by 2,000 in the other class they shall gain an acknowledgment of honourable distinction; but the candidate shall not be held to deserve the acknowledgment of ordinary proficiency unless he obtains at least half of the number of marks allotted to the divisions of Drawing and Design, Materials, and Construction respectively, in addition to at least a fifth of the number of marks allotted to each of the other divisions in that class.

In order to secure unquestioned impartiality in the examination, each candidate upon complying with the form of application shall receive from the honorary secretaries of the institute a paper containing a number which he shall employ instead of his signature to all work during the examination. Such number is to be so placed that it may be easily removed by the moderators, who shall substitute their own sign as hereinafter provided. A particular sign shall be affixed by the honorary secretaries to the drawings, specification, and objects of skill submitted with the declaration, so that the authorship may not be known to the examiners.

The examination shall be superintended by two moderators, one of whom must always be in the room during the days of examination. Their function shall be to supply the question papers; to see that the intentions of the examiners are fulfilled; to explain the objects of the questions; to take care that no assistance be given by one candidate to another, and that no other persons than the candidates, except themselves, shall be in the room or hold communication with the candidates during the hours of work; to allow no other books to be used than those above permitted; to verify the production of the work in the room by each candidate; to affix to each work produced in their presence by each candidate a distinctive and numerically different sign; and to supply at the close of each portion of the day to the honorary secretaries such productions, with a register of the signs, accompanied by an index, showing the number designating the candidate. The moderators shall be remunerated by the institute in regard of their services at each annual examination.

The examiners shall furnish to the honorary secretaries, in time for the opening of the examination, sealed notes, marked as containing in each the subject for work in the division of drawing and design in the class of ordinary proficiency. The examiners shall meet on the first day of examination; and upon consideration of the drawings produced in the presence of the moderators during the day, as well as of the drawings and specimens of skill attached to the declaration, shall furnish to the honorary secretaries notes of the branches of work for which the respective candidates shall be required to make the detail drawings and specification in the division of construction in the class of ordinary proficiency, and the subjects for which they shall be required to produce specimens of their skill in the division of drawing and design in the class of honourable distinction. At the same time the examiners shall furnish to the honorary secretaries sealed envelopes, marked as containing separately the papers of questions and requirements for each remaining portion of the examination. The contents of those papers shall be as far as possible, uniform for the candidates; and shall be multiplied only in manuscript or lithography, under the immediate superintendence of the examiners. The honorary secretaries shall enclose each paper separately in another envelope, on which they shall mark the class, division, and number of the candidate for whom it is intended, and these addressed envelopes shall not be supplied except through the moderators to the candidates at that portion of the examination for which each is intended.

As the following articles must be ready for return on the last day of examination, the examiners at the same time, or by adjournment, shall take into consideration any degrees, diplomas, certificates, or medals obtained from any society of architects (approved for this purpose by the Council of the institute) whose president or honorary secretary, at the time when such distinction was adjudged, shall have been a fellow of the institute, or from any royal academy of art, or from any university in Great Britain, as well as any printed literary productions, which may be submitted by the candidate; and the designs, drawings, specification, and specimens of skill attached, as hereinafter required, to his declaration; by granting to each group of such objects any number of marks not exceeding two-thirds of the number allotted to the division or divisions appropriate thereunto in the class or classes in which the candidate presents himself.

Within seven days of the last day of examination, the examiners shall furnish to the council their report, stating the number of marks granted to the above-named objects in each division, and to each sign affixed by the moderators to the works produced before them by the candidates.

Upon receiving the report of the examiners, the hon. secretaries shall form a list of the numbers given by them to the candidates, with a schedule of the appropriate signs substituted by the moderators, as well as of the sign chosen by the hon. secretaries themselves for the designs, drawings, specification, and specimens of skill, submitted by each candidate; and shall affix to such list and schedule the marks granted to each moderator's sign, and to each previously-obtained diploma, certificate, medal, literary work, design, drawing, specification, and specimen of skill, so as to ascertain the marks due in each division to each candidate's number: and their report thereof shall be delivered to the council within a fortnight after the examination.

The council shall deduct from any marks granted by the examiners to previously-obtained diplomas, certificates, medals, literary works, designs, drawings, specification, or specimen of skill, the whole number of marks gained in the appropriate division or divisions in presence of the moderators, if less than the half of those above required for such division or divisions of the class or classes in which the candidate presents himself.

The total number of marks then due to each candidate's number shall thereupon be calculated by the hon. secretaries. Should the marks not amount to a number sufficient to pass the candidate, no further notice shall be taken. An alphabetical list of candidates successful in the class of ordinary proficiency, and a list of candidates successful in the class of honourable distinction, shall be publicly exhibited at the institute within one month after the examination. The number of marks gained by each candidate shall not be communicated to any person.

All diplomas, certificates, medals, literary works, drawings, specifications, and objects of skill, submitted with the declaration, shall be returned to the candidate at the close of the last day of his examination. No drawings, papers, or other object produced as work in the presence of the moderators during the examination shall be returned to the candidate.

Fees.

Each application for an acknowledgment of ordinary proficiency must be accompanied by a fee of two guineas; and each application for an acknowledgment of honourable distinction must be accompanied by a further fee of one guinea.

The committe have the honour of making the following recommendations:—

That the rules of the institute as to students and their prizes be taken into consideration by the council with a view to the formation of some system that shall lead educationally towards the voluntary examination now instituted.

That if fewer than six days be devoted to any examination, the examiners should be at liberty to vary the distribution of time prescribed in the regulations.

That the council should be empowered to fix for the first examination a smaller number of days and a less proportion than that above arranged of marks necessary to pass; and to raise for the second examination the proportion of such marks to an average between that of the first and that provided in the regulations, which shall be used for the third.

That, after the third examination, the council should request the examiners to report any change that they may deem desirable in the system.

WHY STEAM TRACTION IS NOT MORE GENERAL.

IT is certainly not very difficult to account for the long delay in the employment of steam carriages, both for passengers and the haulage of goods on the turnpike roads, as a substitute for horse-power. The attention of nearly all the scientific men and capitalists having been so entirely absorbed in another species of conveyance, the subject of steam traction on common roads has been comparatively little attended to, and this may in some measure, perhaps, help to elucidate the "why" it has made so little progress, when compared with other modes of conveyance.

The greatest, the most determined, and, at the same time, the most contemptible obstacle it has had to contend with, is *prejudice*; than this I know of none greater, except it be *impossibility*.

Engineers, as a body, seem to have been wrapped up in the belief than it was "impossible;" and they have not only "believed" it to be so, but have spread and propagated this opinion, with great zeal and perseverance.

Unfortunately, however, for the traction engine, its chief advantage, namely, its *enconomy in application*, becomes a disadvantage to an important and influential class of persons who are useful in promoting speculative undertakings; because such large profits as are made on locomotive railways, in the shape of law expenses, per centage, &c., cannot be made out of them by lawyers and engineers, from their simplicity and facility of employment, therefore we find all such persons advocating railroads.

Next, the *excessive tolls* on steam carriages, imposed, no doubt, from a determination on the part of the trustees to obstruct, as much as possible, the use of steam as a propelling power, arising from their having the erroneous idea that it must be more injudicious to the roads than traction by horse-power, has acted in such a manner as to totally prohibit their use in some parts of the country, if put on with a view to making them a profitable investment.

We can all remember how the late Dr. Lardner, who has been considered a great authority by some people, stated, in a lecture delivered by him in 1836, that, as for "making a voyage directly from New York to Liverpool, it was, he had no hesitation in saying, *perfectly chimerical!* and they might as well talk of making a voyage from New York or Liverpool to the moon." In spite of this dogmatic dictum, in less than two years the Great Western crossed the Atlantic direct; but I have not yet heard of the easy voyage to the moon.

To any one attentively reading the report of the select committee on steam carriages, which sat in 1831, and weighing well the facts then elicited (now nearly thirty years ago) as to what was *constantly being done in actual and regular work*, even at that period, when the superb tools, and beautiful and accurate workmanship of the present day, were, as one may say, quite unknown, the question of why there should have been no attention given to this subject since, must inevitably suggest itself.

To say that steam cannot be applied for traction on common roads, because a few absurd acts of parliament allow of prohibitory tolls being levied on them in some parts of the kingdom, is about as wise as to say that a steam engine could not be made to work, if Government were to put such a tax on coals as would prevent their use except by the richest owners of such engines; and this is precisely the case with steam traction at the present moment.

The idea of a steam engine drawing a heavy load at a speed of twelve miles per hour, was received with ridicule by the most "eminent engineers" of the day.

Sir Charles Dance said, when speaking of the opposition he experienced whilst running his steam coach from Gloucester to Cheltenham,—"That obstacles are always thrown in the way of a new invention, particularly if it is likely to produce important results, from the prejudices of those who have not fairly examined its merits, and by the opposition of others who expect their interests will be affected by its success. Thus, objections have been made to these carriages by various descriptions of persons, viz., country gentlemen, trustees of roads, farmers, coach proprietors, coachmen and postboys, &c. Some said they would be injurious to agriculture; others, that they would destroy the roads; others, that removing horses would ruin the farmers; and others, that it would ruin the coach proprietors, and throw all the hands employed out of work."

Sir Charles Dance's engineer (Mr. Stone) observed,—"This is a very bad place to commence on. We are surrounded with prejudiced people; agriculturists, coach proprietors, coachmen, stable-boys, and others directly or indirectly connected with them; these, *with the old ladies* of Cheltenham, I assure you, offer a formidable opposition to any innovation."

It seems that a great many "old ladies," some of whom do *not* wear petticoats, and *do not always belong to Cheltenham*, are generally to be found opposing anything new, *whether they understnnd it or not*, and are just as troublesome in the present day as they were in 1831. If some benevolent individual would provide a "retreat" for those dear old creatures, so as to keep them out of mischief, what a blessing it would be.

The proposition for the use of steam power on the Liverpool and Manchester Railway, excited the alarm of a great number of the shareholders. At the request of the dissentients, two "eminent engineers," the one engaged on public works, and the other *in the manufactare of steam engines*, "investigated" the subject, and, in "a very able document," proved most clearly that Mr. Stephenson's project was *practically and commercially inexpedient*.

Mr. M'Adam, in his evidence before the committee of the House of Commons, in 1859, says,—"Up to the year 1857, I was perfectly convinced that locomotives could never travel upon turnpike roads; but I was then induced to *see* how they were constructed with what is called an endless railway; my curiosity then led me to look at it, and when I saw it, I was so satisfied with the mechanical construction of it, that I saw the company and requested that they would give me an opportunity of travelling with an engine, so that I might see the effect of it, both as to draught, and to its effect upon the road. They allowed me to do so; and I went to Thetford, and accompanied the engine with a load of some thirty tons, I think, and brought it into London. *It was then in its infancy.* I promised the company when I went down, that I would keep a log of the proceedings of the engine, and let them have a copy of it. I had previously gone much into the subject with several gentlemen who had suggested engines years before. I had talked a great deal to Mr. Brunel about them, and the conclusion which I always came to, and which Mr. Brunel said was a correct one, was, that the resistance of the road to the engines, which were then suggested, was so great, that there would be no balance of power left to draw the carriages so as to pay.

The great mistake which the late Mr Boydell made, was in attending *first* to the introduction of his engine for *agricultural uses*, and that *so exclusively as almost to prevent its adoption for any other purpose.* He constructed them *as cheaply as possible*, and followed that *exceedingly objectionable practice of attaching the cylinders and working gear to the boiler*, hence those who heard of it simply as an agricultural implement, were slow to believe in its utility and great advantages for general haulage purposes; but now that this economy and utility, *under very great disadvantages* (whilst, in the words of Mr. M'Adam, "it was then in its infancy"), have been amply proved and exemplified, there need be no further doubts or uncertainty as to its working, or of its great economy and advantages for traction purposes.

The engines are now being made in a very proper manner. The boiler is *entirely independent of the working parts*, which are attached to a strong plate iron framing, similar to that of a locomotive engine, so that *no strain is thrown upon it*, thus rendering them what they should be, road locomotives. The trains of waggons drawn by these engines are now so arranged that, by means of chains and screw couplings, each waggon is drawn *direct from the engine*, without the strain of the draught being allowed to pass through all the waggons in front of the one drawn behind them, before it reaches it, thus doing away with a great deal of wear and tear, which, with a heavily loaded train, was found to be very objectionable. If, in sending these engines abroad, *proper men* go out with them, and a *correct statement of the circumstances under which they are to be worked has been furnished, so as to enable these requirements to be met*, I am convinced that they will give very satisfactory and profitable results.—*Steam on Common Roads.*

IMPROVEMENTS AT HOWTH.

THIS attractive locality is gradually progressing in public favour. During the last year several commodious houses have been built. The noble proprietor has erected at the corner of Balscadden Bay hot and warm baths, which will shortly be opened, and which will be a great convenience to invalids frequenting this now favourite outlet of Dublin. The path cut round the cliffs on the east side of the hill still attracts tourists and others in search of bold and picturesque scenery. Those who have not yet visited it can have no conception that within thirty minutes' drive by rail from Dublin such romantic scenery can be enjoyed, and there is no doubt that many who do visit Howth return without having seen its chief attractions. This arises, probably, from the difficulty of access to the eastern and southern portions of the promontory. By our advertising columns, however, our readers will find that this difficulty need no longer exist, as Messrs. O'Neill, the enterprising omnibus contractors have placed a light and commodious long car to ply from Howth and Sutton stations. We trust that this effort will be acknowledged by the public in such a manner as to induce the proprietors to continue so great a convenience. By its means the people of Dublin may quit the heat of the crowded metropolis, circuit the whole of the hill, and return with increased vigour, and certainly with renewed appetite, within the space of three hours. At the present moment the herring fishery is not the least interesting feature in the scenery. A vast number of fishing craft cover the sea as far as the eye can reach, and the daily arrivals and departures of these tiny vessels with the traffic of the English agents, who buy up the produce of the fishery, give to the quay a most animated appearance. A large tract of the southern portion of the hill has lately changed hands, and we understand that building on an extensive scale will shortly be the result. The liberal policy of the railway company in granting free tickets to builders of houses along its line will doubtless contribute to the more speedy accomplishment of this result.—*Freeman.*

There is as much iron ore in the Lake Superior district alone as could supply the whole world with iron for centuries. This ore extends over a large tract of country, and sometimes rises into hills several hundred feet high. It contains from 75 to 80 per cent. of pure metal of excellent quality.

COLUMN FOR CRAFTSMEN.

THE PLASTERER.

WITH the craft of the Plasterer is, to a considerable extent, associated, both the artistic and the utilitarian condition of modern architecture; indeed in the former capacity, during the present century at least, his resources have been tested to an uncommon degree, and that which our forefathers performed by the aid of the stone-cutter, has now become the peculiar province of the former, where "economy is the order of the day." Very much of the excellence of plastering work depends on the skill and care with which the component materials for internal or external works respectively are mixed into a mass, as well as the actual quality thereof; and those most in use are cements of various kinds—Roman and Portland being the chief—Plaster of Paris, Scagliola, lime and sand, &c. In ordinary internal work the Plasterer's duty mainly comprehends the rough casting, floating, and coating of chief walls, the lathing, floating, and coating of ceilings and stud partitions; but where ornamentation is desired, as in the case of enriched entablatures, centres, &c., extreme delicacy of manipulation and beauty in design may be brought into requsition, and with a facility not always presented by the employment of a natural stone. Good plastering is easily discernible from bad, being remarkable for smoothness, regularity, solidity, and absence from cracks or other imperfections. The measurement of ordinary wall plastering, partitions, and ceilings is by the square yard of nine feet, but cornices are taken superficially, their members being girt to obtain their width, or sometimes by the lineal foot; an extra allowance being made for each mitre in angles or on projections. Lime enters very largely into the composition of plaster and a very durable cement may be formed—ordinarily termed "compo"—for external work by a simple admixture of that material with good sharp sand. By a judicious use of this simple material, structures—domestic especially—may be made very architecturally pretensions, and in various respects it is certainly preferable to indifferent cement work. Plaster of Paris is so called from the genuine article being found in the hill of Montmartre, one of the environs of Paris; however spurious imitations are in constant use, and those about to apply it to building purposes should make sure to purchase at a respectable house, as affording a guarantee at least to some extent. Ornaments to be cast in plaster must be previously modelled to design. When the clay model is finished and subjected to the atmosphere, a wooden frame is adapted to it, and filled with melted wax, which, on cooling, presents a fac-simile of the model, and by repetition of the process casts *ad infinitum* may be produced. Various patents have been obtained from time to time for improvements in stucco material and cements, that known as "Caen cement" being the nearest imitation of marble combined with permanency. We had occasion in a former number, in describing Mr. Pim's new house at Monkstown, Messrs. Carmichael and Jones, architects, specially to note some columns beautifully executed in this material by Messrs. Hogan and Sons, plasterers; and it is much to be regretted that its expensive character precludes its more general use. Scagliola is a distinct branch of this art, and was invented in Italy, but there are many tradesmen who never witnessed "an Italian sky", proclaim their competency to produce a material, called by same name, of superior description; hence the very objectionable imitations so frequent. The Romans had an art of rendering their plastering, as evidenced in the remains of their aqueducts, much more durable than ours; however we must admit that several of the legitimate tradesmen in that line can produce a very excellent quality of work. The roofs of houses and floors of rooms, at Venice, are covered with a sort of plaster, we presume, corresponding with our Seyssel Asphalte—strong enough to resist the sun and weather for ages. Excepting in commercial housefronts, the public buildings of Dublin display but little of the Plasterer's art, the majority of them, we are happy to say, being, in the much more imperishable material of granite, Portland or limestones; very many, however, of the mansions of the nobility and gentry are faced with cement, and, in numerous instances, display excellent architectural effect In England, with certain exceptions, but London especially, cement is the prevailing material, and the workmen generally have acquired much skill and proficiency in its application. Too frequently, however, the Plasterer's art is made accessary to the concealment of defective workmanship and materials by his brethren, the mason and bricklayer; and modern building capitalists, also, sometimes scruple not to employ it in cheating both themselves and their tenants into the assumption that a neatly plastered exterior ensures a comfortable and safe abode. In London, Manchester, and other English towns, this principle—or rather want of it – is carried out with a vengeance; and two and three story houses are run up there with single brick external walls of the worst materials and workmanship, thinly plastered with cement to deceive the eye.

THE DARK AGES OF ARCHITECTURE.*

(Continued from page 553.)

THE course ran by the Renaissance in England we may take up at the period of Elizabeth, when, the political troubles becoming settled, men were able to turn their attention to art and architecture. For a long time the traditional construction and plan and the mullioned windows held their ground, but coarse, bad, pagan mouldings were introduced as improvements and an equally course sort of adaptation of French ornament was developed into a convenient store of precedents for the dark ages. Stone was made to assume the appearance of cardboard, cut and curled, and monstrosities of every description were delighted in.

This Elizabethan style was that which in England combined the features of the decaying Gothic with those of the revived Classic, and though less refined in detail than the contemporary work in Italy and in France was, perhaps, the most vigorous and picturesque. In time, however, here as on the continent, the Classic element conquered in the struggle, purity of style and correctness of proportion in imitation of Roman precedents were the objects architects set themselves to attain and so were ushered in "the dark ages." Yet many revered names there are among these architects, from whose reputation I desire in no degree to detract, I only lament that their lot fell not in better times. What I seek to show is not that Inigo Jones, Wren, Hawksmoor, and Vanbrugh were not great men, but that they were all the greater for having wrought out so much that is grand and graceful from elements lacking these qualities themselves, and which, when their genius was withdrawn, resolved themselves into the monotony and lifelessness inherent in them. Of the heroes who led this forlorn hope, Inigo Jones was the first and best. The proportions of his design for the portion of the palace at Whitehall which was carried out are as generally admired as they are known; but as it has been used as a precedent for myriads of acrobatic pilings of orders above orders, and breaking the entablatures over to give them some appearance of utility, we need the less regret its not having been repeated by himself.

It is strange that one who so thoroughly appreciated the importance of purity and consistency in the style in which he worked himself, could have so little regard for the same qualities in other styles, as to have built to the old Gothic Cathedral of St. Paul's an incongruous Pagan porch, and refaced the transept end in a manner which, fortunately for his reputation, lives only in tradition; this also has been much lauded for its proportions, but from the representations of it that exist, I confess I cannot regard it with enthusiasm; that it was, however, simply barbarous as an adjunct to a Mediæval cathedral, we may, I think, assume, from a comparison with the effect of the alterations made by another architect, who was not otherwise than a shining light among the constellations of the dark ages, to another of our cathedrals—I mean those made by Wood of Bath, at Llandaff. Now, the works of this architect at Bath are by no means bad of their kind, and would not lead us to suppose that he could have been guilty of the atrocities which I fear can with too great truth be laid to his charge, any more than we should believe upon less certain documentary evidence that Inigo Jones had maltreated in a similar manner the façade of St. Paul's. Of these alterations to Llandaff, I have enlarged the illustrations given by the Bishop of Llandaff in his work upon that cathedral, showing the design "as it was proposed to finish it," and we learn from contemporary letters quoted by the bishop that it was proposed to pull down the two western towers and raise one over the front of the nave, as seen in the design, and "then to finish with a rustic porch." Most fortunately the solicited contributions of the faithful were not sufficient to enable them to realise this conception. We learn, however, that they succeeded so far as to insert "windows framed with wood of another sort, which will come vastly cheaper and look as well as the Gothick," and to finish the interior in "stucko," to their own satisfaction; for the same letter states "that the church on the inside, as far as 'tis ceiled and plastered, looks exceeding fine, and is a very stately and beautiful room."

Sir Christopher Wren had by no means the same artistic feeling as Inigo Jones, though greater mathematical powers and science in construction. As an architect he had golden opportunities in the rebuilding of the city of London after the fire of 1666, and he had the genius to grapple with it in an engineering point of view, and architecturally also so far as it was possible in the style with which unfortunately he had to deal. The manner in which he did this has been so lately thoroughly set forth by my friend, Mr. Kerr, that I need not here enlarge upon his works—the more so as my purpose of showing the thorough intractability of the style which even his talents could not overcome, is rendered self-evident by the following remark, which I venture to quote from that gentleman's lecture on the subject. Speaking in reference to the double dome and screen-wall of the nave of St. Paul's, he says, "They are, at least, the makeshifts of marvellous ingenuity, and still greater artistic power; they are falsities it is true, but they are those of a master mind; they are no common vulgar fibs, but great grand lies of genius."

Now a style that necessitates lying, which requires "marvellous ingenuity and still greater artistic power" to conceal awkward roofs and buttresses at the cost of making one half a building a huge sham to render the other half tolerable, is I think fairly to be said to belong to the dark ages; and that Mr. Kerr's estimate of the makeshift is a correct one, my reminiscences of a church in Venice, by Palladio, the roof and buttresses of which had not been concealed by such ingenious means, yet which seemed to call loudly for a similar friendly shelter, will enable me to corroborate.

The group of the city spires and the towers of Westminster Abbey are conceived and massed with great talent and a true feeling for what is grand and picturesque, yet with such horrible details, such as a substitution of the queerest pots and jars in the place of pinnacles, that it is necessary that one should half shut one's eyes to enable one rightly to appreciate their outlines, and as such are after all borrowed from the older mediœval steeples. One would really rather open one's eyes and see true Gothic steeples with proper details as well. The thin leaden spire of St. Martin's Ludgate-hill, is as a composition rightly placed in contrast to act as a foil to the dome of St. Paul's but in itself is surely no beautiful object.

Time fails me to describe other of Wren's works, or those of his successors who took up his mantle—of Hawksmoor, Vanbrugh, or Chambers, and the rest of the band of that forlorn hope, despite whose efforts architecture sank down gradually to the uttermost depths of degradation, when the ideal of associated English homes were the monotonous, dreary walls of Harley-street and such like, wherein sham reigned triumphant from palace to terrace in plan, construction, and decoration alike. Art and architecture became absolutely dark or dead, and copies of the parodies of the works of other days were all that was attempted. The only merit that can be claimed for them is, as usual, that of "proportion," an element certainly so essential that there can be no architecture without it, yet one, the exclusive praise, of which is a sure sign that there is little else to praise, just as the most sarcastic thing you can say of a man is to laud too highly his good nature, the meaning of which usually is to suggest doubts as to his sanity. To wade through the works of this dreary period either for the purpose of description or reprobation would be a task the uncongeniality of which, together with the undue length to which I find I have extended what were intended to be prefatory remarks, must be my excuse for now shirking what might appear to be the subject I really undertook to treat upon. I cannot but own, however, that it is with some satisfaction that I find the ordinary limits of a paper reached without the necessity of an inquisitorial journey into the city for examples to criticise. In the first place, I am spared the necessity for becoming spiteful; in the next, a chilling reminiscence of the interior of St. Paul's indisposes me to revisit it until it shall have assumed, as we trust it soon may, all over, and not here and there only, in the able hands of our Honorary Secretary for Foreign Correspondence, richer hues, akin to those of St. Mark's at Venice, since we are promised the use of the statue materials for its decoration. Then it might have become incumbent upon me, however disagreeable, to sketch and measure the extraordinary sham portico set up by Sir John Soane at one end of the court of the Bank to match, according to a favourite notion in the dark ages, a real one at the other. Again, I had feared that it would become necessary to study the interior of Sir John Soane's Museum, which otherwise, not having a fancy to become a candidate for residence in that strange eclectic curiosity shop, I had been content to seek amusement from the illustrated catalogue of its contents. I had also been afraid that it would be necessary for me to search and see how far I could agree or not with Lord Palmerston in his admiration of the several buildings which he was pleased to call Italian, and as the Horse Guards was one scheduled in his list, the only pleasant feature in which, to my mind, are the sentries in their uniform, who sit like gorgeous personifications of "Patience" inside instead of "upon a monument," the prospect, I assure you, afforded me slight satisfaction.

I find myself also obliged to omit all consideration of the interesting question of the iconography of "the dark ages," and all research into the origin of the type of cherubs who smile and weep in convenient alternation upon keystones, or into the meaning of the lions' heads, whence flowers dangle to fill up panels, or into the purpose of the sundry pots that affect all high places. The question also of the polychromy of the dark ages, I find myself obliged to omit or postpone, unwillingly, because upon this subject much instruction might be drawn as regards what should be avoided. The main ambition on this point seems to ha [illegible] keep on the safe side; and safe colours which could do no harm, and whitewash, reduced the interiors of buildings to a similar condition of monotony to that we have remarked in the exteriors.

---

* From a paper read by Mr. Seddon at Royal Institute of British Architects.

However, about the close of the last century, there appeared to be commencing a salutary "shaking among bones" (to quote again the phrase of Mr. Ruskin) in an artistic as well as in a political sense, and though it seemed for some time difficult to discern whether there were real evidences of resuscitation among them, and whether such shaking were likely to bring any flesh upon them, we, at this period of time, are able to perceive (at least we flatter ourselves so), that through all the restless changes which have ensued in the successive fashions of copyism since then, there has been beneath the outer garb of Greek and Elizabethan, of Roman, Florentine and Venetian, Renaissance or Mediæval, revived styles which have met the eye, an undercurrent of healthy struggling to attain independence. Just before the Exhibition of 1851, in another lecture, I asserted my belief, in opposition to that of the author above quoted, that not bones alone were being shaken, and that we were upon a sure, if slow, route to progress. The coming Exhibition of 1862 will, it is to be hoped, by its contents, if not by its carcase, afford another favorable opportunity for taking stock, and another starting-point in the road of progress.

What colors are the best to fight under in the future struggle for the advancement of architecture, in which we shall be all engaged, I must leave to the conscience and calm consideration of each.

As to what style may be the best to develop into a healthy, manly, Christian, English, Victorian architecture, I presume not here to dictate, since we differ in opinion on the subject.

It is well that we think not all alike, and are not content, as in the dark ages, like sheep, to follow blindly their leader in all things. But let us fight out the battle, if battle it is to be, in a legitimate and friendly way, without deputations and special pleading on the one hand, yet without fear as to throwing stones because both parties live in glass houses. On the other hand, let each be thankful to the opposing side for pointing out its weak places and turn manfully to repair them. There are plenty of what my friend Mr. Burges calls unnecessary "fizzings and crockets" and sham buttresses, as well as vases and rustications and sham pediments, which may be offered up in a holocaust together, while there is equal room for each party to endeavour, by practice, to prove what their champions have been so vehemently asserting—viz., the capacity of their favorite style to admit the highest art in painting and sculpture, and thus, whichever side conquer in the friendly struggle, both may rejoice alike, and the monotony and follies of the "Vernacular" style, as Mr. Scott calls it, which has descended to us as a legacy from "the dark ages," be left to the speculating builders who delight therein.

THE INSTITUTE EXAMINATION SCHEME.

The scheme of "regulations and curriculum" for a voluntary architectural examination, prepared by the committee of the Institute, and which will be found *in extenso* in our impression for last week, has been at last laid before that body. A special general meeting was held on Monday evening, the 1st inst., to take it into consideration, at which the proceedings were not of a character possessing great general interest.

The nature of the meeting may be briefly summed up by saying that the report was received, a protest virtually entered against anything like a "diploma" as connected with it, and the matter was referred to the profession at large for consideration. This, in fact, was the intention, and will be the force of the resolution passed, which postponed the further consideration of the question till some Monday in November, and made the committee responsible for endeavours to procure in the meanwhile the opinion of other architectural societies.

Deprecating as we do any needless delay, and regretting that this matter was not brought forward at an earlier period, so that if possible a conclusion might have been come to at the present moment, we cannot but admit that, matters being as they are, the only proper course has been taken. To have decided upon a question so vitally affecting the interests of a large part, nay virtually of the whole of the profession, at a thinly attended meeting of the institute, on a hot evening in July, and within a week of the first publication of the details of the proposed scheme, would have been unseemly, nay preposterous; and yet, unfortunately, owing to previous delays, the postponement of the question now must necessarily remit it till after that time of year has passed when no societies are in session, and when many members of the institute are out of town, thus of necessity driving it on to the commencement of next winter. This is what has been preferred, and in order to facilitate as far as practicable the discussion of the question, we propose to make a few observations upon the nature and scope of the proposals—premising, however, that if practicable societies ought to discuss it at once, and not postpone the consideration of it till they reassembled after their recess. There will be a good deal of time necessarily consumed in discussion, and there will be little chance of the suggestions sent to the committee being embodied by them or considered by them with the care they deserve should those suggestions be only received at the last moment before meeting the institute.

The Architectural Association, whose session closed last week, propose to hold a special meeting for the consideration of the scheme, an example which other societies will, we trust, be ready, if necessary, to follow.

Any of our readers looking over the paper we placed before them last week, will perceive that it consists of, first, a set of regulations; secondly, a list of books; and thirdly, a series of forms. And they will do well to bear in mind that, in the instructions of the institute to the committee, it was a leading feature that the examination should have an educational character—that is to say, as was explained at the present meeting, should be of a character to test the education of the candidates and to prove that they are educated men. As a consequence, should the examinations succeed, their result will be to raise the standard of professional education. Bearing this in mind, let us apply for a moment to the consideration of the regulations forming the first part of the scheme.

The nucleus of the regulations is a list of subjects in which candidates are to be examined, and which, it will be at once perceived, is divided into two classes—the one called the class of "ordinary proficiency," the other that of "honourable distinction." In either class the student seeking to enter his name for examination is required to send in a certain amount of preliminary work, and is permitted to send any previously acquired certificates or other distinctions, literary works, or any specimens of skill in his profession. It is open to candidates above the age of thirty to present themselves for examination in the class of "honourable proficiency," without going through the previous examination, but not to younger candidates. It is not, however, necessary that any younger candidate presenting himself to undergo the preliminary examination should immediately proceed to attempt to pass the other. He may postpone that till another year. We had forgotten to state that it is proposed to hold an examination once every year, in the month of January, so often as there are five or more candidates for admission into the class of ordinary proficiency.

A glance at the subjects will show that the list is a pretty comprehensive one; it is capable, in the hands of examiners who are disposed to be severe, of affording an opportunity for a most trying examination.

The subjects in which an ordinarily proficient youth ought to be able to show himself educated are, in the opinion of the committee, drawing and design, mathematics, physics, professional practice, materials, construction, and the history and literature of architecture. To show himself worthy of honourable distinction, he is to prove his more extended acquaintance with the same branches and with languages. For the first-class he must present as preliminary work certain drawings, including a complete design, specification, and a portion of the working details for some building. For the second he has a very wide range in which to submit specimens of artistic skill and power of design thrown open to him, and out of twenty named varieties of work he is required to produce at the least specimens in four, to be his own design and handiwork. We ought to add that in both examinations the candidate will have, by the regulations, the advantage of selecting that particular style in which he considers himself most at home, for the work he has to do, and upon which he is to be examined.

The value attached to the various branches is estimated by marks, of which the total number is 10,000, 6,000 being given to the esssential and 4,000 to the honourable class. Half this number must in each case be obtained to entitle the candidate to rank among those that pass, and the further provision occurs that in the class of ordinary proficiency the candidate must obtain some marks in each division—namely, he must obtain at least half the marks allotted to the divisions of "Drawing and design," "Materials," and "Construction," respectively, and at least one-fifth of the marks allotted to each of the other four divisions out of the seven included.

No such limitation occurs in the second division, the candidate being left to get his marks in all or some of the branches as he can—a method which we think it would be wise and advantageous to pursue in both classes.

No graduated *placing* of candidates appears to be contemplated; those who pass will be named in alphabetical order, and no arrangement is made for denoting the rank they took. It is even provided that "the number of marks gained by each candidate shall not be communicated to any person."

Here it may be right to observe that it is recommended—and no doubt the recommendation will be attended to—that for the first year only half the proposed numbers of marks shall be essential; for the second year the standard shall be raised half-way between that of the third and first years; and that in the third year for the first time the full standard shall be adopted; and then—these being considered, in a sense experimental years—the working of the scheme shall be reviewed, and it shall be considered whether any and what modifications are required.

The other regulations provide for the length of the examinations, which are not to exceed a week for the two classes, and the mode of conducting them. This is to be by written answers, and drawings, and not at all by personal questions and answers, the examiners never seeing the candidates, and the arrangements being under the control of two "moderators," who are to be present during the whole time, and to see that nothing unfair occurs.

The papers of questions are to be, as far as possible, uniform for all the candidates, though being, however, framed in conformity with the preliminary application that each sends in, they will of necessity vary to some extent.

A very large portion of the regulations is taken up by a series of precautions against the possibility of collusion or favouritism, which are all blended into a scheme so complicated that we strongly doubt the possibility of its being efficiently carried out. Mr. Kerr assured the meeting that he had the highest possible opinion of this portion of the scheme, but that he was not perfectly certain that he understood it!

The plan upon which this portion of the thing proceeds is something to the effect that the examiners, the moderators, the candidates, and every other person connected with the work, are to indicate the different portions of work by separate signs, that the honorary secretaries only are to know to what person the signs belong, and that the examiners, having tested each marked parcel of work separately, and given it the number of marks they consider due to it, the secretaries, by adding up the totals which one person has acquired under several different signs, marks, or numbers, will see if he has or has not been successful in getting as many marks as are required to pass him. The proposal is, as we have observed, very complicated. It is right in principle, and resembles somewhat the precautions taken with the same object in view in other examinations; but we fear it might lead to blunders in the carrying into execution, and, of all things, a mistake here ought to be impossible. Students ought not to be exposed to the possibility of an error of allotting the marks that have been gained to the person whose work obtained those marks; and on this ground, if on no other, the most rigid and jealous scrutiny ought to be bestowed on the regulations for the conduct of the awards.

The list of books appended forms a feature of great interest and great value. We know of no authoritative list of the best books on architecture in the English language except this; and here they are with marks affixed to them denoting the subjects for which they are specially to be consulted. The Architectural Association are, we hear, proposing to form a library. We strongly recommend that they should make it a first object to secure the entire series of these books. This list is, however, open to emendation; a few books might with advantage be added in exchange for those on the list, and there are some few which we do not see here that have quite as great a claim to be there as any actually included.

Lastly come the forms. They are preceded by a statement of the fees proposed. Each *application* is to be accompanied by a fee of two guineas for the ordinary and one guinea for the honourable class. We beg to submit that these amounts ought to be reversed. The men capable of taking the honourable degree will usually be better able to pay two guineas than their juniors are to pay one. We presume, too, that these fees are to be returned to unsuccessful candidates. Nothing is said on this head.

The application, to be accompanied by a recommendation signed by three gentlemen, one of a member of the institute, besides a request for the certificate, includes a declaration that civil architecture is and shall be the occupation of the applicant, and that he "will not have any interest or participation in any trade contract or materials supplied at any works the execution whereof he may be engaged to superintend." And in case of his failing, in the opinion of the institute to fulfil these engagements, promises the withdrawal of his name from the list of passed candidates. This we think will require consideration.

Such in its main features is the nature of the scheme laid before the institute, and by them offered for public discussion. We have thought that the best service we could render to that discussion was to furnish in the most available shape the materials for it; we have, therefore, given the scheme at full, and the above condensement of it, abstaining for the present from further expression of opinion as to details than it has been found advisable to introduce in the course of our notice.

At the late meeting one or two of the difficulties which must beset the execution of this scheme were brought forward. Mr. Roger Smith, speaking on behalf of the Architectural Association, expressed the fear that enough consideration might not be felt for candidates by the examiners, who might be prone to forget how few of the young men of the present day have obtained their knowledge of architecture in such a way as to enable them to answer paper questions. This is of importance: the examinations will be a dead failure if men known to stand well among their fellow-pupils and associates, and to be efficient in offices, are plucked; and yet this will be extremely likely to occur unless the greatest care be taken to frame the questions and set the work so that it shall *not be very different in kind* from anything that the men have been in the habit of doing already. We think that perhaps from this point of view the entire exclusion of *viva voce* examinations is to be regretted.

Mr. Charles Barry touched upon a second and graver difficulty—the action to be taken with regard to architects of acknowledged standing. His difficulty—not, however, put precisely in his own words—was this: A class of persons is about to be created, namely, those who have passed the examination; a large majority of architects in considerable practice will never dream of undergoing an examination in order to get into this class. Will this class, without their names, be sufficiently honourable and sufficiently distinguished for persons to come forward to join it? If their names are to be procured, and they will not offer themselves for examination, how are they to be got? The suggestion was thrown out that such persons might be admitted on the certified excellence of buildings they have erected. This we hope will not take place. The value of this examination will, we believe, entirely depend upon its being impossible to pass it except by passing it, and we are confident that numbers of the young men of the present day, and men of high standing too, will gladly avail themselves of this opportunity to gain honourable distinction, when once they are satisfied that the matter is established on a practical, liberal, and equitable basis.—*Building News.*

THE NEW FOREIGN OFFICE.

In the House of Commons on the 8th instant, Lord Elcho moved a resolution to the effect "that the new Foreign Office should not be erected according to the Palladian design now exhibited in one of the committee rooms of the house." He said he had undertaken a difficult task, inasmuch as the design in question was prepared under the special auspices of the prime minister. He advocated the Gothic was the national art. He did not take for a model the buildings in which they were assembled, which had reached the maximum of art, while it presented the minimum of convenience. He instanced several recent Gothic structures in the metropolis, which embraced all possible convenience for the purposes for which they were intended. Contending from their examples, the Gothic style was as well fitted for social as for ecclesiastic purposes.

Mr. W. Cowper said that public opinion, so far from being contrary to the design condemned by the noble lord, was decidedly in its favour. He had consulted persons not only of ordinary knowledge, but the most experienced architects, all of whom praised the Italian design of Mr. Scott as a most admirable one, although that architect was unfavourable to the Italian style. He had in this instance achieved a success which no one could hope to surpass. The design was fully as national as any Gothic style could be, while it harmonised better with the adjoining buildings, and at the same time afforded the largest amount of internal accommodation.

Mr. Layard denied that the Palladian style offered the fittest opportunity for internal convenience. That style must, according to the architectural practice of this country, be mean, as it could not receive that class of pictorial ornament which alone could ennoble it.

Mr. Tite argued strongly against the adoption of Gothic architecture for such an office in such a position. All the best authorities were in favour of an Italian style. He thought that the matter could safely be left in the hands of the government.

Lord J. Manners quoted the result of the inquiries of the commissioners three years ago, who, after a prolonged examination, reported that in respect of convenience and ventilation, no material difference existed between either style. He contended that the original arrangements which placed in the hands of the greatest Gothic architect in Europe, Mr. Scott, the erection of a Gothic building ought to be maintained. All over the country the Gothic style for public buildings was adopted, and by those who could not be classed as architectural reactionists.

Lord Palmerston denied that the Palladian style of architecture was in disfavour throughout the country. The town halls at Liverpool, Leeds, and elsewhere proved the contrary. He defended the impugned design, and invited Lord Elcho, when it was carried out, to lay the foundation stone.

On a division the motion of Lord Elcho was negatived by 188 to 95.

THE SOCIAL SCIENCE ASSOCIATION MEETING.

THE celebrities of the scientific world, with the veteran Lord Brougham at their head, will assemble on the 14th August, in the Four Courts, in this city—a building the arrangement of which is peculiarly adapted for the proceedings of the association, affording a separate spacious apartment for each section, and radiating from a magnificent hall—Gandon's masterpiece—which will be more than ample for the accommodation even of the vast fashionable assemblage likely to be congregated. The first visit of his lordship to Dublin will be most happily associated with this great scientific gathering, and we have no doubt that his presence amongst us, so long delayed, will be regarded with much interest. Although his lordship is in his 83rd year, his giant mind is still bright as in his palmiest days of physical capacity, and as his entire life has served to illustrate the maxim that "we are never too old to learn," we believe that what may even now be observed in our institutions by so critical an eye will prove an acquisition to a store of mental wealth perhaps unsurpassed by any individual of the age. The proceedings will be divided into six sections, viz., "Jurisprudence," Ex-Chancellor Napier, President; "Education," Sir John Shaw Lefevre, President; "Reformatories and Punishments," Attorney-General O'Hagan, President; "Public Health," Lord Talbot de Malahide, President; "Social Economy," Judge Longfield, President; "Trade and International Law," Michael Chevalier, a great French political economist, President. It is thought that his Excellency will dispense hospitality to the entire body; and a conversazione at the Royal Dublin Society, promenade at the Zoological Gardens, and sundry excursions are proposed in the programme. The opening meeting, to hear the president's address, will take place in the Round Room of the Rotundo.

PROPOSED TESTIMONIAL.

WE feel much pleasure in drawing attention to the following proceedings of a meeting held at 4 and 5, Suffolk-street, on the 24th ult., by the Builders' Association, to arrange for the presentation of an address and testimonial to Mr. John Butler, an eminent member of the trade, and defendant in the memorable case of Kempston *v.* Butler, with the particulars of which our readers are familiar. We may take the opportunity of remarking that as the association has again shown signs of vitality, we trust that it may long maintain it, and that the repose it has been enjoying may insure its future invigoration. The chair was occupied by Mr. Wm. Crowe, and Mr. Thomas Henry Carroll acted as secretary. The following resolutions were unanimously agreed to, viz.:—

1st. That the thanks of the association and the members of the profession in connexion with the building business throughout Ireland, are eminently due to Mr. John Butler for his spirited and continuous defence of the rights of the trade in the case of Kempston *v.* Butler, whereby the disputed point as to the liability of contractors to support adjoining premises, has been definitely decided; but that while thus expressing our gratitude to Mr. Butler for having zealously contended for, and successfully obtained a large legal recognition of the non-responsibility of the contractor, we deeply sympathise with the plaintiff in the loss which he has sustained.

2nd. That in order to convey our thanks to Mr. Butler for the service thus rendered to the trade generally, an address be prepared and presented to him, accompanied by a suitable testimonial.

The following gentlemen were named as a committe to carry out the above objects:—Messrs. William Crowe, Samuel H. Bolton, George Moyers, James Beardwood, Henry Johnston, Matthew Lynch; with Mr. Thos. H. Carroll, hon. secretary.

SEWING MACHINERY.

THE journeymen tailors of this city, at a recent agregate meeting, declared that the introduction of the sewing machine had proved a failure as regards their trade, notwithstanding representations to the contrary. The speakers contended that the system which would spring from the use of machinery in the tailoring trade would be vicious and immoral, and upon all these grounds they appealed to the public to support hand labour as being the best, the cheapest, and the most deserving of support. Resolutions to the above effect were unanimously adopted. We should wish to hear the opinion of the boot and shoe makers on this question, for, to our minds, very important facilities have been rendered in that department for the speedy (at least) execution of work as compared with the *hand* system.

THE CLOSING OF THE SESSION.

PROFESSIONAL brotherhoods are temporarily suspended, and prior to a renewal of their labours collectively, artists and archæologists seek physical recreation and the invigorating influence of a balmy atmosphere far away from crowded cities and towns. The past session has been a practically useful one, some most valuable papers having been read, eliciting no less valuable discussions — reports of which appeared in due course in this journal — and a fitting conclusion to the sessional proceedings of the Institute of British Architects has been the establishment of the long talked of "curriculum," a summary of which may be found in this number. Referring to this document, the chairman of the Architectural Association, at the last meeting on Friday fortnight, recommended the members to study it and to prepare themselves for examination on the first opportunity. He had no doubt many would pass with honour to themselves and credit to the Association. He did not think that in presenting themselves for examination they would be expected to know more than young men in their position might fairly be supposed to do, who had used the means of education at their command. With regard to the examination for "honourable distinction," it would be of a more extended character; and some gentlemen might not feel themselves prepared at that moment to present themselves to the examiners; but he had no doubt that many of the members would present themselves at the first favourable opportunity, and pass through the ordeal with credit. In taking leave of this association the chairman further expressed his satisfaction at its progress, and hoped that the members would continue in their desire for self-improvement. Notwithstanding the difficulties with which the association had had to contend, it had effected much good, and he believed that it would prove a useful agent in the acquirement of professional knowledge. He thanked the members for their support of him during his year of office.

It was agreed that during the recess the committee should consider what should be the subject for Mr. Tite's prize, and make a report at the commencement of the session, suggesting three subjects, which should be discussed by the general body, and one eventually decided upon, so that three months might be given for preparation.

The Liverpool Architectural Society have terminated their session by "a gala day"—an excursion to Hawarden Castle and Church, Flintshire; and various other scientific and professional societies, through the kingdom with more or less *elat*, likewise.

WORKMEN'S EARNINGS.

THE penny banks afford inducements to tradesmen and mechanics, however scanty their means, to be thrifty and lay by a something for a rainy day, but the following return for the week ending the 8th instant, of the South Dublin Bank, does not evidence a sufficiency of appreciation, which is much to be regretted:—

Number of depositors, 175; number of new accounts opened, 19; number of withdrawals, 32;
Amount lodged, ... £10 7 11;
Amount withdrawn, ... 17 11 6;
total number of depositors since the 1st January, 1,463; total amount lodged since 1st January, £435 3s. 3d.; balance in bank to credit of depositors, £254 12s. 1d.

MORE SCAFFOLDING ACCIDENTS.

ON the 10th inst., a fall of scaffolding with twenty-five men thereon, occurred at the building in course of erection at Mount Argus. Some of the men were precipitated twenty-five feet: one —John Head—having died from the effects after some days' suffering, and others more or less so. A somewhat similar accident occurred on previous day at Irishtown.

INDURATED PEAT.

MR. BRUNTON, C.E., of London, has taken out a patent for the preparation of condensed peat so as to render it fit as a fuel for locomotive engines, gas manufacture, and domestic use. The process is described by the patentee:—

We take the peat as dug from the bog, which can be had at an expense of from two to three pence per ton, and place it in the machine, which is nothing more nor less than a cone having its apex downward, formed of perforated zinc plates with holes about the eighth of an inch in diameter. In the cone there is an Archimedian screw, and the edges of this screw touch the sides of the cone all round. The machine may be turned by horse, steam, or any other power. The action of the screw presses the peat against the sides of the cone, separating the fibre and forcing the peat through the apertures in a vermicular form. The great object is to remove the fibre, because it is that which keeps the peat open and porous and prevents its condensation. Peat has an inherent tendency as it dries to condense, if you take the fibres away from it; and by this process that object is effected, and the fibrous portions are carried away through the waste pipe. The fibre does not constitute more than from five to ten per cent. of the whole substance, so that the loss involved in its separation is inconsiderable. In a cone of three feet diameter there will be from fifty to eighty thousand holes, so that you will see what an enormous division there is, and how well adapted the peculiar action is to get rid of the water. In order to take advantage of it a stream of warm air from a fan is sent up among the peat as it comes from the strainer, and you get rid by that means of two-thirds of the moisture originally contained in the peat. We calculate that on an average it takes four tons of wet peat to make one of dry. Therefore you have to get rid of three tons of moisture in order to obtain one ton of this hard solid fuel. Two-thirds of the moisture is removed in the first instance by means of the machine, and the other ton is retained in order to facilitate the process of moulding the peat. When the peat passes from the machine it is drawn away by a band and deposited in an ordinary brick moulding machine. When moulded it will take about a fortnight to dry, and then it becomes hard and solid like this which I hold in my hand. That is the whole of the process, and you see it is necessarily a cheap one, because the machine is very simple and inexpensive. The principal part of the machine is made of wood. A cone four or five feet in diameter would cost about 25s., and a screw of cast iron would add little to the expense. There is no need of hand labour, and the only other outlay would be for the moulding machine and drying shed. The great advantage of this fuel is, that it is so dense that it will stand the draught of a locomotive engine. It will burn with a great flame, and produces more gas per ton than Newcastle coal, and the residuum is more valuable than that of coal. The grease which it yields is more valuable than that of coal-tar, and the charcoal is more valuable than coke. I am not aware of the cost of charcoal in Dublin, but in London the price is from £6 10s. to £7 per ton. In South Wales the tin-workers pay from 50s. to 55s. a ton, and I know one tin-worker who gives 40s. a ton for charcoal at the peat works, and pays 12s. a ton for its carriage into South Wales. It is obvious, therefore, that the manufacture of this peat fuel will be most profitable. For railway purposes I believe it will be peculiarly advantageous. We know that Ireland imports all her coal from England, and it is evident that it would be a great advantage for the Irish railways to be able to get their fuel on the spot, as I suppose there are few railways in this country that do not pass through a bog. This fuel can be made at the bog at from 2s. 6d. to 3s. 6d. per ton, and I presume coal cannot be obtained from England for any such sum.

A company had been formed in London to manufacture this fuel, particularly for gas purposes; and upon this point I will read the opinion of Mr. Frederick Versmann, F.C.S., who had made an analysis of this substance, and who concluded his report thus: "I therefore consider your process of the utmost importance, and I have great pleasure in expressing my sincere wish that you may succeed in producing the peat at such a low price as to induce the gas companies, at least partially, to substitute the coal by your prepared peat. It is my firm belief that your process, if sufficiently supported and effectually carried out, will in no long distance materially influence the art of gas manufacture of the present day."

Mr. Ilbery asked whether the condensed peat had been tested in a locomotive?

Mr. Brunton replied. The peat has been tried under blasts of various kinds, and had stood tnem very well. I believe it would answer admirably for domestic purposes, as it makes a bright and cheerful fire. I might observe that it is exceedingly hard, takes a high polish like ebony or bog-oak, and can be made into pulley-blocks, handles of doors, and various other articles.

The Chairman.—A brick moulding machine capable of turning out thirty or forty thousand bricks a day would cost from £75 to £120 or £150, and there would be little more outlay than the cost of the sheds to protect the peat from the weather whilst drying. Two machines of five feet diameter each would give 100 tons of condensed peat per day, and the cost of that machinery would be about £50. The patent right would be 3d. a ton.

There are at present in Bordeaux twenty-five cork factories, employing seventy-five workmen, using annually 3,396,846 lbs. of cork bark, and producing about 10,000,000 corks. 90,000,000 ready-made corks are obtained from the neighbouring places, Nesac, Bayonne, and Provence. The cork trade of Bordeaux, therefore, may be estimated at 100,000,000 corks annually, worth about £156,333. The cutters are paid from 3¼d. to 4¼d. per thousand, and the turners from 1s. 2d. to 1s. 6½d. per thousand; that is about 1s. 6d. per day.—*Mechanics' Magazine.*

FARMERY AT BALLYFIN.

ABOUT sixty miles from Dublin, four to the right of the Mountrath station on the Great Southern and Western Railway, and well into the interior of the Queen's County, the attention of the traveller is attracted by a tower of considerable height, rising at the foot of an extensive range of hills, and surmounted by the "Union Jack." This is the sign to distant passers-by of the exact location of Sir Charles Coote, Bart., at Ballyfin. A good road conducts the visitor to this place, which is particularly attractive on account of the celebrated mountain farm on the estate.

The excellence and uniformity of the extensive range of offices at once engaged our attention, as it appears that the site of these substantial and commodious edifices was originally occupied by open sheds of a wretchedly defective character, and that the present arrangements were designed to harmonize with the beautiful and costly mansion in front. The demesne, which covers an area of 600 acres, is now permanently laid down, after undergoing a process of thorough drainage and reclamation, so as to prepare it for profitable pastures and artificial meadows; the old, useless fences completely removed, the hollows and other irregularities filled up, so as to ensure a gently undulating surface. The stones available after the removal of the old, unsightly fences, were "used up" in erecting the stately tower immediately behind the farm offices; and though only 130 feet high, yet, by the aid of the powerful telescope on the top of the tower, a view of sixteen different counties is obtained.

The extensive range of machinery in the farm-yard are all worked by means of water-power. The threshing machine, which was manufactured on the premises, is large and substantial, without much of that artistic finish now so much displayed on the exterior of these implements, and is capable of threshing, winnowing, shaking the straw, &c.; and the corn, after being perfectly winnowed, is brought back by means of elevators, and conveyed by means of a simple box-conductor to the granary, some twenty yards distant from the machinery. Simultaneously with the threshing of the corn, an underground shaft, turned by the water-wheel, works the furze-bruiser, hay, chaff, and straw cutters, beans, bones, and cake crushers. The hagyard being on a higher level than that of the barn, the corn is easily deposited on the floor adjoining the threshing machine, thus economising time, labour, and a positive saving of grain, during the process of removal. Indeed, we have scarcely ever examined a farm-yard in which the various appliances are so compact and so advantageously arranged, and in which the working of the several departments, and the putting up of the various requisites, are so inexpensively effected. The feeding or cooking house adjoins the byre, and is supplied with an excellent cooking apparatus for preparing mashes and other soft feeding for the cattle.

The cow-house is in keeping with the other farm offices—simple, but substantial and commodious, and forms two sections, running at right angles with each other. Parallel with one side of the cow-house are the barn, granary, and cooking houses; and with the other are the sheep and pig-houses, cart, implement, and harness-rooms, stables, &c., so that the entire constitutes a perfectly squared "lock-up" yard and offices. The roofed-in space in the centre serves for the manure pit, and is furnished with gutters and catchments to collect all the rain water, and carry it to the liquid manure tank, with a view of diluting and augmenting the liquid deposits from the farm offices. Immediately adjoining the dung heap is the large reservoir, into which all the urinal droppings from the different offices are collected, by means of underground sewers for its reception, the contents being subsequently applied by means of a force pump and gutta percha hose to the watering of the dung previous to application: and owing to the manner in which the manufacture of the manure is so completely under control, any degree of decomposition can be ensured by the artificial damping from the tank. The dung obtained by this process cuts like cheese, and retains all its rich properties until applied to the land.

The sheep and pig-house is rather an original structure, and for aiding in the manufacture of home-made superphosphate, we know of no arrangement more effectual. The sparred styes for the animals are about four feet above the ground floor, and by means of openings or arches in the wall underneath, the bruised bones can be readily introduced and evenly strewed over the floor, and, by means of the droppings from the animals above, immediate fermentation ensues, and in the course of a few weeks a mass of completely unadulterated compound is obtained. This arrangement, we believe, was carried into practice at the suggestion of Professor Cameron.

To each of the cottages on the immediate portion of Sir Charles's estate a considerable breadth of land, from 20 acres downwards, is attached. The management of this is effected by the senior members of the family during leisure hours, whilst the wives, daughters, and young children perform all the lighter descriptions of work, such as thinning and weeding the crops, feeding the pigs, calves, &c. The labourers in these cases become the tenants at a moderate rent, and after the new residence and its other desirable appendages are provided, no addition is made to the rent of the original cabin. The comforts, cleanliness, and internal arrangements of the new cottages have produced such an elevating sense of possession on the part of the occupants that scarcely an instance has occurred in which a change of occupants has taken place. Not only this, but the large expenditure of money, amounting to several thousand pounds, devoted to the drainage of the many portions of the estate on the hands of the tenantry, for whose exclusive benefit it has been applied, and for which nothing has been added to the rent-roll. It is scarcely necessary to add to this, that possession under Sir Charles Coote is one of those things which are highly prized when enjoyed, and coveted by those who only know the value of such possession.—*Agricultural Review.*

NEW CHURCH OF SS. PETER AND PAUL, MOATE.

IT is intended to commence immediately the erection of a Catholic parish church in the town of Moate. The style adopted is late Norman. The church will be cruciform in plan, and will contain nave, aisles, transepts, circular apse, side chapels, tower, baptistry, sacristy, porches, &c.; it will be 110 feet in length, 70 feet across transepts, and 51 feet across nave and aisles; cylindrical stone columns, with the characteristic Norman capitals supporting recessed and moulded arches, will divide the nave from the aisles; the aisles will be lighted by recessed semicircular-headed lights, and the clerestory will be lighted by coupled lights of the same character. The entrance front will contain a deeply-recessed Norman doorway, surmounted by a columned arcade, the alternate opens of which will be filled with glass. In the point of the gable will be a circular wheel window, recessed, and finished with columns and mouldings. The transepts will be lighted by triple windows, recessed. The tower will contain a rich moulded doorway, and will be decorated on the four faces of the second stage with arcades; the third stage will form an open bell cot, divided into three divisions on each face by Norman pillars, supporting arches, finished by a corbel table. The entire will be surmounted by a lofty pyramidal stone roof, terminating in a small Irish cross, 102 feet from the surface. The roof, which will be about 56 feet to the apex, will be of open timber-work. The chancel will be finished with a circular groin, springing from short columns supported on corbels. An organ gallery will be constructed, projecting from an open in tower, which will terminate one of the aisles. The material is the limestone of the district.

DILAPIDATIONS.*

INTRICATE and difficult as the laws of dilapidation appear to be generally, those concerning church property, from their stringency, appear to be the most so. It would appear that all "grades of church officers" are liable not only to repairs, but to preservation from decay; and if necessary, to the rebuilding and restoration, even in the case of tempest, fire, or decay by time; the only exception is the curate, from his uncertainty of tenure; but even he, where the whole profit of a benefice has been allotted to him, must submit to the rector or vicar, &c., holding back for the repair of the chancel and parsonage as much as one-fourth of the profits, if so much have been expended during the year.

With regard to other property, it appears that tenants are not to be generally held liable for damage arising from fair wear and tear, the action of the elements, or the results of the lapse of time; and the more frail the tenure, the less liable is the tenant; hence, against a tenant-at-will a landlord can have no remedy for repairs, though such tenant is liable for trespass if he commit wilful damage. Tenants for a longer term are not only liable for dilapidations arising from "avoidable accident, carelessness, or wilful damage," but under covenants or agreements are liable for damages arising from neglect. The tenant from year to year is not only liable for damage from avoidable accidents, &c., but for all dilapidations which are not the result of occupation, or of inevitable accident; thus, if windows or doors be torn off their hinges, glazing broken or cracked, chimney-pieces broken, water-closets stopped up, papering torn down,—such dilapidations not being the necessary consequences of fair wear and tear, the tenant by the year is liable to damages for the same; but he is not liable for any decay, breakage from decay, or loosening, unfastening, or falling off by lapse of time; neither is he liable for accidents from the elements; but a yearly tenant is bound to keep the premises wind and water tight, more particularly where a trifling expense will effect this; unless, indeed, from the effects of time, any parts of the building are rapidly falling to pieces.

With regard to liability for dilapidations of the "tenant to repair under covenant," more particularly a general covenant to repair, the law is so strict and rigid, that a lessee cannot be too careful nor too cautious with regard to his covenant with the lessor; for under such a general covenant to repair, however great may be the dilapidations, even to the destruction by fire or otherwise, from any cause whatsoever, however unexpected or unforeseen, the law will enforce from the lessee a total restoration of the premises, and the same with regard to a so covenanting lessor; but the courts will construe such restorations to be in a reasonable manner; hence, if a lessor covenants to repair, the law will compel him to rebuild in a case of destruction by fire or other accident; but if the lessor hath not so covenanted, he is not held liable so to rebuild or restore, though he maintains his right to sue for rent. A lessee also continues liable for rent, under a covenant to repair, "casualties by fire and tempest excepted," though the landlord refuse to build or repair in such case because he is not bound by covenant to do so. Under general covenants to repair the lessee is liable to damages for dilapidations to buildings erected, during his tenancy, by him or otherwise, as well as to the buildings forming part of the estate when the lease was granted, and the whole must be given up in a state of substantial repair; but he is not bound to make good defects in the buildings from lapse of time, so long as the buildings are not rendered unfit for occupation by such defects; he would, however, be bound to repair any accident accruing from such defects of lapse of time as it would be considered the result of neglecting what he ought to have attended to. At the same time that the law is stringent on the subject of repairs of dilapidations under a general covenant to repair, it is not unjust, for the courts will take into consideration and evidence *with regard to general condition*, to show ruin and decay from age and infirmity in the buildings at the time the lessee entered into occupation, and return a verdict for amount of damages accordingly; and hence the necessity of a careful survey of the premises at such time by duly authorised parties, and a carefully drawn specification of the state of the premises, for the law will not require of a tenant to give a new house for an old one. Without a covenant to "alter and improve," a lessee will not be allowed material and expensive alterations of buildings, externally or interiorly,—not even though by so doing he may have doubled their value,—but with such covenant, on the contrary, he is bound to alterations and improvements as well as to substantial repairs.

It appears that there is a considerable difference between a covenant to keep in repair, and a covenant to leave buildings in repair; inasmuch as in the former case he is liable for breach of contract, immediately he suffers them to decay, though reasonable time will be allowed for doing so; in the second case, of a covenant to leave in repair, an act for breach of contract will not lie until the expiration of the term, even though the buildings be pulled down during the tenancy.

A lessee should never engage to sustain and repair ruinous buildings, for if any part be so far gone as to require pulling down and rebuilding, the law will not consider such rebuilding as the performance of his covenant to sustain and repair.

A promise, by word of mouth, from lessor or lessee, to repair, is held as valid as a covenant under a seal.

An "injunction" may be obtained by a landlord to restrain a tenant from any act of determined mischief, if applied for immediately on evidence of the intent, and may even be obtained by any person having even only contingent interests in the property.

If a lessee, under a covenant to keep in repair, suffer the premises fall into a state of dilapidation, a notice must be served by the landlord, who will then have a right at any time before repairs to bring an action of ejectment against the lessee.

On a lessor becoming acquainted with any necessity for repairs, of which the lessee has covenanted the performance, he should serve on the lessee a notice specifying the same, evidence of which on any action afterwards brought by the lessor for dilapidations, will materially affect the lessee's defence.

POTTERY.

POTTERY may be arranged under two groups, *antique* and *modern*, and in a technical point of view, into three main divisions —*earthenware*, *stoneware*, and *porcelain*. Pottery is either mat or unglazed, enamel glazed, or glazed. The first of these terms needs no explanation; the second comprises all wares to which a superadded opaque vitreous covering is given, generally of a different colour from the body or substance of the ware; and the third denotes a transparent glassy coating or varnish. Antique pottery, which is exclusively comprised in the division "earthenware," is both *mat* and *glazed*, but not enamelled; opaque enamel glazes are characteristic of mediæval periods, especially of the 15th, 16th, and 17th centuries; and modern pottery, particularly porcelain, is almost exclusively of the true glazed kind. These observations, however, do not strictly apply to oriental pottery, the historic development of which has little coincidence with the European; porcelain, the most perfect species of pottery, having been manufactured in China at a very remote period, whilst in Europe it is of entirely modern origin.

---

* New Office Book for Architects, &c. London: Atchley and Co.

The Majolica ware is supposed to have derived its origin from a very similar pottery made by the Moors in Spain from an early period of the middle ages, and to have taken its name from the island of Majorca, from whence the first specimens were probably exported to Italy. During the 15th and 16th, and in a less degree, the 17th century, its manufacture was extensively carried on in Italy, especially in the central districts, where Faenza, Gubbio, Pesaro, Castel, Durante, Urbino, and other neighbouring towns gained great reputation for their fine productions. The most remarkable variety of Majolica is the lustre ware which reflects metalic lustrous tints of various colours, according to the angle at which the light strikes its surface.

Bernard Palissy (born about 1509 in the province of Perigord, in the south-west of France, died 1589,) was the inventor of this characteristic variety of pottery. Palissy was originally a glass painter, but having incidentally seen a beautiful cup in enamelled pottery, of foreign manufacture, he thenceforth directed all his energies to the application of coloured glazes or enamels to earthenware, then little known in France. After many years of unceasing experiment, in the midst of poverty and extreme privation, working likewise in ignorance of processes already familiar in other countries, he completely succeeded in his endeavours; and being already conversant with the arts of design, soon produced beautiful and original works.

Pallissy's pottery may be classed generally under three varieties; first, his "rustic" pieces, called by himself "*rustic figulines;*" the fishes, shells, plants, &c., introduced, being moulded from nature. The second class is characterised by subjects of figures, executed in bas-relief, surrounded by ornamental borders and accessories; and the third is distinguished by enrichments of ornamental forms only.

Palissy's descendants and workmen continued for a long time to manufacture pieces from his designs and models, but they are very inferior in beauty to the original productions.

Josiah Wedgwood, born at Burslem, in 1730, died in 1795, is unquestionably the greatest name in the annals of the ceramic art. The varieties of pottery invented and perfected by his individual agency are, perhaps, on the whole, the most excellent art manufactures this country has yet produced.

THE BOTANIC GARDENS' SUNDAY OPENING QUESTION.

The period for final solution of this long-vexed question draws near, and the Royal Dublin Society will either be compelled to forego a large amount of the government grant, or open the gardens to the public on Sundays. As a matter of prudence, we believe, that the latter course will be adopted; and, though we confess to no partiality for the principles of those who would seem to oppose the opening from religious scruples, we should sincerely sympathise with the society if the good now sought to be effected were at any time perverted into a detriment to so valuable a property. As a mass, the working classes of Dublin are as steadily conducted as those of any other city in the kingdom, yet it must be conceded, that "there are black sheep in every flock," and that *all* the members of same, individually, may not, at *all* times, be so—as fully exemplified at the recent aggregate meeting held in the Rotundo—and a few malcontents might, at such an institution, effect, in a very short period, an amount of damage most difficult, if not wholly impossible, to repair. Perhaps we may briefly suggest a mutually satisfactory and practical solution of this difficulty. It is advanced, that the gardens are too small to accommodate a multitude; admit it, and suppose the public yield to the society the question of *unrestricted* admission, and again the society yield to the public the right of a limited number—say 500 or more—to visit the gardens on Sundays; then the object of the promoters of the movement, viz., to ensure physical and mental recreation, on Sundays, for the toiling artizan and his family, shall have been fully attained; and if, by *free* tickets only, judiciously dispensed through the secretaries of trade societies and other responsible sources, objectionable characters of either sex may be effectually excluded, the possibility, or at least the probability, of damage be obviated, and the society might still preserve with *grace* so valuable an appendage to its estate. Under any circumstances some little precaution against "a crush," as long as the novelty lasts would be indispensable; when the latter wears off will the public permanently appreciate the consummation of a boon for which so much agitation has taken place? We must leave the universal tell-tale to answer.

The greatest span of suspension bridge yet completed in America is that by Mr. E. Serrell, C.E., of ten hundred and forty-three feet, over the Niagara river, at Lewiston.

DEPRESSION IN MINING SECURITIES.

According to the commercial summary of a local contemporary we learn that "Almost every description of Mining Securities have shown marked depression. In Wicklow coppers a fall of no less than £5 has been established within the week, and there is as yet no evidence of the downward movement being arrested. The total relapse within the half year is very little short of £20. The cause is, however, apparent, and seems solely the result of the interruption to the business produced by the American crisis, and it is equally obvious that the first prospect which opens of a peaceful solution, and which is already spoken of, will cause a speedy check to any further depreciation. A striking instance of the effect on Mining Securities thus produced is in the instance of the Mining Company of Ireland, the market value of their shares being almost unaffected by the result of the last half-year's operations, which was satisfactory beyond all expectation. General Mines and Connorrees show a falling off of 5s. in each instance as compared with the closing rates of the proceding week.

INTERNATIONAL EXHIBITION OF 1862.

"Her Majesty's Commissioners hereby give notice that no demands for space, either from local committees or individual exhibitors in the United Kingdom, Isle of Man, or Channel Islands, will be received after Tuesday, the 1st of October, 1861, and that the allotment of space will then be made on the returns sent in up to that date. Where no local committees are formed, provincial application for space will be referred to, and determined by, national or metropolitan committees."

CHURCH BUILDING NEWS.

It is said that the Augustinian Fathers have decided on commencing their new church in John-street (illustrated in the Dublin Builder for May 15, 1861) next spring. The plan will comprise nave 36 feet broad, aisles, transept, chancel, and four chapels; total length in clear and exclusive of transept, 146 feet by 64 feet in width. The nave will be separated from the aisle by lofty Aberdeen granite columns on black Kilkenny marble bases, and will be terminated in an apse of five sides, from which will radiate the side chapels. It is proposed to light the church chiefly from the aisles, which will be as high as the nave. The columns being of marble can be reduced to a very small section, so that the view of the altar from the aisles will be almost uninterrupted. The height of the nave interiorly is 68 feet, that of the aisles 45. The façade towards Thomas-street will be surmounted by a bell-tower, terminating in a French double-pointed roof, and attaining the height of 160 feet. It is proposed later to erect a monastery forming a quadrangle with the church.

The *Sligo Champion* gives the following particulars of a new Roman Catholic church in course of erection at Ballymote, communicated by Mr. Goldie, architect, to the pastor:—"The first division of the contract is now approaching completion. It was to include excavation, masonry, and cut-stone work, and to cost £1,515. To this amount is added stone arches for £100, and a portion of the tower for £260, making in all £1,875. Of this Mr. Barker (the contractor) has drawn £1,688 10s., leaving a balance of £191 10s. to complete the arches, clerestory, west rose window, and chancel window and arch. But to this balance may be added the value of the roof to sacristy, and porch, slates, lime, sand, barging, &c., on the ground, which may be estimated at £50, and which belong to the second portion of the contract, so that you have a sum, or an equivalent, for £241 10s. to complete the first portion of the contract, the value of which is about £199. The important point now to be decided, and that as speedy as possible, is that of carrying on the second portion of the contract, namely, roofing and slating, to which was apportioned the sum of £868. Your present chapel is in a dangerous and unfit state for divine worship. The walls of the new church, if left exposed for the winter, will be sure to suffer from wet and wind."

Three altars have been recently erected in Ennis Catholic church, under the direction of Mr. M'Carthy, architect, by Messrs. Hardman and Co., one being the high altar of very beautiful and elaborate design, and the others side altars of the Sacred Heart of the Blessed Virgin, respectively. The chancel and side chapels have also been richly decorated by the same firm, who are most efficiently represented in this city by Mr. Thomas Early, assisted by Mr. Powel, to whom we understand is due the merit of designing the various statues and sculptured groups in the above-named works.

Sundry works are to be executed at the churches of Aghavallin, Co. Kerry, and Killard, Co. Clare, according to plans by the architects to the Ecclesiastical Commissioners.

The proposed alterations at St. Michan's church, North Anne-street, will, according to the *Freeman*, consist in the erection of a parochial house for seven clergymen, and apartments for public purposes; also the removal of the present old and inconvenient presbytery and an extension of the church and the erection of a new front facing Halston-street. The design of the church front includes the erection of two Gothic towers, which interiorly will form side chapels, leaving between them the chancel for the high altar. The exterior front will be finished in the much-admired Gothic style of the thirteenth century. The towers will be terminated by high pyramidal roofs, crowned with a rich cresting of gilt bronze. Between the towers will rise the central front, surmounted by a high-pointed Gothic gable, the centre of which will be filled by a large and splendidly designed tracery window, elaborately carved and decorated. The apex of the gable will be surmounted by characteristic emblems, and adorned with an elongated oval window or niche for the reception of appropriate decorations. The peculiar character of the frontage presented considerable difficulties to the architect, especially an awkward side passage of a few feet in width—indispensable as regards access to the interior building—which, however, has been made to pass through a Gothic buttress, symmetric with one on the other side. These buttresses progress by graduated stages to the top of the building, forming tasteful accessories to the central details of the structure. Mr. John Bourke, architect.

The new church of Torry, recently consecrated, is built in the mediæval style, with high pitched roof and pointed gables, crowned with crosses. The east window, of stone mullions and finely executed tracery, is of three lights, filled in with stained glass, containing representations of the Crucifixion, the Virgin and Child, and St. Patrick. It also has its nice little screen, making a separation between the chancel and nave. Mr. E. W. Godwin, is the architect, as also of the Gothic structures at Newtowncunningham and St. Johnston.

Tuam cathedral is to be restored, altered, and added to, under the direction of Messrs. Lanyon, Lynn, and Lanyon, architects.

PROTESTANT HALL, WATERFORD.—This hall, recently inaugurated, is situated at the top of Catherine-street, overlooking the river, and commanding a splendid view of the surrounding country. On the left-hand side is the neat and tasteful People's park, and the handsome Court-house. The hall is in the Italian style, executed in red English brick, with massive granite dressings. It has two capacious wings forming committee rooms. The dimensions are: length, 60 feet by forty feet, and height 30 feet. The building is admirably ventilated all round by tunnels discharging through the two towers in front. The gallery, though small, is exceedingly handsome, the iron-work being supplied from Hammersmith. The gas-fittings are of the newest and most perfect description. The architect is Mr. A. Denny; the contractor, Mr. John Fitzpatrick.

Alterations and additions are about to be made to the Mendicity Institution. Mr. J. S. Butler, architect.

Alterations and additions are to be made at the building, formerly the old House of Industry, at Clonmel, for the purpose of converting it into an auxiliary asylum. Mr. Wilkinson, architect.

Knock-bridge, over the canal near the Madden station, on the Belfast Junction Railway, is to be taken down and reconstructed under the direction of Mr. R. Tuthill, C.E., Newry Navigation Company.

It is proposed to light the town of Thurles with gas, and the necessary buildings are about to be constructed.

A new station is to be erected at Omagh for the Dundalk and Enniskillen Railway Company. Mr. Wm. Murray, architect.

The handsome stone structure in progress of building on the slip at the east angle of the pier at Kingstown, is a house for the life-boat.

The Rev. Dr. Taylor, P.P., laid the foundation-stone of a parochial house, at Maryborough, recently, the site selected being known as the Old Golden Croft. Mr. John S. Butler is the architect, and Mr. Edward Craven, Maryborough, the contractor.

A memorial to the late Sir Matthew Barrington, Bart, is to be erected in St. Mary's Cathedral, Limerick.

The Marquis of Downshire is expending a large sum of money on improving the pier and harbour of Dundrum.

A building, affording increased dormitory accommodation for the Royal Hibernian Military School, is in course of construction under the direction of the Board of Public Works' architect.

Two hundred and thirty new national school-houses have been erected in Ireland during the last year.

A numerous staff of artists and tradesmen have arrived from London at Kenmare House, Killarney (the mansion of Viscount Castlerosse) to execute several alterations and improvements, for the reception of her Majesty.

The trustees of the will of the late Rev. William Aloysius O'Meara are about erecting a widows' alms house at Limerick, adjoining the Mount St. Vincent Orphanage.

The Dublin Corporation Water Works Bill has passed the House of Lords, after protracted opposition in its various stages.

THE UNITARIAN CHURCH COMPETITION.

MESSRS. Lanyon, Lynn, and Lanyon, architects, have been declared the successful candidates in a limited competition for a new church, to be erected in Stephen's-green, for the Unitarian congregation. The adopted plan is somewhat of ˥ shape, and shows the body of the church—which will be in the decorated Gothic style, and accommodate 400 persons—placed parallel with the roadway of the green. A principal gable, with very elaborate and handsome features, and screening from certain points of view some existing red brick houses, will present itself at the northern end. The floor of the church, which will be approached by a spacious flight of steps at northern extremity, will be raised 8 feet above the level of the pathway, so as to enable spacious and lofty apartments for schoolrooms to be provided in the basement. This structure will prove a great acquisition to our metropolitan architecture, and the merit of the design is due to Mr. Lynn, of the above-named eminent firm.

BRAY.

THE entire of the property in this locality belonging to Mr. Edw. Breslin has been mapped out, after designs by Messrs. Lanyon, Lynn, and Lanyon, architects, viz., from Quinn's Hotel, in the town, right down to the beach, the Quinsboro'-road, and the back road down to the quay. Mr. Dargan, as may be seen by advertisement columns, is about to build seven houses there, designed by the same architects, and, as may be inferred by our previous frequent notices of works, the general progress of this once "deserted village" is next to mavellous.

LAW NOTES.

Doolin v. *Boyle*.—Counsel on behalf of plaintiff moved for an inspection of the works done by plaintiff for defendant, Mr. James Boyle, at Marino Park, Killiney; and that two measurers, Mr. Read and Mr. Regan, should be allowed to value the work in dispute. Counsel also moved that the subject matter of the action, being one of account, should be referred to the Master of the Court (Exchequer), or to W. G. Murray, architect, as arbitrator. The works had been measured by Mr. Phayre, but he made a return to the plaintiff exceeding in amount the return he made to the defendant, and the latter appeared to have been through mistake. If the case went before an arbitrator, it would be necessary, for the justice of the plaintiff's case, that there should be a new measurement, which it was sworn could now be fairly made.

On behalf of defendant, there was no objection to refer the matter to Mr. Murray, but there was to a new measurement. The works were alleged to be now in a different state. The defence was provided on the copy of the measurement furnished by Mr. Phayre to defendant, according to which there was £150 due. Of this £120 had been paid, and the remainder was lodged in court. The plaintiff claimed a larger sum.

Baron Hughes said he would refer the whole matter to Mr. Murray, giving him power, if upon investigation and in the exercise of his professional judgment he deemed it necessary for doing justice between the parties, to order a new measurement. The costs to be costs in the cause, and abide the result of the arbitration.

Darcy v. *Malone*.—Action by a builder to recover about £200 for extra work at a new chapel in the county Tipperary. The venue was laid in Limerick, and an application was now made by Mr. Ryan on behalf of the defendant, the Rev. Mr. Malone, to have the venue changed to Nenagh.

Plaintiff opposed the motion.

Baron Hughes directed a change of venue to Nenagh.

Macintosh v. *Deane*.—Defendant moved by counsel, before Baron Deasy, in Consolidated Chamber, to have venue changed from Antrim to Cork. It was an action for non-acceptance of a cargo of timber, sent by plaintiff from New Brunswick to defendant, a timber merchant, at Cork. The defence was in substance that the cargo was not in accordance with the written contract. It was sworn by plaintiff that he resided in Cork, and that he was a necessary witness to support his defence, that he was advised and intended to examine timber merchants residing in Cork, whose names he gave. Cork, where the transaction took place, was evidently the more convenient venue.

Counsel on behalf of plaintiff opposed. Motion refused.

A GULLET OR NOT A GULLET.

At the Wicklow assizes on the 9th instant, counsel on behalf of Mr. Latouche appeared to traverse a presentment on the barony of Rathdown for a sum of £568 for constructing *a gullet* along the esplanade at Bray, £200 had been subscribed by the inhabitants, and he contended that it was *not* a gullet but a main sewer for the benefit of the residents along the esplanade, and could not be presented for as a gullet under the 56th section of the Grand Jury Act, nor under the Towns Improvements Act off the barony. Mr. Brett, C.E., county surveyor, proved that it *was* a gullet, and that the enlargement was fully compensated by the £200 so contributed. Judge O'Brien reserved the question for the *twelve* judges.

BOOKS RECEIVED.

The English Cathedral of the Nineteenth Century, By A. J. B. Beresford Hope, M.A.D.C.L. London, John Murray.

A desire to render more justice to this important work than we possibly could in a hasty review, owing to its arrival almost on the eve of publication, induces us to postpone consideration until our next number. We, however, take occasion to mention, that through the courtesy of the author and publisher, "the illustrations of Cathedral Architecture" herewith are presented therefrom.

Pamphlets.—"*An Historical Review of the Restrictions upon Marriage, especially in relation to England, with the true reasons why Marriage with the sister of a deceased wife was prohibited.*" By an Antiquary. London, Wertheim, Macintosh and Hunt. Also, on the *same* subject, by Henry Hall, Viscount Gage. London, G. Watson.

Any consideration of these works, which have a sectarian tendency, and may, for ought we know, possess merit for those whom the subject concerns, "socially or politically," would be quite outside *our* province.

The Tuileries—or rather the southern wing of the palace—is under repair. The cost is estimated at 40,000,000f (£1,600,000).

An industrial exhibition in Bristol is proposed. The committee—composed of influential residents—have already made arrangements which are calculated to insure complete success to the enterprise.

The building of the International Exhibition of 1862 is reported to be progressing with marvellous rapidity. Only two foreign countries decline the advantage of exhibiting, Turkey and Morocco.

The sum of £64,556 has been voted by the House of Commons for the erection, repairing, and maintenance of public buildings in Ireland, for year ending 31st March, 1862.

Miscellaneous.

The Wallace Monument.—Recently the Duke of Athole laid the foundation-stone of the Wallace monument, accompanied by various civic and volunteer bodies in procession. Subscriptions have been sought and obtained in almost every quarter of the globe, and now the fund amounts, after deducting expenses, to £5,500. The cost of the monument is estimated at £7,000, leaving a deficiency of £1,500. The design for the monument is by Mr. J. T. Rochead, of Glasgow. It consists of a Scottish baronial tower, fully 200 feet high, and 36 feet square. The walls are massive, fifteen feet thick at the base, and graduating from five to six feet at the top. At the east side of the tower is a house for the person in charge of the monument. An open courtyard, entered by a massive circular-arched gateway, having bold mouldings, separates the main building from the keeper's dwelling. Above the gateway are the heraldic arms of Sir William Wallace. Passing through the gateway into a stone-arched passage, a series of steps lead to an open octagon winding staircase, projecting from the south-west angle of the tower, and running up nearly to its entire height. Arrowlet slits or lights pierce the walls of the staircase at intervals, almost to the summit of the square tower, and imitation ropework, with moulded angles, bind the walls externally. The staircase forms the approach to several spacious and lofty halls, designed for the reception of visitors and the display of antiquarian relics illustrative of early national history. An imperial open crown of stone forms the apex of the monument. This coronal top is upwards of fifty feet high, and, according to report, is to be built of pure white sandstone. It comprises eight arms, from the angles and sides, all converging and abutting on the centre upon an open newell staircase, and forming a series of flying buttresses, broadly ribbed, having the spandrils filled in with open tracery. Crocketed pinnacles surmount the outer flanks of the buttresses, and some very effective sky lines are obtained by the openings of the crown. Should the funds admit, a marble statue of Wallace will be placed in the upper gallery or hall of the tower. The site selected is the highest point of the far-famed Abbey Craig, about two miles north-east of Stirling. A grand object in a beautiful landscape, this hill has long been a favourite resort of the tourist, who required no "climbing tower" whence to enjoy the richly-tinted panorama of river and plain, hill and dale, which expands before and around him on attaining the summit.

Visit of Her Majesty.—It is the intention of her Majesty the Queen to visit Ireland towards the latter end of next month. Her Majesty will remain four or five days at the Viceregal Lodge, in the Phœnix Park, and will probably visit the Camp at the Curragh of Kildare. Thence she will make an excursion to the Lakes of Killarney. The visit being of a private nature, as was the case with that of 1853, no public reception or ceremonies are contemplated. This event, viewed in conjunction with the present stay of the Prince of Wales amongst us, may be regarded as a significant sign of increasing royal interest in Ireland, and we have no doubt but that it will be most heartily appreciated.

A Condemned Tramway.—The Metropolis (London) Road Commissioners lately resolved that the present tramway on Bayswater-road should be removed, and the road restored to its original state. Mr. Train has been allowed till the 4th of October to carry out their directions.

The Paper Duty.—It is a great mistake to suppose that newspaper proprietors will derive the entire benefit of three-halfpence per pound of duty to be abolished on the 1st of October next. The paper manufacturer will take care to have at least a third of the sum, while, according to the calculation of some of the ablest and most intelligent men in the paper trade, it is not at all improbable that, by the beginning of the year, the rise in the price of rags, consequent on an increased consumption of paper, will be so great as to keep up the price of paper to nearly, if not wholly, its present amount.—*Morning Advertiser*.

Steam Locomotives on Common Roads.—In London, recently, a serious accident took place, whereby several passengers on an omnibus had more or less "bones broken," owing t the horses taking fright at a locomotive employed by the contractor for removing the *debris* from the Hampstead reservoir. The vestry authorities have taken the matter in hand, with the view of preventing the employment of such machines for the purpose.

Stradbally Hall.—The farm offices are roomy, extensive and substantially built, and their perfect uniformity throughout, at once arrests the eye of any person having the slightest knowledge of the style of architecture suitable for an extensive farm. The dairy is just what we had expected, sufficiently large and airy, and supplied with every necessary in the shape of modern dairy utensils; hot and cold water pipes leading from the cistern and kitchen, supply any quantity of water for the necessary purposes, and the splendid marble counters so well stocked with glass and porcelain milk vessels, show that due attention has been devoted to this valuable appendage of the farm. The stables, granaries, harness-rooms, coach-houses, laundry, bakery, byres, piggeries, root-houses, workshops, &c., are all so regularly and so conveniently arranged as to tend to economise a vast amount of time and labour in attending to, and executing the multifarious objects in such a large establishment.—*Agricultural Review*.

Public Works in India.—The competitive examination for appointments in 1861 in the civil engineer establishment of the public works department in India took place on the 3rd of June and four following days, at the India Office. The examiners were Professor Cape, M.A., F.R.S.; Lieutenant-Colonel Auchterlony, Madras Engineers; and Mr. George P. White, C.E. Thirty-two candidates presented themselves for examination, of which, we understand, eleven have been selected for appointments.

American Steam Frigates.—"There is no navy in the world", says the *Daily Wisconsin*, "which has on one station five such men-of-war as will in a few days be cruising off our coast. The Niagara, Wabash, Minnesota, Colorado, and Roanoke, are the *largest* wooden steam frigates in the *world*, and cannot be surpassed as specimens of naval architecture. They carry an aggregate of 180 guns, which can throw 114 pounds more iron in a broadside than an equal number of the 120-gun liners of England. It costs 25,000 dollars a-day to keep them in active service, manned as they are by no less than 2,300 men."

Not Lost.—A gentleman whose house was repairing, went one day to see how the job was getting on, and observing a number of nails lying about, said to the carpenter employed on the works—"Why don't you take care of these nails? They'll certainly be lost." "No," replied the carpenter, "you'll find them in the bill."

Trade Catalogues.—"One cannot but be struck with astonishment at the innumerable ways in which an enterprising tradesman appeals to the public with a view to increase his trade. Printing in all its branches, assisted by the skill of the wood engraver, seems in the present day to be one of the media most generally employed in spreading the knowledge of various manufactures. These arts have ably been brought into use by Mr. Benson, an eminent watchmaker of 33 and 34, Ludgate Hill, and 46 and 47, Cornhill, who has sought, by means of an 'Illustrated Pamphlet' (consisting of nearly 60 pp., and containing upwards of 250 beautiful designs for watches, clocks, &c., with an elaborate description of every construction of watch now made), to enable persons living in any part of the world to select the watch best adapted for their use, and have it forwarded free by post."—*Sun*.

Auctions, Sales, &c.

ON THURSDAY AND FRIDAY MORNINGS, the 18th and 19th instant, commencing each Morning at Eleven o'clock, precisely,
In the WOOD SALES SHEDS,
BRUNSWICK & TOXTETH DOCKS, LIVERPOOL.

211 Logs Mexican Bay MAHOGANY, being the Cargo lately landed ex Magicienne, from Minatitlan.

Apply to Messrs. JAS GRAHAM and Co., Merchants.

60 Logs Tonula MAHOGANY, now landing ex R. S. Ely.

Apply to A. GLASSFORD, Esq, Merchant.

57 Logs Honduras MAHOGANY, ex Jessie.

517 Logs and Curls St. Domingo (Porto Plata) MAHOGANY.

30 do. do. SATINWOOD, now landing ex Chancellor.

On account of the Importers

98 Logs City St. Domingo MAHOGANY, lately landed ex Her Majesty.

Apply to Messrs. IMRIE and TOMLINSON, Merchants.

200 Pieces Crown WAINSCOT OAK BILLETS.

100 do. 2nd Quality, now landing ex Loveley, from Memel.

On account of the Importers.

205 Logs and Planks Bahia ROSEWOOD, weighing about 35 tons, now landing ex Richmond, from Bahia.

Apply to Messrs. JOSEPH TOPLIS and Co., Merchants

3976 Pieces City St. Domingo LIGNUMVITÆ, now landing ex J. H. Elliot.

Apply to Messrs. GUION and Co., Merchants.

To the above will be added Parcels of Italian WALNUT and other FURNITURE and FANCY WOODS, and AMERICAN and BALTIC WHITEWOODS, meantime expected to arrive.

E. CHALONER, Wood Broker and Measurer,
6, East Side Queen's Dock, Liverpool.

ON FRIDAY next, the 19th instant, at Twelve o clock, noon, precisely, on the Quay east side of the Brunswick Dock, Liverpool

20 Logs Prime Waney BOARD PINE TIMBER,
425 do. do. YELLOW PINE Do.
111 do. do. RED do.
300 do. do. BLACK BIRCH.
2378 2nd Quality PINE DEALS,
now landing ex Sirocco, from Quebec.
150 Logs Prime YELLOW PINE TIMBER.
104 do. do. RED do. do.
29 do. do. Lake St. Clair OAK.
35 do. do. BASSWOOD.
160 do. do. BIRCH,
now landing ex Rajahgopaal, from Quebec.
250 Logs YELLOW PINE TIMBER.
380 do. BIRCH,
now landing ex Ann Gray, from St John, N.B.

To the above will be added other parcels of AMERICAN and BALTIC WOODS, and Catalogues, containing full particulars of the above, may now be had on application to

E. CHALONER, Wood Broker and Measurer,
1, East side Queen's Dock, Liverpool.

MAHOGANY, TIMBER AND DEALS.

JAFFRAY BARCROFT will SELL by AUCTION, in the CUSTOM HOUSE DOCKS, on TUESDAY next, 16th July, 1861, the Cargo of Mahogany, just landed ex Johanna Fredcrika, direct from Tonula, containing 59.700 feet of prime panel, counter-top, and cabinet wood.

Also 25,000 feet St. Domingo Mahogany, suitable for table and chair manufacture.

And 31,000 feet of prime Honduras Mahogany.

Detailed specifications of all the above can be had on the day of sale. Also

30 Logs of Wainscot Oak.
7 Pieces Large Quebec Oak.
20 „ Ash.
61 „ Birch.
160 „ Red Pine (large size).
55 „ Board Pine.
1500 „ 1st quality Quebec Spruce Deals.
1200 „ 1st „ „ Pine Deals.

JAFFRAY BARCROFT, Broker & Measurer,
42A, Great Brunswick-street.
Dublin, July 10th, 1861.

Auction of Saint John Deals, Memel and Quebec Timber, &c.

WILLIAM CARVILL will OFFER by AUCTION, on THURSDAY, the 18th July, in the Custom House Docks, at One o'clock p m,

The Cargo of Spruce Deals, Plank and Battens, now landing ex ship Vortex, from St. John's, N.B.

The Cargo of Spruce Deals, Planks and Battens, just landed ex ship Saxon, from St. John's. N.B.

The Cargo of Red and Yellow Pine, Ash, Oak, Pine Plank, &c., per ship Victor, from Quebec.

The Cargo of Memel Timber, Plank, and Lathwood, just landed ex ship Friedrich Wilhelm.

JAFFRAY BARCROFT, Broker & Measurer.
Rathgar Saw Mills, and Custom House Docks,
Dublin, 2nd July, 1861.

N.B.—A Cargo of best Bangor Blue Slates, per Charlotte, daily expected.

Building Materials by Auction.—Shop Sashes, glazed with Plate and Sheet Glass; a number of Memel Beams, Joists, Rafters, Scantlings, Glazed Windows, with Shutters and Trimmings; Doors, Flooring Boards, Slates, &c.

MR. HUGHES having an accumulation of Old Building Materials has instructed the Subscriber to Sell by Auction, on TUESDAY, the 23rd of July, 1861, at the rere of Nos 80 and 81, TALBOT-STREET, the Materials of the Houses recently taken down at the corner of Dame-street and Eustace-street, together with a quantity of other Materials; the entire consisting of several Shop Sashes, glazed with best British Plate Glass; 36 dozen Sheet and Crown Glass, with Shutters; Showboards, Pilasters, and Consols to match; a number of modern good Windows, with Shutters and Trimmings complete; Shop Doors, glazed with Plate and Sheet Glass; several Panelled, Sash, Hall and Ledged Door, Memel and Irish Oak Bressimers, Joists, Rafters, Scantlings, and Flooring Boards, Circular Dome Lights, a quantity of good old Double and Ton Slates, Ridge Tiles, &c; a number of Metal Pillars, Marble and Stone Chimney Pieces, Old Grates, old Iron and Lumber, &c.

CHARLES BENNETT, Auctioneer,
6, Upper Ormond-quay.

Sale at Twelve o'Clock.

All Lots purchased must be removed within two days after the sale, or deposit money will be forfeited.

KILKEE, CO. CLARE.

Handsome & Commodious Marine Residence TO BE SOLD.

THE following Houses—Nos. 1, 4, 9, and 10, M'DONNELL-TERRACE, WEST END, KILKEE.

Nos. 1 and 4 contain each—Parlour, Drawingroom, five Bedrooms, Kitchen, Pantry, Scullery, and Servants' Apartments.

Nos. 9 and 10—Parlour, Drawingroom, four Bedrooms, Pantry, Kitchen, Scullery, and Servants' Apartments.

To each House is attached a large enclosed Yard, with Turf-house. Stabling and Offices can be built.

M'Donnell-terrace commands a magnificent view of the Bay and bold cliff scenery of this delightful and fashionable watering-place. The subscribers, from their local position, have had such advantages in building the Terrace as enable them to offer these beautiful houses at a comparatively small price.

The other houses of the Terrace have been already disposed of, and the purchasers are receiving a large per centage for their investment. The Terrace is built on the estate of W. E. A. M'Donnell, from whom the buyer of each house can have a direct lease for a term of 999 years at a reasonable ground rent.

For further particulars apply to the owners—Messrs. CHARLES M'DONNELL & SON, Timber Merchants and Builders, Kilrush, County Clare.

VITRIFIED SEWAGE PIPES. JOSEPH KELLY has a large Stock at his Stores, JOHN-STREET, which will be Sold at reduced rates.

THE CITY SAW MILLS,
TIMBER AND SLATE STORES,

H. SIBTHORPE AND SON,
Agents for Ireland,
11 AND 12, CORK-HILL, DUBLIN.

SHIPWRECKS—IRISH LIFE BOATS.

APPEAL TO DUBLIN.

THE COMMITTEE OF MANAGEMENT have to state that they have recently expended nearly £7,000 on the following Irish Life-boats, viz.:

PORTRUSH,
GROOMSPORT,
TYRELLA,
NEWCASTLE,
DUNDALK,
DROGHEDA,
SKERRIES,
WICKLOW,
ARKLOW,
CAHORE,
WEXFORD,
ROSSLARE,
CARNSORE,
TRAMORE,
DUNGARVAN,
ARDMORE,
YOUGHAL,
BALLYCOTTON,
WESTPORT.

During the past year the Institution has also incurred expenses amounting to £10,545 on various Life-boat Establishments on different parts of the coasts of the United Kingdom.

During the same period the Society has also granted £1,108 15s. 3d., as awards for saving 499 persons from a large number of shipwrecks on our coasts: a most satisfactory result, and clearly showing how much has been accomplished by the well-directed efforts which the Life-boat Institution has brought to bear on this humane cause. This great and national work has, however, only been accomplished by the Society incurring further liabilities to the extent of £3 834.

With so sacred an object in view as the Rescue of our fellow-creatures from an appalling death by Shipwreck, it might be supposed that the NATIONAL LIFE-BOAT INSTITUTION had claims which would come home to the heart of every one in this great maritime country. Such, it may be hoped, will be the case as its operations become more generally known, and thus an abundant harvest, not only of popular sympathy but of general pecuniary support, will be the permanent result.

The Committee of this Institution do not, therefore, hesitate to solicit most earnestly the support of the people of the CITY OF DUBLIN and its environs, in aid of the benevolent objects of the NATIONAL LIFE-BOAT INSTITUTION. They cannot but sympathise with the vigorous efforts now being made by this Society to save the lives of shipwrecked crews. Their help was never more needed than at the present time, when, through the extraordinary exertions the Society has made within the past few years, it has now One Hundred and Eight Life-boats under its management, for the maintenance of which, in a state of thorough efficiency, a large permanent annual income is absolutely needed, if its humane mission is to be perpetuated.

Contributions are thankfully received by the following Members of the Dublin Branch of the Institution:

CAPT. ABBOTT, R.N., Hon. Secretary.
CAPT. MACLEAN, R.N., 22, Blessington-street.
LIEUT. TULLY, R N., Seville-place.
LIEUT. HUTCHISON, R.N., Harbour House, Kingstown.
P. HOWELL, Esq., Steam-packet Office, 12, Eden-quay.
ANDREW TAYLOR, Esq., 44, North Wall.
JOHN WALSH, Esq., Agent to Lloyd's, Dublin.
W. J EGAN, Esq., Steam-packet Office, 46, North Wall
H. L ALLEN, Esq., Steam ship Office, 5, North Wall.

By Capt. Abbott, R.N., Ulverston-road, Dalkey, the Hon. Secretary of the Dublin Branch; by all the Dublin and London Bankers; and by Richard Lewis, Esq, Secretary of the National Life-boat Institution, John-street, Adelphi, London, W.C.; or by the Collector or Assistant Secretary, Mr. SAMUEL B. TAYLOR, No. 1 Lower Leeson street.

The Dublin Builder.

VOL. III.—NO. 39.

UNDUE PREFERENCE [illegible]FACTURERS.

SOME time since a correspondent [illegible] through our columns of an undue preference alleged to [illegible] public department to the manufactures of certain parties connected with the building line, but the communication was so pointedly personal and invidious, and moreover implied so direct a collusion, that we declined insertion; however as the general principle is one of some importance both to the profession and the various building trades, and is just now receiving much consideration in another direction, we may likewise appropriately direct our thoughts thereto. The question resolves itself simply into this main, although its lateral branches are very numerous, "Is an architect in writing a specification justified in providing specially for the materials manufactured by one particular firm, where those of another or others may be equally desirable as to *quality* and *price?*" We apprehend that if *our* architect friends answer the query, there will be a direct and unanimous *affirmative*, whereas, judging from personal experience, the builder will add as direct a *negative*. Such an opposition of opinion on the part of two great bodies so closely allied in their pursuits, conclusively attests the importance of the question. May it be attributed to conscientious, to interested, or disinterested motives? Is the architect, who specially provides for the employment in his works of certain manufactures, to the total exclusion of others of similar character, actuated by *conviction* that they are *the* most desirable, or may he—an exception, we trust, to a general rule—have given in his adhesion to that practice of "*understanding*" which has been openly stated as not altogether uncommon; or again, is he merely actuated by the somewhat pardonable—under some circumstances, though, under others, replete with injustice—desire, merely to serve a *friend*, when he can do so without detriment to his client? On the first point, we believe that the author of a specification, whether in an official or private professional position, *is* perfectly justified both in noting and maintaining a preference, despite whatever outcry may be raised against him for the provision of such materials in his work as in his conscientious and impartial opinion *shall* conduce *most* to their stability or finish; secondly, when private pecuniary influences are in question, the course is not only untenable but unprincipled and contemptible—although many are found to justify it as "a mere matter of business;" and again upon the score of "friendship", perfectly admissible in private practice, but *wholly* objectionable as regards public officials, whose dictum may, from time to time, exercise a considerable detrimentary influence on the free trade of a market. Let us take as illustrations the materials—"building stones," "bricks," and "cements;" in the two former, the one district may, and most frequently does, yield articles widely differing in quality, and even though with similar ingredients as regards "bricks" especially, a peculiar mode of manufacture may produce a much better article than that obtained in an adjoining field; in like manner, "cement"—which, in point of importance, both in a utilitarian and a decorative regard, ranks next to the foregoing—of whatever class it may be, whether Portland, Roman, &c., comprehends various qualities and kinds, patent or otherwise; can it therefore be justly alleged, if an architect specially mentions *a name* as the source from which the supply is to be obtained, and really believes it to be *the best*, that he gives an undue preference? We should say *not*, but at this point, the question turns on the monosyllable *if*. We are slow to assume that pecuniary influences are so general as some assert, though, on the other hand, their existence to a degree in some transactions cannot be denied, however much we should wish, both in our journalist and private capacity, to maintain the so-called "dignity of the profession." A correspondent of our excellent cotemporary, "*The Building News*"—for whose opinions it is, however, specially noted that the editors are not responsible—speaking of "Commissions to Architects, says:—

"Every architect and builder knows perfectly well that the practice called 'giving commissions to architects' is of common and every-day occurrence. *And why not?* The same system of giving commissions to those who bring in business, additional trade, pupils with premiums, in fact, every gain and advantage, not otherwise or so readily procurable, is in hourly operation by the majority of men engaged in business matters of every kind; fairly conducted, it is one of the principal elements of all commercial transactions,—'get such or such an advantage for me and I will give you so much for it. *What can be more fair?*' A most extraordinary feeling has arisen in the minds of some upon this question, of some who I have not the slightest doubt in the world, actually receive those 'commissions' of which they are publicly so anxious to ignore the *very existence;* this is a folly, and is likely to result only in convincing the public that there is a secret and enormous system of defrauding them of advantages which they would otherwise themselves possess. For it is equally a folly to attempt to bolster up an idea that the public are not already aware that such a system of commission does exist. And, as I have before asked, *why not?* A client engages an architect to superintend a certain work, some items which cannot conveniently be included in the contract are omitted, say stoves, mantel-pieces, and many other items; take a stove for example—perhaps a price has been provided for it, say £5. Now, when that stove is wanted, suppose the builder provides it; after the architect has visited the warehouse and made a selection of a stove of that value, he, the builder, will charge the client £5 for it, paying *himself*, say, for example, £4 10s., the *trade* price, *thus profiting* 10s. Suppose the architect, who, be it observed, has all the extra trouble of attending to select, orders the stove to be sent to the works, and receives 10s. himself, the difference between the trade and retail price, the stove will cost the client still the same price of £5, and he cannot get it for less, for if he buys the stove himself, every one knows that he will be charged not the trade, but the retail price of £5. In what respect in this transaction has the client been defrauded or even unfairly dealt by? It is true the architect might hand over the 10s. thus gained to the client, but is there any, even moral, reason *why he should do so?* The same might be said of the builder, or it might be represented as dishonest conduct on the part of the tradesmen to sell his goods at one price to one person and at a higher price to another. The whole argument against 'commissions' of this nature looks very like an attempt to dictate to tradesmen that they must sell their goods at one price alike to a builder or architect who requires many, as to a private buyer who requires only one. If it is wrong for an architect to buy a thing at the trade price and sell it at the usual retail price, how is it that a builder may do so without reproach? 'Oh?' some one says, 'an architect is a professional man who ought not to buy and sell.' How is it, then, that he may buy and sell the labor of his clerks? Besides, this alters the aspect of the question altogether. If it is only a question of comparative respectability the less that it is said about it the better, to my mind, for young architects must live as well as old ones. An eminent architect considers it not 'respectable' to take commissions for trifling works, so hands them over to a clerk or less fortunate friend, another architect, say in class number two, thinks it *infra dig.* to measure even his own work, so employs a surveyor to do it, number three persuades himself that a 'respectable' architect should not take out quantities of any besides his own work, and so on through the various shapes and forms assumed by that dreadful idol—'respectability.'"

Unquestionably there is much truth in the foregoing, and it may be applied both to English and Irish practice, but we must take exception to the manner in which the writer lays "the flattering unction to his soul" that justifies the principle or rather the want of it; and referring to our own immediate subject must remark that, where such a system has any existence, it, at least, leaves room for assumption of *sub-rosa* understanding on the part of those who continually compel contractors to use the manufactures of *certain* parties and pass by others. A builder who has been accustomed to deal with Messrs. A and Co. for certain materials, and who has always experienced fairness and considerateness therefrom, naturally feels a repugnance to open a new account with Messrs. B and Co., who are strangers, and reminds the architect that he can procure as good (at least) from the latter as the former, but the professional functionary is inflexible, and says, "look to your specification and attend to its provisions, Messrs. A and Co.'s goods are those to be purchased and *none other.*" A multitude of suppositions from that moment pass through the builder's mind, and relations are not on the most satisfactory possible footing.

THE MUSEUM OF INDUSTRY.

THE report of Sir Robert Kane, F.R.S., M.R.I.A., director of the Museum of Irish Industry and Government School of Science applied to Mining and Arts, for the year 1860, states that the arrangement and classification of the several collections in the Museum has been considerably advanced during the past year, and additional specimens obtained have been distributed among the technological series. The educational value of the collections has been much enhanced, and their objects rendered more intelligible to the ordinary class of visitors.

The preparation and affixing of full descriptive labels is carried out. Satisfactory progress has been made in the systematic catalogue; considerable portions of the divisions embracing British and foreign porcelains and earthenwares, and British and foreign fuels and iron ores and iron manufactures have been already prepared. Amongst the additions to the museum have been a collection of foreign woods used in building and cabinet work, and of fabrics manufactured from wood, foreign and Irish; various illustrations of the use of palms, stalks, leaves, and fibres in tropical countries. This branch of economic botany may be considered as now very completely represented in the museum. A collection of materials used in paper making, with an interesting series illustrative of the stages of that manufacture, and various samples of paper from China, and manuscripts written on bamboo paper. In the division illustrating the manufacture of glass and enamel, a series of glass enamel and porcelain, ornamental beads, and also imitations of coral, jet, amber, &c., have been added. A series of copper ores and other associated rocks and minerals from the Dhurode Mine, county Cork, presented by the Rev. M. Cash, has been added to the metallurgic collection. A series of beryls, fluors, garnets, and other minerals which possess very great value as mineralogical and geological illustrations, has been procured, and also a highly interesting specimen of native gold in quartz from Mount Alexander, Australia, in which the geological relations of the gold-bearing lode are usefully illustrated. The arrangement and labelling of the mineral collection is still in progress, but the determination of mineral specimens is necessarily a long and laborious work, when effected with that accuracy which alone can give scientific value to the results, or render the collection worthy of its place in the Government School of Science applied to Mining and the Arts. The total number of visitors in the evenings for the year was 8,934, making the total number of visitors in the year 32,999. In the chemical department very satisfactory progress has been made during the past year under the zealous direction of Mr. Galloway. Five of the most important coals employed in gas lighting have been analysed, and analyses of various varieties of Irish and British coals, together with determinations of their heating powers, have been made for illustration of the gallery collections. Twenty-seven analyses of waters have been made for the corporation of Dublin in reference to the important question of the supply of water to that city, and many other analytical investigations of industrial and scientific interest have been carried out by Mr. Galloway and the session laboratory students under his direction. The library of the Museum has been open during the session to registered students of the Government School of Science applied to the arts. The number attending was 557, giving a daily average of 3.67. The attendance was almost entirely in the evening, as the class of students are usually otherwise occupied during the day.

DUBLIN TO LONDON AND PARIS AND BACK.

We have not failed to notice in previous numbers, as our readers may remember, the exclusion for some years of Dublin from the advantage of those excursions to *the* metropolis, which throughout England are systematically pursued from May to November; and we consequently now experience much pleasure in perceiving that arrangements have been made through the agency of Mr. Henry R. Marcus, of London, the well-known caterer, for an excursion to London on the 5th inst., available for 7, 14, or 16 days, and thence to Paris and back, if so desired. Huge placards and advertisements have already fully announced the fact, but on reference to the small bills we find them in some regards so dubiously worded, as to lead astray many parties not accustomed to the road if not explained. For an excursion to London only, the instructions for the up journeys are now clear enough, viz., to leave North Wall for Holyhead at six a.m. on Monday, 5th instant, and thence by special train to London, returning on the 12th inst.—first-class, 34s, second-class, 16s.; or optional for return on 12th, 19th, or 21st for first-class, 40s., second-class, 20s. The return arrangements are, however, broken off at Bangor (where on a former occasion difficulties arose by the excursion tickets not being available for the next train to Holyhead unless on *payment of an extra sum*), no date for arrival at Holyhead being fixed; however, as we are told that "the steamer will leave for Dublin at 9 p.m., or as soon after as tide will permit," we presume that this special train having merged into the Parliamentary is intended to arrive at Holyhead at 9.5 p.m,—the period fixed in time bills for the latter. Intermediate excursions to Bangor, Conway, Rhyl, and Holywell are in connection therewith, at exceedingly moderate rates. The cheap excursions to Paris and back, announced for 44s. and 32s. 6d., must not be understood as applying to *Dublin*, but *only* from London to Paris and back, and is *an addition* to the return ticket from Dublin to London and back. We hope that arrangements have been made to convey the "excursionists" direct to the train from the steamer on arrival, and *vice versa*, and not as formerly cause them to walk from the jetty to the terminus, a distance of two miles, while the holdrs of *other* tickets proceeded by train.

COLUMN FOR CRAFTSMEN.

THE PLUMBER.

Without underrating the usefulness of the plumber's craft, it must be conceded, that it does not comprehend so extensive a sphere as any of those branches noticed in the foregoing series, and is strictly confined to the constructive. Nevertheless both skill, or the want of it, are apparent, when respectively present or absent in his workmanship. The duties of th[illegible]er briefly comprise the reduction of lead from [illegible]eets of various thicknesses, and in conne[illegible]e laying on of this material, or cop[illegible]case may be), forming all platforms and gutters with proper fall and drips to down pipes, securing the carrying of water off with facility, and, at the same time, staunching all parts to prevent damage to the structure from leakage; again, in the manufacture and fixing of water-closet apparatus with its piping, traps, pan, cranks, cistern, pump, &c., and in the suitable supply of water to the several parts of public or private buildings. Lead is obtained from mines, of which we possess some in Ireland, yielding ore of uncommon excellence, especially in the county Wicklow, where, under the auspices of some enterprising companies, mining operations are carried on most extensively. The following particulars of the process of reducing lead from its raw state to pigs may here prove interesting. After the ore has been taken from its bed, it is smelted, first being picked, in order to separate the unctuous and rich, or genuine ore from the stony matrix and other impurities; the picked ore is then pounded by machinery under stampers, and being washed, is put into a reverbatory furnace to facilitate the evaporation of sulphur. When the surface becomes somewhat pasty, it is covered with charcoal and well shaken together, the fire increased and the purified lead flows into moulds, holding about 154lbs. each, and their contents are known as *pigs*. Lead is inferior in tenacity to other metals, for a leaden wire, the 120th part of an inch in diameter, can only support 18·4lb. without breaking. It melts at a temperature of 612 deg. (Fahr.), and boils and evaporates at a higher. Cast sheet lead, used for architectural purposes, is technically divided into lead of 5lbs., 5½lbs., 6lbs., 6½lbs, 7lbs., 7½lbs., 8lbs., 8½lbs., by which it is understood that every superficial foot is to contain those respective weights according to price. Milled lead used by plumbers is very thin, seldom containing more than 4lbs. to the foot super., and is by no means adapted to platforms exposed to the sun's rays or to great wear, being liable to expand and crack. The lead that lines the Chinese tea-boxes is reduced to a thickness to which it is said European plumbers cannot approach, the process of so doing being as follows:—"The caster sits by a pot containing the melted metal, and has two large stones, the lower one fixed and the upper moveable, having their surfaces of contact ground to each other, directly before him. He raises the upper stone by pressing his foot upon its side, and with an iron ladle pours into the opening a proper quantity of the fluid metal. He then lets fall the upper stone, and thus forms the lead into an extremely thin irregular plate, which is afterwards cut into a proper shape." Solder is used by plumbers to secure the joints of lead work, where other means would be improper or impossible. As it is a rule that solder should be easier of fusion than the metal intended to be soldered, the plumber, therefore, uses a composition of equal parts of tin and lead fused together, and run into moulds and technically called "soft solder." Plumbers' work is estimated by the lb. or cwt., and the weight of each quality may be discovered by the table below.

Thickness.	lbs. to a square foot.	Thickness.	lbs. to a square foot.

LONDON BRIDGES.

Every one who has visited London, no doubt, has noted amongst its chief features the various bridges which span the Thames between the City at King William-street, and Chelsea at the West end. London bridge was in its day a very fine work, but is now inadequate to accommodate the enormous traffic passing over it. Blackfriars has been for many years in a dangerous and dilapidated state, and measures for its rebuilding have at length been adopted. Waterloo bridge is one of the most perfect specimens of architecture in the world. Hungerford Suspension answered its purpose well, but is being replaced by one for Railway purposes, and will be re-erected at Clifton, near Bristol. The Chelsea Suspension, a comparatively new structure for combined traffic, is a magnificent work, and not less so, though of a different character, promises to be that now in course of erection at Westminster, the particulars of which are hereunder quoted from a description by our able contemporary, *The Building News.* For the two latter, Mr. Page is the engineer:—

In a very short time the last traces of the first stone bridge which ever spanned the river Thames will be removed. It is second in antiquity only to Old London-bridge, and second also to it only in its obstructive qualities. For years it has been a positive nuisance, and its condition had at length justified the language used by the Company of Watermen and the West Country bargemen in their petitions, 125 years ago, against its erection. It had become "a great prejudice to the navigation of the river Thames, so as to render it dangerous if not impracticable." The arches were propped up, the echoing alcoves were demolished, the balustrade was removed, the roadway was lowered, everything in fact, which ingenuity could devise, was done to lighten the bridge and add to its support, but to no purpose—the piers still continued to sink, and the bridge to assume a more ruinous aspect. It is as curious as it is amusing now to remember the enthusiasm which its erection excited, and the eulogy bestowed upon everything connected with it a century since:—"The length, breadth, and regularity of the design, the breadth and depth of the river it extends over, the quantity of water which passes through it without sensible obstruction, the spaciousness and commodiousness of the carriage and footways over it, the easy ascent it affords, the defence of passengers against the weather in their way over it, the watch for the security of their persons, the beautiful globular lights suspended on irons that project inwards with a lofty sweep from the top of each recess and on the sides of the abutments," all combined to render it superior to every bridge known or described in history, in "estimable particulars and circumstances."

Notwithstanding all these advantages, the opposition to its erection was so well sustained, and such bitterness of feeling was entertained by interested parties that a clause was inserted in the Bill providing that persons willfully destroying or damaging the said bridge should suffer *death.*

It was intended by the Commissioners who laboured, as Labeyle says, "for the honor of doing what was thought impossible," to erect a timber super-structure of peculiar and ingenious construction, but the great frost of 1739 occurring whilst the works were in progress, tore away the piles and left the stonework almost uninjured. This circumstance enabled the architect to obtain the Commissioners' sanction to a stone bridge of fifteen arches on what was then esteemed a peculiarly grand scale, the former, for instance, increasing from a span of 52 feet (excluding the small abutment arches) on each side, to one of 76 feet for the centre arch, and the piers from 12 feet broad to 17 feet. The entire length of the bridge was 1,220 feet, its breadth 40 feet.

If our ancestors who exhausted the terms of praise upon the old bridge, could but witness the structure with which Mr Page supplies its place, they would, indeed, require a new vocabulary to express the full extent of their admiration. The width of the openings is almost doubled throughout, whilst the number of them and the substance of the piers opposed to the river is diminished more than a half. There is no "easy ascent," but a perfect level to the roadway over the bridge. Cheesewring granite in the piers, and iron in the super-structure, take the place of stone, and on such scientific principles has the new bridge been built that one half of the bridge was finished before the old was removed, and opened to the public before the other half was commenced, and yet when completed there will be no indication of it in the structure. The whole will fit together with the nicest accuracy, and be as sound as if it had been constructed in the ordinary manner.

The first half of the bridge was opened to the public sixteen months ago. Within two years from that date, that is, next spring, the whole will be completed. The present appearance of the works is exceedingly interesting, and shows fully, by the quantity of material accumulated, the nature, the magnitude, and the importance of the undertaking. A temporary wooden bridge for foot passengers has been built to the eastward of the new bridge. The space between it and the portion already opened, and daily traversed by vehicles, is crowded with stacks of beams, sheds for shoeing and ringing the piles, wharves for the reception of materials, dredging boats, wooden houses, huge travelling cranes, masses of wrought and cast-iron girders, heaps of iron plates, platforms for gravel and cement to form the concrete, ponderous "monkeys" in constant action driving down the piles, blocks of granite, stores for tackle, &c., slabs of iron sheathing piles, immense framing to support the temporary bridge, the *debris* of the old one, through all of which the river and the steamers rush uninterruptedly, and amidst which the workmen labor regularly. A sort of balcony projects from the eastern side of the new bridge. It has been built temporarily to facilitate approach to the works; ladders lead from it downwards at regular intervals. By means of it we can pass over and note the progress which has lately been made. The bridge will consist of seven elliptical iron arches, each formed of sixteen parallel pierced ribs, stiffened with transverse girders; on these transverse girders convex iron buckle-plates, about a yard square, will be riveted to bear the wood blocks, which will form the foundation of the roadway to the bridge. Outside these ribs a face rib will be fixed, but it will have nothing to do with the support of the bridge, being placed only to give an agreable finish to the exterior of it. The ribs are not all equidistant; the central ones, upon which the greatest weight will of course be, being closer than the two external ones on either side.

The piers are built of Cheesewring granite, and are 85 feet from cutwater to cutwater, with a thickness of only 10 feet. The roadway will be, when finished, 75 feet wide. Semi-octagon buttresses, with moulded caps and bases, stand on the tops of the cutwaters, and the parapet between them is of iron, pierced with trefoils, and surmounted by a moulded capping.

The first two or three arches of the old bridge on both sides have, as our readers doubtless know, been absorbed in the abutments of the new one. The abutments are finished, and the springing girders fixed in their places on a bedding of felt, to insure equal pressure, and to allow for the expansion of the metal. The openings of the seven arches increase gradually in width from 85 feet next the shore, to the centre, where the opening is 150 feet wide. The first pier from the Middlesex side is just completed, but the "waistcoat-pieces," as the lowermost girders are called, are not yet fixed. The workmen, at low water, are engaged cutting away the superfluous concrete from the foundation. The second pier is finished, and the waistcoat-pieces fixed. The third pier has only lately been commenced, and we have thus an opportunity of observing the construction of the foundations upon which it is to rest. Elm piles with iron points are driven down some 30 feet deep through the bed of the river. These are placed 2 feet 6 inches apart throughout the surface of the pier. They are surrounded by iron cylindrical piles linked together by means of tongues and grooves, with iron sheathing piles "jollied" down some 2 feet 6 inches below low-water mark. The whole of the interstices between the piles are then filled with concrete, mixed in the proportion of one part of gravel to four of Portland cement. Temporary piles are driven outside to retain the concrete; they are afterwards drawn, and the concrete trimmed off, as we have just noticed the workmen doing it on the second pier.

On this foundation the granite piers are built. They are splayed off at the ends, on plan, to form cutwaters, the verticle line of which is a very graceful and artistic curve. The fourth pier is finished, and the lower girders are in their place upon it. The fifth pier is scarcely so far advanced as even the third; the piles are only half driven, and close by it we see, at low water, the last remnants of the old bridge—one of the foundations of a pier, with the heavy solid mass of Portland stone, which, far more than the weight of the super-structure, hastened its settlement and ultimate ruin. The piers were too massive, and sank, and the upper portion of the bridge sank naturally with it. That seems the reason why no diminution of stonework above could materially check the ruin of the work. The stone the bridge was built of came from the best Portland beds; it is very hard and comparatively uninjured, although it has been exposed to the same gaseous agencies which, in a few years, have disintegrated that of the Houses of Parliament. It has been bought by different contractors, and some of it is being now used in the new offices of the London and County Bank in Lombard-street.

Still crossing the balcony attached to the bridge we come to the 6th pier and find the bridge in a more forward state, the convex buckle-plates are on and the whole span is finished, with the exception of the central girder to the span, which, with its transverse girders, will be of wrought iron. In the next and last span, even this portion is fixed in its place. The central girder, corresponding to the key-stone of an arch, is throughout the bridge of wrought, whilst all the rest is of cast iron. This has been provided to guard against the effects of vibration caused by the transit of carriages over them. A layer of india-rubber or gutta-percha is placed at regular intervals between the girders to allow for the expansion of the iron. The lines of the girders are scientifically drawn, and the weight most skilfully directed. There is no undue pressure anywhere, and no waste of material. In appearance the bridge will surpass every bridge which has hitherto been thrown across the river, and it is built in accordance with the soundest principles of modern science. It will be an equal boon to passengers of all kinds, on foot or on horse, in carriages or in steamers, to waggoners and to bargemen. It will enable a good view to be obtained of the grandest pile of modern times, and be itself an elegant adjunct to it; it is a great ornament to the metropolis, and a work of great public utility.

It is being built by Government from the designs of Mr. Thomas Page, C.E. The ironwork has been supplied by Messrs. Cochrane.

Since the above was in type, we have learned that the designs, submitted in limited competition by Mr. Page, C.E., for the rebuilding of Blackfriars, also have been selected.

ARBITRATIONS.*

THE law with regard to arbitration is too extensive a subject to be exhausted within narrow limits, and indeed it would answer no useful purpose to attempt to do so, as the subject is more appropriately treated of at length in the works of practice intended for the special use of the legal profession. So far, however, as lay arbitrators and laymen are concerned, the more salient points of the law of arbitrations will be found in the following, the object of the author being to set before his readers the landmarks by which they must be guided in matters of this sort:—Parties desiring to end any controversy for which there is no other remedy but by personal action or suit in Equity, may, by arbitration, agree that the submission of their suit to the award or umpirage of any person shall be made a rule of any court of record which the parties shall choose, and insert their agreement in the submission or the condition of the bond or promise whereby they oblige themselves to submit to the award or umpirage of any person or persons; which may, on affidavit of the witnesses thereto, or any one of them, be made a rule of court and enforced by the usual means. The submission so made is not revocable without leave of the court; and the arbitrator or umpire is to proceed with the reference notwithstanding revocation by the parties, and make his award, although the person making the revocation shall not afterwards attend the reference; and the court, or the judge thereof, may from time to time enlarge the time for making the award. When the reference is or is intended to be to two arbitrators, one appointed by each party, either party in the case of the death, refusal to act, or incapacity of any arbitrator appointed by him, may substitute a new arbitrator, unless the document authorising the reference show that it was intended that the vacancy should not be filled up. Where an action is brought, and it is made to appear to a court or judge that the matter in dispute consists wholly or in part of matters of mere amount, which cannot be conveniently tried in the ordinary way, the court or judge may decide the matter in a summary manner, or order that it be referred, either wholly or in part, to an arbitrator appointed by the parties, or to the officer of the court, or in country causes to the judge of any county court, upon such terms as to costs and otherwise as the court or judge shall think reasonable; and the decision of the court or judge, or the award or certificate of the referee shall be enforceable, by the same process as the finding of a jury on the matter referred. An action by an engineer for professional services, the claim depending partly upon his right to commission and partly on the propriety of charges for work done, the items of which were numerous, the judge ordered to be referred to arbitration as a matter of account, consenting to try the question with regard to the right to commission as a question of fact. It has also been held that an action for dilapidations where money is paid into court, and the question is only as to the amount of the dilapidations, may be a matter of account, and the subject of a compulsory reference under the 17 and 18 Vict., c. 125, § 3. The court, by which the rule or order shall be made, or which shall be mentioned in the submission, or any judge, by rule or order, may command the attendance and examination of any person to be named, or the production of any documents to be mentioned in the rule or order; and disobedience shall be deemed a contempt, if, in addition to the service of the rule or order, an appointment of the time and place of attendance signed by one at least of the arbitrators, or by the umpire before whom the attendance is required, shall also be served either together with or after the service of the rule or order. The mode of conducting the arbitration must be left to the arbitrators, subject always to the liability of their award to be set aside if they conduct it illegally. In conducting the arbitration, however, they must act impartially and not consider themselves agents for the persons by whom they were respectively appointed. An arbitrator greatly errs if, in the minutest particular, he takes upon himself to listen to evidence behind the back of any of the parties to the submission; and where an arbitrator questions a witness, and receives statements from him in the absence and without the consent of one party to the reference, the court will set the award aside, without taking into consideration the nature of the statements, or the probability of their having influenced the decision. The court will also set aside an award on the ground of interviews having taken place between the arbitrator and one party in the absence of the other; and similar misconduct on the part of the person applying will not prevent the court setting aside the award, for the matter concerns the true administration of justice. If a reference be to two arbitrators, and the terms of the reference do not show that it was intended that there should be an umpire, or provide otherwise for the appointment of an umpire, the two arbitrators may appoint an umpire at any time within the period during which they have power to make their award, unless they be called upon by the terms of the reference to make the appointment sooner. In any case where an umpire shall have been appointed, it shall be lawful for him to enter on the reference in lieu of the arbitrators, if they shall have allowed their time, or their extended time to expire without making an award, or shall have delivered to any party or to the umpire a notice in writing stating that they cannot agree. The appointment of an umpire in a submission to arbitration is a judicial act, and must therefore be made or signed by the arbitrators at the same time, or in each other's presence; for if it be not, the court will not issue an attachment for non-performance of the award of the umpire. Where the arbitration bonds were conditioned for the performance of the award of the arbitrators, or of the umpirage of such persons as the arbitrators should jointly choose between the parties, and the arbitrators agreed upon several matters, but not being able to agree upon one point, they referred that point to an umpire, the award was held to be bad, as the umpire should have gone into the whole case and the arbitrators had in effect chosen an umpire between *themselves*. and not between the parties to the submission. An award is final between the parties, unless the objection is apparent on the face of it; and no objection can be taken on the ground of a mistake in point of law, unless the grounds of the objection appear on the award, or in some authentic shape before the court in which it is questioned; nor will a mere statement of facts from which it may be inferred that the award was founded upon an incorrect notion of the law of the case avail. If, however, the award be contrary to law, it may be impeached; for it would be an excess of power on the part of the arbitrator; but not unless the law upon the subject of the award be clear. An action on *assumpsit* was brought on an agreement to build a house according to certain drawings, plans, and specifications, and to the satisfaction of the plaintiff, and with the best materials; alleging as breaches that the defendant did not build the house to the satisfaction of the plaintiff; and that he did not perform the work with the best materials. The defendant pleaded—first, *non assumpsit;* secondly, that he did the works to the satisfaction of the plaintiff; thirdly, that before the breach the contract was rescinded; fourthly, leave and license; fifthly, that he deviated from the drawings by the direction of the plaintiff's architect; sixthly, a plea stating an agreement between the plaintiff and himself to build a stone wall in lieu of the wall mentioned in the original agreement; seventhly, that by command of the plaintiff he erected a stone wall instead of a brick wall. The plaintiff thereupon took issue on the first two pleas, traversed the third, sixth, and seventh, replied *de injuria* to the fourth, and demurred to the fifth. The cause was at the assizes referred to an arbitrator, the costs of the cause and reference to abide the event; and the arbitrator awarded a general verdict to be entered for the defendant. On proceedings being taken to set aside the award, it was held that it was not uncertain, inconsistent, or repugnant; and that it was not necessary for the arbitrator to assess contingent damages on the demurrer, neither party having requested him to do so, but acted as if the matter had not been submitted to him. With regard to the fifth plea—namely, that the defendant deviated from the drawings by the direction of the plaintiff's architect, it was held that it was bad on general demurrer, as the architect was not shown to be the plaintiff's agent to bind him by any deviation from the approved drawings. Any arbitration or umpirage procured by corruption or undue means, shall be adjudged and esteemed void of none effect, and shall be set aside by the court on complaint made before the last day of the next term after it is made and published to the parties. An award upon a general reference cannot be impeached for erroneous judgment upon facts, but it may for excess of power or mistake admitted by the arbitrators, as well as for corruption or misbehaviour. There must, however, be satisfactory evidence against the arbitrators to induce the court to interfere. With regard to the fees and remuneration of an arbitrator, it may be desirable to observe that the court has no general jurisdiction over arbitrators as to the amount of fees charged by them, whether the reference be under a rule of court or not; nor over the attorney who prepares the award; the remedy would appear to be by action for money had and received; but to give the court jurisdiction in the matter, a clear intention of the parties to the arbitration must at all events be shown. Where, however, there is an express promise to pay arbitrators the costs of their award, a joint action for their recovery will lie against the parties liable, even though no demand for payment of the costs may have been previously made; and where a party to an arbitration is compelled to pay a lay arbitrator an exorbitant sum in order to take up the award, he may maintain an action for money had and received, to recover the excess beyond what is a proper remuneration for the arbitrator's services.

---

* The Law of Contracts. By W. C. Glen. London: Atchley and Co.

THE MUNSTER MODEL FARM, CORK.

ABOUT ten years ago, a committee, consisting of the most influential landed proprietors in the vicinity of Cork, contemplated attaching a considerable extent of land to the Queen's College, with the view of affording the students an opportunity of applying theoretic teaching in agriculture to practical farming. Accordingly, an area of 127 statute acres of choice arable land, at a convenient distance from the college, was rented from his Grace the Duke of Devonshire, at a rent of about 34s. per statute acre. The plan was attempted to be carried out shortly after the opening of the college; and it was expected that a sum of £5,000, out of the "Reproductive Loan Fund" granted by the government for the purpose of improving agriculture in the province of Munster, could have been got for this purpose by the local committee. In this they were disappointed, and the scheme fell through for a time. Ultimately, the Commissioners of National Education took the matter up, became responsible to government for the application of the money to the purpose originally intended by the local committee, and, in March, 1853, they took possession of the 127 acres of land known as the "Ballygaggin Farm." The grant was immediately appropriated to the erection of the recently finished extensive range of buildings, comprising a residence, apartments, schoolrooms, dormitories, lavatories, kitchens, &c., for the agricultural teachers, matron, pupils, &c., and a commodious set of substantial farm buildings and offices for the requirements of the farm. Two years ago, the new buildings were opened for the admission of eligible agricultural boarding pupils, on payment of £8 per annum, for which they are lodged, educated, and boarded during the year, and those whose proficiency stands the test of a competitive examination are, at the end of the year, qualified for admission into the Glasnevin Institution.

The farm-steading is on the covered principle, and the advantages are most obvious here. A walled-in square may be considered as representing the outline of this portion of the premises, one side of which is occupied by the barn, straw, root, and cooking houses; another by the stable, calf, and bull houses; a third, the manure yard; and the fourth, the piggeries, sheep-pens, &c.; and in the central portion of the square, the byres for the dairy and fat cattle. The roofs are supported by upright cast iron pillars, and two opposite partition walls, running parallel with each other. The piggery and sheep-pens on the one side, and the stable and calf-pens on the other side, are separated from the byre by means of two longitudinal walls, and a direct passage communicating with each from the feeding houses in front, as well as free egress for removing the manure, &c., in the rere. Ample ventilation is secured by means of louvres and moveable windows overhead.

The dairy cows—thirty-two in number—when in the byre, face in opposite directions, and are supplied with fodder from the feeding alleys in front. A space of about four feet between the two rows of cattle is available for the removal of dung, and supplying bedding, whilst the channels behind take away all the liquid droppings to the liquid manure tank adjacent to the dung yard. All the rain water on these extensive concerns is secured by catchments leading into the hollows of the upright pillars, and thence conveyed to a cistern, and used for washing and other rough domestic purposes. This arrangement, as may be seen, is something like the old Scotch style of farm-steading, and the advantages are self-evident.

The floors of the houses for the young stock, pigs, sheep, &c., are all sparred, and the liquid droppings conveyed, by means of conducting channels, to the tank, where they are afterwards applied, either to the grass, as artificial watering, or to the damping of the dung previous to application. The piggeries are tenanted by excellent specimens of the pure York and Berkshire breeds; and several of these are entered for exhibition at the forthcoming show of the Cork Agricultural Society.—*Agricultural Review.*

Eight acres of ground have been taken at Bray for cemetery purposes.

PRACTICAL OBSERVATIONS ON RAILWAY WORKS.*

THE various works necessary for the formation and completion of a well-appointed railway, may be arranged under four distinct but concurrent branches of civil engineering; viz., the general survey and levelling; second, the excavations and embankments; third, the formation of the permanent way; and, lastly, the erection of the several buildings. These works comprehend every variety of engineering practice. In ordinary cases the operations of the engineer are confined to the one locality, whereas the construction of railway works requires an intimate knowledge of the character of the whole country, and the customs of the inhabitants. A perfect command of the resources of his profession is also of the highest importance to the engineer, in order that he may meet the various difficulties which present themselves to his notice, during the prosecution of works at remote distances from each other, and which may be progressing simultaneously.

All the great lines of railway which have been constructed, or are in progress, not only throughout this kingdom, but on the continent of Europe, are constructed, with very trivial variations, upon one uniform principle. After the ground has been levelled, and the bottom properly prepared, stone blocks, measuring 18 in. to 2 ft. square, and 12 in. deep, are placed at intervals, varying from 3 to 5 ft. from centre,† according to the weight and strength of the rails intended to be used; on the centre of the upper surface of these blocks is placed a cast iron chair, having a cushion of prepared felt placed between it and the stone block, and pinned down to the block by iron pins, driven into wooden pegs, previously inserted in holes drilled in the stone: these chairs are the props, which from point to point support the rails, the stone block being the foundation of the chair. The rail is manufactured by the process of rolling in lengths, regulated by the distance between the chairs; thus, if the chairs be 3 ft. apart, rails are manufactured in lengths of 15 ft. five chairs supporting each rail; if the chairs be 4 ft. apart, the rails are rolled into 10 ft. lengths, and are supported by four chairs. The stone blocks are placed upon a firm bed of broken stone, or other well consolidated matter, so that as little yielding as possible shall take place beneath them, and that the rails shall maintain their position with the utmost practicable truth and accuracy.

"In those parts of a line where a valley or low ground is crossed by an artificial mound raised upon it, the earth of which such mound is formed requires a considerable time to become consolidated, the use of these massive stone blocks would be attended with many difficulties and much inconvenience.

"On such parts of the lines of railway, therefore, it has been customary to substitute temporary supports for the rails, by laying across the road rough beams of wood, usually formed of large timber split through the middle, the flat side being placed downwards, at the same intervals as those at which stone blocks on other parts of the lines are used. To these timbers the chairs which support the rail are pinned. This mode of construction has less stability than that already described; but as the mounds or embankment on which it is usually formed are subject, for a considerable time, to subsidence or settling, as it is called, these cross timbers are found to be capable of being packed up with much less trouble and at less expense than stone blocks.

"They are therefore adopted, and continue on the embankment until the materials of which these embankments are formed become completely consolidated, the timbers are then removed and stone blocks substituted for them, as in the other parts of the line."

The buildings on a line of railway are numerous and important, but their distribution on an extended and narrow line of road is very prejudicial to the general effect of these works. They may be classified as follows:—

Over the railway. Under ditto. Skew ditto. Viaduct ditto. Aqueduct ditto. Occupation ditto.	Bridges of iron, timber, brick and stone.
Engine stations and depots. Passenger ditto. Water ditto. Depots for goods.	Stations.
Under rivers. Through hills.	Tunnels.

To which may be added detached buildings, consisting of cottages for workmen, stationary engine-houses, lodges, coke ovens, sheds, stabling, &c., &c.

---

* Designed by Mr. Frederick Darley, late architect to the Commissioners of National Education in Ireland.

* New Office Book for Architects, &c. London: Atchley and Co.

† The distance between the rails is subject to some slight variation, but the engineers are pretty well unanimous in their opinions respecting this branch of railway practice.

KILMORE CATHEDRAL.

On the 17th of July, 1860, the new cathedral of Kilmore, the subject of our present illustration, was consecrated ; it was erected to supply the place of the old building, which had become very dilapidated, and had quite lost all the distinctive features of an ecclesiastical edifice. The new building has been erected from the designsof Mr. W. Slater, of Carlton Chambers, London, architect ; the drawings having been sanctioned by the commissioners ; the builder employed being Mr. Hague, of Cavan. The majority of the sees being small, the cathedrals in this country are usually of no great size ; this building is, therefore, about the average dimensions. The object kept in view was to provide accommodation for a large congregation, and at the same time to preserve the distinctive cathedral arrangements.

The plan is cruciform, consisting ofnave and aisles, transepts, central tower and chancel; the style adopted is the second pointed. The nave has a clerestory of spherical triangles, and is separated from the aisles by an arcade of three arches ; the roof is open with arched ribs ; the west door is double with a pier in the middle ; the tympanum being filled with carving in medallions on a field of diaper. The chancel proper is two bays long, and the east window has five lights. The tower rises one stage above the roofs, and is finished by a four-sided pyramidal roof. The internal arrangements are as follows :—The nave is occupied with open moveable seats for the general congregation ; in the south transept are placed the children of the schools, in the north is the organ. The vestry is on the north side of the chancel, in which is introduced, with very good effect, the old Norman doorway of the old cathedral. The stalls for the clergy and choir are placed under the tower, the bishop's throne being on the south side—all these are of oak ; the back stalls, 10 in number, are for the clergy, and have carved ends and divisions. The stalls for the choristers have ends with a carved top and finial, the front being divided into panels, the upper part of which is also carved. The book board for the choristers is supported by columns with carved brackets. The bishop's throne has over it a canopy carried on columns with carved caps, the spandrel and cresting of the canopy is also carved ; they are executed by Mr. Forsyth, of London, from the designs of Mr. Slater. The chancel is left unencumbered with seats, so as to be available for gatherings of the diocesan clergy, ordinations, and the like. The font is placed near the west door. The pulpit stands at the north-west pier of the tower. These were executed in Dublin by Messrs. Purdy and Outhwaite, who also carried out all the stone carving. The materials used in the general construction are a dark limestone procured in the neighbourhood, with a lighter stone from Dungannon for the dressings. The external effect of the church is much increased by its very favourable position on the brow of a gentle elevation. There are at present only three stained glass windows in the church—two in the south transept, by Mr. Ward, and one in the south aisle, by Messrs. Clayton and Bell. The chancel is paved with Minton's tiles. The whole work forms a memorial to Bishop Bedell, who was born at Black Notley in Essex. He received his education at Emmanuel College, Cambridge. In 1626 he was chosen provost of the University of Dublin, at the decease of Archbishop Usher. He continued in that office only two years, being appointed Bishop of Kilmore and Ardagh in 1629. He was a man much beloved by both Protestants and Roman Catholics. His death, which was accelerated by the treatment he received during the rebellion, took place in 1641. He was buried in the graveyard of his own cathedral. The remark made by a Roman Catholic priest at his burial deserves record, as showing the deep impression the sanctity of his life had made on all who knew him —" Sit anima mea cum Bedello."

QUANTITY AND QUALITY OF VENTILATION.

It is a popular fallacy, that all the advantages of good and effective ventilation are secured by the *free* transmission of air through a building or the apartments thereof; but a wide difference in reality exists between the effect which *quantity* has on *quality* when properly diffused, and when it is not so. That vitiated or heated air ascends above the pure or colder atmosphere as oil does on water, is as easily comprehensible a theory, as that water finds its level ; and yet from this simple fact not being sufficiently borne in mind in the arrangement of buildings, much defective ventilation is prevalent. Our churches, theatres, concert-rooms and other halls for public assemblies are mostly built with provision through numerous corridors, opens, &c., for a never-failing supply of cold air, while but comparatively little is secured for the withdrawal of the heated, in the positions to which its nature causes it to tend, and proportionately to the quantity sure to be generated where a crowd is assembled. The consequence to the health of the frequenters is most deleterious, as the vitiated air vainly seeking vent at the highest level of the apartment, being forcibly pushed up by the heavier element, is cast downwards to be *re*breathed alike by the healthy and the unhealthy into the sources from which it was emitted ; and could we but analyse this heterogeneous mixture, what a variety of poisonous ingredients would be found therein. But to bring the subject more " home," our dwelling houses are often built in utter defiance of all sanitary principles, a current of air from the front door meets another from the back, and simultaneously uniting, they rush into the apartments, up the chimneys, up the stair-cases, and down again. Fire-places are so planned that, if their contents were sufficient " to roast an ox," the perpetual draught of biting air not only prevents the equable diffusion of heat, but the two extremes meeting treacherously affect the physical system of the occupants. The fact of a fire-place being in a bed-room is regarded as a guarantee of perfect ventilation, but this too is a mistaken notion ; for, if placed diametrically opposite the door, the air rushes to the flue with such rapidity as only to create a current from side to side without in any way serving to expel the vitiated air generated by a sleeper. The same forgetfulness of that " simple fact" also induces the opening of the lower sash of a window when an apartment becomes heated, but the consequence is, that though a volume of fresh air certainly will rush in, still the foul remains playing upwards ; and the temperature at the feet becomes suddenly changed to cold, while that at and above the head is still warm. How, under such circumstances, can sufferers from severe colds, bronchitis, &c., &c., wonder whence they originated ? The average amount of the oxygenic essential (for each individual) is 600 cubic feet, but for the better preservation of health this must be constantly changing, not in *quantity*, not by the production of currents and draughts, but by maintaining the *quality*, which can only be effected by perpetual supply of fresh, and a perpetual expulsion of the foul.

PRIZE DRAWINGS.

At the recent meeting at Leeds of the Royal Agricultural Society of England, prizes and commendations as under were awarded :—

Plans for Laborers' Cottages.

For the best plan of a double cottage, containing not less than three bedrooms in each, the cost not to exceed £220 the pair, 1st prize, £35, Messrs. Richardson and Ross, Darlington.

Highly commended, Mr. W. Blackmoor, Rotherham.

Commended, W. Wilds, Hereford ; W. Lightly, Bedford-row, London ; W. J. Price, Pimlico, London ; W. Ward, Hulme, Manchester.

For the best plan of a double cottage, containing two or three bedrooms in each, the cost not to exceed £180 the pair, 1st prize, £25, J. R. Corby, Stamford, Lincolnshire.

Highly commended, W. Blackmoor, Rotherham.

Commended, J. Trought, Acton Burnell, Shrewsbury ; J. W. Poundley, Kerry, Newton, Montgomery ; E. Foggett, Blackburn ; J. H. Brown, Upper King-street, Norwich.

For the best plan of a single cottage, the cost not to exceed £120, 1st prize, £25, Walter M. Boden, Birkenhead, and J. T. Lea.

Highly commended, A. Watson, Everton, Liverpool.

Commended, Messrs. Child and Son, Leeds ; B. Lay, Oswestry, Shropshire ; T. H. Lomas, Nottingham ; Joseph Bradley, West Heslerton, York.

The best plan of a pair of cottages, of irregular design, the cost not to exceed £210, 1st prize, £10 ; 2nd do., £5.—No prize awarded ; insufficient merit.

Plans of Farm Buildings.

For the best plan of farm buildings, adapted for a farm of not less than 500 acres, and providing for the use of steam power, £50, J. E. Watson, 22, Grey-street, Newcastle-upon-Tyne.

Highly commended, Messrs. Hicks and Isaacs, Bath ; P. D. Tuckett, London ; James Fox, Albion-street, Leeds ; and Mr. Gowthwaite.

Commended, J. Parsons, Harewood, Leeds.

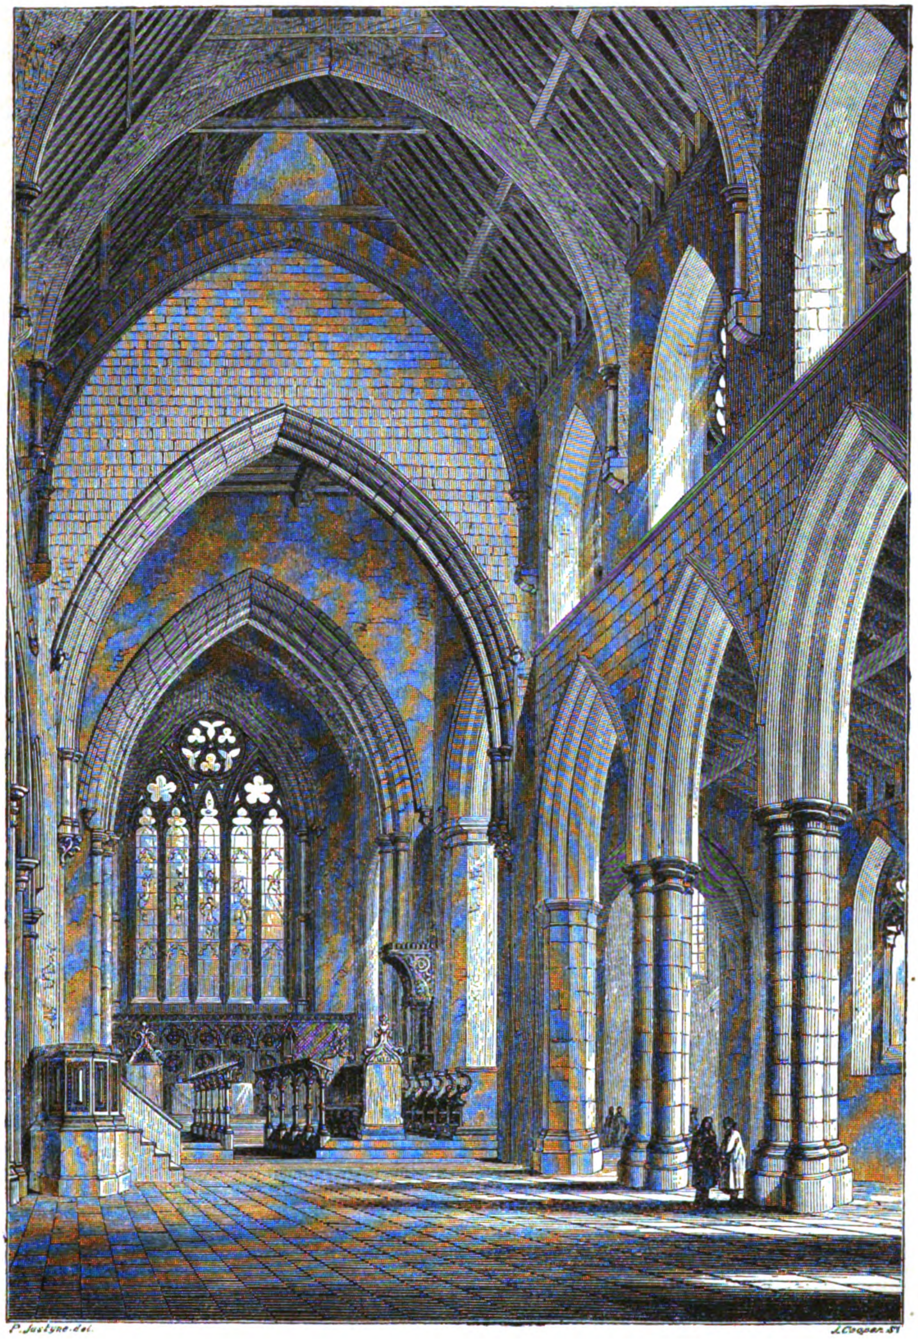
For the best plan of farm buildings, adapted for a farm of 200 acres, £25, Messrs. Hicks and Isaacs, Bath.

Commended, Frederick Chancellor, Chelmsford, Essex ; Messrs. J. Bailey, Denton, and W. Burnett, Westminster, London.

In the first class there were 27 competitors ; in second ditto, 19 ditto.

The following summary of the competitors in each class for cottages may be interesting :—

Class 1.	Double cottage not to exceed	£220	145
„ 2.	Ditto ditto	£180	72
„ 3.	Single cottage	£120	81
„ 4.	Pair of irregular cottages	£210	30
			328



KILMORE CATHEDRAL—INTERIOR.

Mr. Slater, Architect.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

NEW COLLEGE OF PHYSICIANS.

MR. WILLIAM G. MURRAY, architect, has been declared the successful candidate in the recent limited competition, and according to his designs the new college will be erected on the site of the old Kildare-street Club-house. A premium of £50 has been awarded to Mr. John M'Curdy, and we now proceed to particularise their drawings, as also those of the other competitors—Messrs. Turner and Drew, J. S. Butler, C. Geoghegan, and D. C. Ferguson, architects, respectively:—The selected plan provides a building three storeys in height, including basement—where, as in all the other plans, the culinary offices and living rooms for caretakers are situated—a façade with 61 feet frontage and about similar height, and a depth from front to rere of 83 feet, being two feet less than that defined in the instructions to competitors. The ground or principal floor is approached from the street under a tetrastyle Roman Doric portico through a semicircular-headed doorway, with smaller window opes of corresponding character in the intercolumniation at either side, and thence through a vestibule to the entrance hall, which is 18 ft. by 16 ft., and decorated with Corinthian columns and coffered ceiling. Off this apartment are a reading room, 20 ft. 3 in. by 18 ft., and a private staircase to the right (lighted from an inner area); a council room and examination hall, 20 ft. 3 in. by 18 ft., communicating with a registrar's office, 14 ft. by 13 ft. 6 in. at the left, also lighted from an area; and at the level of first lobby of principal staircase, which is central, and consists thereat of *one* spacious flight, is the college hall, 59 ft. 6 in. by 30 ft., occupying the entire rere of the building. Minor apartments, &c., are also introduced. On the first floor a library, 34 ft. by 18 ft. (with librarian's apartment behind), and a museum, 25 ft. by 18 ft. are provided in front, the double flighted staircase descending to lobby, the upper portion of the college hall, and the two small areas at rere, before described, comprehending the remainder of this storey. The façade is a classic combination of Roman Doric and Corinthian, boldly and sensibly treated. At either side of the portico, which has disengaged columns and is finished with a triglyphed entablature and blocking, is a square-headed architraved window, central between it and a broad rusticated pier over which is broken a continuous pedestal. From this level rises central, and to the extent in breadth of the portico, a pedimented projection with three quarter Corinthian columns over those below, and semicircular-headed window opes between; and at each wing are coupled antæs over the piers. The windows of this storey between centre and wings are pedimented. A main entablature, mutuled and dentilled, with a balustraded parapet, surmounts the whole. Perspective views, both of the exterior of the building and the interior of the college hall, admirably drawn and etched by Mr. Trevor Owen, afford a good idea of the effect when executed, and we have no hesitation in saying, without disparagement to the other designs, that this building will prove in every respect suitable, and an acquisition to the architecture of the city.

Mr. M'Curdy's elevation is considerably more elaborate than the foregoing, and his general arrangements more extensive and costly—indeed so much so, that he would seem to have lost sight of one of the conditions of the competition as regards expenditure. But the drawings—seven sheets in number—are very creditable, and represent such an amount of labour as the premium awarded will hardly do more than moderately requite. The ground plan shows a portico with double entrances and steps at either side, leading to a central hall, 30 feet by 20 feet, and an inner ditto, 30 feet by 16 feet, with a grand staircase of reverse arrangement to the selected one—viz., *double* flights to lobby, and *single* therefrom to first floor. A beadle's office is placed in the front, at left of hall, and the registrar's also there at the right, with a waiting-room adjoining; a general reading-room, 37 feet by 30 feet, and a committee-room, 30 feet by 20 feet, across the rere; and on the first floor a curator's room is placed over entrance hall and the library, 44 feet by 20 feet, and museum, 50 feet by 20 feet, each carried up to a great height, and with galleries above at either side; a principal hall, 58 feet by 30 feet, is over reading and committee rooms. The design for this front is also a composition of Roman Doric and Corinthian, though the ornamentation and the fenestral arrangements are Italian and Venetian. A projecting portico with three arch-headed opens highly rusticated, and a Corinthian columned superstructure above, a continuous triglyphed entablature for the basement, and a highly ornamental do. and balustraded parapet above, would seem in the description—were it not for our preliminary remark—to suggest a similarity in design to that approved. But it is not so, for the elaborateness of its ornamentation contributes a character of "Club House" architecture which the other has not; and in viewing the latter, we confess to have been temporarily transported in imagination to Pall Mall and the neighbouring district, where palatial structures abound like trees in a forest. The porch columns and triglyphed entablature being lower than that of the principal storey, the entablature of the *latter* is continued behind the balustraded parapet of the *former*, which we do not approve of. In other respects the elevation has merit.

Messrs. Turner and Drew submitted *two* sets of plans and *three* different designs for the façade; all of more or less merit, but to our mind that marked A is A *one* of the entire lot, and B equally commendable as an architectural composition, but unsuitable for the intended purpose. The application of the latter to a concert hall, arcade, or bazaar entrance would find numerous admirers of its pleasing broken outline and vigorous details. Design A, unlike any of the others, has three storeys, exclusive of basement, a distyle in Antis Roman Doric portico, with plain entablature surmounted by a coat of arms; square-headed windows with rustic piers on principal storey; a series of arches springing from entablature over coupled Ionic columns, and embracing two storeys, the second and third, with semicircular headed windows lighting the latter, a handsome bracketed and pannelled main entablature and ornamental parapet. The arrangements of both Messrs. Turner and Drew's plans are very commodious.

Mr. Geoghegan's plans present, in their general features, rather well-contrived arrangements; the principal floor comprising a central entrance hall, 19 feet by 12 feet, with inner hall and intersecting corridor, a central grand stairs with single flight; a committee room at right of hall, a registrar's office at left, and a beadle's and reading-room at rere, with minor apartments intermediately placed. On the first floor the principal hall, 56 feet by 28 feet extends across the entire front, and separated by the staircase and lobby are the museum and library, each 31 feet 8 inches by 18 feet 9 inches. Considerable labour seems to have been incurred in elaborate and various coloured patterns of tiles on the floors of hall and passages, admittedly well executed, but a superfluous work. The façade has some merit, but is too light for the purpose, though we have no wish to put the architect out of conceit of his design, which is about the best of these we have seen by him. On the basement or ground story, a central semicircular-headed ope with a projecting balcony above resting on carved trusses and metal work in the door panelling, defines the entrance, and on either side are two square-headed windows, the wall having alternately raised and sunk continuous ashlar courses surmounted by a plain moulded string course. Above this level, and lighting the "college hall," are five tall semicircular-headed arched opens with *black* stone dressings—too severe a contrast—and in the spandrils above are medallions, the whole terminated by an entablature, with a parapet over, having raised panels in the frieze, whereon are inserted the names of Æsculapius, Aristotle, &c., &c.

Mr. J. S. Butler is hardly as happy in his design for the elevation of this building as in others of his works, it being of Italian character, with coupled rusticated quoins at wings carried up full height, a narrow but highly ornamental centre-piece and two windows with small piers at either side, those of the ground floor having grouped sculpture over, and of the first segmental pediments, except the centre, which is angular, the general contour being crowded, and displaying excess of features—a fault irremediable even by the most skilful working out of detail. In the plans we have nothing special to note. Mr. D. C. Ferguson has two designs—both classic—one more expensive than the other, but seems either to have not carefully studied his subject or to have entrusted the drawings to less competent hands; in candour and with regret we must say there is not a particle of architectural merit in either. A slight similarity exists as to arrangement of the centre-piece of elevation with the adopted plan, but it merely consists in the *fact* of each author having decided on a projecting portico of two orders—Roman, Doric—below and Corinthian above, terminated by a pediment; but looking on "*that* picture and on *this*"—reversing the quotation—a marked contrast in favour of the former is palpable in the treatment of accessory features. In the abstract we cannot, with certain exceptions to be inferred from our notes above, regard the display on this occasion compared with others as respectably representing the available professional talent of our city, for such an important work.

INTERNAL DECORATION.[*]

THE philosophy of architectural ornamentation is continually being more deeply sifted, and a sound eclecticism is widening its area of choice. The application of coloured material—marble, brick, and so on—both to the main features and the decorative details of buildings, is every day coming into vogue with a fulness which never could have been compassed while the steam-engine was still unknown. A few years since those who were in the van of this movement for "polychromatic architecture," or for "constructive coloration," had to give reasons and prove opportunities; now we are almost overwhelmed with success. Architects—Gothic, Italian, Victorian, Sacred, and Profane—are all vying with each other who can produce most red brick, yellow brick, and black brick—most granite, serpentine, and encaustic tiles—over their buildings. There may be here and there exuberance, if not extravagance; but this is only the natural recoil from the malebolge of stock brick and cement in which we had been so long wandering. I have almost now to address a caution in another direction, and to remind the man who is planning a Gothic interior that there is such a thing as a paint pot, and that while "constructive coloration" may rightly be his staple, there were brave men of old who have left immortal achievements traced by their brushes in the higher branches of pictorial decoration. Mosaic—the most ancient and the most eternal system of pictorial art in Christian churches—has hitherto been a stranger to England, but mosaic pictures are in contemplation at St. Paul's. Carvers in stone and wood are ever making fresh progress, both in their own handiness and in the respect which they enjoy; workers in metals and enamellers of tiles are rising in general estimation; glass painting, which used to be reckoned amongst the lost arts, is not only found again, but found in a state of constant advance towards artistic perfection. Above all the unity of all art is beginning to be practically organised. The architect, the painter, the sculptor no longer selfishly pursue their own independent professions, as if they were rivals and antagonists, but they either of themselves borrow from time to time their neighbours' craft, or else they combine together—while each adheres to his own department—to complete those works whose failure or whose success depends upon the combination. Giotto, is at last recollected, both painted and built, and Michael Angelo was sculptor, painter, and architect. In one word, eclesiastical, and indeed all architecture in England, is at this moment working out for itself that lesson which the equalising effects of science now enable northern regions to learn to an extent which used to be only allowed to the warmer south—that of the fusion of construction and decoration in the variety of materials, natural and artificial, and the contrast of their forms and colours. It is the experimental adoption of this system which makes the broad distinction between the more meritorious new churches of the last ten years and their predecessors built within the preceding years. Accordingly I anticipate that our new cathedral will show more complete and gorgeous developments of English polychromatic architecture than we have yet beheld. I go further and say that it is to the successful working out of this element of beauty that I look in the new cathedral as the compensating æsthetic advantage for the disuse of those constructional features—those double aisles and fringing chapels of the old cathedral—which, with all their grandeur and their loveliness, can find no place in our purer and simpler system.

---

[*] Beresford-Hope's English Cathedral of the 19th century. London: J. Murray.

HELIOGRAPHIC PRINTING.

Two processes, the one for "photolithography", the other for photo block printing," have been patented under the above title, by Messrs. Beatty and Alexander, in this city, some particulars of which we take from the specification as follows:—We take a sheet of paper or any other substance free from granular texture, and coat its surface evenly with the transfer medium ordinarily used for transferring drawings to stone or zinc, or take any other suitable transfer matter or composition used by lithographic artists, which answers the purpose; but we prefer the medium composed of two ounces of isinglass, quarter of an ounce of arrowroot, quarter of an ounce of gum tragacanth, and four ounces of flake, white, or washed chalk. This composition, when warm, is about the consistence of cream. We apply it in that state with a flat brush or sponge to the surface to be coated; the surface thus prepared, when dry, is hot-pressed or calendered.

In addition we use gelatine, size, dextrine in solution, arrowroot, wheat, barley, and rice flours made into jelly paste, to which may be added flake white and gamboge, lucine or vegetable albumen, and also animal albumen, either alone or covered with the transfer medium. We sometimes impregnate the paper with a composition of asphaltum dissolved in turpentine, or benzole and caoutchouc dissolved in chloroform. If the photographic proof to be reproduced be formed of delicate shading, we mix with the composition already described hard granular substances, such as fine emery powder, peroxide of iron, glass, and flint finely ground in a mortar in proportions according to judgment.

In order to make the surface so prepared capable of producing a photographic proof, we employ bichromate of potash or other chromate salt having similar properties. Further operations with it are conducted in a room from which daylight is partially excluded. A quantity of the solution is poured into an earthenware tray of the size to answer the prepared surface, and is carefully taken by the corners and its middle allowed to come in contact with the liquid, dropping the corners gradually to prevent air bubbles; if any be formed, they should be removed with a glass rod. Having allowed it to remain some minutes upon the solution, changing its position at intervals, it is lifted and allowed to drain, and primed up by one of the corners. When thoroughly dry it may be pressed or calendered if necessary; this operation of sensitizing the prepared surface may be performed a second time. By the well-known processes of photography, photographic proofs are obtained which may be negatives of the objects which we wish to make a printing surface on stone or zinc. When sufficiently lighted, the copying frame should be removed into the dark room. Upon inspection it will be found that a faint image is formed on the prepared surface.

The next operation is to utilize this property of the chemical action of the light, and to change the nature of the image in order to produce a printing surface. This we perform by an impression taken from a metal plate executed by an engraver; it may have on its surface a mezzotint or aquatint ground, or it may be a ruled plate, the lines being horizontal and diagonal, of different degrees of fineness. When the impression is dry, or partially so, it is placed up in a zinc tray containing water, in which some gum arabic is dissolved, heat being applied under the tray. The proof is allowed to remain until the water becomes heated; it is then taken up and laid face down on water at a lower temperature, when it will be found that the printed impression will leave those portions of the proof unacted on by the light. A gentle rubbing with a piece of Canton flannel or a camel-hair brush will leave the photographic proof in printer's transfer ink, in consequence of its adhesion to the insoluble lighted portions, and will retain the grain of the plate from which it was printed.

The following circular has been addressed by some of the metropolitan master builders to the editors of various publications:—

Sir—We have read the letter in the journals of the 15th inst., headed "The Builders' Strike," signed by eight gentlemen, most of whom we believe to be members of the legal profession, the avowed object of which was to obtain a hearing for the workmen. In the first place, there never was less reason to complain of want of publicity upon any question, abundant currency having been given to the statements of the workmen by the public press, and the masters have at all times been ready to discuss with their own workmen, in detail, all matters affecting their interests, but have declined to see the delegates from trades' unions.

Although it is now stated that the present movement on behalf of the men is not for what is termed the "nine hours' system," the change resulted entirely from the renewal of that agitation. Payment by the hour is intended solely to remove this cause of strife for the future, and there is no wish, nor has it ever been intended, to deprive the carpenters of their customary allowance for sharpening tools, or any other trade privileges which they have hitherto enjoyed. The assertion that masters wish the men to work longer than ten hours per day, except in cases of emergency, we emphatically deny. So contrary, indeed, is the fact, that we are frequently requested by the men to allow them to make overtime at the usual rate of wages—a request that is often on that account acceded to.

It would be manifestly unjust to submit to arbitration a question practically settled to the entire satisfaction of the great majority of the men employed in the building trades, and now only kept alive by the agitation of a few members of the trades' unions.

In justice to the men in our employment, we indignantly deny the statement that they are inferior workmen, or that they are working under protest. They have been selected for their skill and experience, and the majority of them have been with us for many years, and we are certainly at a loss to conceive by what reasoning the few men now on strike can venture to impugn the abilities of many thousands of their fellow-workmen.

In conclusion, we beg to deny, in the most explicit manner, any covert intention— a charge which has been industriously circulated—and we cannot too distinctly assert that our only object in the change was one of conciliation.

We are, Sir, your obedient servants,
Cubitt and Co., Gray's-inn-lane.
Holland and Hannen, Duke-street, Bloomsbury.
George Myers, Lambeth.
George Mansfield and Sons, Gray's-inn-lane.
George Smith, Pimlico.
Waller and Son, Lyall-street, Belgrave square.
John Kelk, South-street, Grosvenor-square.
Lucas Brothers, Lambeth.

July 18.

At a recent sale in London, the carved chair, designed by William Hogarth for David Garrick, was knocked down at 300 guineas. Miss Burdett Coutts is said to have been the purchaser.

THE INCORPORATED BRICKLAYERS OF KINGSTOWN.

This body has addressed a remonstrance to their fellow parishioners against the employment of strange hands from Dublin on the new church of St. Patrick's, at present in course of erection, alleging, and with some reason too, that "they naturally expected as the funds are to be collected solely in the parish, they should be employed in the erection of St. Patrick's church in preference to strangers. The work, however, had scarcely commenced, when, to their surprise, the members of the society—the only incorporated one in Kingstown—were disemployed, and in their place were taken strangers, and (some at least) doubtful characters; adding that they respectfully represented this to the committee, requesting that the builder should not be permitted to act in a manner so arbitrary, but finding no redress, now come with much reluctance to place the matter before the parishioners, declaring that, should this course be persisted in, they shall give no subscriptions themselves, nor hesitate to advise their friends to withhold their contributions until the affair be managed in a proper manner."

We can well understand the difficulty of a contractor's position in this question, but if an adjustment be practicable we think the appeal entitled to favourable consideration, although we should have preferred it were made on its own *merits*, without the alternative threat expressed at conclusion.

Notes of New Works.

Mr. Sykes, of Dame-street, is about erecting two houses at Rathmines.

A new front is being put to Mr. Brunker's shop, Grafton-street. J. S. Sloane, C.E., architect; Mr. Drysdale, builder.

A villa residence for sub-inspector of constabulary is about to be erected on the demesne of Caherconlish, county Limerick, for Charles M. Wilson, Esq. J. S. Sloane, architect. Probable cost, £1,250.

The restoration of the great tower of Lusk has commenced under the superintendence of J. S. Sloane, C.E., the funds having been generously supplied by the neighbouring gentry at the instance of the Rev. W. Reeves, D.D., Sec., M.R I.A.

A very beautiful and useful ornament to the town of Swords, is about being erected in the shape of a fountain (to supply the central portion of the town with water) by the governors of Swords school. Their architect, Mr. J. S. Sloane, C.E., has taken the necessary levels and surveys, and the works will shortly commence.

We understand that Messrs. Cockburn and Son have been declared contractors for the new Insurance Offices, to be erected in Upper Sackville-street, on the site of those recently occupied by the "Standard" and the "Colonial" companies. Mr. William Murray, architect.

Plans are in preparation by Mr. J. J. Lyons, architect, for five dwelling-houses of novel character, and to face the main road, to be erected at Clonskeagh, on the property of Messrs. Henshaw and Co., implement manufacturers, ironmongers, &c.

Premises have been taken in College-green and Dame-street by two Scottish insurance companies, who intend to rebuild and alter them for the requirements of their offices.

The clock turret over the dining hall of the South Dublin Union Workhouse is to be completed, according to a specification by Mr. Murray, architect.

The timber bridge, leading from Dollymount to the North Bull, is being repaired by the Ballast Board, under the direction of Mr. John Connolly, a (Buckingham-street) contractor. It has for a long time needed some improvement.

The permanent way of the Sligo Extension Line is now laid from Ballymote to the south side of the cutting at Maheraboy, and on the 1st of November the entire line from Sligo to Longford will be open for traffic. A temporary wooden terminus is being erected, and a number of hands are engaged.

It is proposed to establish a lunatic asylum for the North Riding of the county of Tipperary.

A short line of railway is proposed to be constructed from the wooden bridge of Avoca towards Collatten, and through Lord Fitzwilliam's estate.

The inhabitants of Dundalk are anxious to pave the town with the Caithness flagging now being employed in Talbot-street, in this city. The material appears to be very strong and durable.

The works on the Dublin and Meath Railway are progressing with great rapidity; Messrs. Moore, Brothers, contractors. An inspection by the directors, the engineer, Sir John Macneill, and others, was made on the 16th ult. The line is 35 miles in length, of which 23 are on the main line from Clonsilla to Navan, and 12 on the branch from Kilmessan to Athboy, and, as no considerable engineering difficulties were presented, the cost is comparatively small. Upwards of £30,000 have been expended on the latter portion.

The Ulster Banking Company have taken premises in College-green, opposite the Bank of Ireland, which will be suitably fitted up as offices, &c.

The recently erected new church of Ballintemple, Dundrum, has been consecrated.

The foundation-stone of the new Roman Catholic church at Carrickmacross has been laid.

The extensive alterations and additions for some time in course of progress at the Royal School, Enniskillen, are fully completed, as also those at Dungannon, but at this latter establishment still further extension is required, and Mr. M'Curdy, architect, has been instructed to prepare plans for same.

Sundry works are to be executed at the churches of Aghancon, King's County; Killala, county Mayo; Castletown Arra, county Tipperary; Ballylanders, county Limerick; and St. John's, city of Kilkenny.

Extensive alterations and additions are being made at Coltness House, near Glasgow, for R. Holdsworth, Esq.; Mr. Thomas Turner, architect.

An entrance, &c., is in course of erection at Montalto, Co. Down, for David S. Ker, Esq., M.P.; Turner and Drew of Belfast, architects.

Mr. H. Grissel, proprietor of the Regent's Canal Ironworks, London, has been declared contractor for the erection of the new lighthouse to be erected on the Calf Rock, South Coast of Ireland. He is assisted by Mr. Alfred Cook, C.E., and the difficulties to be surmounted being of a more than ordinary nature their combined skill will be severely tested.

Mr. Lawton has been declared contractor by the Port of Dublin Corporation for the construction of two new wharves on North Wall-quay. A project for producing the quay and other works in connection therewith is on the *tapis*.

NAAS.

Some alterations are in progress at St. David's Parish Church, Naas. Among others, an early English triplet window, 18 feet in height, is in course of erection in the chancel, to the memory of the late vicar, the Rev. Walter de Burgh. The pins have polished limestone columns with carved capitals, dog tooth, &c. The stone work and sculpture are being carried into execution by Messrs. Abbey and Harrison of Great Brunswick-street. The stained glass by Edmonson. A rearrangement of pews is being made, open ones with carved bench ends being substituted; chancels altered, passages tiled, &c. &c. Mr. Thomas Drew, architect. This church contains a few remains of the early English period; among others, a very fine and venerable font, part of which is in excellent preservation. We may mention that the liberality and good taste of some departed churchwardens have fitted it with *wooden* legs, beautifully *turned*, and that its youth has been renewed weekly by being *black-leaded*. A tower—commenced on a gigantic scale in the last century, by a defunct Lord Mayo, suggestive in its uncompleted vastness of the tower of Babel—contains a very fine bell of the 16th century, as it informs the inquirer by a Latin inscription. A very beautiful stone pulpit, lectern, &c., were erected a short time since; Messrs. Purdy and Outhwaite, sculptors.

The town of Naas presents few objects of interest and little signs of progress; within the last year or two additions have been made to the county gaol and court-house; Mr. M'Curdy, architect; and the Town Commissioners have converted the old gaol into a town-hall for public purposes. It does not call for any special remark whether viewed constructionally or artistically. The town is still unlighted with gas, and does not boast of a bank, although the assize town of the county.

To the generally uninteresting architectural character of the town, the spire of the R. C. church offers an exception. It is, we believe, the work of Mr. M'Carthy, and is of remarkable beauty; viewed from all points of the low, flat country, by which it is surrounded, whether in sunshine or storm, it presents an object on which the eye ever dwells pleasantly. *Inter alia* we may mention, that close to the town an extensive ruins of a brick building, in the Jacobean style, interesting as having been commenced by the unfortunate Strafford, and the building of which is said to have been one of the sins laid to his charge in the indictment which cost him his head.

As has been before mentioned in these columns, a mansion is in course of erection in the neighbourhood, for Richard Moore, Esq., of which Messrs. Lanyon, Lynn and Lanyon are the architects; its elevated situation, lofty tower, and uplifted gables make it a prominent feature in the landscape. Not far from this a mansion has been erected for Penthony O'Kelly, Esq., which presents some features worthy of notice.

Although scarcely falling within our province, we cannot pass by, on our way to Dublin, without noticing the extraordinary inscription which adorns the gate piers of the town burial ground, "Lord Mayo to the inhabitants of Naas has bequeathed *a lasting habitu-*

tion not made with hands.'" We will venture to say a more ludicrous use of Scripture is rarely met with, and if the statement be only borne out by facts, the "inhabitants" ought to be sincerely grateful to the long departed nobleman.

LAW NOTE.—CORK ASSIZES.

Klein v. *Boland.*—Action by Mr. Frederick Klein, a local civil engineer, against Mr. Thomas Boland, for £95, alleged to be due for work and labour. Plaintiff's case was, that in 1856 defendant presented a petition to the Landed Estates Court for the sale of his property, and employed Mr. Klein to survey it. Plaintiff surveyed the property and furnished his bill at a sum of £283 16s., which was stated to include two separate accounts, one for £100 16s, which the taxing master reduced to £35, as the proper sum; and the other for £183, for lithographic plans, which were laid before the taxing master for the purpose of determining what items should be allowed as against the estate. For the defence the case relied on was, that in point of fact the plaintiff was not employed by Mr. Boland, and never thought of demanding payment from him until claim was disallowed by the taxing officer, and that the plaintiff agreed to accept whatever the taxing officers allowed.

Verdict for defendant, with costs.

TIPPERARY ASSIZES.

Darcy v. *Malone.*—Action for £297, alleged to be due to plaintiff by defendant, a P.P., for extra works executed as contractor for the building of the parish chapel of Kildangan.

Referred to John Stephen Dwyer and Joshua Robert Minnitt, Esqrs., for arbitration and award.

Reviews.

The English Cathedral of the Nineteenth Century. By A. J. B. Beresford-Hope, M.A., D.C.L. London: John Murray.

At first glance the title of this book would seem to imply merely a history or description of the cathedral structures erected during the present century, but in truth its purpose is much more comprehensive, and embraces a general review of cathedral art, both from an ecclesiastical and an architectural point of view, the respective peculiarities of existing Roman Catholic and English church structures, the contrasts of the continental and the English styles, and an essay on internal decoration, &c., is added. Mr. Hope, whose capacity to deal in a masterly manner with any subject appertaining to architectural progress, is too well known to render comment necessary in introducing him as the author, takes exception to the deficiencies apparent in the cathedrals of the present day, and advocates the inauguration and extension of a completely reformed system of church building, commensurate with the growing requirements of the age, and especially alludes to colonial progress in this regard as compared with that at home, in the following terms:—"It is true that no cathedral has been reared in England or Wales for the use of our communion within this century. But in that great England beyond the seas—the British colonies—where the church has had to constitute itself in every particular without the material advantage of being 'established,' the cathedral system has been within the last quarter of a century evolved out of nothing as the foundation of a great creative work." Citing illustrations in support of this assertion—the justice of which, however, appears questionable in many respects—references and views are given of the proposed cathedral designed by Mr. Carpenter—a man who never had the worldly good fortune to complete a building equal to himself—for Colombo, the capital of Ceylon,[*] those of Brisbane, New South Wales, by Mr. Burgess (the well-known successful competitor for the memorial church at Constantinople); St. Kitts, West Indies, by Mr. Slater, of which an effective photograph appended to the volume illustrates the interior; and Sydney and Calcutta cathedrals, the latter of which the author pronounces to be, "though deficient in beauty and correctness of arrangement, remarkable for the massiveness and size of its construction, and for the far seeing appreciation of the true office of a cathedral, put forward as the reason for building it by a prelate no way identified, but the reverse, with any strong views of ecclesiastical organization or ritual precision." Further than to assume that this building, judging from the illustrations is "lofty, spacious, and airy," with "an ample chancel or choir," of which an uninterrupted view is afforded to all the congregation, owing to the absence of the usual arcade piers, and may consequently in a utilitarian regard answer its purpose, we cannot either admire it in its integrity as even a partially successful work, nor as presenting any features desirable for adoption as a model for cathedral architecture. The mongrel character of its "Gothic" or "Christian Style," both externally and internally, the design of a colonel of engineers, which speaks volumes, and which the author feels bound to describe as "a sort of corrupt Perpendicular," and the waggon-shaped ceiling, admitted likewise to be "in no way amenable to any law of taste," suggest a regret that even qualified praise should be given to such a work, or that as a specimen it should have found its way into a book otherwise so valuable. Sydney cathedral, which is cruciform in plan, with nave, aisles, two rather squat western towers, choir, and transepts as ill proportioned as it is almost possible to be, can only be regarded as an effort—a wretched imitation of previous works, with stiff treatment throughout—a design on the whole, like the previous one, "to be avoided." Indeed, reviewing those examples of colonial architecture, and some of the descriptive matter referring to others, we cannot quite clearly see where "the foundation of a great creative work" is to be found. The author in explaining the idea which he proposes to develope respecting "the Cathedral of the Nineteenth Century," says, "the building and the institution are to be a cathedral distinct from and opposed to a parish church and its organization; they are to be English—English, that is, both nationally and ecccelesiastically—distinct from and opposed to foreign; and last but not least, they are to be of the nineteenth century, as distinct from and opposed to one of any earlier age." From the foregoing it is easy to perceive that the purpose of the work is no mere compilation or elucidation of facts and theories collected from the previous works of others, with additions under a new dress, but a broad, comprehensive, independent, and original plan. Speaking of British cathedrals of recent date, that of St. Ninians, Perth—designed by Mr. Butterfield "in a somewhat severe variety of Middle Pointed," for the Scottish Episcopalians, and which in many regards is highly meritorious though not wholly unobjectionable in others—is placed in foremost rank, and next thereto is that at Kilmore, in Ireland, the subject of our present illustration, and fully described at page 546.

The object aimed at, as above stated, is one of unquestionable desirability, for we live in too progressive an age to be content at merely following "precedents" in the cathedral buildings of the nineteenth century; and to conduce towards the attainment and maintenance of same, there is much of theoretical argument and practical illustration to be found in this book, which throughout is highly interesting, and displays great erudition, especially in those chapters treating of the contrasts between Early English and Early French architecture, and the "features" and "uses" of cathedrals respectively, in addition to being very handsomely produced in all departments.

Church and Conventual Arrangement (illustrated). By Mackenzie E. C. Wallcott, M.A., F.S.A., of Exeter College, Oxford, London: Atchley & Co.

The almost simultaneous appearance of *two* works, by able authors devoted to the consideration of Ecclesiastical Architecture, must be regarded, both as a happy coincidence and an illustration of the reactionary tendency of the age, to revive and reform a long-neglected branch of art. The exact purpose of the book now before us, as compared with that by Mr. Hope above reviewed, must not however, be confounded, and is thus briefly explained in the preface:—"It has been threefold; *first*, to trace and delineate the gradual and successive development, and the mutual influence of various schools of early Christian and mediæval architecture; secondly, to exhibit the expansion of the early church, owing to ritual changes, national character, or the intercourse of the builders with other countries; thirdly, to show the original type of conventual arrangements with its subsequent divergencies and modifications induced by the special requirements of particular orders of religious." Accordingly the history of the various styles of church architecture, including Byzantine, Basilican, Lombardic, Continental, and British, with their several sub-divisions; and the prevailing characteristics in *conventual* and conventual *church* arrangement according to the habits and requirements of the occupying communities, are ably traced through reference in notes, to eminent authorities, so multitudinous as even at a glance to show an almost infinite amount of labour on the part of the earnest author. Passing from Continental to English architecture, he says, "The earliest English architecture of which we have any record, historical or material, was neither borrowed from France nor communicated from Germany. The Latin and Greek schools were distinguished by an apsidal east end. The Irish was equally marked by a square east end, a form adopted in England, Wales, Denmark, the north of Germany, and partially in the north of France;" and in a note adds, that "Dublin appears to have been the school of North Wales." Again, he remarks that "the connection between the church of Glastonbury, where St. Patrick was said to have been buried, and those of Ireland of similar size, according to rule, has been well pointed out by Mr. Poole (Hist. of Eng.). The Cornish churches of the fifth to the seventh centuries, built by Irish missionaries generally, were provided as in Ireland with a well; simple parallel chancel, separated by a low stone step, with a stone altar and a stone bench table." Elsewhere we quote from this work a special chapter on the architecture of Ireland. In the chapters referring to conventual church arrangement, we find that, "that of the Benedictines was uniform, a cruciform building with towers and chapels marked by great magnificence;" while that of the Cistercians displayed "extreme simplicity of outline, absence of triforium and pinnacles, a single central tower, a simple west front and plain undivided windows—for no ornament of any sort, not even of painted glass, was admitted—and a flight of stairs led from the transept into the dormitory." The churches of the friars are also alleged to have been, whether Franciscan, Dominican, or Carmelite, "oblong, of unbroken length, destitute of a triforium, and generally provided with only a single aisle or a single transept; and the general plan of the Irish Franciscan monasteries to have included an irregular quadrangle "with square cloisters in the centre, bounded by the church generally on the north side (Kilconnell, however, being an exception), and by the monastic buildings on the other three sides." Moreover, he adds, that "the architecture appears to have been copied from Italy and Spain," and that "within the pale there was an undoubted English influence." The Irish cloisters, like those of Spain and France, were never glazed, and exhibit an arcade of open arcades, supported by pillars; those of Kilconnel appearing to be a simplified arrangement of those of Huelgas and Fontevrault."

---

[*] See page 573, No. 38, of this Journal.

We have, perhaps, by the foregoing remarks and quotations, without further penetration, afforded sufficient reason for conclusion, that the work is one of *some* merit; but we may, with perfect safety, go farther and assure, that it presents an invaluable and almost inexhaustible fund of reference, collected from the most unquestionable sources, comprehensively classified; and therefore its desirability of acquisition by archæologists and those either professionally or otherwise engaged in the study of the church and conventual architecture, is placed beyond question. As to its outward style of production, the name of the publishing firm is a guarantee of excellence; the illustrations, which comprise plans of various continental and British cathedrals, abbeys, monasteries, &c., being especially well executed by Mr. J. R. Jobbins, a lithographer of eminence, to the character of whose work the majority of our readers are no strangers.

Received.—Copies of recent numbers of *Old Jonathan* and the *British Workman*, both very useful and creditable publications in their way; also the August number of *The Lamp*, which seems to be progressing in merit and popularity.

Miscellaneous.

Preliminaries of the New Water Works.—The Lord Mayor called a special meeting of the Town Council together on the 30th ult., to give vitality to the bill just obtained from Parliament for the construction of the necessary works to ensure an improved supply of water to this city. Our cotemporary, the *Freeman*, which certainly has devoted itself with much ability and earnestness to the development of this project all through, and, no doubt, is prepared to share in the responsibility or the merit in the event either of failure or success, says—"the first result of this step will be the equalisation of taxation, and the removal of those impediments to sanitary improvement which the existing form of taxation has interposed. A great evil will thus be gotten rid of at once. The poor will no longer have to pay for the rich, and the introduction of a water-closet and a bath into the homely dwelling of the son of toil, who most needs an occasional bath, will no longer, as now, subject him to a tax practically prohibitory in its nature and extent. If the new act effected these two purposes alone—the equalisation of taxation, and the removing of the tax on sanitary improvement—it would be a boon worth all the cost and labour at which it was procured."

The Illustrated Sheet for June 15th.—In answer to enquirers for the illustration of St. Mary's Institute for Catholic Blind Females, Harold's Cross, which should have accompanied our number for June 15th, we beg to say that the block was accidentally and seriously damaged and has been sent to London to be repaired, *if practicable*, and an electrotype cast taken therefrom. We await its arrival to present the promised illustration; but should it not have proved possible properly to repair it, we must have another engraved, so as to perfect our volume for the current year.

The Perfection of Mechanism.—"In short, all the improvements for our convenience and comfort, dating from a state of barbarity to one of high civilisation, are but the cumulative results of inventive ingenuity; and in no instance is this more clearly seen than in the history of those beautiful inventions which have from time to time been brought to bear upon the science of Horology. Trace its history from the time of the Romans with their clepsydra or water-clock, and Alfred with his candles, from hour glasses and sun-dials, down to that miracle of ingenuity 'The Watch,' and see how improvement has succeeded improvement, until at last those now manufactured by Benson, of 33 and 34, Ludgate Hill, and 46 and 47, Cornhill, London, have been characteristically described as 'the perfection of mechanism.'"—*Standard.*

Benson's Illustrated Pamphlet, post free for two stamps, is descriptive of every construction of watch now made. Watches safe by post to all parts of the globe.

Clontarf.—By your frequent notices of this neighbourhood, you evince an interest in its welfare, but when you complain of its retrogradation, may I ask, have you remarked the filthiness of the entire strand, and the intolerable stench at the first bathing boxes, which, you very properly say, are "an outrage on decency?" All the filth of the city is here deposited, the water polluted thereby, and as black as ink, yet swarms of the lower orders luxuriate in it during summer months. Add to this the frequency of "corpses." —I mean of dogs and cats—along the shore, and certainly in a sanitary regard the investment of capital even under the most encouraging landlord, would seem to be questionable prudence.—Pedestrian.

[Our correspondent does not weigh the admitted *dis*-advantages with the advantages, and that alluded to could to a considerable extent be remedied, if the property were under the auspices suggested. —Ed.]

Pillar Letter-boxes.—One of these has been fixed at the intersection of Lower Gardiner-street and Great Britain-street as a substitute for the branch office so many years at Wyer's (stationers), in the latter-street; but on sending to be posted therein a small parcel containing four copies of the Dublin Builder, the aperture was found *too small to admit them*, and consequently they had to be forwarded to the G.P.O. In distant localities this might be attended with *great inconvenience*, and ought to be looked to at once. The actual outward size of the open is 6 inches by 3 inches, but the flap only recedes from the front, leaving a clear passage for letters, newspapers, &c., less than *an inch and a half*—quite too small.

The Late Mr. Woodward.—Propositions are being circulated by a committee, consisting, amongst others, of the Dean of Christ Church and Dr. Acland, Messrs. Holman Hunt, G. Richmond, and G. E. Street, which has been formed for obtaining subscriptions for a memorial to the late Benjamin Woodward, architect, of Oxford and Dublin. The circular speaks of the deceased as one of the gentlest and most appreciative mind, which, while it elevated his tastes and exalted his feelings, made him almost a recluse in society and greatly restricted the number of his intimate friendships. Of his singular genius it is superfluous to speak. The plan for the memorial is somewhat a novel one, comprising, first, a biographical and critical sketch, of his life and his works; secondly, a series of photographic illustrations of his principal public and private works, to accompany the above-named sketch, and to include both general views of elevations, and also numerous details, such as roofs, windows, doors, and interiors; thirdly, a bust, in marble, to be presented to the Oxford New Museum. It may be well to state that Mr. Woodward was the architect of the Crown Fire-office in Blackfriars, lately put forward in the House of Commons, and rightly so, as a fine sample of Modern Gothic Art. He also held a high position at the competition for the new Government offices.—*Athenæum.*

Architecture at the Royal Hibernian Academy.—Alluding to this department of the exhibition now open in Lower Abbey-street, the *Freeman* says—"The architectural drawings in this room comprise several beautiful and tasteful designs. The approved design for the new church of St. Andrew, by Mr. Lynn, is a perfect gem of its class. It is to be regretted that the site of the old church in St. Andrew-street, whereon the new building is intended to be erected, is not sufficiently spacious to display the noble proportions of the projected Gothic edifice. There is a handsome design for a collegiate school, and a design for a new Catholic church from the pencil of our talented townsman, Mr. Charles Geoghegan, architect of St. Joseph's Deaf and Dumb Asylum at Cabra. It may be observed that the architectural drawings and designs are of great excellence, and are arranged most judiciously in this year's exhibition, the general character of which as regards the variety and excellence of the works of art presented may be justly pronounced most creditable to Irish genius."

The New Bridge in Cork.—Having alluded in an earlier number, at some length, to the progress of this important structure and the excellent character of the work, we note with pleasure that our approval has been endorsed by that of a local journal, which says—"It will well repay a visit to any one anxious to see what superior masonry and cut stone work is to look in at the works of Patrick's Bridge, now rapidly drawing to a close—the ballustrades particularly are the most perfect specimens of chiselled work we have ever seen in limestone. Indeed the whole structure reflects the greatest credit on the architect, Sir John Benson, and the contractor, Mr. Hargrave, for the superior manner it has from the foundation up been executed."

Public Health.—At the approaching meeting of the National Association for promotion of social science, the committee in this department will comprehend Messrs. Thomas N. Deane, J. J. M'Carthy, and F. V. Ciarendon, architects; B. B. Stoney, C.E.; Doctors John Gray, J.P.; Rawdon Macnamara, W. R. Wilde, Robert Law, Joseph Lawlor, Richard Daniel, J. B. Greene, and James M. Wilson, Esqrs.

BENSON'S WATCHES AND CLOCKS.
Manufactories, 33 & 34, Ludgate Hill, and 46 & 47, Cornhill, London, E.C.
Established, 1749.

J. W. BENSON, as an eminent and old-established London Watch and Clock Manufacturer has, for the guidance of intending purchasers, published a new Illustrated Pamphlet on Watches and Clocks (free for 2 stamps), which should be carefully read by all before buying. It contains a full description of every construction of Watch now made, with their prices, including Chronometer, Duplex Lever, Horizontal, and Vertical escapements. It contains also numerous designs for the decoration of Watches, by eminent London Artists, made expressly for this Manufactory, and sketches and prices of various kinds of Clocks and Timepieces. This work is so arranged that persons living in any part of the world can select the Watch best adapted for their use; and have it forwarded free and safe by post, direct from the Manufactory, on receipt of a remittance. It also contains plain and practical directions as to the Watch to buy and how to use it. Every Watch warranted for two years

Benson's Lady's Watch.—"Exquisite artistic feeling in ornamentation and perfection of mechanism." —*Morning Post.*

Silver, 3 to 18 guineas. Gold, 5 to 50 guineas.

Benson's Gentleman's Watch.—"All that can be desired in finish, taste, and design."—*Globe.*

Silver, 2 to 50 guineas. Gold, 6 to 100 guineas.

Benson's Lever Watches.—"Leave nothing to be desired but the money to buy them with."—*Standard.*

Silver, 4 to 30 guineas. Gold, 7 to 50 guineas.

Benson's Horizontal Watch.—"A good Watch without paying an exorbitant price."—*Daily Telegraph.*

Silver, 2 to 8 guineas. Gold 5 to 20 guineas.

Benson's Clocks . . . . . . 1 to 50 Guineas.

Liberal terms to captains, merchants, shippers and watch clubs. Old watches taken in exchange, or repaired. All communications to be addressed to the Manufactories,

33 & 34, *LUDGATE HILL*, or
46 & 47, *CORNHILL, LONDON.*

IMPERISHABLE TESSELATED PAVEMENTS.—H. SIBTHORPE AND SON, Agents to Maw and Co, are prepared to supply Designs for Floors of Churches, Conservatories, Entrance Halls, and Passages, with proper Workmen to lay them in any part of Ireland.

Various specimens may be seen at their Warerooms,
11 and 12, CORK-HILL, DUBLIN.

TERRA COTTA—Warranted to stand the most severe frost.—This material is especially fitted for Garden Decorations, and for all exposed work, such as Fountain Basins, Garden Vases and Statues, Balustrades, Tracery for Terraces and Parapets, Terminals, Crosses for Gables, Capitals of Columns, Brackets, Consoles, Chimney Shafts and Pots, and all other work exposed to wet heat, and frost. Specimens may be seen at 16, Great Marlborough-street, London, W., and at the Works, Stamford, Lincolnshire.

TO BRASSFOUNDERS, ENGINEERS, REFINERS, ETC.

THE PATENT PLUMBAGO CRUCIBLE COMPANY beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist.

For Lists, Testimonials, etc., apply to Battersea Works, London, S.W.

EMPLOYMENT WANTED—ARTIZAN REMONSTRANCE.

WHATEVER erroneous impressions may have gone abroad in certain quarters, respecting the actual purport of our mission, we point with confidence to that part of it so far fulfilled during the last two and a-half years, and ask for a single instance to be adduced against us wherein we have ignored the claims for consideration of "*the artizan*," and unduly identified ourselves in the interest of "*the master*." Such never *was*, nor ever *shall be* our wish, silent or expressed; and those in our confidence acquainted with circumstances to which we cannot now refer specially, will at least endorse as perfectly sincere and truthful this statement, which to remove apprehensions we feel called on to put forward *distinctly*, in reference to the subject in question. True, that common gratitude will induce a leaning towards those who in all stages of a responsible undertaking have extended a helping hand—such, indeed, as we always found ready to our grasp since this journal was established—and true also, that even into the most enlightened spirit prejudice may creep against others from whom support might have been reasonably expected, and which was partially withheld. But we should be unworthy of occupying that honourable position to which through popular favour we flatter ourselves as having succeeded, if in our conduct of this periodical, which is essentially an organ relating to scientific, artistic, and *industrial* pursuits, we yielded one tittle of independence of principle to the detriment of any of the numerous classes with whom it is associated. Our many friends and supporters — however they might openly seem to approve—would inwardly and justly despise us if we pandered to their tastes, their opinions, or their actions, praising as good that which was palpably wrong, merely from motives of individual interest, and we should doubtless ultimately reap the reward to which such unprincipled conduct would be entitled—a result directly opposite to that which we trust to attain by pursuing an *opposite*, an *honest*, and a *straightforward* course. To the point, however; we learned with much regret, through a most intelligent and respectable deputation of the regular carpenters of this city who waited on us on the eve of the advent of this number—as they were also about to do on numerous local architectural and building practitioners—that the large number of *two hundred and eighty men* of their body—the regulars and irregulars respectively—are at present out of employment in this city. Yet business is flourishing and the season has hardly yet reached its zenith. Have their masters and they disagreed? Is there a strike? A turn out? A nine hours' movement? Have "their brethren of the bench" in London, Liverpool, or elsewhere influenced them to a position of antagonism against their employers? are all questions at once suggested by such a state of things, but which are finally answered by a single negative. What then? *Machinery* has been the *indirect* medium of usurpation on their established rights; that which was formerly accomplished by their hardy hands, with "the sweat of toil" upon their brows, and their jack planes, bench cramps, chisels, and various other manual appliances at their side, is now effected for the most part by "steam" as a motive power; the driving shaft and endless strap, the circular, the band, and log cutting saws, the mortise knife, &c., supplanting the place of the former. Nevertheless the joiners' craft cannot be dispensed with; component parts must be fitted together, mouldings cleaned off and mitred, affording ample work for *all;* and still there are 280 *skilled hands* out of employment in this branch of trade alone. However deplorable the result, it would be as fallacious on our part to advocate the practicability "of stopping the tide with a pitchfork"—to use a vulgar but popular and expressive phrase—as to denounce in this progressive age the employment of machinery, which, in connection with steam, has been not inaptly designated "the great pioneer of modern civilization;" but, as we stated above, it is in this instance the *in*direct, not the *di*rect cause. What is the latter? The words of the deputation answer the query—"the importation into an extensive saw mill in this city, from England and Scotland, of a quantity of carpenters and joiners at unequal wages, ranging from 12s. to 34s. per week, to do work which we *offered* to do—but were refused even a trial—at our regular rates of wages. We do not object to machinery; we are willing 'to fit' carpentry so prepared, but we, as local artizans, have a prior claim for employment." This is the simple substance of the case as laid before us, the very limited time that elapsed prior to publication rendering a thorough investigation of *all* particulars impracticable. However, we give it, that the parties who feel aggrieved may have the opportunity of making their views public through our pages, which are also freely thrown open to any discussion that may be elicited on the subject. Before concluding, we must make passing reference to a statement that has also reached us, to the effect that the rights of architects who exclusively should furnish designs for timber constructions are also being infringed on, by the volunteered gratuitous supply of ready "cut and dry" drawings, or the preparing of such to suit circumstances. This is treading "dangerous ground," and we cannot too strongly—on behalf of the architectural practitioners of Ireland, who will unquestionably to a man unite in the sentiment—deprecate such a course, which, if interest alone be consulted, it would seem most prudent to discontinue. We sincerely hope the breach will be repaired, so as to prevent the necessity of further remarks on our part.

Somewhat touching the above subject, the *Irishman* has the following able remarks, to which, by the deputation, we are referred:—

"It would be an insult to the intelligence of the members composing those trades' unions to suppose that they attempted to battle with, or beat down, the employment of machinery in their respective branches, by clamour or combination. The men are willing to work with, and alongside, it; but, at the same time, they are anxious to participate in the obvious advantages which are accruing wholly to the benefit of the capitalist, by the present expedition of the work—the less number of hands required, and the consequent saving of time. Invoke the aid of machinery, say they, we don't object, for we know objection is futile. If you take the labour from the many, and if the many suffer by the transaction in the meantime, why not the many seek for some slight benefit, if possible, by the transaction—or make whatever resources that is left them subservient to compensation for loss endured? Man is a self-propelling machine; food is the fuel by which he is enabled to keep his parts in motion. Sleep is necessary to the system, that it may not relax or go out of repair; and, being a living entity, and not an artificial one, he is susceptible to suffering or a break-down of any of his parts. The injuries he may sustain might paralyse his efforts; and his working gear, of the body or mind, when once broken, or injured, seldom admits of a permanent mending. The loss sustained therefore may be a crush—protracted, final, and irremediable.

"By the introduction of machinery into many of the branches of trade, and latterly by its more extensive adaptation to purposes of the building art, a transitionary state is caused in those branches of trade, and like all other revolutions, whether in the matter of commerce, or science, or trade, a time is required for the settling down to a level again; of making good the breaks occasioned, and the changes necessitated. During those phases of change, the interests of large bodies of men are seriously affected. The diminution in the usual number of hands employed on the old system, and the consequent hardships to be endured by the surplus number being obliged to work for less, emigrate, or seek what is most difficult and betimes impossible—a new means of employment. In the face of so many disadvantages, and against great odds, men seek for a relaxation. They argue that machinery should be for the benefit of all—to shorten the hours of labour, to seek some respite from continuous and all-absorbing toil—to have some time for recreation—as a moiety of compensation for the ordeal endured. Some boon, as a set off against the obvious blessings, and benefits, and huge profits pocketed by the capitalist, the workman claims this respite and relaxation; and his claims seem just."

LORD BROUGHAM'S INAUGURAL ADDRESS.

ALLUSION is made elsewhere to the proceedings of the Social Science Association and the address of the President, Lord Brougham—a masterpiece of eloquence—delivered on yesterday evening in presence of a most distinguished and numerous assembly, the substance of which will be found in the following, our limited space unfortunately precluding its publication *in extenso*.

His lordship, after paying a most graceful compliment to Ireland and the Irish, especially "the great capital" which he pronounced to be "renowned for having given to the world men illustrious in all departments of science and of art, as well as of arms," and referring to the transcendant genius of Grattan, Plunket, Wellington, Wellesley—the great patriot, the consummate orator, the first of warriors and foremost among statesmen—all of whom he had been doomed to outlive—said—It now becomes my duty to note the progress which social science has made during the last year, and its present state and prospects. We are met again by the complaint that few of the plans proposed by us have been accomplished, and that, of the measures originating in our labours, many have failed to pass through the legislature. But the progress of all the sciences and arts is slow, because their improvement is necessarily gradual. Our limited faculties can never reach at once the utmost excellence of which they are capable, and their exercise can never complete suddenly any great work, but must proceed by steps towards its accomplishment. In the whole circle of science you find gradual progress to be the rule. Thus the vast changes which Newton made in mathematics and in physical science were effected after others had made a near approach to the same point. The calculus, in itself so great an extension of analytical science, and in its consequences producing such a revolution in all the exacter sciences, had, above a quarter of a century before its invention, been nearly discovered by Cavalleri and Roberval, and still more nearly by Fermat, and some years later most nearly of all by Barrow; while the doctrine of gravitation, and its explanation of the heavenly motions, had been approached, at any rate had the way prepared for it, by Galileo, Kepler, Huyghens, Borelli; and even his optical discoveries had been partially anticipated by Krontaud of Prague, and Antonio, Bishop of Spelatro. The science of chemistry, from the dreams of the alchymists to the erroneous theory of Stahl, made slow progress, and by successive improvements was freed from those errors, and grew into the science which Black, Priestly, Lavoisier, and Davy brought to its present state. The great rule of gradual progress governs the moral sciences as well as the natural. Before the foundations of political economy were laid by Hume and Smith, the French economists had made a great step towards it, and Turgot had himself worked, and as a minister had patronised, the labours of others in the same direction. Again, in constitutional policy, see by what slow degrees the great discovery of representative government has been made from its first rude elements—the attendance of feudal tenants at their lord's court, and the summons of burghers to grant supplies of money. Far from being impatient at this slow progress, we ought rather to reflect that the sure advance of all the sciences depends in a great measure upon its being gradual. But the common law of our nature, which forbids the sudden and rapid leaping forward, and decrees that each successive step prepared by the last shall facilitate the next, is in an especial manner of importance and of value in the social sciences, which so nearly affect the highest interests of mankind. Here our course, to be safe, must be guided by the result of experience, and must always be of a tentative kind. We must even be prepared to change our direction and our pace, and to retrace our steps when we find we have gone too far in a wrong direction. The skilful navigator, when steering on an unknown coast, after taking all precautions to obtain information respecting it, having no chart, or none that can be relied on, proceeds with the lead ever in his hand, and the glass at his eye, lies to, when he can, at night or in a fog, and has his sails and his helm always ready to change his course on the least indication of peril. The safety of his ship and crew depends upon such precautions; and the safety of the community depends upon all proposed improvements, which are changes, being first most maturely considered, and, when adopted, being carried into execution by such advances as shall give time for correcting errors, or stopping short, or altering the course pursued, when actual experience proves it to be wrong."

His lordship then referred at considerable length to the great change that had taken place in our jurisprudence, and then to the change in the economy and management of estates by owners of property in these terms—"The improvements in agriculture have obliged landlords to make a great outlay upon draining and farm buildings, highly beneficial no doubt to themselves, and therefore well bestowed; but in most instances so difficult as to require the help of loans. Yet, at the same time, they have generally contributed in a degree formerly unknown to what could afford no pecuniary benefit, the building and support of schools, improving the dwellings of the poor, and the building and repair of churches, thus spending most upon these excellent objects when they had least to spare. Nothing can be more delightful than to contemplate this progress in classes, generally speaking, the most reluctant to approve of changes, because the slowest to believe in their expediency, or even safety; and it affords the strongest reason for extending to the agricultural labourers and their children the benefit of those wholesome restraints of late years imposed upon the improper employment of labour in other branches. It is a most consolatory circumstance to all friends of social improvement, and of the sound and liberal principles which insure its progress, that the reign of these principles seems to be established universally."

After a comprehensive review of the recent reforms in the matters of voting at universities, patent laws, charitable trusts, the bankruptcy and insolvency, and criminal laws, and other branches of jurisprudence, the learned lord proceeded to consider the department of "Education," the repeal of the paper duty—"that gross and glaring anomaly in our legislative, as well as our administrative proceedings"—and passing on to "Sanitary Science," remarked, "that considerable progress has been made. The Quarantine Committee have brought their labours to a close, and presented an elaborate report. The information collected, and the suggestions made, are admitted to have essentially improved the sanitary condition of our mercantile marine. The diffusion of sanitary knowledge is a most important part of the duties of this department; and as the association has from the first desired and accepted the co-operation of women, the council have had no doubt in affiliating the Ladies' Sanitary Society, which acts under the highest patronage, and spreads among the poor a knowledge of the laws of health; it being now admitted that much of debility, disease, and premature mortality in this country results from ignorance and error, and might be prevented."

Referring to the "Criminal and Reformatory Department" his lordship stated "it presents very satisfactory results, and it may be fit at this meeting that we dwell more especially on the Irish branch of the subject. The number of reformatory schools is but small, and it is devoutly to be wished that they were multiplied. But the diminution of crime in this island, of late years, is most satisfactory; and allowing that the great migration, since the famine years, has had much influence, enough of the improvement remains to reflect the greatest credit upon the instructors of youth and the ministers of religion. The decrease in the number of the people makes any comparison of the commitments for offences inconclusive, unless we regard the proportion of these to population. There were in 1856 as one to 923 of the people; in 1859, as one to 1,117; and in 1860, as one to 1,217. The number of juvenile offenders decreased in a still greater proportion."

Comparing the working of the convict system in the case of the English and the Irish respectively, his lordship said "the different results of the two systems may be gathered from the fact that at Lusk we see numerous convicts set to work, and only retained by moral restraint, without any sentinels, while at Portland we see the convicts quarrying stones for the breakwater under the guard of sentinels with muskets and bayonets, and on the breakwater itself, which is more difficult to guard, free labourers, and not convicts, are employed. Another test of the Irish system may be stated as decisive—the confidence of the public in the reality and the permanence of the reformation effected, inasmuch as discharged convicts at once find employers willing to receive them, experience proving that they may be relied upon as steady and trustworthy servants."

After alluding to other topics his lordship proceeded—"In the great department of social economy much attention was at the last congress given to the important introduction into the manufacturing districts of the co-operative system—the establishment of unions by the working classes, for the purpose of sharing in the profits on the goods consumed or used by them, as well as of preventing adulteration of those goods, and for the other purpose of carrying on branches of manufacture. In both these kinds of union the progress has been very great since last year, and in the latter those doubts which seemed to exist of the scheme's practicability have been almost altogether removed. Above 50 companies for manufacture have been established since last congress, besides many of mere stores. In these last a capital of £500,000 is invested; but in the former the manufacturing concerns represent a capital of nearly £2,000,000, exclusive of the Manchester Cotton Company (limited), whose capital is £1,000,000. The returns of Mr. Tidd Pratt show the creation of about 250 co-operative societies within the last twelve months, all enrolled under the Friendly Society Act. It is not wonderful that the members of such unions should be of an educated class, but that they should often exercise themselves in literary labours is remarkable. . . . The effect of co-operation in preventing strikes, so pernicious to the working classes and so dangerous to the peace of the community, has been everywhere felt. The late strikes at Colne may be ascribed to the want of co-operative unions in that district; but the mischiefs occasioned, and which left their deep traces behind, opened the people's eyes to their error, and the consequence has been the establishment in that district within the last three weeks of a shed with 700 looms upon the co-operative plan. It is important to observe that, with another subject anxiously dwelt upon, as well as strikes, at all our former meetings, the great cause of temperance has been intimately and most naturally connected. Not only are such of the contributors as had before been subject to intemperance weaned from their habits, but it is mainly to temperate habits that the formation of these unions may be traced. Exceptions there may, no doubt, be; but, as a rule co-operative societies are composed of sober and industrious men. It is equally consolatory to find that the improvement of health, the extirpation or mitigation of disease, everywhere keeps pace with the increased habits of temperance. But in no respect is it more gratifying than to observe the connexion of temperance with the diminution of crime. In France, it appears, from our colleague, Mr. Quetelet's statement, that no less than a fifth of all the murders during the last four years had their origin in tavern brawls. Source of disease, of poverty, of crime!—how long shall the heavy curse be suffered to afflict us? How long shall we submit to a conqueror more cruel than the armed invader—to a tyrant the most inexorable of all, which has subdued rational men, and avenged the world of unreasoning creatures for the wrongs received at his hands?

"The employment of women" was next treated of by his lordship, who said that "the printing establishment opened by Miss Faithful has gone on with increasing success," and that a volume under Her Majesty's sanction was in course of preparation at the Victoria Press. His lordship next referred to "the truly wise and benevolent plan of closing early and allowing a Saturday half holiday," also to the happy effects attendant on the addition of lectures to the libraries of great establishments, and then to the sixth department on "international subjects," which he treated most comprehensively, but being chiefly of political tendency, we must pass over to the conclusion of this most brilliant address, as follows:—

"We have been surveying the progress of the past year, and have only had time to touch the higher points in the outline, leaving of necessity much that is of importance untouched. The past lends encouragement to the future. Let us then persevere to the end. But let us not forget that all our efforts to improve the condition of our fellow-creatures, and make them worthy of their destiny, are as nothing compared with the progress in higher things. These are the great aim and end of our being. In all our pursuits, in our whole existence, an instinctive sense attends us that we are unsatisfied. The want of somewhat permanent ever haunts us. Whatever exertions we have made, whatever success had, whatever gratification received, only makes us feel how hollow it all is—how much we desire that which endures. The scenes of early days, which we revisit, now become dim from time, peopled with the forms of those whose memory they sadly recall, make us long for the bright scenes that can never fade, and for rejoining friends to part no more. The present doubt, and the struggle, and the darkness, is for the hour; the prospect is cheering, and it is for ever; and so it is with our National Association, which commands our allegiance, and justifies the hopes it inspires. Undaunted by resistance — undisturbed by faction—undismayed by real coldness or affected contempt, we persevere in our course of social labour; but we lift our views higher, to scenes far above the darkness of ignorance that shrouds one region, the mists of doubt that obscure, the storms of passions that vex another, and behold the lofty summit shining in the faith and adoration of God, glowing with universal benevolence to man. "As some tall cliff," (I gladly pronounce these noble lines in the land which gave them birth)—

> 'As some tall cliff that lifts its awful form,
> Swells from the vale, and midway leaves the storm;
> Though round its breast the rolling clouds are spread,
> Eternal sunshine settles on its head.'"

THE SHOW AT BELFAST.

If there were special evidence required of the growing prosperity of Ireland, we could scarcely find any more conclusive than that afforded in the recent show of the Royal Agricultural Society held at Belfast, which was everything that could be desired, viewing it either locally or nationally; and moreover the arrangements made for the reception both of the animals and implements exhibited, as also for the accommodation of visitors, were most complete. We must not, however, stop to expatiate on the merits of "shorthorns" or "longhorns," or "sheep," or "swine," or "poultry," however much in common with the general public we may venture silently to appreciate them, but, leaving that privilege to our agricultural cotemporaries, pass on to the stands of the manufacturers, with whom our province is more directly associated, and amongst whom we recognised some old friends, and as was but reasonable to expect, the local firms competed with great enterprise, and a laudable emulation seemed to prevail not only amongst themselves but with the Irish, English, and Scotch manufacturers, who also exhibited. This we believe to be the true secret of a nation's prosperity, and as long as competition is carried on with an honest and earnest spirit, it cannot fail to conduce thereto. With Messrs. Musgrave, Brothers, our readers have been made acquainted in our notices of their manufactures exhibited at the same society's shows in this city, and comprising stable and farm-house fittings, improved gas apparatus, stoves, garden furniture, strained wire fencing, entrance gates and railings, &c.; and their usual excellence was so well sustained at this show, that we are only permitted the opportunity of recording, as before, our unqualified approval; Messrs. Riddell and Co., and A. Macdonald, also of Belfast, and Messrs. Francis Morton and Co., of Liverpool—a firm whose manufactures we made special note of in previous numbers of this journal—Messrs. H. J. Morton and Co., of Leeds; Hernulewicz, of Edinburgh; Thomas Perry and Son, Glasgow; and Kennan and Son, of Dublin, were all exhibitors somewhat in same line, each having their own peculiar merits and features, the latter however comprehending in addition a department of workmen's requisites in the mechanical arts. The engineer exhibitors were very numerous, and comprised, besides others, the well-known houses of John Bennie and Son, Newry; Young, Ayr; Clayton, Shuttleworth, and Co., Lincoln; John Gray and Co., Glasgow; Kirby, Banbury; Richmonds and Norton, Liverpool; Barrett, Exall, and Co., Reading; Ransomes and Sims, and Turner, Ipswich; Howard, Bedford; Shekleton, Dundalk; J. Hornsby and Sons, Grantham; Riches and Watts, Norwich, &c.. Mr. Robt. Brown, of Ferguslie fire-clay works, Paisley, had a remarkably excellent collection of pipes, troughs, tiles, fire bricks, &c., and Mr. John Moore, of Ravenhill, Belfast, was an extensive exhibitor in somewhat similar character of building materials. Amongst the miscellaneous exhibitors were Mr. Kent, of London, whose knife-cleaners, egg-beaters, &c., are world-famed, and Mr. Bradford, of Cathedral-steps, Manchester, had a crowd of enquirers at his magic washing-machine. Altogether this was a highly instructive and creditable show.

SERIOUS CHARGE AGAINST A WAR DEPARTMENT OFFICIAL AND A CONTRACTOR.

On yesterday morning, the 14th inst., Mr. Hamilton Connolly, chief clerk in the Engineers' Office, Dublin Castle, and Mr. John M'Elwain, of Naas, builder, were brought before the police magistrates on charge of embezzlement and forgery. The case for the prosecution is briefly as follows—that during the last two years at least, various sums or money had been fradulently obtained through the prisoners' collusion in altering the items certified for at foot of the contractor's accounts—in one instance from £100 to £700, and in another from £271 11s. 5¾d. to £576 1s. 5d.—and in forging the initials, after erasures, of the Colonel and District Commanding Engineer, Edward W. Dunford, proved by a fellow clerk, Mr. Minty, to be in Connolly's handwriting. The secretary to the Hibernian Bank proved the payment to M'Elwain of the drafts of the Accountant General for the exaggerated sums, also the lodgment by M'Elwain of an acceptance of Connolly for over £200, that same might be discounted. Counsel for the Crown would not consent to take bail, and the prisoners were accordingly remanded to stand their trial at next sessions. Mr. Sidney, counsel for the prisoners, with Messrs. Fitzgerald sen., and Ennis, as attorneys, reserve the defence until then. We deeply deplore the unfortunate position of Mr. M'Elwain, who for many years we believed to be one of the most respectable men in his trade.

SUBTERRANEAN CHURCHES.

In a recent number of the *Building News* we find the following:—Interesting excavations are now going on in land adjoining the Presbytery of Ferrières-Haut-Clocher, near Conches, in France, department of the Eure. The origin of this exploration is curious; a cow was passing over the ground, when suddenly the earth opened and swallowed the poor creature up, as the good folks of the village declared; the cow had in fact broken in the roof of a subterranean building, and after Crummey had been rescued from her bewildering position safe and sound, and every soul in the neighbourhood had looked into the big hole, means were taken to learn something more about it. No legend told of any underground building, and the antiquarians of the vicinity have an unexpected treat presented to them. The place was soon discovered to be a vaulted chamber 8 or 9 yards in length, 7 feet high to the crown of the vaulting, and of about the same width; no pavement has yet been found, but it does not appear that the excavation is completed. The subterranean chamber is about five yards north of the Presbytery, and twenty yards from the apsis of the church, and there is no reason to doubt that there exists or did exist a communication, being the first and the last. The church was originally built in the thirteenth century, and the original tower is still standing, but the nave is the work of the sixteenth century, while the eastern portion is believed to be as old as the tower. It is well known that at times the Christians were prohibited from practising their religious ceremonies in the light of day, and that they were frequently driven to resort to subterranean places of worship like their predecessors the early Christians. Such chambers are found attached to many abbeys and other religious establishments; near the Benedictine Monastery of Jumiéres is an immense underground construction, which is said to extend for more than a mile, and which has become famous through the history of Agnes Sorel. The Abbey of Fontenelle or of St. Waudrille, near Caudebec-en-Caux, is another of these curiously interesting structures; and a third was discovered some time since by accident at Torp, a dependance of Jumières in the forest of Brothorme.

MINIATURE WHEEL OF FORTUNE.

Augustus (for that was the Christian name by which the boy Pugin preferred to be called) created great amusement by illustrating the ups-and-downs of the pupils on "a wheel of fortune." Every week the rotatory machine was sketched with great spirit, each pupil being represented standing upon a projecting bracket attached to the wheel. The favourite was always at the top, capering and laughing with pencil in hand, while the one least fortunate was seen hurled to the ground by the revolution of the wheel. Others were planted on the ascent or descent, according to the degree of favour in which they stood with their master, their doleful or joyous faces being cleverly expressed by a few spirited touches. Great amusement was produced by this humorous device; and the publication of a new wheel of fortune every week was eagerly looked for by his fellow pupils.—*Ferrey's Recollections of Pugin.*

THE BUILDERS' STRIKE AT LIVERPOOL.

The following circular, with reference to this unfortunate circumstance, has been recently issued:—

The associated master builders of Liverpool beg to inform the public that their workmen have, with a few exceptions, struck, and left the works of their respective employers; and that the building operations in the neighbourhood are, therefore, comparatively at a stand.

The changes and reductions lately made by the workmen in the hours of labour, and the consequent unequal value of the labour worked on the different days of the week, have rendered the payment of wages by the day no longer just or applicable.

With a view to rectifying the difficulties and confusion which had arisen under these circumstances, the master builders issued a signed declaration, in the form of a printed notice, to the effect that on and after the 2nd of September next they would pay wages by the hour instead of by the day.

On the 20th instant, the bricklayers and plasterers in the employ of the parties who signed the declaration struck, and left their work; and on the 27th instant the carpenters and joiners also struck, and left their work, the reason assigned for the striking being, the refusal of the masters to withdraw their names from the declaration.

The master builders *declare that their only object in the proposed change is to place the remuneration of labour on a fair and just basis;* they do not wish to reduce wages or interfere with any existing privilege or custom enjoyed by their workmen; and they have no ulterior object in view beyond the change in the mere detail of paying wages by the hour instead of by the day.

In consequence of the strike, the masters have determined to adopt the new system of payment on the 1st August instead of the 2nd September, so that their shops are now open for workmen who are willing to work under the terms proposed.

Committe-room, Clarendon-buildings, July 31, 1861.

BUILDING ACTIONS.

(Belfast Assizes.)

Stewart v. *Girdwood. Girdwood* v. *Stewart and Others.*—These were actions arising out of a building contract. Mr. Girdwood, defendant in first case, and plaintiff in second, is the proprietor of extensive print works at Old Park, near Belfast, which were burned down in 1859. Early in the following year Mr. Girdwood commenced rebuilding them with Mr. Young, of Belfast, as his architect, and Mr. Stewart, of Belfast, as the contractor and builder. An agreement was entered into between the parties incorporating the specifications and plans, and limiting the time for the completion of the works, with various clauses usual in similar contracts. The works were completed and certified for by the architect in September last, but upon the balance of this account, amounting to £406, being claimed by the builder, Mr. Girdwood declined to pay it, alleging that there were various defects and departures from the specifications, which rendered the works less perfect than the contract required. The builder brought his action for the above balance, and also for an alleged assault committed by Mr. Girdwood, in turning the builder and his men out of the works, which was stated to have happened in September last. Mr. Girdwood, after being served with the plaint in the first case, brought an action on the bond which had been given by the builder and two sureties, conditioned for the faithful performance of the works. The pleadings in each action were of considerable length, and involved questions of great intricacy. The first case having been called on, and the pleadings opened, while senior counsel was proceeding with his statement, the learned Judge suggested that the cases should both be referred to three out of six of the jury who had viewed the premises, and after some discussion, this was arranged. The award in each case to be taken as the verdict.

CARLISLE BRIDGE.

At a recent meeting of the Corporation, Alderman Reynolds gave notice that, "in September, he would move the re-appointment of a committee to report on the practicability and probable expense of rebuilding Carlisle-bridge, and stated that an attested copy of the new Westminster-bridge could be erected for £40,000.

Mr. Whelan said he would object to an iron bridge. He called attention to the memorial of the inhabitants of Merchant's-quay and Bridge-street, complaining of the narrowness of the flagways.

Mr. Bonsall observed that the memorial was before No. 1 committee. When the city engineer returned from London directions were given to have the prayer of the memorial complied with as far as possible.

Mr. Kelch said when he was a member of the South Dublin Union Board he found that £33,000, belonging to the old police authorities, were in the hands of the government. The reply to an application about that money was that when it was required it would be given. Now, in his opinion, a new bridge across the Liffey at the Custom-house was much required; and the large sum to which he alluded would defray the cost of that much-needed work.

Notes of New Works.

It is proposed to erect a new town hall at Bandon, and the Duke of Devonshire has contributed £100 towards the expense.

The Cork Waterworks Committee have received tenders for certain works to be done at No. 1 reservoir.

Ground has been taken at Bushfield-avenue by Mr. Thos. Connolly, stucco plasterer, Rathmines, for the erection of four houses, two of which are nearly completed, and have red brick fronts, granite cornice and blocking, &c. Immediately opposite are three pair of semi-detached houses in progress, one pair belonging to Mr. Carson, architect, and the others to Messrs. Woods.

A new church is to be erected in Ballinlanders, county Limerick, according to drawings by the architects to the Ecclesiastical Commissioners.

Sundry works are to be executed under same direction at Armoy, county Antrim, and Crossmolina, county Mayo.

The first sod of the Newcastle and Rathkeale Junction Railway was turned on 10th inst. by the Earl of Devon, in presence of a vast concourse of people, and with all the circumstance and *eclat* which generally attach to such interesting proceedings.

Two semi-detached dwelling-houses at Avoca-avenue, Blackrock, and of architectural character, are being completed for Mr. M'Nally, under the direction of Mr. Carson, architect; Mr. Hugh Kelly, builder, who is also completing two other houses at Oaklands, Rathgar, for Mr. Henry Todd; Mr. Ferguson, architect.

The new convent of Letterkenny has been inaugurated. It has been erected from designs by Mr. Goldie, architect, and has an elegant and spacious façade, comprising extensive and lofty halls, dormitories, for the accommodation of boarders, refectory, cells for the nuns, basement offices, chapel, with the western elevation flanked and supported by a tower surmounted by a cross. All the apartments are cheery and well ventilated, and everything has been done to consult the health and comfort of the inmates. The little chapel is exceedingly well designed and beautiful, with its stained glass window over the altar, containing the representations of our Lord, the Blessed Virgin and St. Joseph, from Messrs. Barff and Co., Dublin.

The water supply to, and drainage at, Island-bridge Barracks is to be improved. This would seem to be a result of the recent inspection by the commissioner appointed for that purpose.

A new palm house is to be erected at the Glasnevin Botanic Gardens, according to plans by the architect to Board of Public Works.

A new national school-house is to be erected at the cross roads near Clonsilla, Athlone, and Mr. Wm. N. Holton, has granted a free site.

Messrs. Patrick Kerr and George Carolin, builders, have been declared joint contractors for the additional buildings at Maynooth College, and for the new model school to be erected at Lurgan under the Board of Public Works.

A contemporary has the following:—As a proof of the interest manifested by the Countess of Glengall for the welfare and prosperity of Caher, we may mention that her ladyship has decided upon receiving no tenders for the building of her new mansion save those furnished by builders resident in that town.

Extensive Sale of Timber.—We beg to direct the attention of purchasers of timber to the extensive sale by Mr. Edwd. Chaloner, of Liverpool, advertised in this number.

Water Supply to Rathmines.—The Commissioners met on the 21st inst. to receive tenders from parties willing to supply the township with water. The present population of the township is 12,874.

INSTITUTION OF CIVIL ENGINEERS.

SUBJECTS FOR PREMIUMS, SESSION 1861–62.

THE Council invite communications on the following, as well as other subjects, for premiums:—

For a limited number of papers of distinguished merit, pecuniary awards will be made, not exceeding in each case twenty-five guineas, in addition to the honorary premiums. The subjects marked *, have been selected as those upon which, it is hoped, such communications may be received during the ensuing session. But papers on other subjects, if of adequate merit, will be taken into consideration, in the adjudication of the pecuniary awards.

1. On the principles upon which the Works for the Improvement of River Navigation should be conducted, and the effects of the works upon the Drainage and Irrigation of the District; including accounts of the systems of Moveable Dams *(Barrages Mobiles)* in Rivers on the continent.

2. On the effect of Engineering Works in causing injurious Scour, Flooding, or Silting-up, in Tidal Estuaries, or Rivers.

3. On the effect of Sluicing, in removing and preventing deposits, at the Entrances of Docks on the Coast and in Tidal Rivers

*4. On Reclaiming Land from Seas and Estuaries. (Twenty-five Guineas.)

5. On the Results of the Employment of Steam Power on Canals, and of other measures for the Improvement of Canals as a means of conveyance for heavy traffic.

6. On the Method of constructing Foundations, for large Structures, in deep water; and on the various systems of Driving Piles.

7. Description of Cast or Wrought Iron Cranes, Scaffolding and Machinery, employed in large works, in Stone Quarries, as Hoists, or Lifts on Quays, in Warehouses, &c., especially where either Steam or Water, is used as a motive power.

8. The Selection of Sites for the Construction of Docks on the course of Tidal Streams, with reference to communication with Railways, and with Inland Navigation.

9. The Selection of Sites for, and the Principles of the construction of, Breakwaters, Harbours of Refuge, Piers, Moles (whether solid, or on arches), Sea Walls, and Shore Defences; illustrated by examples of actual works.

10. On the Arrangement and Construction of Floating Landing-stages, for Passenger and other traffic.

11. The Construction of Lighthouses, their Machinery and Lighting Apparatus; with notices of the methods in use for distinguishing the different Lights.

12. On the Mechanical Methods of Boring and of Sinking large Shafts, of introducing the Tubbing and the impervious lining, and of traversing running sand and other difficult strata.

13. The Result of Contrivances for facilitating the Driving of Tunnels, or Drifts in Rock.

14. Accounts of the various modes adopted for Moving Earth in Tunnels, Cuttings, or Embankments, with the cost.

15. On the different systems of Swing, Lifting, and other Opening Bridges, with existing examples.

16. On the Construction of Suspension Bridges, with rigid platforms, and the modes of Anchoring the Stay-chains.

17. The results of a series of observations on the Flow of Water from the Ground in any large district; with accurately recorded Rain-guage Registries, in the same locality, for a period of not less than twelve months.

18. On the Construction of Catch-water Reservoirs in Mountain Districts, for the supply of Towns, or for Manufacturing purposes.

*19. Accounts of existing Waterworks; showing the methods of supply, the distribution throughout the streets of Towns, and the general practical results. (Twenty-five Guineas.)

20. The Comparative Duty performed by, and Improvements in the Construction of, modern Pumping Engines for raising Water for the Supply of Towns, or for the Drainage of Mines; noticing, in the latter case, the depth and length of the underground workings, the height of the surface above the sea, the geological formation, the contiguity of streams, &c.

21. The results of the use of bucket and rotary pumps, for lifting large quantities of water to a limited height, as at the Haarlem Meer, or at Whittlesea Mere, or for the purposes of Irrigation; with descriptions of the Machinery employed, and the application of such Machinery to the raising of the sewage of large Towns.

22. The Drainage and Sewerage of Large Towns; exemplified by accounts of the systems at present pursued, with regard to the level and position of the outfall, the form, dimensions and material of the sewers, the preventions of emanations from them, the arrangements for connecting the house drains with the public sewers, and the disposal of the sewage, whether in a liquid form, as irrigation, or in a solid form, after deodorisation.

23. On the Means of Rendering large supplies of water available for the purpose of Extinguishing Fires, and the best application of Power to the working of Fire Engines.

21. On Boiler Inspection as practised in this country and on the Continent, with remarks as to the comparative merits of the two systems.

25. On the Causes of the alleged Failure in Economising Fuel in working Steam expansively, and the probable conditions for insuring success.

26. On the results of the use of Superheated Steam, and of Surface Condensation.

27. On Substitutes for Steam, and the Causes of their failure.

*28. On the results of the use of Tubular Boilers, and of Steam at an increased pressure, for Marine Engines, noticing particularly the difference in weight and in speed, in proportion to the Horse Power and the Tonnage. (Twenty-five Guineas.)

29. On the measure of Resistance to Steam Vessels at high Velocities.

30. The Substitution of Machinery for Manual Labor, for Raising, Lowering, and Reefing the Sails, Weighing the Anchor, &c., on board ship.

31. On Steam Vessels of Light Draught for the Shallow Rivers of India, &c.

*32. On the Form and Materials for Floating Batteries and Iron-plated Ships ("Frégates blindees"), and the points requiring attention in their construction. (Twenty-five Guineas.)

33. On the Construction of Rifled and Breach-loading Artillery; and on the Initial Velocity, Range, and Penetration of Rifled Projectiles, and the influence of Atmospheric Resistance.

34. Description of Street Railways and Carriages, as used in the United States of America, in Paris, and elsewhere, with the results.

35. Improvements in the Construction of Railway Carriages and Waggons, with a view to the reduction of the gross weight of Passenger and Goods Trains; also of Railway Wheels, Axles, Bearings, Axle-Boxes, and Breaks, and of Bearing, Traction, and Buffer Springs; treating particularly their ascertained duration and their relative friction.

36. Descriptions of the various kinds of Machinery in use in the principal Shipping Ports, for the Shipment of Coal; noticing particularly those in which the greatest expedition is combined with the least amount of breakage of the Coal; and also accounts of the means of unshipping and measuring, or weighing the Coal, on its arrival in Port.

37. On the means of Utilising the products of the Distillation of Coal, so as to make Coke commercially as cheap as Coal; with descriptions of the ovens, and of the best processes used in Great Britain and on the Continent, in the manufacture of Coke.

38. The Precautions to be adopted for guarding against Accidents by Fire-damp and After-damp in Mines.

39. The Chemical Analysis, and the application to economic purposes, of the Gases generated in Iron Blast Furnaces.

40. Description of Modifications of the present systems of Smelting Iron Ores, of improvements in the conversion of cast-iron into the malleable state, and of the manufacture of iron generally, comprising the distribution and management of Iron Works.

41. Improvements in the Manufacture of Iron for Rails and Wheel Tyres, having special referenee to the increased capability of resisting lamination and abrasion; and accounts of the Machinery required for rolling heavy Rails, Shafts, and bars of Iron of large sectional area.

42. On the construction and application of Steam Hammers.

43. On the use of Steel Bars and Plates in Engine-work and Machinery, for Boilers and for Shipbuilding.

44. The process of Manufacture, and mode of treatment, of Aluminium.

45. On the Forms and Dimensions of Journals of Machine-shafts, Axles, &c.; with the best composition for the linings of bearings, and the most approved method of lubricating.

46. On the Mechanism of Astronomical Instruments.

47. On Machinery adapted for the Better Separation of the various Substances found in Combination with Metallic Productions.

48. On the Substitution of Machinery for Manual Labor in Mining Operations; and on Hydraulic Machinery in Mines.

49. On the Improvements which may be effected in the Buildings, Machinery and Apparatus for producing Sugar from the Cane in the Plantations and Sugar-works of the British Colonies, and the comparison with Beet-root, with regard to quantity, quality, and economy of manufacture.

50. Accounts of Improvements in Flax and Cotton Machinery, and in the processes for preparing those substances for manipulation.

51. An account of the mechanical means at present in use for facilitating the operation of Packing Materials and Goods, whether by Hydraulic Power, or otherwise.

52. The uses of Vulcanised, or Mineralised Caoutchouc; the means of increasing its durability, and the modes of causing its adhesion to metal.

53. On the application of Photography to Engineering.

54. On the Application of the Electric Telegraph to Railway Train Signalling.

*55. Railway Accidents—their causes and means of prevention;

showing the bearing which existing legislation has upon them. (Twenty-five Guineas.)

56. Memoirs and accounts of the Works and Inventions of any of the following Engineers:—Sir Hugh Middleton, Arthur Woolf, Jonathan Hornblower, Richard Trevithick, William Murdoch (of Soho), Alexander Nimmo, and John Rennie.

Original Papers, Reports, or Designs, of these, or other eminent individuals, are particularly valuable for the Library of the Institution.

The competition for premiums is not confined to members, or associates of the Institution, but is equally open to all persons, whether natives or foreigners.

The council will not consider themselves bound to award any premium, should the communication not be of adequate merit, but they will award more than one premium, should there be several communications on the same subject deserving this mark of distinction.

The communications must be forwarded, on or before the 1st of January, 1862, to the house of the Institution, No. 25, Great George's-street, Westminster, S.W., where copies of this paper, and any further information, may be obtained.

Charles Manby, Honorary Secretary.
James Forrest, Secretary.

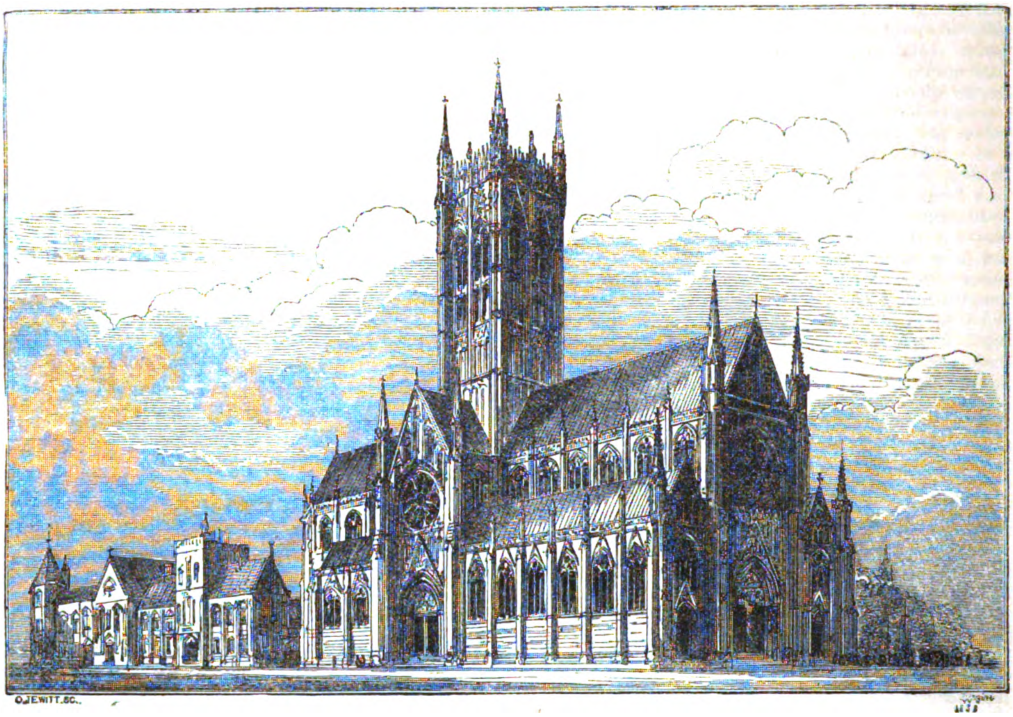
25, Great George's-street, Westminster, S.W., July, 1861.

THE KILDARE-STREET NEW CLUB-HOUSE.

The resolution to build a new Club-house was taken in 1859, and the firm of Deane and Woodward received the requisite instructions to prepare the plans. Those gentlemen accordingly prepared plans for a site embracing one more house in Leinster-street, and one less in Kildare-street than are at present occupied, but the requirements of the club were such as to make it impossible to arrange the several buildings on the proposed site. The house in Leinster-street was therefore abandoned, and another taken in Kildare-street, and by this means a sufficient area was acquired for the buildings in the rear. The style adopted for the first building was Italian Gothic, but with semicircular heads to the windows like those in the New Museum building at Trinity College. We should have preferred having the windows either thus, or, better still, pointed, but it is difficult to sway the opinions of a committee, especially in the first stages of a plan, and indeed a building that looks best in execution is seldom very attractive on paper, which makes the difficulty greater. The committee rejected both pointed and circular openings. The architects, therefore, set about designing a window embracing not only good construction in the material to be used (viz., brick), but one which would afford the largest proportion of light, as it was only possible to light some of the rooms from one side. This latter consideration materially influenced their views in the design of the windows which was finally adopted. It has many advantages. 1st—A proper arch spans the opening, and yet the squareness of the frame is not sacrificed. 2nd—The smallest possible obstruction of light in so large an amount of opening occurs, two slight columns taking the place of what must otherwise have been a large pier. In this building the unpleasant effect of the usual boarding of brick and stone is avoided. The alternate long and short stone, usual in dressings, is, to our mind, very ugly. Wherever stone has been used it has either a straight or curved line of demarkation from the brickwork. The form of the ground suggested in a great measure the arrangement of the ground-plan, which is as follows:—On entering the hall in Kildare-street, you have on right and left the porters' and waiting rooms. Ascending three steps you arrive at the great central hall, opening off which on the right, with window of course facing Kildare-street, is the coffeeroom, 60 by 30, and 22 feet high. On the left, facing Leinster-street, and looking into the College-park, is the morningroom, of the same dimensions. Behind the coffeeroom, and entered from a passage (traversing its whole length, and communicating at one end with the main hall, and at the other with the members' private entrance and staircase to their bedrooms on the top storey) are the bar servants' waitingrooms, clerks' rooms, and servants' staircase. The principal hall and staircase is lighted from the top, and on the ground and upper storey an arcade with Portland and limestone columns runs round its four sides. The stairs commence in the arcade on the left as you enter from the principal entrance, pass under the floor of the upper corridor, opposite entrance, and turn again to the left by a flying flight withinside the arcade. By this means a complete corridor all round the four sides of the hall is maintained on the upper storey. The ballustrade is formed of perforated slabs of stone. The capitals, bases of columns, the ends of steps, and arch of flying flights, are carved with flowers, birds, and animals. The upper corridor is tiled in an elaborate pattern, and the floor of the hall is paved with Portland, Forest of Dean and Cumberland stone, with dots in encaustic tiles. A skirting of tile runs round the upper corridors, the hall and down the wall flights of steps. It is proposed to decorate the hall and staircase with colour and gilding. The second stairs, fire-proof throughout, is for the domestics; it is of brick and granite, and runs from attic to basement. The third is of timber, and is the members' private stairs, communicating as before with the members' bedrooms and the passage to the private entrance in Kildare-street. In the rere of the main building, on the ground floor, communicating with the corridor on three sides of a court-yard, are six dressing-rooms, water-closets, private diningroom, two billiardrooms, 32 by 20, lavatory, bathroom, and at the back of billiardrooms, a racket court, with its necessary dressingrooms, &c. The racket court is supposed to be the best that has been hitherto built. It is covered with a light iron roof, with central skylights, and bands of glass the whole length of court. The dimensions of the court are 66 by 33 feet; available playing height 44 feet. On first floor of main building the arrangements are as follows: Over the morningroom and, consequently overlooking the College park is a drawingroom 60 by 30 by 21. The bow window in this room commands one of the most beautiful views in the city. Over the coffeeroom are a writing-room, 40 by 30 by 21; and a room unappropriated at present, 30 by 25 by 21; and over the entrance hall parlour, and waitingrooms, a cardroom, 20 by 30 by 21. Off a corresponding passage to that described as at the back of the coffeeroom, are a conferenceroom, a lavatory, and a committee room. The twenty-one feet of height in the front rooms is divided in the rooms off the corridors, overlooking courtyard, into four storeys, which afford apartments for female upper servants. Over the private diningroom, and going to the courtyard, is a smoking room, 35 by 36, with open timber roof, with water-closet and a separate stairs, at the back of principal stairs. On the storey over the principal floor of main building are fifteen bedrooms for members, with bathrooms, cleaning-rooms, porters' boot, and bellroom, &c. The average size of bedrooms is fourteen by twenty-one. The basement is entirely vaulted in brickwork, and contains all the cooking requirements and bedrooms for servants, with spacious wine and beer cellars. In the decoration of the principal rooms wall painting has been mainly relied on, the funds at the disposal of the committee not being sufficient to provide what may be termed architectural embellishment to any great extent. What has, however, been done has been executed in conformity with the views of the architects—that construction should be visible, and ornament added to construction. With this idea the beams supporting floors are left exposed, and will be decoratively painted. A continuous string, or corbel of stone, projects into the room ceiling below plaster, for the ends of the joists to have secure resting place without being bedded in walls, the fear of decay being thus avoided. This string is very richly carved. Similarly, and for a similar purpose, under the beams, large and deep stone corbels are inserted in the walls, and break up the monotonous line of string course before described. These are also richly carved. The ceilings are flat between the beams, and at their junction with the upright of walls over the stone string are beautifully designed cast plaster flat enrichments. The carving of the building has been executed upon the principles adopted in the new Museums, Trinity College, and the University Museums, Oxford, which is, permitting the workmen to think for themselves and to design their own work. No drawings have been made in detail for any of the carved work in the building, a careful supervision and rough sketches, to ensure a certain character of foliage, being all that was deemed necessary. The cost of the stone carved cornices in the principal rooms is not greater than the same elaboration in plaster. The whole carving of the building, inside and out, has cost under £800. This work cannot be considered finished until the decorations of the rooms are completed, and we hope that, although it may be deferred for some time, they will be ultimately carried out under the advice of the architect. The contractors for the buildings have been the Messrs. Cockburn and Sons, who have performed their duty in the most admirable manner. The cost of the building, including fittings, will be about £25,000.—*Packet.*

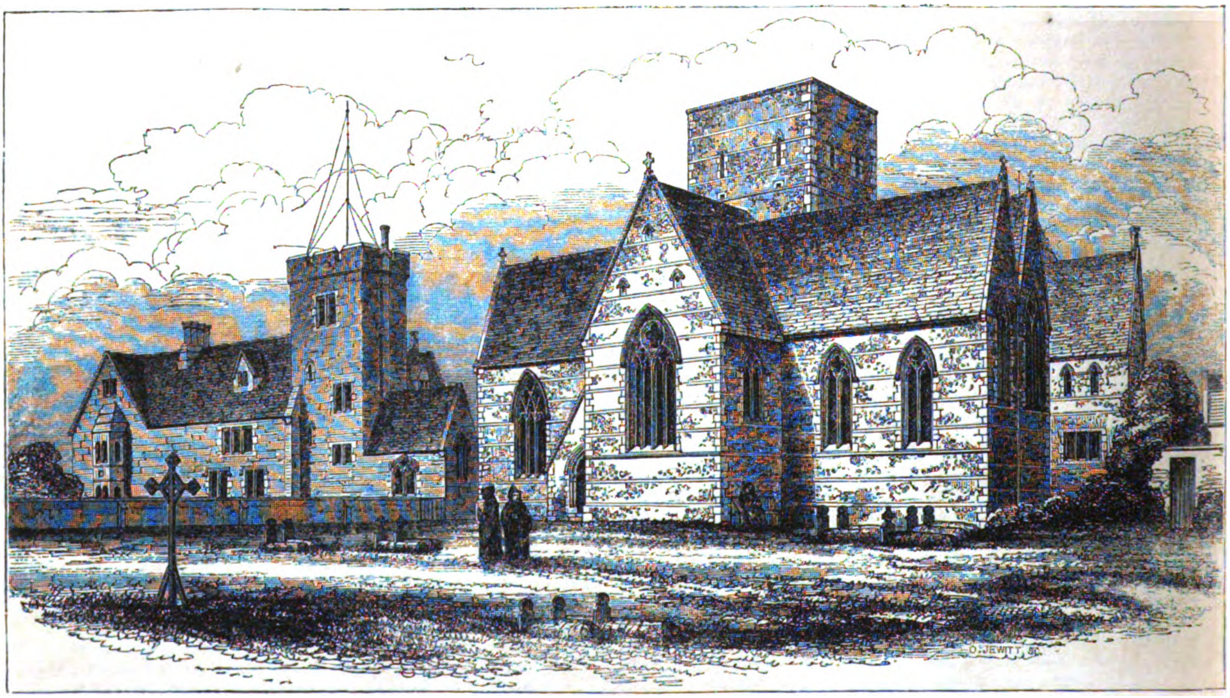
Social Science Sketches.—We may now enjoy cheap railway excursion trips, "London and Paris, and back" in such a time—close carriages and suffocation—crush and squeeze—coke vapour, tunnels and smuts. Then, again, in the matter of our "local habitations" (ahem, Shakspeare) how do we stand, or rather how do they fall, in the nineteenth century? Badly enough. Will any one venture to compare the great, substantial, warm old houses, with the gingerbread structures which have usurped their place in these latter times; shams, made—like the Yankee's musket—to sell, not to last, nor to make happy? Where now are to be seen rising up those stately piles, with their solid walls, their noble porches, wide doorways, massive doors, and warm, secure apartments wherein our fathers loved to dwell? Nowhere! they have disappeared, they have been improved out of the world, and they have been succeeded by the shaky, insecure, and toy-like shells which modern builders delight to "put together;" for, alas! houses are not built now, they are merely "run up."—*Saunders.*

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS



NORTH-WEST VIEW OF ST. GEORGE'S ROMAN CATHOLIC CATHEDRAL.

(As originally proposed by Pugin.)



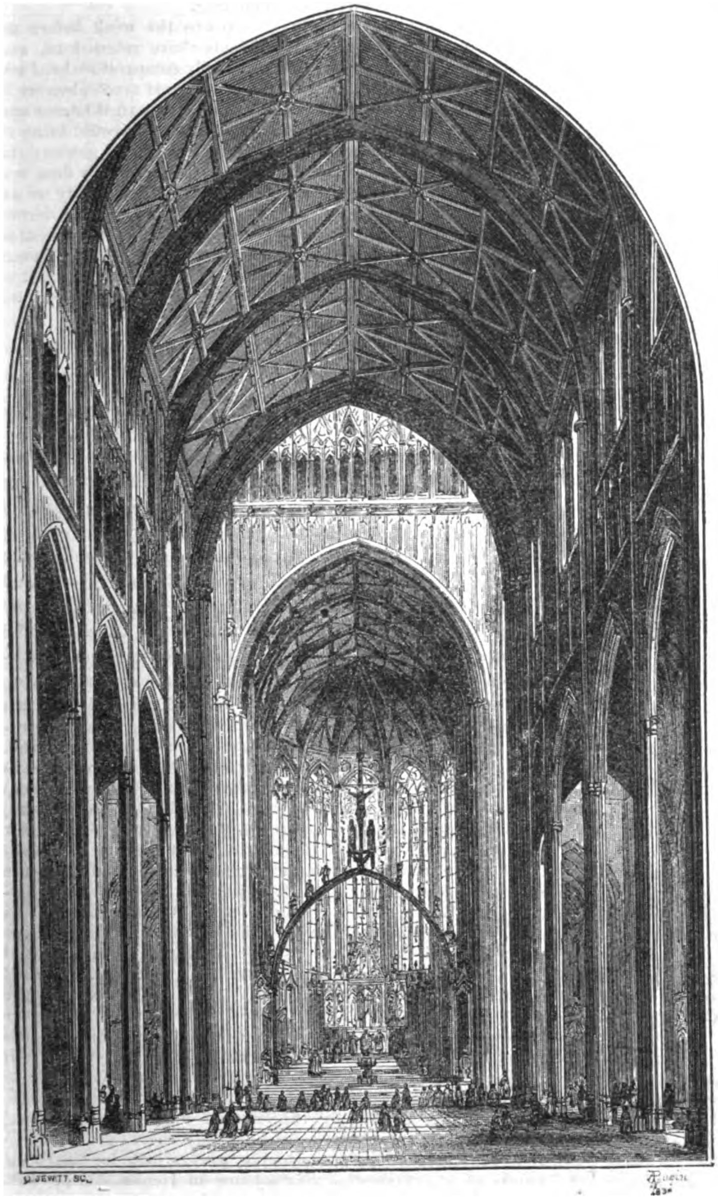
CHURCH OF ST. AUGUSTINE, WEST CLIFF, RAMSGATE (founded by Pugin).

Together with Pugin's Residence—THE GRANGE.

THE LATE A. WELBY PUGIN.

Few men have lived in modern times, with whose career events connected, have furnished more interesting material for biographical reminiscence, than did those associated with the late Augustus Welby Pugin. Like many other luminaries in the artistic and scientific hemisphere, the lustre of his great mind was hardly appreciated till withdrawal caused its loss to be keenly felt, and even then an apathetic public was slow enough in paying tribute to his memory. However, one worthy spirit, indignant that such a celebrity should sleep with name unrecorded in the annals of the age to whose progress in art he so materially contributed while living, volunteered the task of his biography, modestly declaring, that "it had been deferred from time to time, under the impression that a more competent person might undertake it." We have now the result before us in a handsome volume, entitled "Recollections of A. N. Welby Pugin and his Father, with notices of their works," by Benjamin Ferrey, architect, F.R.I.B.A. — a gentleman with whose name, as an eminent London practitioner, and the designer of the late Sydney (Lord) Herbert's church at Sandymount, near this city, our readers are doubtless familiar.

To none more than to the habitual readers of this journal can the perusal of Pugin's memoirs prove interesting, comprehending as they do a history of his professional connection with Ireland, which was by no means unimportant, his services being engaged on the new buildings at Maynooth College (which at one time proved so vexatious an affair that he tendered his resignation, and could only be induced to withdraw it by a memorial from the executive board), the cathedrals of Killarney and Enniscorthy, the churches of Gorey, and others in Co. Wexford, the convents and churches at Parsonstown and Waterford, the noble mansion of Lord Dunraven, at Adare Manor, &c.; and we may also add, that when the mental aberration which unhappily for some time preceded his death, became a topic for universal comment, none more deeply grieved for the prostration of such a giant mind than did those in this country, who had learned to appreciate its invaluable assistance, when vigorous, towards the revival and improvement of Mediæval art. In truth, Pugin effected in a few years a total revolution in architecture, and though he naturally felt chagrined at the unprincipled piracy of his designs by various architects of the day, his true love of art for its own sake induced him to be reconciled thereto, as is forcibly illustrated in the following characteristic sentiment—"I believe I design for all of them, for I see actually my own casts and figures used, and then they abuse me afterwards. These men can afford to sell cheap, for they *steal* their *brooms ready made*; however, the movement progresses, and the right sort of thing becomes general, and that is the great point." But though Augustus Welby Pugin has passed away, his fame and his precepts survive him; and we may here perhaps appropriately remark—as it is now generally known that on his son and successor, Edward Welby, has descended the mantle of the father, as did that of the father's father (also an architect of uncommon ability, and by birth a Frenchman) on him—that the most ardent aspirations of the great revivalist may even yet be consummated.



INTERIOR OF ST. GEORGE'S ROMAN CATHOLIC CATHEDRAL.
(As originally proposed by Pugin.)

Of Pugin as a mere child at school his biographer informs us, "It was remarked of him by one of the masters, that whether in Greek, Latin, Mathematics, or any other branch of education, he would learn in twenty-four hours what it took other boys many weeks to acquire; he was quick in all that he attempted, and fluent in speech, expressing his opinions in the most dogmatic manner with volubility and vehemence," also that "he had an almost intuitive talent for drawing, and as soon as he could handle a pencil commenced sketching." It is said that during the probationary period of the young Pugin's career, he, in conjunction with his fellow pupils and his father, frequently afforded aid to architects, whose acquaintance with Mediæval art was superficial in working out Gothic designs, and the author adds, "It is to be feared that the system of working by *other* people's *hands* and *wits* is not now wholly abandoned; but there is a meanness in the practice which cannot be too much reprobated, and he is unworthy the name of a conscientious architect who condescends to such surreptitious proceedings" Whatever may be adduced to controvert this, we believe it to be a truism, but which sooner or later becomes notorious, and even within a comparatively limited circle, were we inclined to describe, it many examples might be cited. The first engagement "on his own account" of Augustus Welby Pugin seems to have been the designing of plate for the celebrated goldsmiths, Rundell and Bridge, who, as is related in his memoir, "while engaged in an examination of some ancient designs for plate in the print-room of the British Museum, chanced to notice that he (Pugin) was employed in copying the prints of Albert Durer and Israel Silvester, and struck by his skill in drawing, accosted him, and soon found that he possessed just the genius his firm was seeking." This introduction led to another, that of designing for Messrs. Morel and Seddon, upholsterers, the entire furniture in the Mediæval style for the important additional buildings then in progress of erection under Sir Jeffrey Wyatville, a task entrusted by the elder to the younger Pugin, and the result is thus summed up by his biographer, "Without asserting that this work when completed was wholly successful, it may fairly be said that the furniture was remarkable for great variety of form and detail, producing an expression of fitness not to be found in any other modern attempts, and it may be doubted whether any person but Pugin could have designed such a multitude of objects with equally happy results."

Passing over a variety of incidents in the junior career of Pugin, of which his theatrical connection with the Italian Opera as scenic designer, and his maritime freak, whereby, in a return voyage from

Holland and Flanders, he lost everything he possessed, being wrecked off the Scotch coast, and narrowly escaping with his life, are not the least important, we come to the period when he may reasonably be regarded as having launched his bark on the sea of life, independent of his father. His skill in Gothic became so rapidly and extensively known, that finding himself overwhelmed with commissions from architects both to work out details from their sketches, and full sized models for foliage, he determined on taking extensive premises in Hart-street, Covent Garden, and "undertook to supply all the ornamental portions of buildings which could by possibility be executed apart from the structure, and be fixed afterwards." Here for a brief period—abruptly terminated for want of capacity to estimate the pecuniary return—the great master inculcated into the minds of a few chosen craftsmen those principles of design which subsequently, "growing with their growth," expanded into universal precedents and completed the total regeneration of mediæval art. Referring to this event his biographer says—"The failure in this business scheme fully determined Pugin henceforward to stick closely to the exercise of his profession in a regular manner, for he had sense enough to see that he was not fitted for commercial enterprise." His ardent love for his profession led him to visit every cathedral of importance in England, measuring and studying their chief features, the result of his labours being illustrated and presented to the public in his well-known standard works, and his enthusiasm in the pursuit may be readily inferred from the following characteristic expressions in a letter from Wells to a friend—"If you want to be delighted, if you want to be astonished, if you want to be half mad as I at present am, for God's sake come over to Wells. The most magnificent things for detail that can be seen, splendid remains of every style and every description of Gothic architecture. You have no conception of the magnificence of the cathedral. I am well acquainted with everything here, and have got introductions to all the most secret corners. No *artists* indeed! The figures of the west front are magnificent—splendid specimens of sculpture. Tell that to Mr. L——, and tell him that the *antique* fades away before the *ancient* Gothic for ever!" About the year 1835 he seems to have attained to a large amount of professional practice, partly attributable to the previous erection of a dwelling for himself at St. Mary's Grange in a novel adaptation of the Mediæval style to a domestic structure, as also to the publication of his well-known work, "Contrasts." In manner Pugin is described to have been brusque, and most susceptible of offence, and in dress most eccentric, various amusing anecdotes in connection therewith being graphically related in the course of the biography. One with reference to his connection with the new Roman Catholic Cathedral of St. George's, London—his original designs for which we are enabled, through the kindness of the publisher, Mr. Stanford, 6, Charing Cross, to present to our readers herewith—being especially desirable to record in the biographer's own words—"He at once prepared, with his usual skill, very beautiful designs, and the committee were duly summoned to receive him and hear his plans explained. They were of an elaborate kind, and provided for a cathedral, with chapter-house, cloisters, conventual buildings, and every usual adjunct. The drawings excited great admiration, and many questions were asked, to which Pugin gave most satisfactory replies. Indeed, all promised well, and nothing seemed likely to prevent the realization of this magnificent project, when a member present very naturally asked the amount at which he estimated the cost, also the time it would take to carry his scheme into execution. These requests met with no direct reply; entering upon that part of the subject was for the present evaded, and the conversation turned to another point. Meanwhile, Pugin, in a manner not to excite observation, swept up the several drawings which were on the table, politely asking those who were admiring the details to be good enough to hand them to him for a few minutes. Having thus collected his plans, Pugin deliberately rolled them up, took his hat, wished the gentlemen good day, and walked out of the house, leaving the committee in perfect astonishment at his inexplicable conduct. The next day, some members of the committee calling on him for an explanation, met with a rough reception. 'You asked me,' said he, 'to furnish designs upon a grand scale, I complied with the request, and supposed that I was dealing with people who knew what they wanted. The absurd questions, however, put to me soon showed my mistake. Who ever heard of a complete cathedral being built in the life of one man? If you approve my design, adopt it. and carry out all, or part, in its integrity, as the means may be forthcoming.'"

Our next illustration, for which we are indebted to similar courtesy, exhibits a view of a church and residence built at West Cliff, Ramsgate, at Pugin's own expense, the former comprising nave, chancel, centre tower, south aisles, and transept, and as an architectural composition the work speaks for itself. Respecting the circumstances attending Pugin's becoming a Roman Catholic, we must pursue our invariable rule of declining discussion of any subject with religious or political reference, and for the success of a project in all other regards so happily conceived and so ably matured, we cannot but express a regret—whatever may be our personal sympathies—for the likelihood of the extent of appreciation being curtailed, owing to the extreme views put forward by the writer of the appendix, whose admittedly eloquent pen occasionally wanders into a strain which is sure to prove unpalatable to many even of Pugin's greatest admirers. It is, however, but justice to *the* author of the work to quote his explanation of this. He says—"His family have felt that however desirous Pugin's biographer might be to do him justice, yet that the author of these pages being a member of the Anglican branch of the Church Catholic, and not a son of the Roman Catholic Church, it was impossible he could appreciate the motives which actuated Pugin in all he did, and hence might unintentionally deprive him of the halo inseparable from his labours, he has therefore, in deference to these opinions, readily admitted the contribution of the succeeding chapters, relating amongst other matters to a great dispute on the hierarchy question of 1851;" and that "he feels it incumbent on him to add that he cannot agree in some of the conclusions drawn by the writer in his notices of Pugin's published works." For some time previous to his death—which took place on the 14th September, 1852, at the early age of 40 years—the unmistakebly insane state of Pugin's mind became a matter of notoriety, and in verification of the popular saying that "a story never loses anything in its carriage," his physical misfortune was through idle and absurd reports, which temporarily gained credence—being propagated through a professional contemporary—tortured into shapes which his family took the earliest opportunity of contradicting.

For the foregoing we are chiefly indebted to the work before us, which, however, treats the various incidents above referred to, and numerous others not included in our necessarily comparative brief notice, much more comprehensively. We experienced much pleasure in its perusal; the memoir throughout is sketched with a truthfulness and earnestness such only as a sincere friend and admirer could bring to bear in paying a deserved tribute to departed worth and genius; the anecdotes are graphically related; and the whole certainly does not justify the the writer's own modest estimation of his ability as an author, above alluded to. The style of production ensures a handsome addition to the library, and of the excellence of the illustrations our readers can form an opinion by reference to those in our present number. In this department, however, we should not omit to mention that there are several *fac similes* of Pugin's own sketches, an illuminated design for his wedding card, &c., likewise.

THE SOCIAL SCIENCE ASSOCIATION MEETINGS.

Lord Brougham, the most distinguished man of the age as a lawyer, statesman, scholar, orator, and philosopher combined, arrived in this city for the first time on Monday evening last, per express boat "Telegraph," in company with his Grace the Duke of Wellington, and on yesterday evening, as President of the National Association for Promotion of Social Science, delivered his opening address in the Round Room of the Mansion-house, an epitome of which we give elsewhere. The banquet, at which our worthy and hospitable chief magistrate will entertain numerous distinguished guests, including the noblemen above named, his Excellency the Lord Lieutenant, H.R.H. the Duke of Cambridge, General Commanding-in-chief, the judges, the members of the Corporation, &c., takes place to-day, and will be on a magnificent scale. Each president of department will inaugurate the commencement of proceedings by an address in the following order:—The Right Hon. Joseph Napier, President of Department of Civil Jurisprudence, in the Solicitors'-room, Four Courts, the subsequent meeting to be held in the Court of Chancery; to-morrow, Sir John George Lefevre, K.C.B., President of second Department, "Education," in the Court of Exchequer; the Attorney-General, the Department of "Punishment and Reformatories," on Saturday, in the Court of Common Pleas; on Monday, Lord Talbot de Malahide, the fourth Department of "Public Health," in the Court of Queen's Bench; on Tuesday, Judge Longfield, the fifth Department of "Social Economy," in the Nisi Prius Court; and on Wednesday the sixth and last section, that of "Trade and International Law," M. Michel Chevalier. Reunions will take place at the Royal Dublin Society and Museum of Irish Industry, and his Excellency will receive members and associates (ladies included) at Dublin Castle on the evening of the 19th inst., at half-past nine. The grand central hall of the Four Courts building, together with the several courts above named and branching therefrom, have undergone complete decoration, most suitably effected by the eminent firm of Hardman and Co., Grafton-street. Excursions to Lusk, Malahide Castle, and to Wicklow will complete the proceedings, after which we trust that the numerous strangers who may sojourn in Ireland during this memorable period, will return to their homes impressed with a better idea of our character and position than is usually described by prejudiced organs.

THE GRAY TESTIMONIAL.

If zealous devotion to a philanthropic purpose, regardless of personal sacrifices, and combined with the exercise of singular ability and business aptitude in its accomplishment, justify public appreciation of individual merit, then indeed is the compliment about to be bestowed by the citizens of Dublin on Dr. Gray for his eminent services in connection with the improved water supply of the city—now all but *un fait accompli*—most appropriately and happily conceived. We need not remind our readers that we recorded *in extenso*, from time to time, both the proceedings in the Corporate Assembly and the evidence adduced before the Royal Commissioner and the Parliamentary Committee, and that from the embryo state of the Vartry project to its consummation, Dr. Gray's able arguments, and lucid, practical deductions in its favour, were called into requisition. Whatever may have been our misgivings at an earlier stage as regarded "capacity and cost," we confess to at least a suspicion of the possibility of error when we find in Dr. Gray—of whose mechanical genius many an engineering professional might be proud—so stedfast an adherent to this as the most desirable source, all circumstances considered, and volunteering character and everything else to aid in its development. Those who will take the trouble to glance over our past volumes and numbers for the current year, will see every reason to conclude that were it not for the immense perseverance and ability displayed by Dr. Gray, the bill now obtained for the improved supply would, in all probability, have been thrown out by the opponents to the scheme, who mustered in goodly force and from first to last presented a most determined front; add to this the personal inconvenience in attending meetings, both in London and here, experienced by an individual who has various other duties of a most responsible and arduous character to perform, and which of necessity must often have remained in abeyance to the public duty so spiritedly undertaken, and it must be allowed by all, even the most inimical to the adopted source of supply, that at least a debt of gratitude is due to Dr. Gray. Though the proposed testimonial, however important it may be, will scarcely prove commensurate with the value of the services rendered, we nevertheless hail it as a graceful tribute to merit, and have no doubt it will be modestly appreciated as such by the talented and earnest recipient.

A SLOW SUBURB REVIVING!

With a pleasure equivalent to the regret previously experienced in our frequent records of the declining condition of Clontarf neighbourhood—in many respects so highly favoured by nature—do we now take occasion to make known the symptoms of a reactionary and progressive movement, which, comparatively slight though it be, is still worthy of appreciation, as a step in the right direction. In a recent notice we alluded to "the antiquated mud and thatch structures" on the main road, particularizing certain of them, and promising, for the edification of such of our readers as have not had an opportunity of viewing them personally, to perpetuate their memory by illustration. However, the opportunity for so doing is happily passing away from us in one of the instances alluded to, owing to the speedy demolition of a block between M'Knight's, the grocer's, and St. Edmund's (Mr. Lemon's) to make way for a new and spacious thoroughfare between the Clontarf and the Howth roads, opening up on each side about half a mile frontage of most desirable building lots, and effecting "a short cut," which must prove of great convenience to the inhabitants along each route. It is but due to the promoter to state, that this improvement is being carried out on the *Howth* estate, and we sincerely trust that Mr. Vernon will even at this the eleventh hour follow a good example, and raze those abominable eyesores that present themselves on his property, as also afford something like *reasonable* encouragement to capitalists to build suitable substitutes. For the present we reserve the promised illustrations!

NEW UNITARIAN CHURCH, STEPHEN'S-GREEN.

Within the last few years an evident reaction has taken place in this city in the matter of ecclesiastical architecture, and not the least important of the recent acquisitions will be, when completed, the new Unitarian church in Stephen's-green, to be erected from designs submitted in limited competition by Messrs. Lanyon, Lynn, and Lanyon, architects. The style will be Decorated Gothic, and a façade, some 60 feet in length and of picturesque broken outline, will be presented towards the Green, parallel to which will be placed the length of the church—a one-armed transept extending at right angles thereto, and forming the letter L inverted thus ⅂. The basement comprises boys' and girls' schools, each 28 feet by 24 feet, and provided with separate entrances; a vestry or committee-room, 31 feet by 17 feet 3 inches, and other apartments, about 17 feet high from floor to floor of the church above, which is consequently elevated several feet over street level, and is approached through a porch with spacious flight of steps and lobby. The church has a nave, 55 feet 6 inches by 28 feet, separated by an arcade of three arches from an aisle 14 feet wide, and from transept by a great arch, and is to be roofed with open timber framed trusses, &c., stained and varnished. A ladies' retiring room and two staircases are situate off lobby in transept, and immediately over is the choir or organ gallery. At east end will be a large five-light elaborate traceried window, a four-light ditto in transept, and others in the nave. On elevation the transept will present a principal gable, at one extremity 62 feet high, flanked with buttresses, terminated with a floriated cross, and displaying the traceried window before described, also the entrance doorway leading to boys' school and vestry at ground level (the corresponding entrance to girls' school, with traceried window above lighting the staircase to church, being in a smaller contiguous gable, 33 feet high); and at the other extremity will be the principal porch, surmounted by a handsome traceried parapet, and having a deeply moulded and recessed cinqfoil headed doorway. Between the principal and lesser gables will rise an octagonal belfry tower in two stages, with canopied niches in the upper, and terminated by a weathered spirelet—the remaining portion of the frontage above porch showing the traceried windows lighting aisle. Granite rubble stonework of best quality will be employed for the walling throughout, and Bath stone for dressings, &c. As may be perceived by our advertising columns, tenders are being sought for.

WHY WE DO NOT PUBLISH TENDERS!

In our own justification, and in answer to a frequently submitted question, we are obliged somewhat specially to recur to this subject, and without hesitation put the saddle on the right horse. We find a general desire on the part of builders competing for contracts, that the amounts of tenders should be communicated through our medium; and in our desire to render in this, as in every other department comprehended within our province, every information, we sought to obtain them, but vainly. Now, why should this be in Ireland, whereas in England the professional organs of similar character each week contain particulars of such competitions, freely furnished by the architects or other officials concerned? Every builder who expends his time or his money, or most probably both, estimating for a certain work, whether in public or limited competition, is (if unsuccessful) at least entitled to know on what principle the adverse decision (to him) was arrived at. In the former case we should be sorry to hold that if the competition for a contract work be open to *all*, that, as a matter of course, the lowest tender should necessarily be accepted, however undesirable either as to workmanlike competency or solvency the proposer might be; but we *do* maintain that if a select few be named, that then *the lowest* only should be accepted. In either case, however, when all is straight and right, the amounts of the tenders should, in justice to the competitors, and *pro bono publico*, be published, and we must again earnestly request of professional gentlemen and the secretaries of public bodies to forward same to this office.

EMO PARK.

The extensive alterations and additions to the Earl of Portarlington's mansion at Emo Park are nearly completed—the latter comprising 16 spacious and well-ventilated bedrooms, 13 feet 6 inches high, divided by an upper and lower corridor, 80 feet in length. On the upper storey, and at right angles with the main building, is a picture-gallery 137 feet long, lighted by seven lantern lights, terminating with conservatory, the roof of which is wrought iron and circular, and through this conservatory is the entrance from the mansion into the new wing. The storey under the gallery is divided into waiting-rooms, offices, and valets' brushing-rooms; the girth of the wing measuring 600 feet.

A handsome circular saloon, 26 feet 6 inches diameter and 50 ft. high, is erected in the centre of the mansion; it is lighted from a dome, with plate glass centre, of rich and beautiful design. The ceiling of this apartment is divided into 16 panels, deeply coffered, the mouldings of which are fully enriched, and rosettes of different patterns are placed in each panel. A fully enriched Corinthian entablature is supported by eight sienna marble pilasters, resting on pedestals of the same material, with white marble bases and mouldings. The Corinthian capitals are wrought in Keene's marble cement, beautifully polished. Between the pilasters are oval and square panels, richly ornamented; a festoon of flowers, also wrought in Keene's cement, is gracefully placed and tied over the oval panels, and dropping at either side—the under compartments being filled by four doors and four niches. The architraves, pilasters, consoles, and entablatures are veined marble; the skirting all round is also of white marble, and richly moulded niches, with marble figures therein, 6 feet 6 inches high, are introduced in the walls. The floors are laid in rich parquetrie to correspond with panels in dome, the Portarlington arms being beautifully executed in centre panel. The walls, ornaments, mouldings, &c., in this saloon are finished in Keene's marble cement, and are highly polished.

The new drawingroom ceiling is most elaborately executed in stucco and richly gilt, the floors here also being laid in parquetrie, which, together with the floor of the saloon, are highly polished. The doors are solid mahogany, and all the window-sashes round the mansion are mahogany, filled with plate glass, and two panes in each. The cost of these improvements amounts to £7,000, including the gas works. Mr. William F. Caldbeck is the architect, and Mr. Thomas Connolly the contractor, who has also built the gas-house, chimney, and gas-tank, the latter 25 feet diameter by 12 feet high.

THE ORIENTAL BATH PROCESS.[*]

First, the bather leaves his clothes in a private stall, closed by a curtain, having previously given his trinkets to the bath superintendent, who is responsible for anything that may be lost. The bath costume is put on before leaving the dressing stall; and consists, for gentlemen, of a kind of coloured kilt, or large towel, fastened round the hips; and in the case of ladies a kind of toga is used, descending from the shoulders like the ordinary bathing dress, and made according to the fancy of the wearer.

As the floor is heated, it becomes necessary to put on wooden pattens before entering the next room, which is called the tepidarium, and is moderately heated. In imitation of the Turkish fashion, couches are provided in this room; but the Romans were not so luxurious, and contented themselves with sitting down. Here the bather remains until the perspiration begins to start, and then goes into the caldarium, or the hottest room, which is also called the sudatorium. Here he does not lie down, except during shampooing (or systematic kneading and pressing of the entire body). In Pompeii the caldarium was very long, and had hot-water baths at both ends, leaving an open space in the centre, for lifting weights, and going through other manly exercises; but the Turk likes to get all the exercise done for him, and accordingly never misses being shampooed. It must not be supposed, however, that this process is as necessary to an Englishman as it undoubtedly is to a Turk; although for those whose habits are unavoidably sedentary it cannot be too highly recommended. An important part of the bath is the removal of a quantity of loose scales, which the moist hot atmosphere detaches from the skin; and this is effected either by systematic hand rubbing, or (more expeditiously) by a kind of rough glove specially made for the purpose. This is done after the shampooing, and is followed by a thorough soaping with a froth of soapsuds, which is washed off by a succession of bowlfuls of warm water, mixed according to fancy in the basins of the lavatorium. Then follows a process which is not Turkish, but which is recommended for this climate, namely, cold affusion, either by water lifted with the bowls provided for the purpose, or by the spray from a rain-douche, or the column-douche for those who are robust, and possess good reaction.

When this is not used, the Turkish system of remaining a considerable time in the cooling-room must be followed in order to ensure the closing of the pores; but after a good douching no one need be afraid to go straight out of the bath, and engage in either business or pleasure, according to circumstances. I anticipate that this plan will be the most followed of all, especially by those to whom time is an object; but those who desire to go through the whole Turkish process will not be disappointed; nor can any one say that we have not met the wishes of those who have a desire for dry air at a high temperature, as a room has been specially added for medical use, which can be used by any bathers who desire it, after their own fashion; but the company do not hold themselves responsible for any mode of bathing except that which they recommend.

Private rooms have also been added for the convenience of noviciates who may have prejudices against bathing in public, although we cannot understand how the frequenters of the public plunge baths of this country can have any scruples against a mode of bathing in which the bather is partially clothed during the entire process. Neither in sea-bathing nor in the public baths already established throughout the country is there anything approaching to the scrupulous delicacy which is observed in the Turkish bath. E. H.

ARCHITECTURAL ASSOCIATION.

At a special business meeting held on the 26th July, in accordance with a requisition for the purpose of considering the report of the Committee of the Institute on the question of Architectural Examinations, the following resolutions were passed:—

"That the Architectural Association expresses its general approval of the proposed regulations and curriculum as forwarded to it by the honorary secretaries of the Royal Institute of British Architects, but begs to submit that, in the opinion of its members, the following modifications in detail would, if adopted, prove improvements:—

"That the titles of ordinary proficiency and honorable distinction should be modified, and senior and junior examination be substituted.

"That, to paragraph 4 on page 1, the following words be added,—'or such other books of tables as the Examiners, upon his application, shall allow.'

"That, except under ordinary circumstances, the Examiners shall be exclusively men belonging to the architectural profession.

"That 500 marks should be deducted from History and Literature and added to Mathematics in the first examination.

"That on page 3 the words 'whose President or Secretary at the time when such distinction was adjudged shall have been a Fellow of the Institute,' be omitted.

"That the third paragraph on page 4 should be revised or omitted, as the practical result seems to be that the larger number of marks a candidate obtains for answers the worse would be his position.

"That a method should be adopted for informing the unsuccessful candidates of the subjects in which they have failed, and possibly it might be advantageous to tell them the number of marks they obtained.

"That the scale of fees should be reversed: one guinea being payable for the first and two guineas for the second examination.

"That the declaration should be modified; that the fact of a candidate discontinuing his profession, or supplying materials with the knowledge of his client, should not occasion his removal from the list of passed candidates.

"That the secretaries be requested to communicate these resolutions to the honorary secretaries of the Institute, and to the honorary secretary of the Examination Committee."

INSTITUTE OF MECHANICAL ENGINEERS.

On the 31st ult. and 1st inst. this body held at Sheffield meetings for the transaction of business. Sir William Armstrong, the inventor of the celebrated gun bearing his name, presided, and delivered an inaugural address, in the course of which he said—

"It is the iron, and not the golden age, which is the true age of civilization; and England has led the way in the march of progress, chiefly through her skill and energy in producing this metal, and applying it to mechanical purposes. Iron, unlike all other metals, has three phases of existence—cast iron, wrought iron, and steel, each equally useful, and yet so different as to be virtually separate metals. In the manufacture of steel, the town of Sheffield enjoys an unrivalled eminence, and our discussions on this occasion will naturally be directed to those various questions of peculiar interest which at present apply to that most useful product. I have hitherto spoken only of the mechanical arts as applied to the purposes of peace, but I have yet to refer to the darker side of the picture in speaking of their application to the purposes of war."

Papers were read by Alderman Brown on "The Manufacture of Steel Rails and Armour Plates;" by Mr. Bessemer on "The Manufacture of Cast Steel, and its application to Constructive Purposes;" by Mr. Vickers (Naylor, Vickers, & Co., steel bell manufacturers), on "The Effect of the Combination of Carbon with Iron in increasing or diminishing its Strength;" and by Lieut.-Colonel Kennedy on "The Construction and Erection of Iron Piers and Superstructures for Railway Bridges in Alluvial Districts." Mr. Vickers, in the course of his paper, remarked that—

"The superior strength of cast steel cannot be better illustrated than by remarking that castings of steel, without hammering, rolling, or other means of mechanical compression, show a very high degree of strength and tenacity far above that of castings of any other metal in practical use. Advantage is taken of this property of cast steel to make bells of that material, one-third lighter than bronze bells of the same diameter; and this lighter steel bell will still bear double the breaking strain of the bronze one. Another superiority of steel castings is that they are not as liable as other metal to break when subjected to concussions during intense frost, as proved by the fact that cast steel bells are rung in Russia and Canada, where the thermometer ranges below 20 degs. under zero (Fahrenheit), without the least injury, while the heavier and thicker bronze bells could not be rung in the same temperature without cracking. The same properties have led to the manufacture of cast steel railway carriage and engine disc wheels, with tyres, in one solid body."

THE CITY HALL.

Referring to the decoration of this building which our readers have already been made aware, through these columns, of being in progress, the *Freeman*, which not unfrequently, in its vigilance to record every local improvement, anticipates our intention—has the following:—

"The interior of this splendid edifice has also been for some time past undergoing extensive repairs and decorations. The great difficulty of reaching the interior of the dome, in order to decorate the ceiling, &c., has been successfully accomplished, and without accident, by Messrs. Eakins, of Upper Sackville-street. The panellings and lozenge-shaped compartments of the dome are coloured white, picked out with yellow on a blue ground. Although this colouring is pleasing in its character, it would have been more so had the tints chosen been simply blue and white, and made as much as possible to resemble the colours of the sky, which a dome in miniature represents. The windows have been cleansed and painted, and the spaces in stone work all renovated. To the credit of the Corporation must be said that no great public building has undergone such material alterations as this, with less general detriment to the plan of the architect, and if Gandon himself were alive to see the building, he could scarcely find fault with the practical uses to which a large portion of the hall has been appropriated. The statues of Grattan, George III., Lucas, O'Connell, and Drummond, which have been encased, will be uncovered in a day or two, and thoroughly cleaned. The side doors leading to the offices have been painted in oak, and the general aspect of the hall is highly pleasing. We must reserve our highest praise for the manner in which the grand staircase of this fine civic structure has been embellished. The prevailing colour of the walls is blue, of a negative tint. The lantern lights have been painted and cleaned, and the figures on the slopes are finely brought out in imitation of cameo. Had the dome been decorated in this way, the whole thing would be nearly faultless. Up stairs the committee rooms are painted in oak, and just ready for public use. Externally, the railings, barriers, gates, &c., &c., are all being newly painted. Of the council hall we have often spoken. When this contract is completed, the City Hall, both externally and internally, may be pronounced to be in a fine state of preservation."

---

[*] Read by Dr. Haughton, at the Architectural Society of Liverpool, April 17, 1861.

Miscellaneous.

A Vandalism.—The attention of the authorities is requested to the progressive destruction of the remains of the old defences of Limerick. Those walls with which so many important events are associated, and so much of the renown of Limerick blent, are gradually disappearing, demolished in some instances for the meanest and most miserable ends. It is said that they are pulled down piecemeal to aid in the construction of sheds and piggeries; and that in the neighbourhood of the ever famous and ever glorious Black Battery, where the Brandenburghers fell before the native valour of Limerick men, the stones which their sacrificial blood consecrated are appropriated to the vulgar and vile uses named. There are citizens living who remember when the summit of the ramparts was as broad as a carriage drive, but now we believe scarce a footpath remains to manifest the bulk of those bravely held walls.—*Munster News.*

Export of Railway Material to India.—The activity which prevailed last year in various branches of the iron trade is to some extent explained by the immense shipments made of *materiel* to India, on account of the vast railway works now in progress. It appears from an official return that last year no less than 234,710 tons of materials were despatched to India of the collective value of £2,140,703, being the largest consignment made in any one year since the works were commenced. The proportion of *materiel* taken by each company was as follows, omitting fractions:—East India, 56,488 tons, of the value of £580,887; Madras, 88,346 tons, of the value of £296,842; Great Indian Peninsula, 25,971 tons, of the value of £236,365; Bombay, Boroda, and Central India, 32,981 tons, of the value of £335,668; Scinde, 2,056 tons, of the value of £26,582; Punjab, 24,107 tons, of the value of £251,211; Indus Steam Flotilla, 1,240 tons, of the value of £17,215; Great Southern of India, 17,139 tons, of the value of £118,574; Calcutta and South Eastern, 6,088 tons, of the value of £74,174; Eastern Bengal, 30,333 tons, of the value of £213,686.

The Census of Ireland.—Table III. presents the number of houses inhabited, uninhabited, and building in 1841, 1851, and 1861, with the decennial increase or decrease between the two latter periods. The number by which the inhabited houses had decreased for the ten years ending 31st March, 1851, was 282,616, or 21·27 per cent. less than those recorded on the 6th June, 1841; while by the present inquiry we learn that the number of inhabited houses is 993,283, and the decrease since 1851 is only 52,990, or 5·08 per cent. The number of uninhabited houses in 1851 was 65,263, while in 1861 an examination of the same item shows but 39,972. In 1841 there were 3,313 houses in process of building, in 1851 only 1,868, and in 1861, 3,047. Taking the inhabited houses in 1841, there were 1·11 families to each house; in 1851, 1·15 families; and in 1861, 1·14. The localities in which the house accommodation has decreased most are the counties of Tipperary, Kilkenny, Meath, King's, and Queen's, in which also the population has very largely decreased; while there has been an increase of inhabited houses in the towns of Belfast and Carrickfergus, the County of Dublin (chiefly in the suburban districts of the metropolis), the cities of Cork, Dublin, Waterford, and Limerick, and the counties of Antrim, Armagh, Londonderry, and Sligo.

Mechanics Wanted.—We notice placards about this city from Liverpool employers for Dublin mechanics at liberal wages. Application is directed to the Clarendon-rooms, John-street.

Re-opening of the Theatre Royal.—After a very unusually protracted recess, the doors of the Royal are about to be re-opened on the 19th inst., an engagement with Mr. Drew, an Irish comedian, of whom we have had occasion formerly to speak, being announced. On the 16th an operatic company, with powerful caste, and comprising Mddles. Titiens and Anna Whitty, Mesdames Lemaire, and Bellini, and Signori Guiglini, Delle Sedte, Fallar, Ciampi, Bossi, Bellini, Cazaboni, and Mr. Swift, will make a first appearance. The repertoire comprises some old favourite operas, and Verdi's last, "Un Ballo in Maschera."

Japanese Arts and Manufactures.—Dr. MacGowan has been delivering at the Exhibition building a series of highly interesting lectures on this subject, and illustrated them by a variety of curious articles, showing the mechanical skill and ingenuity of these people, especially in the working of metals. The lecturer also treated of those of India and China, and was most attentively listened to.

Sir John Vanbrugh.—This architect, almost equally eminent as a dramatic poet, died in 1726. He was for some time Clarencieux King of Arms, to which appointment, when he succeeded, Swift's pun, was that he might *now build houses.* He was knighted at Greenwich, September 9, 1714, appointed Comptroller of the Royal Works, January 6, 1715, and Surveyor to the Works at Greenwich, August 17, 1716. The bespattering of flippant wit with which he was loaded by Walpole and others may be properly contrasted to the opinion of Sir Joshua Reynolds, who says, "In the buildings of Vanbrugh, who was a poet as well as an architect, there is a greater display of imagination than we shall find, perhaps, in any other; and this is the ground of the effect we feel in many of his works, notwithstanding the faults with which many of them are charged. For this purpose Vanbrugh appears to have had recourse to some principles of the Gothic architecture, which, though not so ancient as the Grecian, is more so to our imagination, with which the artist is more concerned than with absolute truth. To speak of Vanbrugh in the language of a painter, he had originality of invention; he understood light and shadow, and had great skill in composition. To support his principal object, he produced his second and third groupes or masses." Again he says, "This is a tribute which a painter owes to an architect, who composed like a painter, and was defrauded of the due reward of his merit by the wits of his time, who did not understand the principles of composition in poetry better than he, and who knew little or nothing of what he understood perfectly, the general ruling principles of architecture and painting. Vanbrugh's fate was that of the great Perrault. Both were the objects of the petulant sarcasms of factious men of letters, and both have left some of the fairest monuments which, to this day, decorate their several countries; the façade of the Louvre; Blenheim and Castle Howard." Walpole, who was content to live in a barbarous den at Strawberry Hill, says of this truly great architect, "He seems to have hollowed quarries rather than to have built houses." This author also attributes St. John's Church Westminster, to Vanbrugh, in his notice of him, though at another place he assigns it to Archer.

The Austrian Engineers' Union have forwarded us their prize list for the ensuing year. They offer two prizes—one of 400 German dollars, and a second of 200 dollars—for an historical and theoretical account of the latest roofs of wood and iron, beginning at eight fathoms, up to the largest accomplished width of span. Two other prizes of like amount are offered for an historical, statistical, and critical account of the apparatus and means used for greasing railway carriages. Competitors for these prizes must send in their contributions before the end of October, 1862. Persons wishing to compete for these prizes should apply for prize lists to the *Ingenieur-Verein*, Vienna.—*Mechanics' Magazine.*

Our Coinage.—The recent inquiry of Mr. Potts, in the House of Commons, as to the appointment of a new resident engraver to her Majesty's Mint, seems to us—who have taken especial interest in matters relating to the coinage—to merit notice, and we trust that the Chancellor of the Exchequer will think so too. There is, as we have repeatedly shown, too much reason to be dissatisfied with the metallic currency of Great Britain. It is the growth of a great number of years, and presents many faults and incongruities, apart from the deterioration of age and hard work. If, now, the Chancellor of the Exchequer would only take the initiative in organizing a decimal system of coinage, and appoint an engraver to the Mint, who would be able and willing to furnish new, unique, and beautiful designs for it, of what an admirable measure of social reform would he not be the parent? Or if a committee were appointed, consisting of *savants* and practical men, empowered to examine into the defects of the existing coinage, and to suggest improvements in it, what good might not be effected? Probably, however, the hon. member for Barnstaple has other and equally good propositions to make on the subject, and we, at all events, shall await with anxious interest the next motion made by him respecting it.—*Mechanics' Magazine.*

Parisian Workmen.—The industrial population of the French capital has long held the highest rank as an aggregate of artistic workpeople, having great adaptation to their calling in consequence of natural and ancillary circumstances. The popular development of the fine arts, the schools, the daily appliance of science to industry, the neighbourhood and relation to many different works of art, form a kind of ensemble of instruction which imperceptibly penetrates the whole industrial class, and gives a notable precocity and singular vivacity of intelligence to the operative *enfans de Paris*. When able to earn high wages, the Paris artizan and his family, if possessing the natural characteristics of economy and decent deportment, are also able to accomplish much with their money. It is calculated that the ordinary rents paid by the working class in Paris are far higher, often double, than the cost of the same accommodation in London. Fuel is also about double the price, and meat much dearer. So those three items being indispensable, we can understand how it is that these metropolitan workpeople are generally reduced to a decidedly lower scale of subsistence, comfort, and enjoyment, than their English competitors. Everything in the way of clothing is likewise higher in price, as also are coffee, sugar, and some other little necessary luxuries. Tea is unknown, and the entry duty on provisions raises the price considerably. Here we doubtless find the cause why fabrication of articles of luxury, requiring artistic manipulation, and yielding more gain to their makers than articles of necessity, forms the vast and most profitable department of Parisian industry.—*Dublin University Magazine.*

Brief Letters.—The poet Rogers used to tell a story of the brevity of Talleyrand's correspondence; for once a lady wrote to him in high-flown terms of grief, informing him of the death of her husband, and expecting a letter of condolence in return; but the only answer was:

"Helas, Madame!
Votre affectionne, etc.,
Talleyrand."

In less than a year the same lady wrote that she had married again, to which the laconic reply was:

"Oh, ho, Madame!
Votre affectionne, etc.,
Talleyrand."

Equally laconic, and more kindly, were the letters that passed between Garrick's widow and Edmund Kean, after the old lady had seen the latter's performance of a part in which her husband was matchless:—"My dear sir: You can't play Abel Drugger. Yours faithfully, C. Garrick." "My dear madame: I know it. Yours faithfully, Edmund Kean."

Labourers' Dwellings.—The only new feature connected with the administration of the Land Improvement Acts during the year has been the passing of the Act 23 Vic., c. 19, authorising loans for the erection of dwellings for the labouring classes in Ireland. On the passing of this act the instructions for the guidance of the commissioners were approved by your lordships. On receiving their lordships' approval the Board designed four sets of suggestive plans, and framed a general specification of works for the information of applicants, showing the mode of erection which they considered most suitable, and the cost of which was not likely to exceed the amount sanctioned by your lordships in paragraph 3 of the instructions. Although their plans, specifications, and estimates, together with the instructions, have been printed and extensively distributed thraughout the country, only twelve applications for loans for the erection of labourers' dwellings have as yet been received by the Board; but probably several, in addition, may still be applied for during the present year.

Farm Buildings.—The several totals comprehend 299 loans, amounting to a sum of £80,360, which have been sanctioned to proprietors for the erection of farm-buildings, of which 182 loans, amounting to £61,660, have been completed in the undermentioned counties, viz.:—Antrim, £1,050; Carlow, £1,200; Cavan, £1,200; Cork, £7,200; Clare, £950; Donegal, £650; Down, £1,000; Dublin, £2,400; Fermanagh, £100; Galway, £2,900; Kerry, £1,650; Kildare, £2,980; Kilkenny, £1,040; King's County, £350; Limerick, £4,500; Longford, £1,000; Louth, £1,100; Londonderry, £1,150; Mayo, £5,840; Meath, £1,200; Queen's County, £2,050; Roscommon, £4,730; Sligo, £1,890; Tipperary, £6,230; Tyrone, £950; Westmeath, £850; Wexford, £550, Wicklow, £900. Total, £57,610. Of the remaining 47 loans for farm buildings which have been sanctioned, 14, amounting to £4,850, have not been proceeded with, and do not, therefore, appear in the table, which includes 15 loans, amounting to £4,850, for buildings commenced during the year 1860. The other loans stated therein have reference to works of previous years.

Public Testimonials and Statues.—The number of public statues and testimonials, either proposed or in progress at the present moment, to the memory of public men recently deceased is more remarkable than at any other period. Among those in progress to commemorate the services of distinguished statesmen may be mentioned one to the memory of Lord Melbourne in marble to be erected on the north side of St. Paul's; another of the late Lord Macaulay at Cambridge; a literary institute and statue to Earl Dalhousie at Calcutta; a statue to Lord Elphinstone, and a memorial to Count Cavour. A military statue and trophy to the Duke of Wellington, twelve feet high, in bronze, will shortly surmount the Wellington column, erected for the purpose at Liverpool, and statues to Havelock and in honour of Sir Hope Grant, are proposed in the places where they were born. Statues to the eminent engineers Robert Stephenson and Isambard Brunel are being executed by Baron Marochetti, to be placed opposite Palace-yard. Another statue, in addition to the one at the Euston station, is about to be erected to George Stephenson at Newcastle, and one is talked of to the late Mr. J. Locke Sir Charles Barry, the architect of the Houses of Parliament, is to have an effigy in Westminster Abbey. An architects' travelling fund is to be established in honour of the late Mr. Pugin. In the religious world two commemorative monuments have just been inaugurated to Dr. Watts and James Montgomery, and another is dedicated to Bunyan. Sir Hugh Myddleton, the projector of the wealthy New River Company, and who is said to have died in penury, is to have a drinking fountain erected to his memory at Islington. Dr. Baily, the late physician to the court, is also to have a statue. Among the most recently proposed testimonials, apart from statues, are those of the Right Hon. Milner Gibson and Mr. Braidwood.

The Builders' Strike.—Wednesday, the 7th inst., the period of two years expired for which the master builders had entered into their bond of association, leaving them free either to cease or renew their connexion with the association. A deputation from the masons' committee accordingly waited on following day upon the firm of Messrs Waller & Son, the extensive contractors of King's-road, Chelsea, to ascertain the final decision of the firm upon the question of the compromise. The result of this interview was the abandonment of the hour system, and the unconditional acceptance of the terms of the compromise by that firm, the only stipulation on their part being that as far as possible they should receive back their old workmen. This firm require the services of about ninety masons, sixty of whom will commence work this day, and the remainder in a few days. The Society of Amalgamated Engineers yesterday paid in their first trade gift to the strike committee, and considerable sums were received from other societies.

The Broken Pane.—M. Bastiat, a French political economist, writes amusingly on the indiscretion of capital. He takes the case of a broken pane of glass by way of example. Jacques Bonhomme, as he calls him, is the sufferer. One day the son of this worthy citizen breaks a pane of glass, and he is very angry in consequence; but the neighbours hasten to make the consoling reflection that "it is an ill wind that blows nobody good." Such accidents do good to industry. Everybody must live. What would become of glaziers if windows were not broken? Such is the form of theoretic error that taints popular reasoning. "Supposing that six francs are required to repair the damage, if it is meant that the accident brings six francs to the glazier, and encourages his industry to the extent of six francs, I grant it readily; the reasoning is just. The glazier comes, he finishes the job, he pockets six francs, rubs his hands, and in his heart blesses the mischievous urchin. *This is what is seen.* But if, by way of inference, it be concluded, as it is too often, that it is a good thing to break windows—that it makes money circulate—that the result is an encouragement to industry in general—I am obliged to cry *halt!* Your theory stops at *what is seen*, it takes no account of *what is not seen.* It is not seen that since our citizen has spent six francs on one thing, he cannot spend them on another. It is not seen that if he had not had that pane of glass to replace, he would have replaced, for example, his shoes now down at heel, or would have placed another book in his library. In short, he would have made of these six francs some use which now he cannot make. Let us, then, make the reckoning of industry *in general.* The pane of glass being broken, the industry of the glazier is encouraged to the extent of six francs; *that is what is seen.* If the window had not been broken, the industry of the shoemaker—or some other—would have been encouraged to the extent of six francs; *that is what is not seen.* As Jacques Bonhomme forms part of society, it must be concluded that society has lost the value of the broken pane. Hence, by a process of generalising, we arrive at the conclusion—"Society loses the value of objects uselessly destroyed; to break, to destroy, to dissipate, is not to encourage the national industry; or, more briefly destruction is not profit. The reader," proceeds Bastiat, "must try to establish clearly that there are not two persons only, but three, in the little drama to which I have called his attention. The first, Jacques Bonhomme, represents the consumer reduced by destruction to one enjoyment instead of two. The second, the glazier, shows us the producer whose industry is encouraged by the accident. The third is the shoemaker, or any other craftsman, whose industry is discouraged to the same extent by the same cause. It is the third person who is always kept in the shade, and who, personifying *what is not seen*, is a necessary element in the problem. It is he who shows us how absurd it is to see a profit in a destruction. It is he who will soon teach us that it is not less absurd to see a profit in a restriction, which is, after all, only a partial destruction."

Our Mineral Wealth.—The value of the minerals raised in 1860 was £26,404,459, against £24,226,526 in the preceding year—increase, £2,177,933. The value of the tin, copper, lead, silver, zinc, pig-iron manufactured from the ores of those metals raised during the period was £16,939,717, against £15,447,086—increase, £1,492,661; of other minerals and metals, £170,927 in 1860, against £95,000 in 1859; and of coals, £20,010,674 in 1860 against £17,994,941 in 1859, thus showing the aggregate value of our metals and minerals when brought into the ordinary commercially marketable condition to have been £37,121,318 in 1860, against £33,537,020 in the preceding year—the increase being equal to £3,584,291. Mr. Hunt's volume has this year been enriched by the appending of a general statement of the progress of British mineral industry since the publication of the statistics was commenced.—*Mining Journal.*

The Commissioners of Public Works, in preparation for her Majesty's visit, are placing on the raised portion of Carlisle Pier, immediately under the shed, a series of seats, six in number, each about two feet wide, and the riser of each about one foot above the other. They will form a concave on either side of the part left open for the gangway or landing place from the steamer, branching off to the right and left about 150 feet on either side, thus affording an excellent view to those occupying them. The portion of the railway next the usual landing place will be platformed over to the extent of 75 or 80 feet, so as to give a greater area for placing the galleries. Then immediately opposite the open space, and on the part of the pier usually employed as the place for embarking, there will be another gallery erected parallel to the coping of the railway.

A Photographic Machine.—A Lyons newspaper says that a machine has just arrived from America which is capable of printing 4,000 photographic proofs in an hour from the same negative. The paper used is said to be prepared with gelatine and impregnated with iodine of silver mixed with other substances, which endow it with extraordinary sensibility. It is then rolled on a cylinder, and unrolled, when in the machine, by clock-work, so that each portion remains about a second opposite to the negative, which during the movement on the paper is covered by a lid worked by the same machinery. The sun's rays are brought to bear upon the original in a concentrated form by means of a powerful lens. The result is said to be that photographs which, by the ordinary process, cost at least 1f. 50c. each, can be produced at the rate of a sou each.

Iron and Steel.—A process has been invented by Mr. William Longmaid for an improvement in the manufacture of iron and steel, which consists in the introduction during the operation of puddling of a small quantity of gold, which is diffused throughout the mass, and which is said to confer extraordinary durableness. If the results alleged should be substantiated by sufficient trials, there seems a probability that it will have an important influence on the manufacture of artillery, ships' plates, anchor cables, and all these portions of railway plant in which tenacity is most essential.

The Turkish Bath an Antidote to Drunkenness.—Patients suffering from the effects of that fertile source of illness—intemperance—often have recourse to the bath, and as the blood is usually the seat of disease in this case, no remedy is yet known so effective. It enables the sufferer to inhale in an increased degree the legitimate stimulant of the body, oxygen; the blood is so purified by the process, that health is restored, the craving appetite for strong drink ceases, and a relish is felt for a purer and ten times more agreeable exhilaration. The blood, having deposited the nourishment obtained from the food on the tissues of the body, receives, in returning, the impurities rendered soluble by the oxygen obtained through the lungs and skin. These effete materials are afterwards eliminated by the various organs provided for that purpose. The more complete the oxydation is, the more perfectly will these functions be performed, and the more completely will the system be rid of its impurities. But when spirits are taken, the oxygen, instead of entering into combination with the effete matter, has a greater chemical affinity for alcohol, and combines with it in preference. This being often repeated, it is easy to conceive that the system will become clogged with its impurities, and this, together with the reaction after the undue stimulus of the spirits, gives the drunkard, when sober, that horrible feeling of depression and languor, and consequent craving for fresh excitement.

Artistic Designs for Watches.—"A number of new and artistic designs for the embellishment of watches have been invented and exhibited by Mr. J. W. Benson, of 33 and 34, Ludgate Hill, and 46 and 47, Cornhill, who has exerted himself with commendable success to provide, in this particular branch of manufacture, the union of taste and usefulness so striking in the productions of the French artificers. The recent progress in the art of watchmaking in England is owing to the enterprise and industry of several gentlemen, who are now reaping a just reward for their ingenuity. Amongst these Mr. Benson holds a prominent position, and his designs may therefore be recommended to the notice of the public."—*Daily Telegraph.*

Improvements in Street Lighting.—It has been ascertained that by placing near the flame ordinary gas burners a receptacle containing coal naptha, the brilliancy of the light is much increased. An invention based upon this principle is already the subject of a patent vested in a public company. The patentees state that by the use of their process a saving of one-half may be made in the expense of lighting by gas. To test the accuracy of this assertion, experiments have just been made in London, under the authority of the Commissioners of Sewers. Moorgate-street was selected for the trial, there being in it few shops, and only one or two private lamps. The lamps experimented upon were twelve in number, six upon the western side, fitted in the ordinary way with burners, and consuming upon the average five cubic feet of gas an hour, and six upon the eastern side, fitted with burners, having attached to them the apparatus of the patentees, and consuming two and a half cubic feet an hour. The experiment extended over 30 nights. The burners without the apparatus consumed about 4·39 cubic feet per hour; while the burners with the apparatus consumed only 2·09 cubic feet per hour. The district inspector of the commission, who saw the lamps nightly, reported his opinion that the light given was perfectly equal, an opinion in which he is supported by residents of the neighbourhood. Mr. Heywood, the engineer of the commission, who principally conducted the experiments, is, however, inclined to think that the lights are not quite equal in intensity. He states that three cubic feet of gas, carburetted by means of the naptha, are equal to five cubic feet of gas not carburetted. On this assumption he shows that by the adoption of the new process, the reduction of the cost of each lamp a year would be 20s. and that there being 2,825 lamps in the city, the annual saving of £2,825 might be effected.

Barracks and Huts.—Within the last 20 years there has been expended on barrack, huts, &c.:—At Colchester, £117,757; at Pembroke, £61,241; at Shoeburyness, £84,927; at Shorncliffe, £210,292; at Hythe, £26.864; at Fleetwood, £13,380. Much further expenditure is proposed, and has been approved by the government—£50,000 for cavalry barracks at Colchester; £27,000 for additional accommodation and works and a church at Shoeburyness; £4,000 at Shorncliffe, and about the same sum at Hythe, and at Fleetwood £10,000 for purchase and alteration of bath house, &c., nearly £10,000 more for hut encampments, and in a future year £18,000 for permanent barrack and hospital.

French Photographers and the Exhibition of 1862.—The French photographers are disposed to resent warmly the proposed classification of photography. The Paris correspondent of a daily contemporary remarks:—"The French commission for the exhibition of 1862 has prepared forms of application for intending exhibitors, and has appointed seven places in Paris for their distribution. The chief office is in the Palais de l'Industrie. In connection with this subject, I may mention that the photographers here are exceedingly displeased with what they understand to be the decision of the English commission relative to the classification of their productions with the instruments by means of which they are produced. They say very pertinently that silks are not put with looms but with similar products, and therefore that photographs should be placed with engravings and lithographs. Some of the best photographers declare that they will not exhibit unless an alteration is made in the plan. Perhaps the matter only requires a little explanation, and I therefore merely report facts for the consideration of the commission."

TENDERS

For the erection and completion of a manse for the Rev. Mr. Burns, P.M., in Wexford, from designs by Mr. Richard Pierce:—

Redmond	£649	0	0
O'Connor	600	0	0
Pierce (accepted)	600	0	0
Willis	595	0	0

To Correspondents.—T. B., Thomastown (We could not undertake to wade through such a production); T. F., Blackburn (We are unable individually to recommend at present; the better course is an advertisement).

NOTICE.

Post-office Orders and Remittances should be made payable to Mr. Peter Roe, *Printer and Publisher*, 42, Mabbot-street, Dublin.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to* "*The Publisher of the* Dublin Builder," 42, Mabbot-street. *All other Communications should be addressed to the* "*Proprietor and Editor*," 17, Lower Gardiner-street.

Iron Founders, Plumbers, &c.

TUPPER AND COMPANY,
Manufacturers of
Patent Galvanized Iron, and
Galvanized Tinned Iron, Corrugated and Plain;
Also
Patent Galvanized and Galvanized Tinned Tiles.
Estimates and Drawings furnished for Iron Houses, Churches, Roofs, Sheds, Stores, &c.
All sorts of Iron Work Galvanized.
Merchants and Shippers Supplied.
Works—LIMEHOUSE AND BIRMINGHAM.
Offices—61a, MOORGATE-STREET, LONDON, E.C.

GALVANIZED WROUGHT IRON
CISTERNS.
MANUFACTURED BY
TUPPER & COMPANY,
61a, MOORGATE STREET, LONDON, E.C.
Galvanized or Lead Service Pipe, Brass Ball Valves Bib Cocks, &c.
Prices delivered in London.
N.B A Discount to the Trade, Builders, &c.

From 4½d. per gal.
MADE TO ANY SHAPE
OR SIZE REQUIRED.

GAS APPARATUS FOR LIGHTING PRIVATE HOUSES.

J. EDMUNDSON AND CO. call attention to their PATENT GAS APPARATUS, by means of which Noblemen's and Gentlemen's Mansions, Out-offices, and Farm-steadings can be brilliantly lighted with Gas, at an expense much less than from oil or candles. It is also well adapted for lighting Towns, Villages, Mills, Public Establishments, &c.

The Apparatus produces more Gas from a given quantity of Coal than any other. The brilliancy of the light far exceeds that used in the principal towns of Ireland, and its purity is such as is only found in Home-made Gas.

In districts where Coal is scarce and Peat plentiful, *Gas from Peat* can be economically manufactured by J. E. and Co.'s Apparatus, which is compact, inexpensive, and so simple in construction that any labourer or farm servant of common intelligence can manage it.

J. EDMUNDSON AND CO. will have pleasure in waiting upon any gentleman who desires to know the cost of the erection of Gas Works at his residence or other establishment, and will be prepared to submit, free of expense, an estimate for the work.

Gas Engineers, Contractors, and Ironmongers,
34, 35, AND 36, CAPEL-STREET, DUBLIN.

HAMMERSMITH IRON WORKS, DUBLIN.

MESSRS. TURNER AND GIBSON, Manufacturers of IRON CONSERVATORIES, Fruit Houses, Pine Pits, etc.

Ornamental Works, Bowers, Porches, Balustrades, Trellises, Flower Stands, Vases, etc.

Grand Entrance Gates, Guard Railings, Farm Gates, Hurdles, and Strained Wire Fencing, etc

Iron Roofs for Railway Stations, Breweries, Gas Works, and Farm Buildings, etc.

Warming & Ventilating Dwelling Houses, Prisons, Conservatories, Mills, and Public Buildings, etc.; House, Laundry, Cooking, and Steaming Apparatus.

Bridges, Girders, Iron Lattice, Bowstring, Suspension, Patent Balance Rolling, and Swivel Bridges, and Floor Girders

T. and G. beg to refer, as specimens of *their work*, to the Iron Conservatories, Heating, etc., as erected at the Royal Botanic Gardens, Kew; the Inner Circle Botanic, Regent's Park; Cheltenham: Viceregal Lodge; Glasnevin; and various Works by them throughout the United Kingdom.

WILLIAM TURNER,

OXMANTOWN FOUNDRY & IRON WORKS,
103, NORTH KING-STREET, DUBLIN.

Cast-Iron Girders, Plain and Ornamental Pillars, Moulded and Plain Gutters, Tank Plates, Gas Retorts and Pipes, Kitchen Range Work, Millwright, Castings, Balconies, Brackets, Staircase Ballusters, etc., supplied. A large variety of Models for the above in stock.

NEW Balance Rolling BRIDGE.
KENNY'S PATENT.

The undersigned beg to call the attention of Engineers and the Public to the above description of Opening Bridge, as now being constructed for the entrance to the St. George's Dock, Custom-house Quay, Dublin, for the Board of Works, which will be found superior to the ordinary Swivel Bridge, both in point of simplicity of Construction and Cost.

Plans and Specifications furnished, and Licenses granted on application to

TURNER AND GIBSON,
Proprietors and Manufacturers,
HAMMERSMITH IRON WORKS, BALL's-BRIDGE, DUBLIN.

IRON CASTINGS.—Castings of every description for Gas and Water Companies, Millwrights, Builders, Plumbers, &c., made at
SEVILLE IRON WORKS, SEVILLE-PLACE, DUBLIN.

POOLEY'S PATENT WEIGHING MACHINES.—These Machines are used upon the principal railways of Great Britain, and are unrivalled for accuracy. Specimens may be seen, and every information obtained from
H. SIBTHORPE AND SON,
Agents for Ireland,
11 & 12, *CORK HILL, DUBLIN.*

TO BUILDERS AND PLUMBERS.

SHEET LEAD—in Sheets or cut to any dimensions—and Lead Pipe of the best quality. MAURICE BROOKS, Sackville-place, Dublin.

Statuary, Marbles, Cements.

Plaster of Paris.
Roman Cement.
Portland Cement.
Patent Mastic Cement.
John's Patent Stucco Cement.
Keene's Patent Marble Cement.

Of the best quality, to be had of

SALMON RICE, AND CO.
3, ANGLESEA-STREET.

Also Crown, Sheet, and Plate Glass; Fire Bricks, Tiles, &c; Painters' and Plasterers' Brushes.

Gypsum for Agricultural Purposes

Steam Mills and Manufactory—CROWN-ALLEY,
Established, A.D. 1780.

TO ARCHITECTS AND GENTLEMEN HAVING MANSIONS IN COURSE OF ERECTION.

JAMES HOGAN AND SONS,
Stucco Plasterers, General Cement Workers, Modellers, &c.,
168, GREAT BRUNSWICK-STREET,

Beg leave to state that they are prepared to undertake Contracts in the above line. Ornaments for Cornices and Centre Pieces for Ceilings supplied. Fronts for Houses done in Portland or Roman Cement at first cost price. Country Orders strictly attended to, and first class workmen sent to all parts of the Kingdom.

C. WILLIAM GIBLAN, Plain and Ornamental Plasterer and Architectural Modeller, 29, GREAT BRUNSWICK-ST., DUBLIN.

This establishment is the only one in Ireland that has a variety of Colossal Statues, Groups, Busts and Vases, Basso, Mezzo, and Alto Relievo Antique Subjects; Centres, Cornices, &c.

C. W. G. has purchased the stock of the late Agent to the Patent Siliceous Stone Company.

P.S.—Men sent to all parts of the Kingdom.

BEST CEMENTS.

ROMAN CEMENT, PORTLAND CEMENT, and PLASTER PARIS STORES,
10, Sir John's-quay, Dublin.

George Holmes and Co. are constantly supplied with the above materials of genuine quality, direct from the best manufacturers. Also Sewerage Pipes, Junctions, Bends, &c.

CHIMNEY PIECES—in Italian, Belgian, Irish, and English Marble; Enamelled Slate, and Cast Iron: suitable for Drawing-rooms, Dining-rooms, Bed-rooms. &c. A very large Stock to select from. MAURICE BROOKS, Sackville-place, Dublin.

PATENT SILICA CEMENT.

ARCHITECTS and BUILDERS are requested to try this CEMENT. It carries more Sand than Portland, works with greater facility, and dries of a perfectly uniform color (that of Caen stone.) It is entirely free from the efflorescence of nitre, which disfigures work executed in Portland or Roman cements.

A specimen can be seen at No. 80, Bankside, Southwark, Messrs. J. NEWTON & CO, of whom it may be procured, or direct from the manufacturer, F. M. EDEN, Orchard House Cement Works, Blackwall, E.

Oils, Colours, Glass, &c.

MANNIN'S Wholesale and Retail
Drug, Oil, Colour, and Glass Warehouse,
2, GREAT BRUNSWICK-STREET.
(near D'Olier-street.)

Cattle Medicine of all kinds.

N.B.—Every article is warranted genuine, and at the lowest price.

PLATE GLASS, Pier and Chimney Glasses, of the largest dimensions, Silvered; and all sizes, Silvered and Unsilvered, for mirrors, sashes, and shop fronts.
WALTER BURKE,
91 AND 93, MIDDLE ABBEY-STREET.

WINDOW GLASS for Dwelling Houses, Out-offices, Conservatories, &c., with a large assortment of Plate Glass Mirrors.
MAURICE BROOKS,
SACKVILLE-PLACE, DUBLIN.

UNION PLATE GLASS COMPANY.
The very beautiful article of Plate Glass, manufactured by this company, can be had at the price of the lowest in the market, shipped to any Port in Ireland.
H. SIBTHORPE AND SON,
Agents for Ireland,
11 AND 12, CORK-HILL, DUBLIN.

SHIPWRECKS—IRISH LIFE BOATS.

APPEAL TO DUBLIN.

THE Committee of Management have to state that they have recently expended nearly £7,000 on the following Irish Life-boats, viz.:

Portrush,
Groomsport,
Tyrella,
Newcastle,
Dundalk,
Drogheda,
Skerries,
Wicklow,
Arklow,
Cahore,
Wexford,
Rosslare,
Carnsore,
Tramore,
Dungarvan,
Ardmore,
Youghal,
Ballycotton,
Westport.

During the past year the Institution has also incurred expenses amounting to £10,545 on various Life-boat Establishments on different parts of the coasts of the United Kingdom.

During the same period the Society has also granted £1,108 15s. 8d., as awards for saving 499 persons from a large number of shipwrecks on our coasts; a most satisfactory result, and clearly showing how much has been accomplished by the well-directed efforts which the Life-boat Institution has brought to bear on this humane cause. This great and national work has, however, only been accomplished by the Society incurring further liabilities to the extent of £3 834.

With so sacred an object in view as the Rescue of our fellow-creatures from an appalling death by Shipwreck, it might be supposed that the National Life-boat Institution had claims which would come home to the heart of every one in this great maritime country. Such, it may be hoped, will be the case as its operations become more generally known, and thus an abundant harvest, not only of popular sympathy but of general pecuniary support, will be the permanent result.

The Committee of this Institution do not, therefore, hesitate to solicit most earnestly the support of the people of the City of Dublin and its environs, in aid of the benevolent objects of the National Life-boat Institution. They cannot but sympathise with the vigorous efforts now being made by this Society to save the lives of shipwrecked crews. Their help was never more needed than at the present time, when, through the extraordinary exertions the Society has made within the past few years, it has now One Hundred and Eight Life-boats under its management, for the maintenance of which, in a state of thorough efficiency, a large permanent annual income is absolutely needed, if its humane mission is to be perpetuated.

Contributions are thankfully received by the following Members of the Dublin Branch of the Institution:
Capt. Abbott, R.N., Hon. Secretary.
Capt. Maclean, R.N., 22, Blessington-street.
Lieut. Tully, R N., Seville-place.
Lieut. Hutchison, R.N., Harbour House, Kingstown.
P. Howell, Esq., Steam-packet Office, 12, Eden-quay.
Andrew Taylor, Esq., 44, North Wall.
John Walsh, Esq., Agent to Lloyd's, Dublin.
W. J. Egan, Esq., Steam-packet Office, 46, North Wall
H. L. Allen, Esq., Steam ship Office, 5, North Wall.

By Capt. Abbott, R.N., Ulverston-road, Dalkey, the Hon. Secretary of the Dublin Branch; by all the Dublin and London Bankers; and by Richard Lewis, Esq, Secretary of the National Life-boat Institution, John-street, Adelphi, London, W.C.; or by the Collector or Assistant Secretary, Mr. Samuel B. Taylor, No. 1 Lower Leeson street.

The Dublin Builder.

VOL. III.—NO. 41.

LONDON CLUB HOUSES.

ONE of the principal—of the multitudinous—objects of interest in the world's metropolis is the magnificent collection of club-houses at the West End, and though to us frequent visits have rendered them familiar as "household words," we each time cannot fail to contemplate them with admiration. Last week in our rambles through Pall Mall it struck us to jot down a few particulars respecting the most remarkable of these structures, judging that our readers would gratefully accept them. The subject, however, admits of more comprehensive treatment than mere technical description of the buildings, and we shall first briefly trace the origin of "the club" and its history to the present day. The earliest existence of a club is supposed to have been about the latter part of the sixteenth or beginning of the seventeenth century, that held at the Mermaid Tavern, in Friday-street, where Shakespeare, Beaumont, Fletcher, Raleigh, Selden, Donne, and other notabilities of the period assembled, perhaps being the first. Johnson wrote the "Leges Convivales" for a club held at the Devil Tavern, and Addison, in his "Spectator," describes a political association which he styles "a grand alliance." In the early part of the last century this kind of establishment became general and popular, about the most remarkable being the "Beefsteak Club" of which the famous "Mistress Peg Woffington"—the only female member—was president. At the time of the trial of the seven bishops in the reign of King James was established the celebrated "Kit Cat Club," which attained the zenith of its glory in the reign of Queen Anne. Rich, the pantomimist, in conjunction with the Lord Peterborough, established a second Beefsteak Club in 1735, and this (we believe) still exists. Various others of less important character were subsequently founded, but numbers of them were but short lived. The club system of the present day would seem to be very perfect, and provides suitable rendezvous for the respective requirements of noblemen, men of fortune, legislators, literati, professionals, commercials, &c. Amongst the most remarkable are the Reform, the Carlton, the Athenæum, the Senior and Junior United Service, the Travellers', the University, the Union, &c., and the generally highly meritorious architectural character of their features have caused them to be frequently compared to Italian palazzi. The following will serve to convey an idea of the general arrangements of these establishments, subject, of course, to modification to suit special circumstances.

Communicating with a spacious hall, whence branch corridors or passages, are reception or visitors', morning, private dining, porters' and coffee rooms, with minor apartments, billiard and smoking rooms, bar, &c., in less prominent position; principal and private staircases leading to the other storeys; and it is the custom, where practicable, to add a tennis or racquet-court for the recreation of the members. The first floor usually comprises drawing-room—where in some clubs there is a great display of luxury and expensiveness, the finest taste of the upholsterer being called into requisition—a library fitted up with every convenience, also private, retiring, and card-rooms, &c. On the upper storeys, whatever may be their number, are placed the members' bed and dressing-rooms *en suite*, together with separate accommodation for the providore and domestics; and in the basement are all the requisites for the important department of the *cuisine*, cellars, stores, &c.

To give some idea of the liberal scale on which the morning rooms are supplied with periodicals, it is recorded that even in the year 1844, when journals and serials were infinitely less numerous than at present, the sum expended by the Athenæum Club for English and foreign newspapers was £471 2s. 6d. Externally the Army and Navy Club-house is one of the most striking, designed by Messrs. Parnell and Smith, architects, somewhat after the style of the Cornaro Palace, at Venice. It is placed at the intersection of George's-street with Pall Mall—the principal entrance being in the former through three semicircular-headed arches—and presents two storeys and a mezzo, the lower consisting of a series of rusticated piers with dwarf pilasters and entablature in each square-headed open, and surmounted by a continuous modillioned cornice; the upper, a range of coupled Corinthian columns, resting on a broken pedestal, balustraded opposite the window opens, which are semicircular-headed, and surmounted by an entablature with highly enriched frieze and ornamental bracked cornice, crowned with a handsome balustraded parapet and panelled piers. The area through which light is transmitted to basement is enclosed by a balustraded wall.

The United Service Club, though first in seniority, is, when viewed in comparison with others noticed in this article, of less pretensious character architecturally than many of them, being in an Italian style generally pronounced to exhibit "incontestible evidence of insipidity and poverty." The "Athenæum," designed by Mr. Decimus Burton, is truly worthy of that eminent gentleman's ability, and presents a rusticated basement with Roman Doric portico, the ends of which are perforated with windows, surmounted by a tryglyphed entablature and balustrade, with a figure of Minerva standing on a central pedestal. The principal storey has seven windows, with access to a balcony, and ornamented with cornice and trusses. On the main entablature is a remarkably beautiful frieze, in *basso relievo*, copied from the Elgin marbles, and a bold projecting cornice Close by is one of the late Sir Charles Barry's *chef-dœuvres*, "The Traveller's" Club, and perhaps equally successful in some regards is "The Reform," by the same architect. The dimensions of some of the principal apartments in the former are as follows:—Coffee-room, 68 feet by 24 feet 9 in., and 18 feet 6 in. high; principal staircase, 45 feet by 16 feet; drawing-room, 39 feet by 23 feet 9 in., and 24 feet high; card-room, 28 feet 9 in. by 23 feet 9 in.; libraries, 48 feet by 24 feet 9 in., and 17 feet 6 in. high; reading-room, 29 feet 9 in. by 19 feet 6 in. Here is Italian architecture indeed in its integrity and purity, stamped by a dignity and poetry of expression rarely approachable even in some other examples of high excellence. "The Carlton" next claims a notice. When this building was originally proposed, Mr. Sydney Smirke and Mr. G. Basevi were to act conjointly as architects, but on the premature death of the latter, the designing and carring out of the work devolved exclusively on the former. It has a most imposing elevation, and strongly resembles the front of St. Mark's at Venice, which, we believe it is admitted, the architect adopted for his model. The frontage towards Pall Mall is 133 feet, and the height about 70 feet. Caen stone was employed for the facing of the main exterior, and polished Aberdeen granite columns and pilasters, presenting a very pleasing contrast, are introduced. The internal arrangements of this establishment are of a most comprehensive and costly scale, and some of the apartments—the coffee-room especially, which is 90 feet by 36 feet—are magnificent. By the same architect, in conjunction with his father, Sir Robert Smirke, is the University (Oxford and Cambridge) Club adjoining. This building extends 87 feet, and is about 57 feet high. A portico occupies the central position, and an entablature continued across the four Corinthian columns of same, nearly equally divides the lower from the upper storey. A handsome entablature and balustrade terminates the summit of the front elevation, and break over a central projection of equal width with the portico. Some beautiful and appropriate ornamentation is introduced throughout. All the above and various others, not forgetting "The University," in Suffolk Place, "The Union," and the new "Conservative," are well worthy of study both by those within and without the pale of the architectural profession; and at this season of the year, when such facilities are presented for an economical sojourn in the metropolis, we would commend such of our readers as are disposed to excursionizing to saunter for a while in Pall Mall.

HOUSES OF THE CHINESE.

THE distribution of their houses is perfectly uniform; and it would be improper, and even dangerous, for an individual to depart from the general mode. Le Compte tells us of a mandarin, who, having built a house higher and more beautiful than those of his neighbours, was accused before the Emperor, and, fearing the consequence, he pulled down his house, without waiting for the sovereign's decision.

The Chinese lay out more than half of the ground occupied for their houses in courts and narrow walks; those of the merchants

Canton, which are close by the water, are narrow and very long; but there is no difference in the disposition of their interior. The level ground is crossed in its length by a broad walk, passing through the middle, and stretching from the street to the river. On each side are the apartments, consisting of a saloon for receiving visits, a bed-chamber, and sometimes a study, or closet. Before each set of apartments is a court, having a fishpond, or cistern, at its extremity, containing an artificial rock in the middle, whereon grow bamboos and several other kinds of plants, all which form a miniature landscape, of picturesque appearance. Some of the fish are so familiar, that they come to the surface of the water, and allow themselves to be fed with the hand. The sides of the courts are ornamented sometimes with flower-pots, and sometimes with shrubs in flower, vines, or bamboos, forming green arbours. In the middle, upon a pedestal, a large porcelain vase is generally placed, filled with those beautiful flowers called *lien-hoa*. They also frequently keep in these little courts pheasants, bantam-hens, and other curious birds.

Instead of paintings the Chinese hang up large pieces of satin, or of paper, set in frames, and painted in imitation of marble or bamboo, on which are written, in characters of azure blue, proverbs and distichs of morality, taken from the principal Chinese philosophers. They also sometimes have leaves of white paper, quite smooth, containing large characters, traced by some skilful hand, in China ink; this ornament is much esteemed. The bottom of the drawing-room is composed of folding-doors, over which is a lattice, covered with painted gauze, for the admission of light into the bed-chamber. The doors, which are of wood, are of very neat workmanship, ornamented with different characters and figures, and sometimes richly varnished and painted red, blue, yellow, or some other colour.

In the middle of the lower part of the chamber, and above a table which contains various ornaments, a very large leaf of thick paper is frequently suspended, covered with ancient Chinese paintings of different figures, enclosed in squares. The Chinese have a great veneration for these ornaments, under the idea that the painters were inspired; and the connoisseurs pretend to distinguish the hands of the several masters, and give a very great price for such as pass for originals I have seen many of these paintings; they usually consist of landscapes or figures, drawn with China ink, on white paper. In general they are touched with spirit, but they are too incorrect, and too little finished, to deserve much attention.

The furniture of the large room consists of chairs, stools, and tables, made of rosewood, ebony, varnished wood, and sometimes simply of bamboo, which, though cheap, is very neat. When the furniture is of wood, the tops of the stools are often of marble or of porcelain; and though such seats are very hard, they are very agreeable in a climate where the heat of the summer is excessive. On small tables, or stands, four or five feet high, placed in a corner of the room, are seen dishes of citrons, and other odoriferous fruits, branches of coral in porcelain vases, and glass globes containing gold-fishes, with a kind of herb something similar to fennel. They also decorate their tables, which are made only for ornament, with small landscapes, composed of shell-work, plants, and a kind of lily that grows among pebbles covered with water. They have also artificial landscapes, made of ivory, crystal, amber, pearl, and precious stones. I have seen some that cost a thousand *taels* (more than three hundred guineas), but they are mere toys, and wretched imitations of nature. Besides these landscapes, the tables are ornamented with porcelain vases of various kinds, and small copper vessels, the latter of which are much esteemed. The forms of these vessels are generally simple and agreeable; the Chinese say they were made two thousand years ago by some of their most celebrated artists; and such as are really antique (for there are some counterfeits), sell at an excessive price; one of them sometimes costs no less than three hundred pounds. They are kept in small pasteboard boxes, and are only shown on great occasions; nobody touches them but the master, and, to keep them clean, he brushes them from time to time with a hair-pencil, made solely for the purpose.

Lamps form the most prominent ornaments of the chambers; there are generally four of them hanging from the ceiling by cords of silk. They are of various shapes, as square, octagon, &c., and are composed of an extremely fine silken stuff, decorated with very neat drawings of flowers, birds, and landscapes.

A partition of folding-doors separates the large room from the bed-chamber. I have already observed that, in warm weather, these doors are left open all night, for the admission of cool air. The chamber is very small, and has no other furniture than the bed and some varnished clothes-trunks. The beds are sometimes extremely magnificent; the bedsteads, or frames, which very much resemble those of Europe, are of rosewood engraved, or of lackered wood; the curtains are of taffety, or gauze, sometimes flowered with gold, and commonly dyed blue or purple. A band of embroidered satin, about a foot in breadth, goes round the whole top of the bed; the embroidery is in compartments, of various forms, and represents flowers, landscapes, or human figures, accompanied with moral sentences and fables, written with China ink and vermilion.

By the side of the bed-chamber is a passage, leading to the cabinet, which is also enclosed by walls, and lighted by windows. The walls are ornamented, like those of the saloon, with moral sentences and antique pictures; the furniture consists of arm-chairs, settees, and tables. The books are disposed on shelves, and on a table near the window lie the pencils, and other things necessary for writing, the instruments used for arithmetical calculations, and some select books, all laid out in great order.

Besides these apartments there are also the dining-room, the kitchen, the apartment for the domestics, the bath, the privy, the office, or counting-house, and, towards the street, the shop.

Such is the distribution of the houses of all the merchants at Canton. Those of other people only differ in having their general plan accommodated to the ground on which they are built; for the apartments, the courts, and other conveniences, have everywhere the order just described.

The *leou*, or upper storey, consists of many great halls, occupying all the breadth of the house, above the apartments of the ground floor. They are used occasionally as chambers for lodging strangers. In every house there is a number of shutters, two or three feet broad, and ten or twelve feet high. When they wish to make chambers they fix these shutters to the floor and ceiling, and in a few hours make as many apartments as they wish. Some of these shutters are cut from the top to within four feet of the ground, and the openings filled with very thin oyster-shells, which are sufficiently transparent to admit daylight. All the windows in China are made of these shells.

In one of these great halls, and commonly in that next the door, the image and altar of the domestic idol are placed, so that all who enter may see it. The rest of the second storey is divided into apartments for the family, and over the shops are the rooms for the shop-keepers.

The sides of the Chinese houses next the street, are altogether plain or employed as shops. There is no opening except the door, before which a mat is hung, or a screen is placed, to prevent passengers from looking in. The houses of the merchants of Canton have a very gay and handsome appearance towards the river.

The materials used for building are wood and brick. The latter are either simply dried in the sun, or baked in an oven. The walls of the houses are commonly about eighteen inches thick, and the bricks, which are about the size of our own, are used in the following manner: the masons place three or four beds at the foundation, entirely solid; after which they dispose their bricks alternately length and breadthwise, along the two sides of the wall, so that those laid across touch one another, and occupy the whole breadth, but those placed lengthwise have a space between them; on this layer or bed a second is laid, with all the bricks lengthwise, and the joinings of the cross-bricks in the first layer, are covered with a whole brick in this. The work is thus continued alternately to the top; and by this means the expense of work and time, as well as the weight of the wall, are very much diminished.

The tiles that cover the roofs are plain and semi-cylindrical; the latter are laid on the joinings of the former. The Chinese, like the Goths, always let the wood appear withinside the ceiling, for which reason the beams and columns are frequently made of precious wood, and sometimes they are richly inlaid with ivory, copper, and mother-of-pearl.

MARCUS' EXCURSIONS.

We take the earliest opportunity to disabuse the public mind even of a remnant of any unfavourable impression respecting the arrangement of excursions between Dublin and London, and from personal experience we can testify that in every respect those now under the direction of Mr. Marcus, the enterprising excursion caterer for the L. & N. Western Railway, are desirable, and conduce to the comfort of the passengers. Of course it would be unreasonable to expect that an excursionist who only pays his 16s. or his 20s. for a return ticket should be transmitted to and fro London with the same speed as a passenger by "Mail" or "Express" at treble the fare; nevertheless, between certain points on the line, the speed is fully as great, and there is no stoppage unless where necessary for refreshment, or to allow the through trains to pass by. The steamers, although only "cargo" boats now, were formerly the "Express" boats, and are both sea-worthy and commodious, making—when special for an excursion trip—the journey across channel to North Wall in about *five* hours. Up to and from Chester the excursionists are accompanied by a very efficient and courteous manager, Mr. Hewson, who is quite a host in himself, and there is no lack of pleasant company, for all seem bent on enjoyment, "leaving dull care behind." We notice another announced trip for the 6th inst., and if as many as on the last occasion *to* Dublin—perhaps some 300—independent of those for intermediate places—avail themselves of it, we apprehend that the success of the speculation will justify a continuance of what certainly is a great boon to the public.

WHY MANUFACTURES DO NOT SUCCEED IN IRELAND.[*]

In considering this subject I have arrived at the conclusion that, if we exclude Ulster, the manufactures which do not succeed are those requiring any considerable amount of skilled manual labour. In Dublin there are large and important breweries and distilleries, by which princely fortunes have been realised; but, when we take into account the value of the products, we find a very small portion of the expenditure goes for the wages of the workmen. In like manner all our agricultural products employ very few skilled hands, and, indeed, the tendency is rather to convert tillage land into pasture, and thus to manage with fewer workpeople; and here I would remark that, even when the wages of agricultural labourers and other similar classes were less than one shilling per day, labour, though nominally cheap, was not really so. If you observed a number of workmen in a field, you would find one-half of them loitering carelessly, while the master was equally careless in superintending them; and yet the very same men when removed across the Channel, being well supervised, did their work well, and were prized by their employers, whether on the farm or in the construction of railways; and the same causes which brought about this improvement in their circumstances, enhanced by the diminution of our population, are now producing the same effects at home. The farmer or contractor having to pay higher wages, is compelled to take care that he gets value for the increased pay, and thus the labourer is taught to be more constantly and habitually industrious. When we turn to some other branches of manufactures, such as leather, woollens, and paper, we find them languishing and even retrograding; and this notwithstanding that the raw material is produced at home. Irish tweeds and friezes are deservedly valued for their strength and texture; but the merchants cannot procure them in sufficient quantity; and not long ago one of the Dublin drapers having contracted to supply a workhouse in England with Irish frieze, finding he could not get the entire quantity in Ireland had it manufactured in Yorkshire, imported it, and then re-shipped it to the union—in fact to within a few miles of the place where it had been made; and perhaps there is not anywhere a better opening for energetic manufacturers than is presented by this branch in Ireland. In the manufacture of paper an abundant supply of water is essential for other purposes than driving power, and in this respect Ireland is better supplied than either England or Scotland. This manufacture affords suitable and healthy employment for women and girls as well as for men, and the abolition of the duty on paper will certainly give a stimulus to this branch here as well as elsewhere. One difficulty with which a papermaker has to contend here, is in the management of the women employed in cutting and sorting the rags. The moment the foreman's back is turned they get careless, and the consequence may be that a large lot of paper is spoiled from such simple cause as allowing an old India rubber suspender to get into the rag engine. The India rubber threads cannot be reduced to pulp, but are chopped up into minute pieces, which are almost invisible until in the process the web of paper has to pass between heated rollers, and then the rubber melts and produces dirty blotches. One of our most extensive manufacturers informed me lately that he had been so much annoyed, and had lost so much in this way, that after again and again dismissing the women, and finding one set no better than another, he was turning his attention to procuring materials, such as cotton waste, which required little or no preparation previous to being thrown into the rag engine. I do not consider this intractability an insuperable difficulty; on the contrary, my own experience has satisfied me, that kindly and persevering training and supervision will overcome it, and in proof of this I might adduce instances of the success of energetic individuals, such as Malcolmson, of Portlaw; but the evil does exist, and we should not shut our eyes to it, or take offence at its exposure, however unpalatable, and I apprehend it is to be thoroughly overcome only by early training at home, where tidy orderly habits should be inculcated in childhood by example as well as by precept. In prefacing these remarks I excluded Ulster, where manufactures do succeed, and where the inhabitants are more akin to the Scotch, and their domestic economy presents to their children examples of industrious frugality. I trust it is not necessary to say that I am actuated by no unkindly feeling towards the Irish working classes, or by any desire to laud one portion of the kingdom and disparage another; we can have no hesitation in allowing that the Irish possess more inherent talent and genius than either the English or Scotch, and their brilliant success at competitive examinations for Government appointments prove this and reflect the highest credit on their conductors; they carry off a fair share of prizes when they enter the lists at any public exhibition or competition, but unless they exercise more perseverance I fear they will be distanced by the indomitable energy of the English, and the steady industry of the Scotch. These qualities are more to be depended on in the battle of life, and will outstrip genius however talented. Another serious and palpable disadvantage with which manufacturing in Ireland has to contend, is the high price of coal, which has become quite indispensable; while water power, everywhere plentiful and regular, is becoming comparatively valueless on account of its inconvenient situation; the expense of conveyance to a mill in the country, and thence to a market, not being compensated by cheap water power; and thus we see flour and other mills springing up in our large cities and seaports driven entirely by steam, and where they have an advantage over country mills as regards foreign grain. Not only is the coal high in price, but the bulk of it is of inferior quality, and so far as the port of Dublin is concerned, the coal trade is in anything but a creditable state. We depend for our supplies on a fleet of small, old, unworthy sailing vessels, and the consequence is, we are every now and then running short, and the price is proportionately advanced. That I am not exaggerating when I say these vessels are unworthy, the storm of 9th February last afforded melancholy proof, when more than a dozen of ships were wrecked within the bulwarks of Kingstown harbour, into which they had run for shelter, and had made fast to moorings, but even there they were not safe from the violent cyclone. The receding wave snapped the half-rotten, inefficient cables, and in a short time some were sunk, and others literally dashed and churned to pieces, and all of them colliers from twenty or thirty to two hundred tons burthen. For such trades as mechanical engineering and shipbuilding, iron as well as coals has all to be imported, and the wages paid in these branches are generally high, most of the skilled men having to be brought over from England or Scotland, where they learned their craft. This latter disadvantage would be lessened gradually as apprentices were reared, but at present nearly all our steam engines, locomotives, and steamships have to be imported. It is sometimes urged that want of capital is the chief cause of failure, but I cannot admit this when I know that the most eminent of engineers and shipbuilders of England and Scotland have all risen from very small beginnings, and there is abundant capital in Ireland. It is, also, sometimes said that the sons of our manufacturers, or merchants, who have realised fortunes, rather despise trade or manufactures, or employment of any sort, and will not continue to carry on the same business, but this is not peculiar to Ireland. The system of education in Ireland may be open to objection in so far as amongst the classes who can afford to pay for a liberal education, more importance is attached to acquiring a knowledge of languages and the classics than to the more useful branches, and frequently when a young man enters a counting-house or bank, he is found comparatively ignorant of the simplest rules of mercantile arithmetic, and in this respect is quite inferior to boys who have been educated at National Schools. There are other causes, some of them local or temporary in their effects, and it would not at all surprise me to have very cogent means advanced in favour of directing all our attention and energy to the cultivation of our natural products, animal and vegetable, rather than to manufactures.

THE APPLICATION OF SYMBOLS TO SOCIAL SCIENCE ILLUSTRATED BY THE PROBLEM OF EDUCATION.[*]

The utility of symbolical methods in questions of a social character could not admit of any reasonable doubt. Statistical inquiries are essentially symbolical, for they present results in a brief numerical form. They sometimes even lead to the expression of empirical algebraical formulæ representing the laws of certain social phenomena. In questions where probabilities have to be estimated, the most refined analysis is frequently indispensable for the exact solution of the problems. The mode of applying symbols now adduced is far simpler, and is perhaps more analagous to their employment in chemistry and biological science. Professor Owen had communicated a paper to the British Association in 1848, in which he advocated the utility of symbols in connexion with osteology as instrumental for the compression of facts, while clearly exhibiting certain anatomical relations. The close connection between biological and social science suggests the possibility of employing symbols also in the latter department of knowledge. A specific advantage attends such an application, for the questions of social science are necessarily more or less connected with our feelings and interests, and we should, therefore, gladly avail of any circumstance that would allow us to eliminate from such discussions everything likely to excite such feelings. Statistical results, when fairly obtained, were thus not only valuable in themselves, but were also most likely to impress the minds of those against whose preconceived notions they might happen to militate. The more closely social problems approach those of exact science the more likely are we to attain the truth. One of the questions most debated in this department may furnish an illustration. I refer to the interference of the state with education. If we designate by the capital letters A, B, C, D, &c., the number of individuals belonging to the various religious denominations composing the population of a country; by *a*, *b*, *c*, *d*, *m*, the number of persons belonging to the various educational denominations, and by

---

[*] Abstract of a Paper read by Mr. A. Armstrong at recent Social Science Association Meeting.

[*] Paper read by Professor Hennessy at recent Social Science Association.

u, v, w, x, &c., the number of persons belonging to the religious denominations, A, B, C, &c., who believe that a mixed or united system of education is most advisable, then it follows that $A-u=a$, $B-v=b$, $C-w=c$, $D-x=d$, &c., and $u+v+w+x+$, &c. $=m$. Each educational party is clearly defined by these expressions, and the principle of "Freedom of Education" amounts to saving that a, b, $c-m$, are all to be treated on equitable terms—all receiving a fair share of the bounty of the State, and the results of education developed in connection with all them to be received on the same footing. Another point that may be illustrated by symbols is a fallacy that frequently obscures educational discussions. It is assumed that the nature of education depends not on the teachers or the methods, but on the pupils. The distinction between symbols of operation and quantity in mathematics immediately shows the futility of such an assumption. If a number x is operated upon in any way the nature of the operation may be denoted by f, and the result $f(x)$ is classed in accordance with the operation. Thus in education its denominational or mixed character depends upon the operators (teachers and books), and not upon the objects operated upon (pupils). This view, although clearly stated, is far from being new. In a correspondence on education between the Cardinal Archbishop of Malines and M. Rogier, the Belgian Prime Minister, both the prelate and the statesman agree in this view of the nature of education. In the report of the Commissioners of the University of Dublin, several distinguished members of that body have expressed their views as to the Protestant character of the University remaining unaltered as long as the corporate body remains untouched. On this ground the Commissioners appear to have very naturally abstained from recommending any fundamental alteration in an institution so closely connected with the Established Church. Thus the Commissioners appear to acquiesce in this correct view of the nature of education. On other questions of social science besides education, it may be important to detect similar fallacy of confusion between the operating agencies and the thing operated upon.

PATENTS VIEWED INTERNATIONALLY.

Mr. K. A. Macfkk read a paper on this subject at the recent Social Science Association, in which he referred to the fact that 3,000 patents were sealed annually. He did not dispute the justice and expediency of the principle of rewarding inventions, but he thought that the advantage of patents had been probably exaggerated. The present mode of applying the principle was not consistent with free trade. British manufacturers had to compete with rivals who laboured under no restraint from patent monopolies, and had no payments to make to patentees. He would preserve existing monopolies for three years to each invention; afterwards he should have honorary or pecuniary reward. The plan of national remuneration to inventors was intimately connected with the idea of an international system for that purpose, which would require a very large contribution from each state. The author, in concluding, quoted the words of Coke, that "all monopolies are against the antient fundamental laws of the realm," and submitted that a better mode of rewarding inventions might be derived than that which already existed.

Mr. Webster said that the grant of patents was not a case to which the principles of free trade were applicable, inasmuch as no trade was in existence at the time of the grant, the object of the grant being to reward the inventor for the creation of the new trade, which, when created or established, became free, the creation of the patent being for a limited time, a time supposed to be sufficient for the creation or establishment of the trade. It was urged by Mr. Macfee and others advocating the same views that the inventor was to be rewarded. The question was reduced to the work of rewarding the inventors. Now, all nations whose attention had been directed to the subject had come to the conclusion, that the best way of rewarding the inventor was to allow him to work out his own invention, the difficulty of doing this being well known, and the greater the more valuable the invention. This subject had been under the consideration of a committee of the association, who had agreed to a series of resolutions directed mainly to two objects, the one that patents should not be granted in the manner described by Mr. Macfee as by a self-judging necessity, but only after proper inquiry to grant a license upon reasonable terms to any person requiring to use the invention. The system of compulsory license had been suggested by Mr. Macfee in his paper in the transactions of the association as a remedy for the inconveniences complained of. He (Mr. W.) thought these resolutions of the committee would be found to meet real objections to the present system. In the new patent law one step towards the attainment of international copyright had been attained—namely, the condition that the British patent for a foreign invention should have no longer animation than the foreign patent, so that the inconsistency of a treaty open to all abroad and not open here might be obviated. No matter what might be the difference of views on the subject the association were obliged to Mr. Macfee for his views on the question.

THE BUILDING STRIKE OF THE PRESENT YEAR IN LONDON.

Mr. Fredkrick Harper, M.A., read a paper on this subject, detailing the origin and progress of the movements in connection therewith.

Mr. Pollard Urquhart, M.P., said the demand of the Unionists in 1859 was a reduction from ten hours to nine, the masters, at the same time, paying the same wages as before. The men denied that this was equivalent, as was alleged, to raising the wages ten per cent.; and they insisted that it would not amount to more than an increase of two-and-a-half per cent.

Mr. Randal M'Donnell said there appeared to be some discrepancy in the statements in the papers. The working men said they had not time for relaxation, and they said, at the same time, that if it was left to themselves they would chose the long hours instead of the short ones. In the first paper it said that the nine-hours' movement was unanimously called for, notwithstanding that the men were anxious to have opportunities for improving their mentaland physical condition. It was manifest that there must have been some persons they were anxious to coerce.

Mr. Lefevre said it was desirable that there should be a uniform working day, and that it was undesirable that payment should be made by the hour, and the masters conceded that point. The great mistake, he thought, of the late strike was, that the questions of increased rate of wages and diminished day were mixed up. He was of opinion that the public thought that the ten-hours' day was better than the nine-hours' day, and that it having been so decided against the men, they should not have renewed the question.

Mr. Scott, of Belfast, always advocated, as an employer, the eight hours' movement in preference to nine or ten hours. He himself had more work performed in eight hours and a half than he formerly had done in nine or ten hours. The intelligent workmen might be said to be generally in favour of the nine hours' system, but some workmen, not alive to their moral and intellectual interests, were in favour of long hours in order to get larger pay. Every person having experience of the employment of labour know that workmen would do as much work in nine hours as in ten under the present system.

Mr. Newton, of London, said no doubt many men would work any number of hours for the sake of the wages, but if the majority of the men in an establishment were in favour of short hours it was as great an injustice that the minority, who were in favour of the employer, should control them as if the majority should control the minority.

Dr. Hancock thought there was another interest, not referred to, involved—namely, the wives and families of workmen, and that it was not a mere question of wages or contract between master and man; and in view of this third interest, he was of opinion that there was in nature an hour for labour. In every trade in Belfast, with the exception of one or two, the working hours were ten. He thought the hour system was injurious to the best interests of the men and of society.

Mr. Lushington, of London, expressed himself in favour of the limited day.

Dr. Shaw, F.T.C.D., was of opinion that the present movement on the part of the employers was to degrade their workmen to the condition of the horse. In Liverpool the men in the building trade were working harmoniously until the employers issued an ukase that they should adopt the hour system, and then after they had taken the initiative they turned round and said the men had struck.

Mr. Wright, of Birmingham, was of opinion that the limited day would have the effect of reducing the good workman to a level with the bad workman. He contended that the tendency of employers was to diminish the hours of labour.

THE SOCIAL AND SANITARY CONDITION OF THE LABOURING CLASSES OF IRELAND.

On this interesting and important subject a valuable paper was read by Dr. Fitzpatrick, after which the Rev. Mr. Brougham remarked that he had been in the north and south of Ireland and had seen the disgraceful state of the cottages, in many instances the animals in the same sleeping apartments with the inhabitants. He referred particularly to the county of Donegal, where, he said, Lord George Hill had done all in his power to advance the prosperity of his tenantry, but such was the prejudice against him they seemed determined to go contrary to his wishes.

Lord Talbot de Malahide said there was no question there was a great many dwellings of the poor in a very bad state; but at the same time he must *demur to the generality of the statements* he had heard to-day. He did not dispute that the cottages were *all* capable of improvement, and he must say that they were not *just so bad* as they were described. He had some knowledge of the peasantry in his own neighbourhood, and he must say that they were not open to the many charges which had been brought against them.

Charges had been brought against the cottages of Meath, Navan, &c., but he must certainly say that they were undeserved. The cottages were not as neat as in England, but still they *were more cleanly kept than in Scotland.* Much as they might deplore the present state of things, they could easily be remedied. There were a great many landlords anxious to improve the dwellings of the cottagers and tenants on their estates, and he must do them the justice to say that he had seen numerous instances in which the most degraded families had shown that they only wanted an opportunity to improve. He had no doubt there was a great deal of jealousy amongst the tenantry, but that could be controlled by judgment and proper management. On certain estates allowances were made to tenants to improve their dwellings, and that, of course, gave them an interest in making them comfortable—in making improvements as to dampness, better ventilation, and so forth; and he must confess, from his own experience, that he *never found them at all backward in claiming these advantages.*

PUBLIC HEALTH.

SOME of the following remarks on this subject, by Dr. Hastings, strikingly corroborate our own "On Quantity and Quality of Ventilation" at page 686:—

"He mentioned towns in England where, the science of public health being studied, the deaths were reduced 2 per cent. In a town of 20,000 inhabitants there would be a saving of 400 lives annually; and who could over-estimate the value of a science that was capable of producing such great results. In Ireland, glorious country though it was, there was sufficient wretchedness, misery, and disease to demand the attention of philanthropists, and induce them to spread information amongst the people respecting the laws that govern the body, so that they could, by their own habits, lengthen to the utmost limit their lives. Ireland was said by one of her most rising young physicians to be the natural *habitat* of typhus fever—a disease that could be completely exterminated if it was determined to do so. It had been exterminated in many places in England. The room in which they were assembled was *a striking illustration of ignorance of the law he* (Dr. Hastings) *was alluding to; it was badly constructed and badly ventilated.* It was made to hold *two thousand persons;* the *ventilation* was *imperfect;* one hundred lights were burning, each consuming as much oxygen as five persons; the carbonic gas *far above pressed upon the crowd below*, rendering them drowsy and sleepy, and when they got up the next morning they would be wondering what was the matter with them. He earnestly appealed to the meeting to study the great questions bearing upon public health, and to make their information on the subject beneficial to the community."

INTERNAL DECORATION OF, AND MONUMENTS IN, CATHEDRALS.

THE cathedral such as I have been contemplating might be constructed of the cheapest materials and with the simplest details, and yet might from its size and character be an imposing pile. But it is equally susceptible (if means and inclination are favorable) of the richest architecture and the most sumptuous decoration: and in that noble rivalry with the cathedrals of ancient days which I dare to claim for it, it can and it ought to avail itself of every aid which the science and the resources of our generation have placed at its disposal. The philosophy of architectural ornamentation is continually being more deeply sifted, and a sound eclecticism is widening its area of choice. The application of coloured material—marble, brick, and so on—both to the main features and the decorative details of buildings, is every day coming into vogue with a fulness which never could have been compassed while the steam-engine was still unknown. A few years since those who, like myself, were in the van of this movement for "polychromatic architecture," or for "constructive coloration" (according as the question was viewed from the one side or the other), had to give our reasons, and had to prove our opportunities: now we are almost overwhelmed with success. Architects, Gothic, Italian, "Victorian"—sacred and profane—are all vying with each other who can produce most red brick, and yellow brick, and black brick, most granite, serpentine, and encaustic tiles all over their buildings; while quarries at the Lizard Point and at Peterhead have become lucrative properties. It is well that it should be so. There may be here and there exuberance, if not extravagance; but this is only the natural recoil from the malebolge of stock-brick and cement in which we had been so long wandering. I have almost now to address a caution in another direction, and to remind the man who is planning a Gothic interior that there is such a thing as a paint-pot, and that, while constructive coloration may rightly be his staple, there were brave men of old who have left immortal achievements traced by their brushes in the higher branches of pictorial decoration. Mr. Dyce has shown us what fresco can do to the glory of God, at All Saints', Margaret-street, while the groined chancel-roof of the same church, adorned by his learned and skilful fancy, is a work no whit inferior to the vault of S. Jacques at Liege, or of Sta. Anastasia at Verona, and produced by a far more durable process. Mosaic—the most ancient and the most eternal system of pictorial art in Christian churches—has hitherto been a stranger to England; but mosaic pictures are in contemplation at St. Paul's. The church at Haley Hill, Halifax, due to Mr. Akroyd's munificence and to Mr. Scott's skill, is full not only of the painter's and the constructive decorator's, but of the sculptor's art, inside and out. Carvers in stone and wood are ever making fresh progress, both in their own handiness and in the respect which they enjoy; workers in metals and enamellers of tiles are rising in general estimation; glass-painting, which used to be reckoned among the lost arts, is not only found again, but found in a state of constant advance towards artistic perfection.

Above all, the unity of all art is beginning to be practically recognised. The architect, the painter, and the sculptor no longer selfishly pursue their own independent professions, as if they were rivals and antagonists, but they either of themselves borrow from time to time their neighbours' craft, or else they combine together—while each adheres to his own department—to complete those works whose failure or whose success depends upon the combination. Giotto, it is at last recollected, both painted and built; and Michael Angelo was sculptor, painter, and architect.

In one word, ecclesiastical and indeed all architecture in England is at this moment working out for itself that lesson which the equalising effects of science now enable northern regions to learn to an extent which used to be only allowed to the warmer south—that of the fusion of construction and decoration in the variety of materials, natural and artificial, and the contrast of their forms and colours. It is the experimental adoption of this system which makes the broad distinction between the more meritorious new churches of the ten last years and their predecessors built within the ten preceding years. Accordingly I anticipate that our new cathedral will show still more complete and gorgeous developments of English polychromatic architecture than we have yet beheld. I go further, and I say that it is to the successful working out of this element of beauty that I look in the new cathedral as the compensating æsthetic advantage for the disuse of those constructional features—those double aisles and fringing chapels—of the old cathedral which, with all their grandeur and their loveliness, can find no place in our purer and simpler system.

For some years there has been a strong movement in favour of memorial windows in preference to masons' tablets—a movement due in the first instance to that venerable man, still living, Mr. Markland, and to his honoured friend, now deceased, the wise and good Dean Chandler of Chichester—of which I desire to speak with the greatest respect. It has done incalculable good both in what it has checked (namely, those blisters, hideous in their form, and still more hideous in their treatment, which have encumbered so many square acres of church-wall) and in what it has produced—namely, the general restoration of painted glass throughout our churches. But there are many cases where a more solid and palpable monument is desirable—a monument which will reproduce the man himself.

I need not multiply instances in proof of my allegation. I have already hinted at the desirability of treating the nave aisles more as passages than for purposes of congregational accommodation; but even if this use of them would rather interfere with the practicability of employing them for monuments, except for such as were wholly recessed in the wall, no such objection would apply to the choir aisles; and here accordingly we have a further reason, of a most practical nature, for the adoption in our cathedrals of the chevet.—*The English Cathedral of the* 19*th century, by A. B. Beresford Hope.*

INSCRIPTION ON THE HAVELOCK STATUE.—Although the statue to the memory of General Havelock in Trafalgar-square has been up some time, the inscription has only just been placed upon the pedestal. On the front the inscription is as follows:—"To Major-General Sir Henry Havelock, K.C.B., and his brave companions during the campaign in India. "Soldiers—Your labours, your privations, your sufferings, and your valour will not be forgotten by a grateful country!—H. Havelock." The inscription on the back of the pedestal is as follows:—"The force commanded by Havelock consisted of the Staff, Cavalry, Volunteers, 12th and 13th Irregulars, 3rd Oude Irregulars; Royal Artillery—3rd Company, 8th Battalion; Bengal Artillery—2nd Company, 3rd Battalion; 1st Company, 5th Battalion; 6th Company, 9th Battalion; Bengal Engineers; Infantry—5th Fusileers, 84th Regiment, 64th Regiment, 90th Light Infantry, 78th Highlanders, 1st Madras Fusileers, Ferozepore Regiment of Sikhs.—Behnes, sculpsit" It may be mentioned that the bronze of which the statue is composed is just in the state in which it came from being cast in the furnace, but that since its exposure to the atmospheric influence it is gradually assuming the appearance of a black, instead of a bright bronze, and which will soon cause it to harmonise in colour with its companion statutes in Trafalgar-square.

COMPETITION DESIGN FOR PROPOSED UNITARIAN CHURCH.

Our chief illustration exhibits one of two designs submitted for this building, in recent competition, as previously noticed, and though not the accepted, is deemed worthy of presentation to our readers, as displaying many noteworthy features, and, on the whole, a meritorious composition.[*]

Referring to the materials proposed to be employed in its erection, the author recommends the adoption of English brick for the plain faces of the outside and interior, and Portland, or Caen, for the dressings and the piers and arches of the interior. The ground-floor to be rendered fire-proof by brick arching, but not included in the estimated expense. The accommodation to be provided is for rather more than 300; the aisles to be laid with tiles.

ESTIMATE.

For building complete,	£4,000
Painting,	100
Gas fittings,	200
Heating,	200

THE REGULAR OPERATIVE CARPENTERS.

Referring to an article that appeared in our last number, under the title of "Employment Wanted—Artizan Remonstrance," we have received the following:—

TO THE SECRETARY OF THE REGULAR OPERATIVE CARPENTERS' ASSOCIATION.

Sawing, Planing, and Moulding Mills, North-Wall, Dublin,
29th August, 1861.

Sir,—It is with extreme regret I learn by the Dublin Builder of the 15th inst., that such a number of your body are out of employment. Presuming that the allusion to a large manufactory concern has reference to mine, I take the liberty of addressing you, feeling you will set me right before the body.

1st, As to importing Englishmen and Scotchmen, I have over one hundred persons in the joinery department, two alone of whom are Englishmen, and one a Scotchman; two of these were workmen of this city before entering my employment; the remainder of my hands are Irishmen.

2nd, When a deputation of your body called upon me, I at once told them that I was most anxious to avail myself of their assistance, and to employ them with other men; but work upon these terms was refused unless I dismissed all my old hands who had faithfully served me since the commencement of the mills. When employing men I have been and am willing to engage men of your body.

Our joinery works were first established to protect our local trade from foreign importation; each week I saw mouldings, greenhouses, &c., upon our quay, so that a trade, like many others, was fast leaving the country; this has been in a great measure put an end to, but even yet I observe with regret quantities of joinery imported into other Irish seaports from England, which could be supplied at home on more favourable terms. Not alone could imports of such goods be prevented, but with the aid of the intelligent Irish artizan in conjunction with improved machinery, there is nothing to prevent our exporting to England and foreign markets.

The American States, in consequence of improved machinery, are enabled to export manufactured wood goods and furniture to all parts of the world. From the extent of trade they command, the number employed is larger, and the remuneration of the artizan much higher than here, and should the steam joinery works of this city be stopped to-morrow English work would be largely imported, to the serious loss of the workmen of Dublin.

(Signed,) Thomas S. Martin.

THE INCORPORATED BRICKLAYERS OF KINGSTOWN.

The following document has been addressed to us for publication, after having appeared repeatedly as an advertisement in a morning contemporary, a course—to say the least—*unusual*, and we might add more, but willing to assume that it was adopted through an error of judgment, we shall not further reflect on it:—

TO THE EDITOR OF THE DUBLIN BUILDER.

Sir,—We respectfully beg leave to call attention to the fact that, in your notice of our protest against the disemployment of the regular bricklayers of Kingstown at St. Patrick's Church, Monkstown, you have fallen (inadvertently, we believe) into the error of supposing us to find fault with the members of Dublin bodies. We did not at all mention or intend anything of the kind. We have too much respect for the regular bricklayers of the city to do so, because, like us, they endeavour to support the rights and respectability of trade, and admit into their societies none but competent and trustworthy tradesmen. We did, however, and do complain of the arrangements in the work referred to, and a short time will, we believe, show us justified. In the address which we issued for self defence, we confined ourselves to the most simple and moderate statement of facts, and carefully avoided any exhibition of angry feeling. Your sympathy with the contractor (if he is such) would disappear on a nearer and local view of the matter. Our men were discharged without reason, and pretenders of the trade employed; this is not all; our rules are duly registered, yet he publicly declared our society to be illegal. Now, were we disposed to malice, we might, for this and other insults, inflict legal chastisement. We decline, however, to notice the impertinence of this nameless individual, even should he occupy a contractor's position. Our forbearance is due to the fact that our desire is not to indulge in personalities, but to attend to our interests and rights as tradesmen and inhabitants of Kingstown. We shall trespass on you no longer than while we observe that tradesmen and working men generally take our view of the question, and they (being on the spot) are the best judges.

Signed on behalf of the Incorporated Bricklayers' Society, Kingstown, by

Richard O'Carroll, Chairman.
John. J. Hickie, Secretary.

Evidently there has been a very erroneous interpretation put on our remarks, inasmuch as that we made *no allusion whatever*, *direct* or *indirect*, in the article in question to the Dublin bodies; and as regards "our sympathy with the contractor," we freely confess that up to the moment of publication we do not happen to know *who* he is, or do we care to inquire. The simple matter for us to consider was, the subject of the protest—viz., "that the local men naturally expected, as the funds were to be collected solely in the parish—most probably in part from themselves and their friends—they should be employed in the erection of St. Patrick's Church in preference to strangers;" and it will be seen that, under the circumstances, we admitted they had "some reason too" to claim it, and again, that "their appeal" against "disemployment" was "entitled to consideration."

VICTORIA AND ALBERT BRIDGE.

In appropriate commemoration of her Majesty's visit to Dublin, the new bridge for some time in course of erection over the Liffey, on the site formerly occupied by the structure familiarly known as "Bloody Bridge," has been partially opened and designated as above. Her Majesty, H.R.H. the Prince Consort, and the other members of the Royal Family passed over it on the 30th ult. in their route from King's Bridge to Westland Row termini, prior to departure from Dublin. In an earlier number we gave a detailed description of this bridge, but may here remark that it is of light and handsome design in cast iron, with a single arch 100 feet span and 37 feet wide, solid granite abutments, &c. Owing to unanticipated difficulty in securing suitable foundations for the abutments, the cost at the time stated by us has been much exceeded. Mr. George Halpin, C.E.; Mr. Killen, contractor.

PURIFICATION OF THE ATMOSPHERE.

In a recent number of the *Freeman* allusion is made in the following terms to a very neat and simple, but at the same time most effective, arrangement for fumigating large rooms, saloons, the cabins of ships, and hospital wards, which has been invented by Mr. Rimmel, the celebrated perfumer of London, and which has been tested on board her Majesty's ship the Victoria and Albert. Her Majesty occasionally felt discomfort from the smell of the oil used on the bearings, which, when heated, gives off a disagreeable, and to some a not only offensive, but most sickening odour. The little arrangement we allude to has been found most effectively to overcome this smell—not by preventing the evaporation of the oil, for that would be impossible, but by causing an agreeable, but delicate, perfume to pervade the entire vessel, and thus not only counteract its effects, but so completely to mask its presence as to render it imperceptible. This arrangement has been much used by M. Silas in the London hospitals, and we have no doubt it will soon become an essential adjunct to the arrangements for all crowded assemblies of the aristocracy, and a pleasing but inexpensive luxury in the reunions of even the less affluent. The little instrument is so constructed that any of Mr. Rimmel's special perfumes may be used, and used in such amount as to impart either a strong scent or an almost imperceptibly delicate "flavour," if we may use the term, to the atmosphere. For the sick room or the boudoir of the delicate it will be found a most agreeable adjunct. The College of Surgeons in London have found it entirely to destroy all offensive smells in the peculiar "saloons" attached to the deadhouse, and have given the invention the highest recommendations after witnessing the successful experiments made by M. Silas.

---

[*] In the process of transferring the drawing from the paper to the stone, an accident having occurred, the illustration is, we regret to say, unavoidably defective, but we shall endeavour to compensate for it in our next subject.

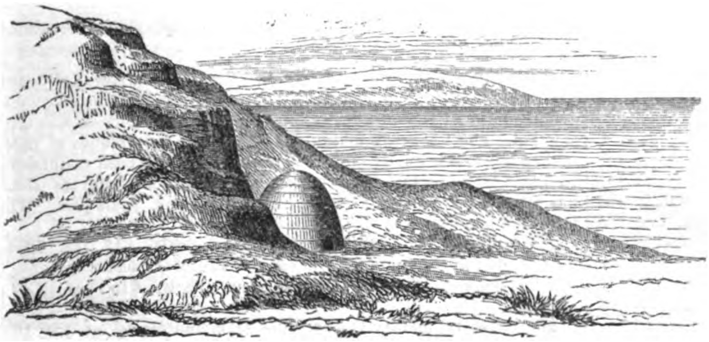
The Circles marked I represent fountains, intended to prevent too great aridity in the air; the effect of which will be to render the process more rapid, so that a bath may occupy less time.

The room D, or Laconicum, will be kept comparatively dry, and of a higher temperature than the other rooms, so as to be more suitable for medical use.

ORIENTAL BATHS, MULBERRY-STREET, LIVERPOOL—GROUND PLAN.

MOST of our readers are familiar with the principle of the Turkish Bath, and in Dublin we boast no less than three very creditable ones; but the movement for their introduction is now becoming so general that the construction of a new one would not be a matter of any importance unless it presented some difference of principle or arrangement from those already existing. We find, however, that there are improvements being introduced which are worthy of attention, and alterations of such a nature that they must be either very much better or very much worse than the ordinary methods now employed. For example, in the very handsome building recently erected in Liverpool under the superintendence of Dr. Haughton, there are some particulars in which very decided alterations have been made from the plans in ordinary use. Instead of the common curved roof, lofty domes (with moveable ventilators in the centre) have been substituted, and in the tepidaria the couches are formed of sloping benches, on which the bathers lie with their feet towards the centre of the room. The lavatories are spacious, and furnished with spray and column douches and tepid shower baths, which can be regulated to any temperature. In the cooling rooms the couches are also sloping, so as to throw up the head, and are placed in the stalls, just as those of Bray or Lincoln-place. The curtains are of crimson damask, and stained glass is used with the greatest profusion in every department. Probably the most attractive part of the building is the tiled floors, which are of the most beautiful mosaic—far superior to the tiles in any other bath in the country, at least in appearance. But if we were asked what was the greatest improvement which has been introduced by Dr. Haughton, we would refer to one of a more practical character—namely, a mode of constructing the flues so as to diminish the combustion of coal. The principle adopted is very simple, and consists in placing false flues under the real ones, so as to prevent any radiation of heat downwards, and has been found very successful. On the whole, the baths are well worthy of study by all who are interested in the subject, and our illustration will more particularly explain the general arrangements.



ANCIENT IRISH SWEATING-HOUSE, RATHLIN.

THE accompanying woodcut shows one of the crude structures still extant in Ireland, to which the Irish country people, when attacked with rheumatic pains and other diseases, have recourse; and it is said that the system is most effectual in restoring to health. The "sweat-house" is roughly put together with stones and turf, the roof being formed of some material, with a hole in the centre. A small aperture is left at bottom through which the patients enter, or not unfrequently crawl on hands and knees, and remain for some time in the interior, where the process of sweating is effected by the fumes from a turf fire previously kindled; after this operation they sometimes plunge into the sea.

THE REGULAR OPERATIVE HOUSE PAINTERS.

A NUMEROUSLY attended meeting of this body, with the co-operation of the building trades, was held in the Mechanics' Institute, on the 29th ult., at which the following resolutions were adopted:—

"That we, the legitimate House Painters of the City of Dublin, are compelled to call a Public Meeting of the different Trades of this City, in order to bring before the public how we are treated by one of our Employers—namely, Mr. James Gibson."

"That, after repeated solicitations with Mr. Gibson to come to a reasonable understanding with the legitimate Painters of the City of Dublin, we are obliged to call this meeting in order to vindicate our character, and to show that Mr. Gibson's cause of complaint is not commensurate with the working men's grievances."

"That we, the regular Operative House Painters of the City of Dublin, having endeavoured by every means to treat with Mr. Gibson, and end the dispute between himself and his men, now ask you, our brother tradesmen, to endorse our acts in resisting those attempted inroads on our character."

"That we, the Building Trades of the City of Dublin, assembled here to-night, do tender our co-operative sympathy to the Regular House Painters of the City of Dublin, as we entirely agree with them that they have acted properly in refusing to admit the individual we have heard spoken of to-night, whose character has been fully established by his committal in a police office in this City, and also for the indefatigable zeal they have evinced by every legitimate means to hold Mr. Gibson's employment, which we regret to find he has denied them."

"That we, the Regular Operative House Painters of Dublin, owe a debt of gratitude, and humbly tender it, to the various trades for their promptitude in identifying themselves with our cause."

"That the marked thanks of this meeting be given to the respectable and influential Gentlemen of the Press for their prompt attendance, as we have always found them to be the friends of Labour, and the unflinching advocates of the Regular Artizans of Dublin."

The Chairman, Mr. Ward, in opening the proceedings briefly explained the reason for which they had been called together on the present occasion, stating that for eight weeks past there had been a strike amongst the operative painters formerly employed by Mr. James Gibson, of Mary-street, and as erroneous statements had been circulated it was deemed right to call this meeting for the purpose of informing the trade and the public of the true state of the case. It should be understood that this was not a strike for higher wages or for shorter time. If it were a mere matter of wages the trade would never think of making public their disputes with a single establishment. But the matter was one which involved their character as tradesmen, and which they, therefore, felt it due to themselves to place before the public. The regular house painters in the employment of Mr. Gibson objected to work with individuals whom they did not recognise as members of the trade, inasmuch as painters, from the nature of their business, were often, as it were, entrusted with the property of noblemen and gentlemen in whose houses they worked, and they did not wish to be associated with persons on whom they could not rely. A deputation had waited on Mr. Gibson and asked him not to employ persons who were not legitimate members of the trade. Mr. Gibson's reply was that the best recommendation a tradesman could bring to him was that he did not belong to the society of the operative painters, and that if the men were not satisfied they might strike the next morning. The society, however, advised them not to strike, in the hope that an amicable arrangement might be come to. This hope proved vain. Mr. Gibson would make no concession. They had found it necessary, therefore, for the sake of their characters, to cease to work for him. He (the chairman) did not approve of strikes in general. They often proved injurious to the tradesmen who took part in them, and, even when successful in effecting their object, a bad feeling was created between employers and their men. But in the present instance the tradesmen had no other course open to them. They could not sustain their trade if they continued to work with persons such as he had referred to, and now they appealed to their brother tradesmen for their countenance and support. The society appealed to the nobility and gentry of the country to sustain them in this matter, and he trusted that appeal would be responded to. He hoped they would not aid Mr. Gibson in his effort to put down the society—a society that gave £20 to the widow of a deceased member, that fed and clothed the orphan, and gave aid to the sick and aged members of the trade when they were no longer able to earn their own living.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

On the 21st ult. the association proceeded to Ford Abbey, where they examined the ruins of the old abbey. The church is a spacious edifice, somewhat of cathedral form, with two square towers, and at its west end is a richly ornamented chapel built by Bishop Grandison. The roof is covered with finely-wrought tracery. The interior, which for many years had been much neglected and the ornaments defaced, has been completely restored to its original beauty, at the cost of several thousand pounds, the greater portion of which was munificently contributed by the Hon. Justice Coleridge, and the various members of his family, and the remainder by subscription. There are several new and elegantly stained windows—one to the memory of the lady of the Hon. Justice Patteson, others of an obituary character given by the relatives of the deceased, or by the tradesmen of the town. This church may justly be considered the most beautiful ecclesiastical building in the county, the cathedral at Exeter alone exceeding it in size.

The party afterwards inspected Cadhay House, and then returned by rail to Exeter from Ottery-road Station at seven o'clock.

On Thursday the association left Exeter by the South Devon Railway for Newton Abbot, at which places carriages were provided to convey the party to Haccombe. Arrived there, the church was examined, and a paper read on it by Mr. W. R. Crabbe. The church, which is now under repairs, is of the early English or first pointed style, the roof being a positive copy of the original. There are a number of tombs in the church, all of the Carew family, and the effigies of two females bearing the date of the 13th century. There are also slight remains of early glass in the west window of the north aisle and nave. Thence the parties proceeded to Compton Castle, certainly a domestic building, but very strongly fortified. The kitchen is a strongly barrelled arch, as also are the rooms over it, and the chapel. The latter is apparently of the third pointed style of architecture. Over the windows and doorway are machicolations. A most valuable paper on the castle, prepared by Mr. C. Spence, was read by Mr. N. H. P. Laurence. The company then passed by Cockington, and went on to Torre Abbey, by which time the rain, which had been threatening to descend all day, came down in heavy showers, and so remained throughout the rest of the day, much to the annoyance of the archæologists and the discomfort of the ladies, who were mostly attired in lace shawls and muslins. The history of Torre Church and Abbey was briefly given by Mr. Ashworth, of Exeter. The abbey was founded in 1196 by Mr. Brewere, high sheriff, during the reign of Henry II. It was of great extent and splendour, and in Leland's time there were three "fair gateways," one of which still remains. The fabric, including the Lady Church, is about 200 feet in length. The principal remains now visible, some of which are incorporated in the mansion, are the arch which formed the entrance to the chapter-house, the tower, the gateway of the ancient foundation, the arch of the Abbey Church, the refectory, and a large grange, now covered with ivy. Of this latter there is a tragical story on record. It is said that after the destruction of the Spanish Armada a great number of prisoners were taken, who were confined here, and so neglected that some of them died of their wounds, but the greater number of them from starvation. The refectory was afterwards used as a Roman Catholic chapel. There were a mill and a large fish-pond belonging to the abbey, the latter of which was filled up with ruins on the fall of one of the gateways about eighty years ago. Subsequently to the reign of Henry VIII. the abbey passed into the possession of the Seymours, and in the sixteenth century fell into the hands of an ancestor of the Earls of Londonderry, whose family built the present house. Afterwards it became the property of Mr. John Stewell, who sold it in 1662 to the family of the Carys. The present possessor is Mr. S. S. Cary.

ST. MARY'S CATHEDRAL, LIMERICK.

We are much pleased to learn that the south transept of this venerable cathedral is about to be immediately restored, under the direction of Mr. William Slater, of London, architect. We shall take occasion to give particulars in an early number.

FARM BUILDINGS AND LABOURERS' DWELLINGS.

Amongst the present applicants for loans under the Landed Property Improvement Act are, in the former department, the Earl of Dunraven, Co. Limerick, Messrs. Stephen E. Collis and Robert A. Hickson, Co. Kerry, and in the latter the Marquis of Londonderry, Mr. Wm. B. Forde, Co. Down, and Rev. Frederick Goold, County Limerick.

TIMBER SALE.

The following is from the "Commercial Article" of the *Freeman's Journal* of 19th August:—

"Timber.—The recently established firm of William Kelly and Co., held their first public sale on Thursday, which attracted an unusually large attendance. The quantity of goods offered was considerable, and the prices obtained were much in advance of those had at the recent public sales, the biddings having been maintained by the most respectable and independent collection of buyers which has attended an auction of wood goods for many years past. The following is a summary of the sales:—

5,760 pieces 1st quality Quebec spruce deals, £17 12s. 6d. to £18 2s. 6d., averaging £17 17s. 6d. per 120 of 12 feet 9 x 3.

3,869 pieces 2nd quality Quebec spruce deals, £15 10s. to £17 2s. 6d.

969 pieces 1st quality Quebec pine deals and plank, at £30 10s.

3,224 pieces 2nd quality Quebec pine deals, £18 2s. 6d. to £22 10s.

960 pieces 2nd quality Quebec pine deals, £23 15s. to £25.

1,510 pieces Miramichi pine deals, £18 to £20 5s.

9,249 pieces St. John and Miramichi deals and battens at from £15 to £16 15s.

167 tons red pine, £3 10s. to £3 15s. per ton.

225 tons white pine, £2 15s. to £3 5s. per ton.

25 tons oak, £4 7s. 6d. and £4 10s. per ton.

40 tons Memel, at £3 10s. per ton.

12 tons elm, at £3 10s. per ton."

ANECDOTES OF A. WELBY PUGIN.

From the entertaining "Recollections," by Mr. Ferry, of this late eminent architect, we collect the following characteristic anecdotes. His mother, writing of him as a boy, says:—

"If he understood how to dress himself I should consider him an universal genius; and a most orderly good creature, if he had not had the skin of his nose twice torn off by a battle of pillows in the suite of rooms they have above, quite out of my observation; however, the second time it happened, I brought him down to a room near me. He does not dislike a little play, but he works infinitely more than he plays, while the rest play infinitely more than they work. His father calls this work of Paris 'Augustus's work,' and well he may, for he has done more than three parts of it, and made sketches and coloured them for the first time from Nature, and written some very good descriptions. *Nevertheless, the fellow cannot dress himself.* When he heard that you left Beverley without seeing the churches, he declared, had he been with you, you would have found him the most restive animal you ever posted with; nor whip, nor spurs, nor anything else would have got him on before seeing those churches."

Referring to his visit to Rochester Castle, his biographer relates:—

"There are always amusing traditions connected with these old buildings, and amongst others belonging to this castle it was supposed that treasures or plate might in emergency have been thrown down the well constructed in the inner wall of the keep. The bare reference to this as a probability only was sufficient, and Pugin at once resolved to make a careful search. He immediately obtained the necessary apparatus, and having hired men to descend the well, fearlessly placed himself in the bucket to be lowered by the windlass, so that he might direct the operations at the bottom. It had been previously ascertained that the well was considerably choked up by quantities of rubbish; and in the removal of this accumulation very little was discovered, his zeal being only rewarded by the acquisition of a few pieces of pottery and glass of Queen Elizabeth's period." . . . . .

"As before remarked, Welby Pugin was extremely delicate in youth, but his present mode of life had certainly one good effect, by giving him Herculean strength, which doubtlessly enabled him so effectually to carry out the work which he so gloriously accomplished. The life he had hitherto led was, as may be imagined, a source of much pain and anguish to his parents and friends, more especially to the refined tastes of his father, who, on meeting a friend, exclaimed with much grief, 'God bless my soul, it was but this morning I met my boy Auguste in the disguise of a common sailor, carrying on his shoulder a tub of water, which he had took from the pompe of St. Dunstan.' Few things probably could have so severely shocked the finely poised susceptibilities of the elder Pugin." . . . . .

"On his first visit, finding the house in an unfinished state, excepting the room which Pugin used as his study; Lord R——r, omitting to remove his hat, at once entered into conversation, the only reply he met with was a look of astonishment. Pugin rang the bell, and ordered his hat; placing it on his head, he said, 'Now, my lord, I am ready.' In this well-merited rebuke, Pugin resembled his father, who was very susceptible of affront, and sometimes even threatened to show people the door if proper courtesy was not shown him in conversation." . . . . .

"He was in the habit of wearing a sailor's jacket, loose pilot trousers, jack-boots, and a wide-awake hat. In such a costume, landing on one occasion from the Calais boat, he entered, as was his custom, a first-class railway carriage, and was accosted with a 'Halloa, my man, you have mistaken, I think, your carriage.' 'By Jove,' was his reply, 'I think you are right; I thought I was in the company of gentlemen.' This cutting repartee at once called forth an apology. The remainder of the journey was most agreeably passed in examining his portfolio filled with sketches just taken in Normandy." . . . . .

"To the ladies of his acquaintance, Pugin's carelessness in appearance was very distasteful; but when remonstrated with on the subject, he never condescended to give a patient hearing, but cut the matter short by saying, 'It's all very well, my dress will do perfectly.' A friend with whom he was at one time staying, after thus expostulating, retorted, with some amount of warmth, 'It is not all very well,' and thought that her remarks had made some impression; and true it was, for on the following morning he presented himself in a smart blue coat with gilt buttons, and a buff waistcoat, exclaiming, 'Well, are you satisfied now?'" . . . .

"Pugin's professional pursuits did not admit of his making many social visits, but he occasionally accepted an invitation. Lord R——r once calling at St. Marie's Grange during its erection, and desiring to make his acquaintance, asked if he would dine with him, to which Pugin assented. 'Very well then,' said his lordship, 'I'll expect you to-morrow at six o'clock.' Thither at the time Pugin repaired, and as he was admiring the stately rooms and objects of art and vertu with which they were enriched, his lordship, who was well known for his simple habits and encouragement of agricultural pursuits, observed, with perhaps generous feeling, that he would as soon live in one of the smallest cottages on his estate as in his large and magnificent mansion. Upon this, Pugin, jumping up and pacing the room in apparent excitement, exclaimed, 'The d—l you would—the d—l you would, my lord; then what is to become of me and all other artists?'" . . . . .

"After an absence of some weeks, Pugin unexpectedly called at his publisher's, who observed that his dress, which usually was untidy, appeared more strange than ever. He was enveloped in a huge pilot-coat, large enough for a man twice his size. On this strange exhibition, Mr. Weale, his publisher, remarked—

"'Why, you appear to have made a mistake, and have got a coat belonging to somebody else.'

"'Oh,' observed Pugin, 'it is of no consequence—I caught up the first garment that came in my way getting into harbour after a stiff gale off Calais; but here are the plates for my book'—at the same time pulling out a heap of copper-plates from under the ample folds of his coat. 'They are all ready for proving.'

"'But how and where did you finish the etchings?'

"'Oh,' said Pugin, 'I finished them in the boat.'

"'Impossible,' replied Mr. Weale.

"'Not a bit of it,' retorted Pugin; 'the motion of the sea makes no difference to me;' and, truly, many of the outlines illustrating the 'Apology' were etched by him under these apparently impossible circumstances." . . . . .

"The annoyance to which Pugin was subjected by applications for designs to be executed from ridiculously insufficient funds, made him at times very irritable. A story is told of his once receiving a letter from a Roman Catholic prelate, requesting designs for a new church of the following description. It was to be '*very* large—the neighbourhood being *very* populous; it must be *very* handsome—a fine new church had been built close by; it must be *very cheap*—they were very poor, in fact had only £ —; when could they expect the design?' Pugin wrote in reply—

"'My dear Lord,—Say *thirty shillings* more, and have *a tower and spire* at once. A. W. P.'"

"Curious stories are told of Pugin in reference to his independent spirit while corresponding with employers or directing their works. The following specimen is an instance of this. The late Lord Stuart de Rothesay, having found some beautiful remains of a conventual building in the south of France, and being about to build a residence on the south-east coast near Christchurch, determined to purchase the materials, have them removed to England, and use them as far as they could be made applicable to the design of a new and large mansion.

"The site chosen by his lordship was a part of the high cliff facing the Isle of Wight. Near this spot there had formerly been a house belonging to the Earl of Bute, the celebrated minister, which, owing to the encroachment of the sea on that part of the coast, was literally by degrees washed into it. Still Lord Stuart thought that by draining the land springs and taking other precautions he could prevent the spread of further mischief. Acting on this belief, he begun the erection of a stately pile at such a distance from the edge of the cliff as was thought sufficient to leave a good margin to the buildings for ages to come. But notwithstanding all precautions, the drainage has not been so effectual as to save the cliff from disruption. By the expansion of frozen land, springs, after severe frosts, and the encroachment of the sea, landslips still occasionally take place.

"Lord Stuart not being perfectly satisfied with the design of the building, which was being conducted under the superintendence of the late Mr. Donthorn, and desiring to obtain the mature judgment of Pugin, invited him to High Cliff to act as his consulting architect. He at once assented, and repaired to High Cliff to inspect the works.

"Arriving in the afternoon, he engaged himself busily in examining all that was going on; soon made himself master of his subject, and with his usual rapidity, before the close of the day had prepared sketches for Lord Stuart's approval.

"After dinner he exhibited his plans, entering into explanations, and pointing out all the alterations which he considered indispensable. His suggestions, unfortunately, did not fall on such willing ears as he expected. Lord S. had spent large sums in the work already done, and was not disposed to pull down heavy stonework just finished; and some amount of demolition was quite necessary to meet Pugin's views. After much discussion, therefore, they separated, Lord Stuart intending to resume the subject on the next morning, but in this he was disappointed. To meet Pugin's convenience, an early breakfast hour was appointed for the next day, and at the time fixed some surprise was expressed that he did not appear. Inquiry being made, it was discovered that Pugin had risen at six o'clock, taken his carpet bag in hand, walked some distance to a little wayside inn, and thence taken his departure by coach to London, without previously giving the slightest intimation of his intention to any one in the house. Thus terminated his connexion with Lord Stuart de Rothesay. All this abruptness arose from the simple circumstance that his employer did not at once adopt his recommendations. Probably this discourtesy would not have been shown at an earlier period of his career, but he had now obtained such a professional standing that he could afford to disregard giving offence."

THE CONDITION OF THE IRISH BARRACKS.

In a recent number this important question received our attention, and we promised soon to revert to it more particularly, but being forestalled in our purpose by our able and popular cotemporary, the "*Building News*," who reviews in a comprehensive series of articles the arrangement of the barracks in the kingdom as substantially recorded in the Commissioners' report published in a blue book, we quote the following therefrom :—

Referring to the Royal Barracks in this city our cotemporary remarks, that "one court enclosed by lofty buildings is entirely closed in on all sides, most of the narrow passages being between buildings of three and four storeys in height, and some entirely closed at one end. To make matters worse, the ground rises rapidly behind the barrack, so there is no free circulation of air at the back. On three sides of the Cavalry square the men's rooms are over the stables, and the rooms in the Royal and Palatine squares have no windows opening to the outer air next the squares, that side being occupied by glazed corridors. There are rooms in the corners and lower flats of the squares, dark, and incapable of ventilation, and which are hardly fit for human dwellings. Although disposed with an apparent regularity on plan, *the total disregard of sanitary principles*, evident throughout every part of this barrack, is *painful to contemplate*. It contains 184 rooms, the regulation number of men being 1,917, and there is a deficiency of accommodation for 629 men, as it would hold 1,288 men only at 600 feet each man, assuming 600 feet per man to be sufficient, but which it would not be in such a building."

Proceeding thence to the "Linen-hall barracks" they are described as being, "in fact, an old linen-hall, leased as a temporary reserve barrack. It now holds 1,094 men by regulation, in 128 rooms, or rather cells; 230 of these men have a space of less that 250 cubic feet each, 291 less than 300 feet each, 302 less than 350 feet each, 101 less than 400 feet, and 170 completing the regulation number, have less than 450 feet each. Thus it appears that of 1,094 men, over 500 have less than 300 feet each, and none have a greater space than 450 feet each. The average is 290 feet per man. As this barrack would accommodate 531 men at 600 feet each, there is the astounding deficiency of accommodation for 563 men out of a body of inmates 1,094 in number. Seeing that this building is totally unfit for barrack purposes, the commissioners considered it unnecessary to recommend any improvements to be attempted. It is enclosed among civil dwellings in one of the worst districts of Dublin, and consists of a number of small closed courts. There are only five open fireplaces in the whole building."

Again—"Arbour-hill barrack, Dublin, was once a prison, unfit for inmates; it is now a barrack for ninety-one men, and that without material alteration. A similar case will be found at Fort Elizabeth at Cork—a building originally occupied as a French prison, but now as a barrack for 180 men, although at the present day hardly anyone would consider it good enough for a prison. Indeed, as a rule, 'military prisons and many provost establishments are planned and constructed on better sanitary principles than are most barracks.' At Stirling Castle the old halls of the palace have been appropriated as barrack rooms by forming galleries round the walls, so as to have two flats of beds, one on the floor, the other on the gallery; the heads of the men in bed in the galleries being above the top of the windows, and there being no outlet for foul air from the top of the room, the only air which the occupants of the beds in the gallery have to breathe is the foul air from the soldiers who sleep on the lower tier of beds below. Barrack accommodation of the worst description is obtained in this way, and the old halls of the palace are damaged.

"May-street recruiting barrack at Belfast, for fifty men, has been converted to its present purpose from a shop or factory, with windows on one side only, opening into a blind alley with its privy, cesspool, &c.

Alluding to the Castle and Shambles barrack, at Galway, our cotemporary says—"The effect is to stagnate and pollute the air, both within and without the barrack-rooms, to obstruct light, and to predispose the men to disease.

"Castle barracks, Galway, contain 12 rooms, and 120 men: giving each man 600 feet, there would be space for 62 men only.

"The Shambles barracks have 32 rooms, contain 256 men by regulation, and have space for 168 only. Both these barracks are embedded among buildings, and have small closed courts, surrounded by high buildings, both are very bad, and both are recommended to be evacuated immediately."

COURT OF BANKRUPTCY.

In re Hugh Kelly.—Mr. D. C. Heron, Q.C., instructed by Mr. Larkin, applied to have the bankruptcy in this matter annulled. The trader was an extensive timber merchant and builder on Sir John Rogerson's-quay. After bankruptcy a composition of 12s. 6d. in the pound was offered, which his lordship, notwithstanding the opposition offered by the Messrs. Martin, accepted. The first two instalments of the composition were unsecured, the last was secured. The unsecured instalments, amounting respectively to £2,200 and £1,800 were paid, or the amounts lodged by the trader with the official assignee. The last instalment was secured, and, under these circumstances, the court was now asked to cancel the bankruptcy, and allow the trader to make use of the credit to which he was legitimately entitled.

Mr. Martin (on behalf of the Messrs. Martin, of the North-wall) opposed the application, on the ground that there was delay in adjusting their accounts.

Mr. Baptist Kernaghan, who attended for several creditors, stated that more had been realised for the creditors under the arrangement than would have been in bankruptcy. He assented to the application.

Judge Lynch said the conduct of Mr. Kelly in the matter since it came before the court had been highly honourable. By his exertions he had realised a very considerable payment for his creditors, and there could be no cause of complaint on that score. He trusted that the fact of the failure would be a useful lesson to the trader in his future dealings. He had no hesitation whatever in annulling the bankruptcy.

The bankruptcy was accordingly annulled.

Notes of New Works.

Additions are to be erected to the Law Club-house, 13, Dame-street. Tenders were received up to the 31st ult.

The new church of St. Mary and St. Peter, at Arklow, has been dedicated; Mr. Patrick Byrne, architect. Style, Gothic.

The foundation stone of the new Presbytery to be attached to Enniskerry Roman Catholic Church was laid on 25th ult., by Archbishop Cullen.

A new store is to be built by the War Department in the armoury yard, Pigeon House Fort.

Sundry works are to be executed at the churches of Aghada, Douglas, and Kilmocamogue, Co. Cork; at Clontarf, Co. Dublin; and St. Paul's, city of Dublin; according to plans, &c., by the architects to Ecclesiastical Commissioners.

Additions and alterations are to be made to Monaghan gaol, according to plans by Mr. M'Curdy, architect.

Four houses are to be built on the esplanade at Bray; Messrs. J. and W. Farrell, architects.

The works at Carlisle Fort contracted for by the Messrs. Moore have been begun under the inspection of Captain Chesney. About 800 persons are employed on them.

The committee of the Dublin Corporation intend building ten labourers' cottages at Baldoyle, and a store in the Greenhide-lane, Bonham-street.

The workshops recently erected in Dundalk for the Dundalk and Enniskillen Railway have been opened for use, and the old ones removed.

Part of the large timber viaduct over the Foyle, near Strabane, is about to be reconstructed. The design comprises iron pillars with lattice superstructure.

The three bridges required by the Board of Trade for the Cootehill Branch Railway have been erected. The passenger station at Cootehill has also been completed.

A new Roman Catholic church is to be erected at Lattin, Tipperary. Tenders to 22nd inst.

The churches of Drumtariffe, Co. Cork, and Kinawley, Co. Fermanagh, are about to be enlarged by the Ecclesiastical Commissioners.

A handsome mansion is to be erected at Caher, Co. Tipperary, for the Countess of Glengall. Messrs. Lanyon, Lynn, & Lanyon, architects.

The interior of the Centenary Methodist Chapel in Stephen's Green is being re-pewed and otherwise improved.

A handsome Gothic oak railing, with ornamental lamps, after the design of Mr. Patrick Byrne, architect, has been fixed in the arcades separating nave from aisles of the new Roman Catholic Church, St. James-street. Mr. James Freeman, builder, constructed it.

The interior of the Four Courts has been undergoing a thorough renovation and decoration, executed with much taste and judgment by Messrs. Hardman & Co., of Camden-street.

A new mansion is in progress of erection for Mr. Thomas Malcomson, under the direction of Mr. J. S. Mulvany, architect.

The Omagh extension of the Ulster Railway has been opened.

A large Roman Catholic Church has been commenced on City Quay, chiefly, we believe, for the accommodation of seamen.

It is expected that on Monday, the 2nd inst., the Newry and Armagh line will be opened for traffic. For a portion of the extension works contracted for by Mr. Gordon new tenders have been invited.

On the 10th ult. the first sod of the Rathkeale and Newcastle railway was turned by the Earl of Devon. It will run from the Rathkeale station of the Limerick and Foynes railway (two miles from Rathkeale), by the town of Rathkeale. It will be only ten miles in length, and will bring the great plain of Newcastle and the surrounding districts in connection with Limerick, and by means of the Cork and Limerick Direct Railway, now in course of construction from Charleville to Patrick's Well—a station also on the Foynes line—will open a direct communication between that district and the city and markets of Cork. The line will pass through a very rich country, the works are of an easy character, and the contract has been taken by Mr. Joshua Hargrave, Cork, for a sum of about £36,000, he taking a fair proportion of the company's stock in part payment of his contract. The engineers are Sir John Benson, of Cork, and Mr. William Barrington, of Limerick.

The works on the line from Monaghan to Clones are making steady progress, for the particulars of which the proprietors are referred to the report of the chief engineer:—

"*Extension—Clones to Cavan*—The Dundalk and Enniskillen Company report that the works are progressing favourably.

"*Extension—Dungannon to Omagh.*—The Government inspector examined this line on the 15th ult., but the opening was postponed for a short time.

"*Aughnacloy Line.*—The bill promoted by the Portadown, Dungannon and Omagh Company for an extension from Dungannon to Aughnacloy, with powers of lease by this company, has passed into law."

GAS.—The town Commissioners of Skibbereen are about lighting the town with public gas lamps, and seek for tenders. The Tullow gas works are to be let.

GAS-LIGHTING OF CASTLEDERG.—Gas works are now being erected at Castlederg, and gas pipes laid down in the streets of the town. The church, hotel, and principal shops have been fitted with gas pipes and burners, Messrs. J. Edmundson & Co., gas engineers, of Capel-street, in this city, having been employed to execute the entire work.

CLONTARF IMPROVEMENT.

TO THE EDITOR OF THE DUBLIN BUILDER.

SIR,—There is opposite the Crescent a portion of strand, bounded on one side by the Drogheda railway, and on the other by the Wharf road, Annesley-bridge, and Clontarf road, which, when the tide is out, is a dirty slob, alike disagreeable in appearance and smell, but when the tide covers it a wonderful difference is felt. The ugly strand is converted into a fresh and pleasant little lake, with an average depth of water of about five feet. Now, to retain say half of the water when the tide ebbs would be a great *desiderutum*; and the simplest way to accomplish this would be to build a broad and low wall about half tide high under each of the three railway arches—the cost would be very trifling. Over these low walls the tide would flow, changing the water twice in twenty-four hours, and at the ebb enough would be left to prevent the disgusting and unwholesome miasma from arising; its appearance would be greatly improved, the youngsters of the neighbourhood would have an opportunity of getting up small boat races during the summer, and in winter would be presented a magnificent and perfectly safe skating ground. Should the inhabitants and landlords of the locality think the matter worth taking up, merely on sanitary grounds, and that subscriptions be necessary to carry out the project. I shall be most happy to contribute my share. A. N.

Review.

The Illustrated Dublin Journal. James Duffy, Wellington-quay.

A NEW claimant for favour in the literary world has appeared, and his *debut* has been attended with acclamation. Most critics regard penny publications as trash, and in very many instances they are so, and more of a demoralizing than instructive character, but we are just turning a point in the revolution of the age when we may reasonably expect more for a penny than hitherto, and in the little production before us we find a highly profitable return for that *important* investment. Were we even to hazard a surmise as to the probable worth of a publication without seeing it, the fact of its emanating from the establishment of the eminent and enterprising publisher, James Duffy, would sufficiently justify us in anticipating favourably, nor are we disappointed in judging the reality. A pleasing tale in three chapters, entitled, "The Miller of Mohill," by no less distinguished a writer than William Carleton, commences the front page. "A chat about Oysters" is somewhat stale, though served up in a palatable style. "Needles and Needlework" is entertaing and instructive. "The Fair Maid of Killarney" enlists many admirers, and the following description of Ross Castle, accompanied by an illustration, is appropriately introduced:—

"The exact date of the erection of Ross Castle has not been ascertained, but, from the peculiar style of the architecture, it may be ascribed to the close of the fourteenth or the early portion of the fifteenth centuries. It was for ages the ancestral residence of the Lords of the Lakes of Killarney, whose martial achievements are still the fertile source of many a popular local tradition. The castle consisted of a lofty square keep, with embattled parapets, based upon a rock of limestone. It was defended on the land side by a massive unornamental buttress, while each corner of the portion directly facing the lake was enflanked by two machiolated defences; the domestic divisions of the fortress were attached to the square tower, and were surrounded by extensive outworks. The interior of the castle evidently contained many well proportioned apartments, and a spiral stone cut staircase still exists, which leads to the summit of the tower, from which many beautiful views of the surrounding scenery may be obtained. Ross Castle was originally a place of great strength, and underwent numerous sieges, the principal of which was the celebrated attack upon it in 1652, by General Ludlow, at the head of the Parliamentary forces. Upon the defeat of the Irish troops, in that year, under Lord Muskerry, at the battle of Knockniclashy, in the county of Cork, by Lord Broghill, the English General, the former withdrew to Ross Castle, where he entrenched himself and whither he was promptly followed by Ludlow. There was an ancient prophecy existing among the peasantry, that the castle was impregnable, and could never be taken until a vessel of war was seen to float upon the lake. Whether Ludlow had heard of the tradition does not appear, certain it is, however, that, considering the natural advantages of the place, and the length of time he might be compelled to remain before it, he resolved to attack it simultaneously by land and water. The English fleet was just then anchored in the Bay of Castlemaine, or Dingle, and, four days after arrival, with incredible energy and perseverance he successfully transported some of the smaller vessels, by mere manual labour, through a country nearly impassable from bogs and woods, and brought them up the intricate and difficult river Laune. The garrison was electrified and intimidated, and immediately capitulated on honourable terms. Smith, in his "History of Kerry," relates that at the time he wrote there was an old man named Hopkins, then sexton of Swords, in the vicinity of Dublin, who was amongst those engaged in drawing Ludlow's vessels into the lake. This Ludlow is said to have lived to the patriarchal age of one hundred and fifteen years. At the commencement of the last century a barrack was erected in connection with Ross Castle, but has long been dismantled, and its walls are now as ivy-mantled as those of the castle itself. Immediately beneath the castle several fine echoes are very distinctly heard; amongst them the famous one of "Paddy Blake," who, when an inquiry is made after his health, is said to answer, "Pretty well I thank ye!"

"A Retrospect of the Dublin Stage," though presenting little of anecdote that was not known before through other channels, is comprehensive and pleasingly written, terminating with the following:—

"The annals of the Crow-street establishment, which was opened in 1758, are, however, too voluminous and interesting to be noticed in a hurried manner, and we therefore reserve them for a future paper, in the compilation of which we shall have frequent opportunities of referring to a work which, for its masterly scholarship, and genial gossipping style, has never been excelled by any emanation from the Irish press; we allude to Gilbert's 'History of the City of Dublin.' The present Theatre-Royal, in Hawkins street, was erected by Samuel Beazley, Esq., in 1820, and the first performance took place on Thursday, January 18th, 1821, the pieces selected for the occasion being Shakspeare's 'Comedy of Errors,' and the farce of 'The Sleep-walker.' Previous to the commencement of the comedy an address from the pen of George Colman was delivered by Mr. Farren, then stage-manager, from which, as an historic outline at the site of the theatre, we quote the following lines:—

"'Here once a market reared its busy head,
Where sheep, instead of tragic heroes, bled;
Bright cleavers formed a band to charm the ears,
Joints dangled in the place of chandeliers;
Stout butchers, stern as critics had their day;
And cut up oxen, like a modern play—
Soon Science came; his steel the butcher drops,
Removes with awe the shambles and the shops,
And learning triumphed over mutton chops!

Then in the School, by patriotism reared,
Arts, Agriculture, Chemistry appeared,
Botanic lore—and studies all too great
For our inferior powers to emulate;
No merit we in Agriculture claim—
To cultivate your favour is our aim—
Which gained, by learned chemists we are told
It turns by playhouse alchemy to gold;
While all the Botany we dare to boast,
Lies in those plants your breath may cherish most.

Again the scene was changed, by wisdom's rule;
Want's refuge then succeeded Learning's school;
No more in streets the shiv'ring beggar stood;
Vice found correction here, and famine food;
Morality rejoiced at Sloth's defeat,
And Pity smil'd to see the hungry eat.

At length, and following these wretched elves.
Beheld another race!—we mean ourselves,
Who, leaning to our predecessors' laws,
Now *beg* most heartily for your applause—
Beg you, brave Erin's sons, and Erin's fair,
To make your Nation's Theatre your care.'"

"A Real Grievance" concludes the number. We shall be pleased to renew our acquaintance hereafter with this periodical, and note its progress.

Miscellaneous.

SIR W. G. ARMSTRONG, AND HIS WORKMEN.—On Monday evening week a most interesting *soiree* of the workmen employed on the Elswick ordnance and engine works at Newcastle-on-Tyne was held in the pattern-shop on the works. No less than 2,500 persons, consisting of the workmen, their families, and friends, sat down to tea. There are 3,000 men and boys employed upon the Elswick ordnance and engine work, and their united wages amount to more than 5,000*l.* a fortnight. The Elswick ordnance works are being largely extended. Among the more recent additions is an apparatus for the manufacture of cannon of weight and strength hitherto unheard of. An immense 300-pounder battery gun is in the course of being formed by the use of the new 10-ton steam-hammer, which can be worked up to 15 tons, and is the largest in England, and is daily wrought at from 40 to 50 strokes a minute. The anvil weighs 34 tons. The bore of the 300 pounder gun will be 10½ inches in diameter; length 14 feet; weight 12 tons. It will be a muzzle loader, and the rifling of its bore will be on the rib pattern. It is expected to be finished in four months. There is also in hand a 200-pounder breach-loading gun, to be constructed on the wedge principle. Extensive foundries are being laid out upon the works, and a test for trying the guns before they are sent up to Woolwich is being built on the south side of the Tyne. Among the orders being executed in the engine department of those works are 13 locomotives for the East Indian Railway Company.

PUBLIC INSTITUTIONS.—A Parliamentary return is published, showing the sums granted to certain public institutions—such as the British Museum, National Gallery, &c., during the last ten years. These sums are, for the year 1860, as follows:—For the British Museum—Amount voted (exclusive of sums for additional buildings, &c.,) £100,850; received from subscriptions, bequests, &c., £1,833 19s. 2d. For the National Gallery—Amount voted (exclusive of all sums for additional buildings, &c.,) £11,670. For the Royal Gardens at Kew—Amount voted (exclusive of all sums for additional buildings, &c.), £14,800 18s. (No sums have been received from subscriptions, donations, or bequests, or from the public during the period referred to.) For the Botanic Gardens at Edinburgh—Amount voted, £1,200; received from the vote of Scottish Universities, £627; annual grant from the Town Council of Edinburgh, £25. For the Natural History and Industrial Museum, Edinburgh (exclusive of sums voted for building)—Amount voted, £1,943 16s.; received from admission fees, subscriptions, &c., in the ten years, £1,523 6s. 6d. In addition to this amount upwards of 20,000 specimens have been presented to these museums, the estimated value of which is £9,144 15s. For the National Gallery, Dublin—Amount voted (in aid of the building), £5,000; received from the "Dargan Fund" (in connection with the Great Exhibition of 1853), —; received from subscriptions and donations up to 1860, £1,440 14s. For the Museum of Irish Industry—Amount voted, £4,966 16s.; fees from students, &c., £58 18s. For the Royal Dublin Society, including Botanic and Zoological Gardens Amount voted, £6,000; subscriptions, receipts from the public, &c., £6,198 1s. 8d.

GLASS CASKS.—A new kind of cask has just been invented, which is replacing, it is said, in the south of France, those now made of wood. They are made of glass, and of different sizes, to contain from five to one hundred litres. Among the advantages they possess may be mentioned that they are proof against all leakage and evaporation, and keep the liquid placed in them fresh and pure to the last. They are stronger, when kept stationary, than the wooden casks, having, in the experiments made, withstood a pressure which shattered the ordinary casks to pieces.

INDIA-RUBBER CARDS.—One of the recent uses to which India-rubber is put is that of furnishing the material for business cards. Besides the various convenient forms which may be given to the material, it may also be improved with any ornament or design suitable to any particular business. The material makes light and prettily-moulded business cards; one advantage of which is that they cannot be defaced easily, and are almost indistructible.

BANBRIDGE LISBURN AND BELFAST RAILWAY.—The following is an abstract of the report laid before the general meeting of this company. The contractors have made very considerable progress, are now in possession of all the land required, and are at work along the entire line. Favourable contracts have been made with the Rhymny Iron Company for rails, and with Messrs. J. P. Corry and Co. for sleeper-blocks. The building of stations at Hillsborough, Dromore, Mullaghfernahan, and Banbridge, has been decided on, and plans ordered from Mr. Thomas Jackson. The directors refer with much satisfaction to the advantages conferred by the passing of the Banbridge Extension and Dublin and Antrim Junction Bills, which will greatly benefit their line.

THE BUILDERS' STRIKE.—The London masons, having obtained the sanction of the executive council of their society, sitting at Bristol, have placed two propositions before the various lodges throughout the kingdom, the votes on which are now being taken, and the result of which will be officially made known on Monday next. These propositions are, 1st—"That the whole of the country jobs and works of the London employers who have not accepted the compromise be immediately struck, and the men working thereon called off; 2nd—That the men be called off the whole of the country jobs and works of Messrs. Myers." If either of these propositions is carried, the men expect it to exercise a considerable influence in favour of an early settlement of the dispute. In the event of the first proposition being adopted, about 800 men will be thrown out; if the second only is agreed to, between 300 and 400 will leave work. During the last few days, several of the Scotch masons who have been brought over to work in Messrs. Myers's yard have left their employ, and reported themselves to the masons' strike committee. Some of these men have had their expenses paid back to Scotland, and others sent to Manchester.—*Daily News.*

THE NATIONAL PORTRAIT GALLERY.—A terra-cotta bust of Oliver Cromwell has just been added to the National Portrait Gallery. It bears the impress of being a study direct from nature, and evidently served as the original model for the marble bust which Mr. Labouchere, now Lord Taunton, contributed to the Manchester Exhibition. The marble bears the name of Edward Pierce, a leading sculptor of the seventeenth century, who executed public statues for the city of London, and whose busts of Sir Christopher Wren and Sir Isaac Newton, at Oxford, rival the most successful efforts of Roubiliac at a subsequent period. In the terra-cotta bust there is a comparative profusion of hair on the head, and even the second wart on his face is lost in the fulness of the mustache. The full hair and starting eyes give a peculiarly lion-like character to the countenance. A marble bust of Lord Jeffrey, the celebrated Edinburgh Reviewer, has also been added to the collection, and the trustees have also secured a portrait of Oliver Goldsmith, which, while it corresponds with the well-known profile by Sir Joshua, has the additional interest of having belonged to Goldsmith himself.

THE SUPPLY OF WATER IN PARIS.—According to the report made by the commission of inquiry relative to the waters of the Dhuis, it appears that Paris is one of the places most poorly supplied with water, the quantity being only 90 litres per head and per day, while the normal quantity is considered to be 150. Rome is the most highly favoured in this respect, receiving 244 litres per head every day; next come in succession as regards quantity—New York, 568 litres; Carcassone, 400; Besancon, 246; Dijon, 240; Marseilles, 186; Bordeaux, 170; Genoa, 120; Glasgow, 100; London, 95. Deducting from the quantity for Paris of 90 litres the quantity for public fountains and watering streets, &c., there only remains 35 litres of potable water per day for each inhabitant.

DUBLIN IN THE YEAR 1776.—A coloured lithograph is about being published, from a drawing in the possession of a gentleman of this city, executed by Mr. William Morrisson, of Bachelors'-walk. The drawing was made by the late Mr. James Malton from a sketch taken in Grafton-street. It represents the street in the olden time, and the personages pourtrayed, either as walking or driving, in the antique coaches, were celebrities of the time, attired according to the prevailing fashions. Amongst "the characters" in the picture are Doctor Ditton, with cocked hat professional cane; also a well-known newsvender of the day, and the Wicklow Sandman, whose voice was so discordant that the citizens of Dublin rewarded him for the favour of his speedy departure from their places of abode. The lithograph will assist in showing the contrast between Grafton-street in 1776 and 1861.—*Saunders.*

IMPROVED IRON AND STEEL.—A process has been invented for an improvement in the manufacture of iron and steel. During the operation of puddling a small quantity of gold is introduced, which, by diffusing throughout the mass, is said to confer an extraordinary advantage. The process is to be applied to the manufacture of ships' plates, anchors, cables, and all those portions of railway plant in which tenacity is most essential.

GOING TO BED BY STEAM.—In the Continental Hotel, Philadelphia, there is a steam-lift for taking the guests to bed, which is said to have cost 10,000 dollars, or more than £2,000.

A prospectus has been issued by the Directors of Bray's Traction Engine Company (Limited), with a view to increasing the capital of that undertaking from £25,000 to £50,000. From the testimony of her Majesty's Government, Messrs. John Penn and Son, and other celebrated engineering and other firms in London, the principle of these engines, which is most simple and efficient, and by which they can be adapted to all roads, has been demonstrated by actual experience; and the directors state that business operations are open to the company, both for the hire and sale of engines and waggons in this country, and that a demand exists for them in all parts of the world. India is instanced as affording a wide field for their introduction in developing the resources of the great cotton and grain producing districts of that empire, while they could be employed as feeders to the railways when those main lines of transport are opened. Another feature of the prospectus is an honorary direction composed of several noblemen, who, from their scientific knowledge and position, are a guarantee of the respectability and *bona fide* nature of the undertaking. The extra capital is required to enable the directors to increase the present rolling stock and establish a factory, so that the engines may be constructed under their supervision, and the quality and nature of the work thoroughly relied on.

Eccentricities of Genius.—One of the earliest applications for space in the exhibition of 1862 was that of an inventor, who, though he does not specify the nature of the articles he intends to exhibit, requires space in every class of the industrial sections to the amount of 72,000 square feet! It must be taken, we suppose as a proof of the versatility of genius that we always find the professions and trades of those intractable inventors have not the remotest connection with their valuable mechanical, chemical, and warlike discoveries. Thus a clergyman may send breach-loaders and models of tremendously destructive shells, while the nurseryman and gardener proffers improvements in surgical instruments, and the doctor a contrivance for forwarding the ripening of fruit on walls. One grocer demands space for the exhibition of a new axle application to all carriages, a new projectile for ordnance, and a new method of propelling ships. An M.A. and F.R.G.S. has models of an invulnerable floating battery, a breach-loading gun and carriage, converting all guns of old pattern into breach-loaders, a refuge buoy, a beacon, a cork poncho mattress, a life, limb, and treasure-preserver, an unfoulable anchor, and some new screw-propeller. An accountant asks space for a model of a self-acting water-closet, with water meter and apparatus for regulating the flow of water all in one, the model of an improved theodolite, and an omnitonic flute, all to be shown together! A bookseller seems overflowing with invention. He has a plan of interminable suspension applicable to bridges, aqueducts, &c., of great span or length, and by which means to do away with the costly supports hitherto used; a target shooting protector for the safety of those employed to note the score; a new paddle-wheel, by which to secure a greater amount of power than is attainable by any other arrangement; a self acting railway signal for day and night, and bolts for gates at level crossings, whereby to prevent the gates from being opened while a train is within a quarter of a mile or any convenient distance; a safety spring mining cage to secure the safe lodging or prevent the falling of the cage in its ascent or descent when conveying men or goods up or down the mine shaft, should the rope or chain break or become disarranged; a new window-sash fastening the door-bolt, by which to attain perfect security, from the impossibility of unfastening them from the outside. A barrister wishes to exhibit two architectural designs—a pair of spring-heeled boots, and a drawing of a man equipped with ditto; diagrams of Coryton's system of fairway lighting off the coasts of Great Britain; a type-composing machine and hand-stamp; models and drawings illustrative of Cosyton's vertical wave-line system of ship construction; Coryton's atmospheric guide-propeller, and Coryton's self adjusting sails. An insurance broker has specimens of wines and other fluids fined by a new and more effective process, and model of the apparatus used; electric telegraph cables and conductors; model of an improved ship, and parts thereof; specimens of improved pavement in carriage roads; specimens of improvements in iron houses, &c.; specimens of building stone preserved by a new material; model of a machine for dressing stone; specimens of improved junctions of iron pipes to prevent breakage; specimens of a new description of embroidery; ditto of paper-hangings; ditto of an improved floorcloth. These, likewise, are all to be shown together. This list might be extended indefinitely. Another class of applicants appear to wish to exhibit, merely to say that they have exhibited. Thus, a private secretary wishes to show specimens of grape, gooseberry and rhubarb wines; and another a method of training vines. One gentleman proposes to exhibit wines, a photographic view of an organ front, designed by himself, and six large views of his fig orchard. A great many intending exhibitors, either from motives of secresy or from not comprehending the term, "Nature of the articles to be exhibited," have either omitted description altogether, or what is worse, defined them very badly. Thus, one declines to give any specification but the number of the class he wishes to exhibit in. One can only be got to admit that his inventions are Archimedean, whatever that may mean another that his "objects are geological;" while a third baffles the Commissioners with the general answer that his articles "are various." Ideas of space are, of course, of the most indefinite kind. People will do anything rather than adhere to the plain dimensions of length, breadth, and height. An organ-builder, after much correspondence, says he cannot tell how much space he will want. Another requires a horizonal space of 200 feet by 100 feet or 20,000 square feet, for the exhibition of some photographs; another wants 100 feet by 100 feet, or 10,000 square feet for carriages. The agricultural implement makers, however, carry off the palm for exorbitancy. They seem to think the building will be rather larger than Salisbury Plain, for one eminent maker demands a space of 1,500 feet by 1,500 feet, or 2,250,000 square feet, nearly three times the whole exhibition space in the building. Equally curious applications have been made in connection with the department of Fine Arts. One gentleman desires to exhibit a poem! Another wants a stand for antique bricks. A third claims space in the picture gallery for "a model room for a working shoemaker, showing sanitary arrangements and economical furniture, cooking apparatus, and bed."

Important Use for Seaweed.—M. E. Lagout has presented a report to the Paris Academy of Sciences on the employment of seaweed, applied in layers against the thin walls of habitations, to prevent sudden variations in and excess of temperature. The marine algæ, such as sea-wrack, may be termed a sea-wool, which has this advantage over ordinary wool, that it does not harbour insects, and undergoes no change by dryness or humidity, provided it be not exposed to the solar rays; from being brown and flexible, it becomes white and almost rigid. In the dark, on the contrary, it is unchangeable, unfermentable, imputrescent, uninflammable, and unattachable by insects. At first it has the objection of being hygromatic, but a single washing in fresh water removes the salt, and then its properties become so beneficial, that a celebrated architect has styled it the "flannel of health for habitations." It has been applied successfully between the tiles and ceiling of a railway station, also in a portable house intended for the use of officers at the Camp of Chalons; also double panels, the intermediate space being filled with seaweed, have been prepared for the construction of temporary barracks at the Isle of Reunion. The Consulting Committee of Public Health, the Society of Civil Engineers, the Council for Civic Structures, &c., have expressed their approval of the judicious employment of the marine algæ, and state that the popularisation of this process will be of great service in dwellings, especially in those of the humbler class, as it renders them both more agreeable and salubrious. It can be obtained for about 20s. the ton, which quantity is sufficient for upwards of a hundred square yards of roofing.

A Peep into the Office of the London "Times."—A French tourist, who has visited the office of the Thunderer, furnishes some interesting items respecting the internal economy of that vast establishment that we have not before seen mentioned. Adjoining the editorial room—which is large, well lighted, and fitted up with desks comprising every convenience for writing—is a dining-room for editors, and the archive room, where are stored all the files of the *Times* since its foundation. Next to the archive-room are the proof-readers' rooms, where are hundreds of dictionaries and encylopædies in all languages and relating to all subjects. A dozen proof-readers are employed during the day, and another dozen during the night. They have an eating-room adjoining that where they work, and their meals are provided at the expense of the establishment. The administration of the *Times* has nothing to do with the subscription to the paper. Smith, of the Strand, sees to the mailing of the papers, of which he takes thirty thousand daily. The remainder are bought by one hundred and seventy news-dealers, who pay in advance. The paper is sold to them less than cost, the proprietors looking to the advertisements for remuneration. The wear and tear produced by the perpetual motion which reigns in this immense establishment are so great that it is necessary to rebuild and strengthen once every two years the lower storeys of the building.

M. Wothly, of Aix-la-Chapelle, states that, after experiments for many years, he has succeeded in obtaining positive proofs from his photographic portraits without employing nitrate of silver or any other of the present agents of photography. These are replaced by a chemical composition much more sensible, and which renders all retouching needless when the negative is without defect.

Watches in Relation to the Fine Arts.—"Indeed, one of them has already made a very marked advance in this respect by producing artistically-ornamented watches, adapted to meet a high standard of cultivated taste. The manufacturer here alluded to is Mr. J. W. Benson, of 33 and 34, Ludgate Hill, and 46 and 47, Cornhill. In recently visiting his newly-enlarged show-rooms, we found a most rare display of highly-ornamented watches of all kinds. The watches here exhibited surpass those of any other English manufacturer, in respect to novely of design, combining artistic beauty and exquisite finish in the ornamentation. The wide reputation which Mr. Benson has gained for the perfect time-keeping qualities of his watches leaves nothing for us to say on this point. Mr. Benson can meet the views of the economic utilitarian with the same facility as he can the wishes of the most elevated. A buyer intent on securing a superior watch of good design and lasting qualities cannot fail of meeting with satisfaction at this establishment."—*Observer.*

Iron Founders, Plumbers, &c.

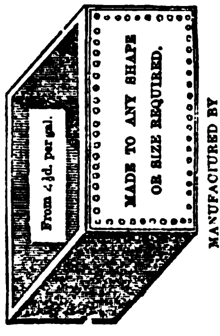
TO RAILWAY CONTRACTORS, BUILDERS, QUARRYMEN, ETC.

EVERY description of Shovels, Sledges, Hammers, Picks, Steel, Crab Winches, Pulley Blocks, Chain; Mason's, Smith's, and Workmen's Tools of all kinds.

THOMAS HENSHAW & CO.,
Hardware Merchants and Manufacturers,
5, CHRIST CHURCH PLACE,
AND
81, MIDDLE ABBEY-STREET. DUBLIN.

TUPPER AND COMPANY,
Manufacturers of
Patent Galvanized Iron, and
Galvanized Tinned Iron, Corrugated and Plain;
Also
Patent Galvanized and Galvanized Tinned Tiles.
Estimates and Drawings furnished for Iron Houses, Churches, Roofs, Sheds, Stores, &c.
All sorts of Iron Work Galvanized.
Merchants and Shippers Supplied.
Works—LIMEHOUSE and BIRMINGHAM.
Offices—61a, MOORGATE-STREET, LONDON, E.C.

GALVANIZED WROUGHT IRON
CISTERNS.



From 4½d. per gal.
MADE TO ANY SHAPE
OR SIZE REQUIRED.

MANUFACTURED BY
TUPPER & COMPANY,
61a, MOORGATE STREET, LONDON, E.C.
Galvanized or Lead service Pipe, Brass Ball Valves Bib Cocks, &c.
Prices delivered in London.
N.B. A Discount to the Trade, Builders, &c.

GAS APPARATUS FOR LIGHTING PRIVATE HOUSES.

J. EDMUNDSON and CO. call attention to their PATENT GAS APPARATUS, by means of which Noblemen's and Gentlemen's Mansions, Out-offices, and Farm-steadings can be brilliantly lighted with Gas, at an expense much less than from oil or candles. It is also well adapted for lighting Towns, Villages, Mills, Public Establishments, &c.

The Apparatus produces more Gas from a given quantity of Coal than any other. The brilliancy of the light far exceeds that used in the principal towns of Ireland, and its purity is such as is only found in Home-made Gas.

In districts where Coal is scarce and Peat plentiful, *Gas from Peat* can be economically manufactured by J. E. and Co.'s Apparatus, which is compact, inexpensive, and so simple in construction that any labourer or farm servant of common intelligence can manage it.

J. EDMUNDSON and CO. will have pleasure in waiting upon any gentleman who desires to know the cost of the erection of Gas Works at his residence or other establishment, and will be prepared to submit, free of expense, an estimate for the work.

Gas Engineers, Contractors, and Ironmongers,
34, 35, and 36, CAPEL-STREET, DUBLIN.

HAMMERSMITH IRON WORKS, DUBLIN.

MESSRS. TURNER and GIBSON, Manufacturers of IRON CONSERVATORIES, Fruit Houses, Pine Pits, etc.

Ornamental Works, Bowers, Porches, Balustrades, Trellises, Flower Stands, Vases, etc.

Grand Entrance Gates, Guard Railings, Farm Gates, Hurdles, and Strained Wire Fencing, etc.

Iron Roofs for Railway Stations, Breweries, Gas Works, and Farm Buildings, etc.

Warming & Ventilating Dwelling Houses, Prisons, Conservatories, Mills, and Public Buildings, etc.; House, Laundry, Cooking, and Steaming Apparatus.

Bridges, Girders, Iron Lattice, Bowstring, Suspension, Patent Balance Rolling, and Swivel Bridges, and Floor Girders

T. and G. beg to refer, as specimens of *their work*, to the Iron Conservatories, Heating, etc., as erected at the Royal Botanic Gardens, Kew; the Inner Circle Botanic, Regent's Park; Cheltenham; Viceregal Lodge; Glasnevin; and various Works by them throughout the United Kingdom.

WILLIAM TURNER,
OXMANTOWN FOUNDRY & IRON WORKS,
103, NORTH KING-STREET, DUBLIN.

Cast-Iron Girders, Plain and Ornamental Pillars, Moulded and Plain Gutters, Tank Plates, Gas Retorts and Pipes, Kitchen Range Work, Millwright, Castings, Balconies, Brackets, Staircase Ballusters, etc., supplied. A large variety of Models for the above in stock.

NEW Balance Rolling BRIDGE.
KENNY'S PATENT.

The undersigned beg to call the attention of Engineers and the Public to the above description of Opening Bridge, as now being constructed for the entrance to the St. George's Dock, Custom-house Quay, Dublin, for the Board of Works, which will be found superior to the ordinary Swivel Bridge, both in point of simplicity of Construction and Cost.

Plans and Specifications furnished, and Licenses granted on application to
TURNER AND GIBSON,
Proprietors and Manufacturers,
HAMMERSMITH IRON WORKS, BALL's-BRIDGE, DUBLIN.

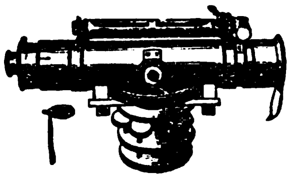
IRON CASTINGS—Castings of every description for Gas and Water Companies, Millwrights, Builders, Plumbers, &c., made at
SEVILLE IRON WORKS, SEVILLE-PLACE, DUBLIN.

POOLEY'S PATENT WEIGHING MACHINES.—These Machines are used upon the principal railways of Great Britain, and are unrivalled for accuracy. Specimens may be seen, and every information obtained from

H. SIBTHORPE AND SON,
Agents for Ireland,
11 & 12, *CORK HILL, DUBLIN.*

TO BUILDERS AND PLUMBERS.

SHEET LEAD—in Sheets or cut to any dimensions—and Lead Pipe of the best quality. MAURICE BROOKS, Sackville-place, Dublin.



THEODOLITES, LEVELS, CIRCUMFERENTERS, Mathematical Drawing Instruments, Scales, Rules, Tapes, T Squares, &c.

JOHN ARCHBUTT, 20, Westminster Bridge Road Lambeth. near Astley's Theatre, respectfully calls attention to his Stock of the above articles, manufactured by superior workmen. The prices will be found considerably lower than ever charged for articles of similar quality. An illustrated price list forwarded free on application. 8-inch Dumpy Level complete, 6 guineas; 10-inch ditto, 8 guineas; 14-inch ditto, 10 guineas; with compass, 1 guinea each extra. Best 5-inch Theodolite, divided on Silver, 18 guineas.

T SQUARE as recommended in the "Builder" and "The Engineer." 42 in., 7s. 6d.; 31 in., 5s. 6d.; 24 in., 4s. Drawing and Surveying Instruments of the best possible workmanship and highest finish. Tapes Chains, Scales, Rods; every article for the Draughtsman or Surveyor made on the Premises.

W. F. STANLEY,
3 & 5, Gt. TURNSTILE, HOLBORN, LONDON, W. C.

LIST OF PRICES ON APPLICATION BY POST.

The best Drawing Pen to be had, price 2s, in Postage Stamps, Post free.

SURVEYING, ENGINEERING, ARCHITECTURE, &c. — PRACTICAL INSTRUCTION is given in SURVEYING, Levelling, Civil Engineering, Architecture, Building, Draughting, Mapping, Measuring and Valuing of Land, Timber, Buildings, &c., by Messrs. HYDE, SMITH, and LEWIS, Civil Engineers, Architects, Surveyors, etc., in a short Course of Instruction on moderate terms, including FIELD WORK and the use of the INSTRUMENTS. For Prospectuses, apply at the Offices, 24, Guilford-st, Russell-square.

N.B.—An Architectural, Engineering, and Mechanical Class for Architects, Builders, Engineers' sons, etc., on moderate terms, including instruction in Drawing, Coloring, Taking out Quantities, etc.

Statuary, Marbles, Cements.

Plaster of Paris.
Roman Cement.
Portland Cement.
Patent Mastic Cement.

John's Patent Stucco Cement.
Keene's Patent Marble Cement.

Of the best quality, to be had of

SALMON RICE, AND CO.
3, ANGLESEA-STREET.

Also Crown, Sheet, and Plate Glass; Fire Bricks, Tiles, &c; Painters' and Plasterers' Brushes.

Gypsum for Agricultural Purposes

Steam Mills and Manufactory—CROWN-ALLEY,
Established, a.d. 1780.

TO ARCHITECTS AND GENTLEMEN HAVING MANSIONS IN COURSE OF ERECTION.

JAMES HOGAN AND SONS,
Stucco Plasterers, General Cement Workers, Modellers, &c.,
168, GREAT BRUNSWICK-STREET,

Beg leave to state that they are prepared to undertake Contracts in the above line. Ornaments for Cornices and Centre Pieces for Ceilings supplied. Fronts for Houses done in Portland or Roman Cement at first cost price. Country Orders strictly attended to, and first class workmen sent to all parts of the Kingdom.

C. WILLIAM GIBLAN, Plain and Ornamental Plasterer and Architectural Modeller, 29, GREAT BRUNSWICK-ST., DUBLIN.

This establishment is the only one in Ireland that has a variety of Colossal Statues, Groups, Busts and Vases, Basso, Mezzo, and Alto Relievo Antique Subjects; Centres, Cornices, &c.

C. W. G. has purchased the stock of the late Agent to the Patent Siliceous Stone Company.

P.S.—Men sent to all parts of the Kingdom.

BEST CEMENTS.

ROMAN CEMENT, PORTLAND CEMENT, and PLASTER PARIS STORES,
10, Sir John's-quay, Dublin.

George Holmes and Co. are constantly supplied with the above materials of genuine quality, direct from the best manufacturers. Also Sewerage Pipes, Junctions, Bends, &c.

CHIMNEY PIECES—in Italian, Belgian, Irish, and English Marble; Enamelled Slate, and Cast Iron: suitable for Drawing-rooms, Dining-rooms, Bed-rooms, &c. A very large Stock to select from. MAURICE BROOKS, Sackville-place, Dublin.

PATENT SILICA CEMENT.

ARCHITECTS and BUILDERS are requested to try this CEMENT. It carries more Sand than Portland, works with greater facility, and dries of a perfectly uniform color (that of Caen stone.) It is entirely free from the efflorescence of nitre, which disfigures work executed in Portland or Roman cements.

A specimen can be seen at No. 80, Bankside, Southwark, Messrs. J. NEWTON & CO., of whom it may be procured, or direct from the manufacturer, F M. EDEN, Orchard House Cement Works, Blackwall, E.

TO BRASSFOUNDERS, ENGINEERS, REFINERS, ETC.

THE PATENT PLUMBAGO CRUCIBLE COMPANY beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist.

For Lists, Testimonials, etc., apply to Battersea Works, London, S.W.

IMPERISHABLE TESSELATED PAVEMENTS.—H. SIBTHORPE AND SON, Agents to Maw and Co., are prepared to supply Designs for Floors of Churches, Conservatories, Entrance Halls, and Passages, with proper Workmen to lay them in any part of Ireland.

Various specimens may be seen at their Warerooms,
11 and 12, CORK-HILL, DUBLIN.

The Dublin Builder.

Vol. III.—No. 42.

MANSIONS OF THE LONDON NOBILITY.

BRIDGEWATER HOUSE.

PURSUING our notice of some of the chief architectural objects of interest at "the west end" of London, we have for this number collected some particulars—with accompanying illustrations—of one of the purest and most beautiful specimens of Italian architecture to be found in any town in the world. Although other mansions more comprehensive and capacious may be seen in a ramble in this locality, which is literally studded with palatial structures, the subject of our sketch—viz., Bridgewater-house, the residence of Lord Ellesmere, to our mind eclipses them all; and is in every respect, whether viewed externally or internally, worthy of the great artist that conceived and matured so noble a design. We have, in our article descriptive of "London club-houses," already alluded to the "Reform" and "Travellers'" as perhaps the *chef-d'œuvres* of the late Sir Charles Barry, R.A., but we may with all justice include this too in the programme of his most successful works. The plan of the storey which we have selected for illustration of the internal arrangements, exhibits the chief apartments, and it will be seen that the block of building is a parallelogram nearly a square, measuring 112 feet 6 inches from east to west, and 122 feet from north to south. The principal entrance is at the south side through a central hall 10 feet wide, which doubtless some of our readers will judge to be rather limited for a building of such importance, this apartment being usually one of the most spacious; but a close inspection of the plan will convince that the architect used a wise discretion in adopting this dimension, so as not to interfere with the other arrangements of his plan, on a comparatively limited site. Communicating with this hall is a continuous corridor, enclosing a quadrangular area 57 feet by 33, whereby an abundance of light is obtained, and thence access is had to the several apartments on the storey, which it is unnecessary here to particularise. It will be observed that the picture gallery—which we may remark *en passant* contains a magnificent collection of works of art—is lighted from above, being consequently carried up the full height of the building. The first floor is somewhat similar in its arrangements, and comprises a suite of apartments, domestic chiefly; and on the second are numerous bed, dressing, and bath-rooms; the culinary offices and servants' rooms, &c., occupying the basement. The west elevation, although presenting less frontage than the south, is selected for our external illustration, being if possible a more perfect subject than the latter, whose general features and details however it will be obvious, to a considerable extent, correspond with the former. The entrance porch is in the centre, and is surmounted by vases of similar design to those above the balustrade, as shown. On the south front there are no wings, the extreme angles being only rusticated, but a central projection breaks the outline. Concluding our notice of this truly beautiful work, we cannot refrain from remarking—though we have no desire just now to enter into a controversy on the respective merits of the Ruskinites or the Gothicists—that the Italian style of architecture, if faithfully studied, presents all the elements for ensuring a chaste composition in every class of structure whatever it may be, without the extravagances too frequently found in the works of many of our modern architects, who sacrifice taste, judgment, and effect most unmercifully at the shrine of originality.

A beautiful drawing of Muckross House, by Mr. Stopford, of Cork, was presented by Colonel Herbert to the Queen, on the occasion of her late visit; and a drawing of Killarney House, by the same artist, was also presented to her Majesty by Lord Castlerosse.

Mr. Ruskin, it is said, is engaged on a volume of Swiss sketches.

PARIS.

The line forming the junction of the Chemin de Fer de Ceinture, with the docks of St. Ouen, is on the point of being completed; there are only a few miles of excavation till the junction is arrived at. The great difficulty encountered by this new line was the passage of the Route Militaire, which, owing to want of sufficient headway, had to be crossed on a level. The junction station is to be 500 metres long, and is to be furnished with eight sets of switches for *manœvres*.

This line of St. Ouen at present only is continued on the right "quai," but is shortly to branch off above the Route de la Revolte, with a line all along the left "quai," or platform. The execution of this railway was not the only work for carrying out the project; it was necessary to reconstruct the double lock which unites the maritime terminus with the Seine, and to do this without emptying the basin. In order to accomplish this a perfectly tight "barrage" was erected, as at the basin of the douaub in the Canal St. Martin, and another one to keep out the Seine, there to empty the inner portion, in order to reconstruct the masonry of the gates. Workmen continue their labors day and night many metres below the surfaces of the two waters. This belt railway of Paris is to commence a passenger service on the 1st April, 1862, whereas it has been exclusively devoted to the transport of merchandise or royal passengers. For goods traffic enormous engines are used, capable of running away with 400 tons, but for passengers a new and light locomotive is to be put on the rails. They are called "*coucous*," and are of moderate power, and easily brought to a stand still at any velocity. Notwithstanding these difficulties, all will be finished by the end of the year, and henceforth the boat service will have its true port in St. Ouen; cargoes will arrive by the Chemin de Fer de Ceinture to all points of the capital, and the quays of Paris will be cleared of the encumbrance of all sorts of merchandise. There will be two special services of passenger trains—one to take provincial travellers from one station to another, and another service to correspond with all the omnibusses in Paris. The stations for the latter will be—at Batignolles, Moncaux, at the Porte St. Ouen, at the Porte D'Aubervilliers (near the bifurcation of the northern line), at La Chapelle, at La Villette, at Belleville (Rue de Crimée), at Menilmontant (Rue de la Marc), à Charonne (Rue des Chemins de Fer), at St. Maudé—where the station is already built—at La Rapée, and lastly at the Ivry station.

At the Arsenal Library, as at the Palais de Justice, the vacations are profitably used to carry on the works of restoration with activity. On the side facing the river the left pavillion is being "rectified," so as to disengage the principal corps of the building. This pavillion will be set back to correspond with that on the right hand, and the interval left by the retreat will be enclosed by a railing on a plinth. As to the opposite pavillion, which had long since been subjected to a similar transformation, it had been masked by a wall now in course of demolition, to make room for a railing similar to that on the left.

On the Rue de Sully, the façade of the library is now altogether disengaged, and a prominent railing encloses the buildings on that side. They date from 1718, and are the work of Germain Bouffraud. When the new Boulevard St. Germain is opened out, the recently constructed entrance to this edifice on the extreme left will stand out, it being now hidden by a mass of buildings which are to come down.

On the façade of the ancient pavillions of the Hotel de Ville three centuries have told with a ravaging effect, though the stone was one of the hardest. The restoration has been commenced, and on the demolition of the "reliefs" of the frontage, they crumbled into dust under the hammer. Perhaps it will be necessary to reconstruct the entire façade. This portion of the hotel was commenced under Francis I. (15th July, 1533), the plan was modified under Henry II. by the Italian, Dominico Boccardo, and the building terminated under Henry IV. (1606) by André de Cercean. Consequently, it took seventy-three years to build.

The transformation of the interior ancient boulevards into a double roadway, with a promenade in the middle, is completed from Batignolles to La Chapelle; trees will be planted as soon as the season for removal arrives.

The Academy of Fine Arts of the Institue has awarded, in its sitting of the 14th September, the grand prizes for a historical landscape, having for subject the March of Silenus. They are as follows:—1st great prize, M. Paul Albert Girave, of Paris, aged 21½ years, pupil of M. Picot; 2nd great prize, M. Gustave Achille Guillaumet, de Paris, aged 21 years, pupil of MM. Picot and Abel de Pujol. Honorable mention to M. Arthur Henri Bonnefoy, de Boulogne (Pas de Calais), aged 22 years, pupil of M. Cogniat. The public exhibition of the grand architectural prizes, the subject being an "Establishment for Baths in a Town furnished with hot springs," will be held in the Imperial School of Fine Arts, Rue Bonaparte, on the 18th, 19th, 20th inst., from 10 a.m., till 4 p.m.

TUAM CATHEDRAL.

The dean and chapter, with the parochial clergy of the diocese of Tuam, having resolved to take steps for making the cathedral worthy of the importance of its situation, invited several architects of eminence to give the matter consideration, and to submit such sketches as would illustrate their views of the best method of accomplishing this desirable object. After careful consideration, the sketches sent in by Messrs. Deane obtained their unanimous approval, and instructions have been given for making the requisite working drawings.

It will be remembered, that at the west end of the building which now serves for cathedral and parish church, stands a relic of Irish antiquity of the most interesting character - obviously the chancel with the chancel or triumphal arch (as Dr. Petrie calls it) of an abbey. This chancel at present forms the porch, and the triumphal arch the western entrance to the modern structure—the central opening of the triple window at the east end of the old chancel being cut down to the ground. This somewhat barbarous arrangement was made early in the present century. What is the precise date of the building used as cathedral it is difficult to ascertain—probably in the 17th century (when an ugly tower was also erected), the windows of a structure of the 14th century were worked up into a building which was in all likelihood intended for the choir of a future cathedral. This is the building which, as has been said, is used for Divine Service now, and is entered through the ancient chancel. It is unnecessary to describe the great beauty as well as antiquarian value of the ancient arch, as in Dr. Petrie's most valuable work it is very fully illustrated. The modern building, as may be expected from the period of its erection, is wholly unworthy of consideration, with its inserted windows, walls internally plastered and lined out to represent stone, plaster groining, and carpenter's gothic fittings, including two imitations in wood of the tracery windows. The genuine windows, moreover, are not interesting, they are of an English character, which does not appear to have been congenial with the taste of the designer. This being the condition of things, the architect had no easy task in arranging a new edifice in connection with the old buildings.

The view taken of the matter by Messrs. Deane was, that at all events the old chancel should remain, not only *in situ*, but should be restored as far as possible to its original relative position with respect to the rest of the church. This was only to be accomplished by building the new cathedral eastward of the old chancel. They propose therefore to do so, leaving the ancient chancel as the easternmost portion of the church, unrestored and untouched, except by the building up of the portion of wall removed from under the central opening of triplet. It will then form a second choir, a reredos being erected under the arch for the altar of the new choir. The old building would receive such stone roof as would thoroughly protect it, but otherwise be left to tell its own story

The modern buildings would, by this arrangement, require to be removed; and, indeed, must have been removed in any case, as without an expenditure which would be almost equal to that necessary for reconstruction, they could not be made homogenous with a new structure of any pretensions. They, however, would remain, without in any way interfering with the new works, until some portions at least of the new cathedral were ready for divine worship.

It is to be remembered, that Tuam Cathedral, besides its diocesan duties, performs also those of a parochial church. The building, therefore, will not present all the features of the old cathedral, but will include as many as are consistent with its other uses.

Messrs. Deanes' design is essentially an Irish cathedral, in plan and style: the cathedrals of Kilkenny and St. Patrick, Dublin, having served for models in many respects. The highly characteristic crenellated battlements have been adopted throughout. The church is cruciform, and consists of a choir fitted up with the bishop's throne, stalls, subcellæ, &c, extending to the eastern arch of the central tower. The choir is 43 feet long and 23 wide, transepts 29 feet wide, nave, having five arches, 23 feet wide, aisles 11 feet. There are no aisles to the choir, but on the south side are a vestry for parish purposes, and a robing-room. The organ is over the parish vestry, its pipes shewing into the choir and east side of the south transept. The choir will be separated from the nave only by a low screen, extending as far as the stalls—viz., about 4 feet at each side, the central part being entirely unscreened. The congregation will occupy four bays of the nave, the transepts, the space under tower, and the part of choir unoccupied by the members of the cathedral establishment. The pulpit would be placed near the north-east pier of the tower, so as to be perfectly visible from any part of the building.

The roofs are open timber, for economy; but it was strongly recommended to groin the choir at least. Early 13th century is the date of the style adopted.

Colonel Vandeleur, M.P., has presented to the Very Rev. T. Kelly, P.P, Kilrush, a magnificent gazalier, for the use of his chapel.

THE KILKENNY MODEL FARM.

Among the educational establishments of this country, the Kilkenny Institution and Model Farm are deserving of marked recognition. The district is naturally favorable to the success of measures designed to diffuse practical agricultural information Historically, Kilkenny, both town and county, is full of interest; and the working of these combined educational institutions but add to this interest—especially in the eyes of those who desire the advancement of the staple business of a great agricultural country.

About six years ago, the Commissioners of National Education, in compliance with the request of the local gentry, and others interested in the advancement of literary and agricultural education, rented from the late lamented Richard Smithwick, Esq., eight acres of land at a convenient distance from the Literary Model School in the city, for the purpose of a Model Farm. On this ground was erected the present extensive range of buildings, at a cost of about £6,000.

The establishment was opened some three years ago, with a staff of literary, domestic, and agricultural officers, for the reception of, and with the accommodation, in the usual style in such institutions, requisite for, ten agricultural and eight literary boarders.

Of the ten agricultural boarders, eight are admitted on payment of an annual sum of £8, and two are received gratuitously on obtaining the necessary marks of distinction at a competitive examination. All the resident pupils are educated, boarded, lodged, &c., free of any further expense, and those of the agricultural class whose acquirements enable them to pass subsequent competitive examinations, are eligible, after twelve months' preparatory training, for free admission into the parent institution at Glasnevin—a distinction which the pupils from the above establishment invariably obtain.

The literary pupils attend the agricultural instructions, but are not required to participate in the labor of the farm. Both classes are treated alike in every particular, so far as relates to the indoor arrangement of the institution—receive the same course of education in all the ordinary elementary branches, physical science, chemistry, electricity, galvanism, the use of the globes, land surveying &c.; in agriculture, the nature, composition, and peculiarities of soils, crops, and manures, drainage, &c.

The farm steading is a neatly covered structure, and includes a byre for dairy and young stock, piggeries, stables, sheep houses, cooking houses, store-room for fodder, barn, granary, dairy, cart shed, implement house, manure yard, &c. Ample sewage is secured from the different offices, and the liquid afterwards either applied to the dung previous to its application, or carted out with the liquid manure barrel and applied to the young meadows. A convenient feeding passage connects the byres, piggeries, and stables with the cooking house and store-rooms, and the feeding of the stock in these departments is attended with great economy and despatch. Sufficient ventilation is provided overhead by means of glass windows and moveable louvres, and light and cleanliness reign throughout. It is only in winter that the stock is house-fed entirely; during summer and autumn they are fed out of doors largely.—*Agricultural Review.*

PROGRESS OF IRELAND.

We quote the following remarks on our national progress from an able, and we may add in *this* instance, *just* article in a recent number of no less an authority than the *Times*:—

"There can be no doubt that, be it well or ill, Ireland is fast becoming like England. The crowded villages and town suburbs built of turf or rough stone, cemented by mud, and the innumerabl ditches and fences that cut up the land, have alike disappeared. English tenant, either English, or Scotch, or Irish, can employ a man all the year round and give him good wages. Instead of the precarious eightpence or sixpence a-day, it is now a shilling all the year round, and more at harvest. The plough now makes as long and as deep a furrow as in this country, and has to return as often before it has finished the field. There are real stacks where there used to be the weatherbeaten haycock or a few loads of wheat. There is seldom seen the waste field abandoned to the rush and the bramble. Household servants, workpeople, and tradesmen get good wages. Where a carriage could not stop without being surrounded by beggars, and where a tourist was followed by a stream of miserable objects from one point to another, such interruption is as unknown as in this country. The union workhouses are not happy places, indeed, for that they are nowhere, but they are comfort and decency compared with the former lot of the utterly destitute. Everywhere manufacture of one sort or another is cautiously creeping in. The mineral resources of Ireland, especially those useful for agriculture, are developed; coalpits that had ruined successive proprietors and companies are worked to a profit. This is no partial improvement. The whole peasantry are better off. They still adhere to their quaint national custom, the tailed coat, the frieze overcoat, with its cape, and the knee-breeches; but the materials are new and good, and the patches not so obtrusive. Even in places where the sum of the population has most fallen off, they are building large and magnificent churches. It is true that many of the estates have passed into English hands, though not so many as we apprehended. It is also true that the new comers are often distasteful to the old residents, and make friends but slowly in any class; but they are said to be a good sort of people, to mean well, and to spend money. They are making Ireland more wealthy, and a better country for a man of any class to live and be happy in."

BUILDERS' FREE TICKETS.

THE following are the conditions on which free tickets will be granted until May, 1863, by the Directors of the Dublin and Drogheda Railway Company, to parties investing capital in building along that line:—

1. For each house of the annual value of £25, unfurnished, and subject to rates and taxes, and which shall be worth at least £400, a free second class ticket; and for each house of the annual value of £50. unfurnished, and subject to rates and taxes, and which shall be worth at least £700, a free first class ticket.

2. Such tickets will be made out in favor of either of the following parties, at the option of the builder.

1st. Of himself for fifteen years.
2nd. Of the Lessee or Assignee of such house for fifteen years
3rd. Of the *bona fide* occupier for the time being, but for no period less than one month at a time. No change will be made in a Ticket when once issued.

3. The free ticket will attach to the house for fifteen years, from the date of the resolution of the directors granting it.

4. Such house must be erected on a site not more than half a statute mile by carriage road from either of the following stations:—Laytown, Balbriggan, Lusk, Donabate, Baldoyle and Sutton, Junction, or within half a statute mile on the western side, and a statute mile on the east side of Malahide, and between Skerries Station and the Strand of Skerries; or within a quarter of a statute mile north or west of Raheny Station, or on any part of the peninsula of Howth.

5. A written application for the ticket, addressed to the secretary of the Company, prior to the completion of the house, or within three months thereafter, must be left at the company's office, accompanied by a tracing or plan of the house, with the name of the architect, and a tracing of the site, showing its position in reference to the adjoining railway station.

6. A fee of twenty shillings is required to be lodged with the application, and without this fee the application cannot be presented to the Board. The fees thus received will be appropriated by the directors to the expense of inspection of the plans and houses by a competent architect, whose opinion will assist the directors when considering the application. The opinion of the directors on the eligibility of the house will be conclusive.

7. Such ticket will be called "Builders' Ticket," and will on no account be transferable. It will, if produced when required, frank the holder *once per day in each direction*, by any ordinary passenger train of the company (having the class of ticket) running over that portion of the line, between the railway station nearest to the house for which it is granted, and the *Dublin Terminus*; or on that portion of the line between said house and *Drogheda Terminus*. The first holder is to elect which terminus he prefers on the first issuing of the ticket, and his choice cannot be altered by succeeding holders during the term of fifteen years. Persons holding such tickets will be subject to the bye-laws and regulations of the company.

8. It is desirable that persons proposing to build should learn the opinion of the directors on the site and plan of the house, by sending in their application, with the aforesaid fee of twenty shillings, *before* the building is commenced. When notice of the completion of the house is given, it will be inspected by the officers of the company, without any additional fee.

The following conditions would have to be assented to, and a book containing them, must be *signed* by each holder of a builders' free ticket:—

9. I acknowledge to have received from the Dublin and Drogheda Railway Company, a builder's ticket, entitling me on the aforesaid conditions, to travel, free of exponse, on a portion of the said railway, as more particularly described in writing opposite to my signature hereto. And I further acknowledge and admit that the said ticket, and the privileges thereto appertaining, are granted to and accepted by me, on the following conditions:—that is to say—

10. That neither the said ticket, nor any interest therein, shall be transferred or transferable by me, nor shall the said ticket be lent by me to any persons to enable them to take advantage of the privileges thereof.

11. That the said ticket shall be produced by me to any officer of the said company requiring to see the same, at any and all times when I shall seek to travel on the said railway by virtue thereof.

12. That the said ticket shall not entitle me to travel daily (free of expense) more than one journey in each direction between the said stations, or any of the intermediate stations, without the sanction of the directors for that purpose previously obtained.

13. That the said company shall be exonerated from all liability for any interruption which may take place in the intercourse along the railway; and that they shall not be required to provide room expressly for my occomodation in a first or any class carriage; nor shall they be liable or accountable in any way, in the event of there not being room for my accommodation in any of the railway carriages at any of the stations.

14. That the said company shall be wholly exonerated and released from all liability whatsoever in the event of any accident happening to me on the said railway, or at any of the said stations, whilst I am in the exercise or enjoyment of any of the privileges conferred by this or any similar builder's ticket.

15. That in the event of the violation by me of any of the conditions aforesaid, the said ticket, and all the privileges attaching thereto, shall thenceforth and for ever cease to be available, or of any effect, notwithstanding the period for which this ticket is issued shall not have expired.

DISCOVERY OF THE RETREAT OF ANCIENT IRISH KINGS NEAR CLONMACNOISE.

THE following interesting facts have been communicated to *Saunders* by a correspondent at Ballinasloe, and when full particulars, as promised, are furnished to the same source, we shall not fail to record them:—

In the month of July last I sent you the particulars of some ancient regal ornaments which had been found by a countryman, and purchased from him by the Messrs. Hynes, of this town. The notice I then wrote attracted general attention throughout the country, and several parties expressed an anxiety to obtain the ornaments, which were of pure gold, and consisted of a crown and collar. An intimation was even sent through the authorities, under the regulations of Treasure Trove, demanding the ornaments, of course at their proper value. They have since been publicly exhibited in the collection of the Dublin Society, and much admired by those who relish antiquarian researches. The Messrs Hynes offered the countryman a handsome douceur if he would point out where he found the relics, but this the wily native knowingly declined to do, no doubt expecting that other articles of value might yet be discovered in the same locality. He has, however, at length divulged the particulars. The man resided at a place called Skea, near the celebrated ruins of Clonmacnoise, on the brink of the Shannon. In the course of some agricultural operations he removed a large flag which opened the passage to a spacious cavern, in which were found the crown and collar, together with some ancient bronze weapons and several utensils used for culinary purposes. The discoverer of this singular labrynth kept it concealed from the knowledge of any one for a considerable length of time, but at length he has been induced to show it to a very few individuals under a promise of secrecy; and, as he is about to leave this country for Australia, he intends for a consideration to lead the way to this curious subterranean chamber, evidently the retreat of the ancient monarchs who reigned in the locality. A friend of mine who has been in the cavern, says that he was so fortunate as to have unveiled to his astonished view the intricacies of this hidden apartment, and many singular vestiges of a defunct race. It was, no doubt, at once a fortalice and residence. The hard-pressed chieftain and his followers found in its recesses the most perfect security and concealment; for if any pursuers had the temerity to tread the tortuous windings of the entrance, certain destruction was sure to reach them ere they reached the apartments, several feet below the surface of what appears to be a limestone crag. I forgot to say that amongst other relics of bygone days are ten elaborately-ornamented slabs, of an octagonal form, and bearing long inscriptions in the Ogham character. There are few who will be able to unravel the story which these venerable records display to the eye of the curious. No doubt they will yet form the subject of study and research to the antiquary and the learned. The discovery of this wonderful cavern throws much light on the legends of Bryan O'Donoghoe, and to this means of retreat from his enemies is no doubt due the story of his compact with the Evil One, from the consequences of which the Abbot St. Kieran is said to have released him. I intend to explore this retreat of the ancient chieftains of this neighbourhood on an early day, and to supply you with a description in detail.

The following report of the pig iron market is taken from Messrs. W. Counal and Co.'s monthly circular:—The pig iron market has been very brisk during the month, and the decline of 1 per cent. in discount has tended to promote activity; but the prices, on the whole, have not improved since last report. The lowest price reached was 50s. 1½d. Cash for warrants, since which there has been a gradual advance of 1s. 6d., closing buyers at 51s. 7½d. The stock of iron in yards is 183,000 tons, against which warrants are in circulation for 178,100 tons.

BRITISH ASSOCIATION MEETING.

PRESIDENT'S INAUGURAL ADDRESS.

The address delivered by Mr. Fairbairn, C.E., F.R.S., LL.D., as president at the opening meeting of the association in the Town Hall, Manchester, on the 4th inst., was remarkably able and comprehensive. We regret that space would not admit of our giving it complete, but in the following will be found the substance of such portions thereof as refer to topics more immediately within our province:—

"Were I to enlarge on the relation of the achievements of science to the comforts and enjoyments of men, I should have to refer to the present epoch as one of the most important in the history of the world. At no former period did science contribute so much to the uses of life and the wants of society. * * * I therefore propose to offer a succinct history of these improvements, as an instance of the influence of scientific progress on the well-being of society. I shall take in review the three chief aids which engineering science has afforded to national progress—namely, canals, steam navigation, and railways; each of which has promoted an incalculable extension of the industrial resources of the country. One hundred years ago the only means for the conveyance of inland merchandise were the pack-horses and waggons on the then imperfect highways. It was reserved for Brindley, Smeaton, and others to introduce a system of canals which opened up facilities for an interchange of commodities at a cheap rate over almost every part of the country. The impetus given to industral operations by this new system of conveyance induced capitalists to embark in trade, in mining, and in the extension of manufactures in almost every district. These improvements continued for a series of years, until the whole country was intersected by canals requisite to meet the demands of a greatly extended industry. But canals, however well adapted for the transport of minerals and merchandise, were less suited for the conveyance of passengers. The speed of the canal boats seldom exceeded from two-and-a-half to three miles an hour, and in addition to this, the projectors of canals sometimes sought to take an unfair advantage of the Act of Parliament, which fixed the tariff at so much per ton per mile, by adopting circuitous routes, under the erroneous impression that mileage was a consideration of great importance in the success of such undertakings. It is in consequence of shortsighted views and imperfect legislation that we inherit the numerous curves and distortions of our canal system. These defects in construction rendered canals almost useless for the conveyance of passengers, and led to the improvement of the common roads and the system of stage coaches; so that before the year 1830 the chief public highways of the country had attained a remarkable smoothness and perfection, and the lightness of our carriages and the celerity with which they were driven still excites the admiration of those who remember them. These days of an efficiently worked system, which tasked the power and speed of the horse to the utmost, have now been succeeded by changes more wonderful than any that previously occurred in the history of the human race. Scarcely had the canal system been fully developed when a new means of propulsion was adopted—namely, steam. I need not recount to you the enterprise, skill, and labor that have been exerted in connexion with steam navigation. You have seen its results on every river and every sea, results we owe to the fruitful minds of Miller, Symington, Fulton, and Henry Bell, who were the pioneers in the great march of progress. Viewing the past with a knowledge of the present and a prospect of the future, it is difficult to estimate sufficiently the benefits that have been conferred by this application of mechanical science to the purposes of navigation. Power, speed, and certainty of action, have been attained on the most gigantic scale. The celerity with which a modern steamer, with a thousand tons of merchandise and some hundreds of human beings on board, cleaves the water and pursues her course, far surpasses the most sanguine expectations of a quarter of a century ago, and indeed almost rivals the speed of the locomotive itself. * * * * Previously to the inventions of Henry Cort, the manufacture of wrought iron was of the most crude and primitive description. A hearth and a pair of bellows were all that was employed. But since the introduction of puddling, the ironmasters have increased the production to an extraordinary extent, down to the present time, when processes for the direct conversion of wrought iron on a large scale are being attempted. A consecutive series of chemical researches into the different processes, from the calcining of the ore to the production of the bar, carried on by Dr. Percy and others, has led to a revolution in the manufacture of iron; and although it is at the present moment in a state of transition, it nevertheless requires no very great discernment to perceive that steel and iron of any required tenacity will be made in the same furnace with a facility and certainty never before attained. This has been effected, to some extent, by improvements in puddling; but the process of Mr. Bessemer—first made known at the meetings of this association at Cheltenham—affords the highest promise of certainty and perfection in the operation of converting the melted pig direct into steel or iron, and is likely to lead to the most important development in this manufacture. These improvements in the production of the material must, in their turn, stimulate its application on a larger scale, and lead to new constructions. In iron shipbuilding, an immense field is opening before us. Our wooden walls have, to all appearance, seen their last days; and as one of the early pioneers in iron construction, as applied to shipbuilding, I am highly gratified to witness a change of opinion that augurs well for the security of the liberties of the country. It is asserted, probably with truth, that whatever thickness of plates are adopted for casing ships, guns will be constructed capable of destroying them. But their destruction will even then be a work of time, and I believe, from what I have seen in recent experiments, that with proper armour it will require, not only the most powerful ordnance, but also a great concentration of fire, before fracture will ensue. If this be the case, a well-constructed iron ship, covered with sound plates of the proper thickness, firmly attached to its sides, will, for a considerable time, resist the heaviest guns which can be brought to bear against it, and be shot-proof. But our present means are inadequate for the production of large masses of iron, and we may trust that, with new tools and machinery, and the skill, energy, and perseverance of our manufacturers, every difficulty will be overcome, and armour plates produed which will resist the heaviest ordnance. We have already seen a new era in the history of the construction of bridges, resulting from the use of iron, and we have only to examine those of the tubular form over the Conway and Menai Straits to be convinced of the durability, strength, and lightness of tubular constructions applied to the support of railways on common roads, in spans which, ten years ago, were considered beyond the reach of human skill. When it is considered that stone bridges do not exceed 150 feet in span, nor cast-iron bridges 250 feet, we can estimate the progress which has been made in crossing rivers 400 or 500 feet in width, without any support at the middle of the stream. Even spans, greatly in excess of this, may be bridged over with safety, provided we do not exceed 1,800 or 2,000 feet, when the structure would be destroyed by its own weight. It is to the exactitude and accuracy of our machine tools that our machinery of the present time owes its smoothness of motion and certainty of action. When I first entered this city the whole of the machinery was executed by hand. There was neither planing, slotting, nor shaping machines, and, with the exception of very imperfect lathes and a few drills, the preparatory operations of construction were effected entirely by the hands of the workmen. Now everything is done by machine tools, with a degree of accuracy which the unaided hand could never accomplish. The automaton or self-acting machine tool, has within itself an almost creative power; in fact, so great are its powers of adaption, that there is no operation of the human hand that it does not imitate. For many of these improvements the country is indebted to the genius of our townsmen, Mr. Richard Roberts and Mr. Joseph Whitworth. The importance of these constructive machines is, moreover, strikingly exemplified in the Government works at Woolwich and Enfield Lock, chiefly arranged under the direction of Mr. Anderson, the present inspector of machinery, to whose skill and ingenuity the country is greatly indebted for the efficient state of those great arsenals. Amongst the changes which have largely contributed to the comfort and enjoyment of life are the improvements in the sanitary condition of towns. These belong probably to the province of social rather than mechanical science; but I cannot omit to notice some of the great works that have of late years been constructed for the supply of water, and for the drainage of towns. In former days ten gallons of water to each person per day was considered an ample allowance. Now thirty gallons is much nearer the rate of consumption. I may instance the waterworks of this city and of Liverpool, each of which yield a supply of from twenty to thirty gallons of water to each inhabitant. In the former case the water is collected from the Cheshire and Derbyshire hills, and, after being conveyed in tunnels and aqueducts a distance of ten miles to a reservoir, where it is strained and purified, it is ultimately taken a further distance of eight miles in pipes, in a perfectly pure state, ready for distribution. The greatest undertaking of this kind, however, yet accomplished is that by which the pure waters of Loch Katrine are distributed to the city of Glasgow. This work, recently completed by Mr. Bateman, who was also the constructor of the waterworks of this city, is of the most gigantic character, the water being conveyed in a covered tunnel a distance of twenty-seven miles through an almost impassible country, to the service reservoir, about eight miles from Glasgow. By this means forty gallons of water per day are conveyed through the hills which flank Ben Lomond, and after traversing the sides of Loch Chon and Loch Aird, are finally discharged into the Mugdock basin, where the water is impounded for distribution. We may reasonably look forward to an extension of similar benefits to the metropolis by the same engineer, whose energies are now directed to an examination of the pure fountains of Wales, from whence the future supply of water to the great city is likely to be derived. A work of so gigantic a character may be looked upon as problematical, but when it is known that six or seven millions of money would be sufficient for its execution, I can see no reason why an undertaking of so much consequence to the health of London should not ultimately be accomplished. * * * * It is asserted by those who have done the least to benefit their country by inventions, that a monopoly is injurious, and that if the patent laws are defended, it should be, not on the ground of their benefit to the inventor, but on that of their utility to the nation. I believe this to be a dangerous doctrine, and I hope it will never be acted upon. I cannot see the right of the nation to appropriate the labours of a lifetime, without awarding any remuneration. The nation, in this case, receives a benefit; and assuredly the laborer is worthy of his hire. I am no friend of monopoly, but neither am I a friend of injustice; and I think that before the public are benefited by an invention, the inventor should be rewarded either by a 14 years' monopoly, or in some other way. Our patent laws are defective, so far as they protect pretended inventions; but they are essential to the best interests of the state in stimulating the exertions of a class of eminent men, such as Arkwright, Watt, and Crompton, whose inventions have entailed upon all countries invaluable benefits, and have done honour to the human race. To this association is committed the task of correcting the abuses of the present system, and establishing such legal provisions as shall deal out equal justice to the inventor and the nation at large. I must not forget that we owe very much to an entirely new and most attractive method of diffusing knowledge, admirably exemplified in the Great Exhibition of 1851, and its successors in France, Ireland, and America. Most of us remember the gems of art which were accumulated in this city during the summer of 1857, and the wonderful results they produced on all classes of the community. The improvement of taste, and the increase of practical knowledge which followed these Exhibitions, has been deeply felt; and hence the prospects which are now opening before us in regard to the Exhibition of the next year cannot be too highly appreciated. The Exhibition will embrace the whole circle of the sciences, and is likely to elevate the general culture of the public to a higher standard than we have ever before attained. There will be unfolded almost every known production of art, every ingenious contrivance in machinery, and the results of discoveries in science from the earliest period. The fine arts, which constituted no part of the Exhibition of 1851, and which were only partially represented at Paris and Dublin, will be illustrated by new creations from the most distinguished masters of the modern school. Looking forwards, I venture to hope for a great success, and a further development of the principle advocated by this association—the union of science and art.

ON THE PRINCIPLES WHICH SHOULD BE OBSERVED IN FORMATION OF STANDARDS OF MEASUREMENT OF ELECTRICAL QUANTITIES AND RESISTANCE.

IN Section A, mathematical and physical science, thirty-one papers were read, from which we select the above, by Sir Charles Bright and Mr. Latimer Clark, the eminent electricians, who said that the science of electricity and the art of telegraphy have both now arrived at a stage of progress at which it is necessary that universally received standards of electrical quantities and resistances should be adopted, in order that precise language and measurement may take the place of the empirical rules and ideas now generally prevalent. Several standards of resistance have already been proposed, but none have as yet come into universal use, and they have all the disadvantage of being arbitrary in their derivation, or of having no relation to other electrical quantities and measurements. Four electrical standards or units are in reality required; these are mutually dependent on each other, and by their aid every conceivable form of electrical manifestation, whether static or dynamic, and whatever its origin or quantity, can be precisely and definitely stated. They are as follows:—

A. An unit of electrical tension, potential, or electromotive force.
B. An unit of electrical quantity, as applied to static electricity.
C. An unit of electric current, or quantity, as applied to dynamic electricity.
D. An unit of electrical resistance.

A. THE UNIT OF ELECTRICAL TENSION, OR ELECTROMOTIVE FORCE.

It is probable that no more convenient unit of tension could be found than that of a single cell of a Daniell's battery—its electromotive force is but little dependent on temperature, or the strength of solutions, while the continued deposit of fresh and pure copper makes its force remarkably constant. It is, moreover, a standard which is in constant use, and its energy is so inconsiderable that it would not often require defining fractionally in practice. It is, however, possible to find a more elementary unit. Recent reseaches have shown, for example, that if a piece of pure zinc be placed in contact with water, or an oxidising acid, the zinc oxidises, and in doing so instantly gives off electricity, thereby lowering its own tension, and raising that of the liquid. As soon as the two have acquired a certain definite and constant difference of tension the oxidation ceases, and the zinc is no longer attacked. If a piece of copper, or silver, or other less oxidisable metal, be placed in mutual contact with the zinc and the liquid, so as to afford a path for the equalisation of the tension, the solution goes on constantly, and the continual flow of the electricity from the liquid to the zinc, through the pathway afforded by the copper, forms what is termed a voltaic current. All oxidisable metals have their own specific limit of tension at which they cease to be oxidised, and any of these tensions might be chosen as a unit, but without any practical advantage over that afforded by the Daniell's element. It is scarcely necessary to remark that the unit of tension is equally applicable to static electricity, and to the tensions existing at different points in the electric current. The zero of tension is naturally that of the earth at the place and time being, and the degree may be either plus or minus.

B.—THE UNIT OF ABSOLUTE QUANTITY AS APPLIED TO STATIC ELECTRICITY.

There is no natural guide for the formation of this important unit (which is the foundation for the two following), and it is therefore necessary to fix on an arbitrary one; it is well known that the quantity of static electricity—that is, electricity under induction—varies, *cæteris paribus*, directly as the difference of tension between the induced and inducing surfaces. The quantity is also dependent on two other conditions, the difference in the surfaces from each other, and the nature of the interposed dielectric. Let us, for the sake of argument, assume the dielectric to be dry air, the difference of tension to be equal to that of one element of Daniell's battery, the surfaces to be one millimetre, as under, and the area to be one square metre; such a standard would be an arbitrary but not an inconvenient one, and to this unit we could refer all other quantities. In practice, this unit would require multiplication by one thousand and by one million. Under this head it is important to observe that any quantity of electricity has a definite existence quite independently of its tension, and when once placed in a body the tension may be raised or lowered, or annihilated, or even reversed in its sign from plus to minus, without any change in its quantity; and when the disturbing causes are removed the quantity remains as before.

C.—THE UNIT OF ELECTRICITY IN MOTION ON ELECTRIC CURRENT.

Having formed a unit of quantity, the definition of this standard becomes simple and obvious; it is formed by a combination of quantity with time. Thus one unit of electricity passing per second naturally forms an unit of current. The practical formation of this standard presents few difficulties. It has been shown by Messrs. Siemens, that when an uniform succession of rapid discharges is sent through a galvanometer, the deflection of the needle is constant and steady. It is easy, therefore, to send a given number of units per second through a given resistance. This method of determining the standard of conductivity has the advantage of being quite independent of resistances. Although it has not yet been put to the test of experiment, there is no reason to doubt that a given quantity of electricity per second will produce an equal deviation of the galvanometer, whether it flow in a continuous stream or in a succession of minute impulses.

D.—THE UNIT OF RESISTANCE.

The standard or unit of resistance should necessarily be the same as that of conductivity, or current—that is to say, a wire that will conduct one unit of electricity in one second of time. This would be a very convenient unit for expressing the resistance of the materials used for covering telegraphic cables, but would be much too large for defining the resistance of telegraphic conductors, and it would require subdivision by 1,000 and by 1,000,000, and these resistances would correspond to wires capable of conveying 1,000 and 1,000,000 units of electricity per second. The value of this mutual relationship and dependence will be seen more clearly if we assume a nomenclature for these units, and for this temporary purpose we will derive terms from the names of some of our most eminent philosophers, neglecting for the moment etymological rules. We shall then have the following table:—

A.—Tension.
1 Daniell's Element .. .. .. = 1 Ohma, or unit of tension.
1,000 Ohmas .. .. = 1 Kilohma.
1,000 Kilohmas .. .. = 1 Milliohma.
B.—Quantity.
1 Ohma, by one metre square at 1 Millimetre distance .. } = 1 Farad, or unit of quantity.
1,000 Farads .. .. = 1 Kilofarad.
1,000 Kilofarads .. .. .. = 1 Milliofarad.
C.—Current.
1 Farad per second .. .. .. = 1 Galvat, or unit of current.
1,000 Galvats .. .. = 1 Kilogalvat.
1,000 Kilogalvats .. .. .. = 1 Milliogalvat.
D.—Resistance.
1 Farad per second .. .. .. = 1 Volt, or unit of resistance.
1-1,000 Volt .. .. = 1 Kilovolt.
1-1,000 Kilovolt .. .. .. = 1 Milliovolt.
1-1,000 Milliovolt .. .. .. = 1 Billiovolt.

The ohma, or unit of tension, is practically a very convenient one for all battery purposes; lower tensions, though not often required, may be readily defined fractionally. The kilohma, or the tension of 1,000 Daniell's cells, is a convenient one for static electricity, and for that of induction coils, as it will pass across a small interval of air. The milliohma is applicable to static electricity of very high tension. The farad, or unit of quantity, is as small a one as is likely to be required in practice. Seventy feet of ordinary telegraph wire with a tension of one cell would contain about a farad of electricity. One hundred farads, if allowed to pass through a very sensitive galvanometer, produce a visible motion of the needle. The kilofarad is a good unit for defining the charge or inductive capacity of submarine cables. The volt, or unit of resistance, is represented by a wire, which would, with a tension of one element, convey a current of one galvat—that is, one farad per second. It would be an useful measure of the resistance of the insulating covering of single miles of cable, although there are some of the most perfect modern cables which offer a still higher resistance. It is, however, altogether too large an unit for the resistance of metallic conductors; it is, therefore, subdivided into the kilovolt and milliovolt, which last measure is probably small enough to be applicable to the resistances of the conductors of ordinary telegraphic cables. For still smaller resistances it is necessary to have recourse to the billiovolt. The mutual relation and dependence of these units is seen at a glance—thus, at the normal tension, a wire having a resistance of 1 volt, will conduct 1 farad of electricity per second, or give a current of 1 galvat—and similarly a wire having a resistance of 1-10 kilovolt will give a current of 10 kilogalvats, that is, 10 kilofarads per second; if the tension be doubled or tripled, the quantities will be increased in the same proportion. The practical introduction of this, or some similar system of notation, would be so great a boon to science and to the art of telegraphy, that it is hoped the British Association will lend its assistance and authority for the settlement of the question, and it is suggested that a committee, composed of members of the association, should be delegated to examine and report on the whole question at the next annual meeting, with power to confer with English or foreign philosophers, and that funds should be provided for the preparation of standards for public use and reference, a duty in which they would meet with the hearty co-operation and assistance of practical electricians.

STEAM SHIP PERFORMANCES.*

Mr. Scott Russell, in presenting the third report of the Committee of the Association on steam ship performances, said the report consisted chiefly of valuable tables, which had been framed from actual experimental trials of various steam ships—some of them in her Majesty's navy, and others employed in the mercantile service. As these tables could not be conveniently read, he would give a short epitome of the objects which had been carried out by the committee during the past year, pointing out those most remarkable points in respect of which they considered their labours had been most successful and most valuable. It had been shown by Mr. Atherton, the chief engineer of Woolwich Dockyard, that by a little variation in the shape of a ship as great a difference could be made in the quantity of freight to be carried by her. The difference in the actual mercantile value of a ship might thus be made to vary as between 100 and 132, giving not less than 32 per cent. profit or loss upon the ship. This was a most important fact, establishing as a truth the principle which the British Association attempted to establish twenty years ago—a principle which was at that time very much ridiculed. Thirty years ago it was believed that if the midship section was given, together with the measurement and displacement, all the elements were afforded for framing a good ship, and that the form was immaterial, and more a question of taste than anything else. The British Association instituted a system of very costly experiments, which they carried on for a number of years; and these experiments satisfied the public to such an extent as to the value of the form of a ship, that he was able to state that there was no ship performing 14 knots an hour which was not constructed in the exact form resulting from the experiments of the Association; and if 14 knots were now as common as 10 knots were formerly, this improvement was absolutely due to the change which had taken place in the form of the vessels. The vessels which formerly sailed 10 knots an hour, and which were built on the old form, required one horse-power to propel two tons. The vessels now performing 14 knots an hour required as little as one horse-power to propel three or four tons; and in the case of the Great Eastern one horse-power was sufficient for the propulsion of nine tons, at the speed of 14 knots an hour. The committee had been very anxious to ascertain, with respect to the velocity of a ship, the best shape of ship suited to that velocity. They believed the best way to accomplish that object was to ask the Admiralty to make such arrangements as would test the resistance of every ship without her engines, by means of a dynamometer, and afterwards by propelling her by steam, so as to determine for each ship what was the real value of her form as distinguished from the value of the propelling power of her engines. The parliamentary committee of the association had waited on the First Lord of the Admiralty, and requested him to institute such experiments, and they had every reason to believe that their request would be granted, and then the following valuable facts would be ascertained. When a ship was loaded to her water-line her screw would be taken out, and the ship as a mere hulk would be dragged by another, and on the tow-rope would be placed a dynamometer to ascertain the exact resistance of the vessel. This had never yet been done with respect to any ship under the control of the Admiralty, They had results of a different nature. They had propelled a ship at a given velocity with her engines, and had calculated by the indicator from the steam in the cylinder, the power of the vessel. But this inference was a vague one, because between the steam in the cylinder and the ship herself there came the following unknown elements. First, the real efficiency of giving out the force of steam; secondly, the real efficiency of the screw in giving out the power of the engine, and converting itself into propelling power; and thirdly, the shape of the ship. The tables appended to the report which he had presented, contained the following returns:—The performance of a large number of her Majesty's vessels in the manner he had indicated, furnished by the Admiralty themselves; and secondly, the result of the performance of six of her Majesty's vessels under peculiar circumstances, including their performances when light, when at their deepest lading, and at different states of trim. The committee had also obtained from the officers of her Majesty's ship, Victor Emmanuel, the results of the performances of that vessel at sea under various circumstances, and seven trials with different screws in Stoke's Bay. The tables also contained the result of the performances of various merchant vessels; of the vessels belonging to the Dublin Company, running between Dublin and Holyhead; and also returns respecting the whole postal fleet of the French kingdom. The report also contained accounts of alterations which had been made in vessels by lengthening them, and by altering and changing their engines. The committee stated that in compliance with the terms appointing them, directing them to obtain information respecting the performance of vessels under sail, with a view to comparing the results of the two powers of wind and steam, "your committee have to state that hitherto they have been unable to obtain such comparisons in the case of merchant vessels, but in the vessels given in the appendix, particulars of one of her Majesty's vessels are recorded under three conditions—viz., under steam alone, under sail alone, and under steam and sail combined, and of two under the latter conditions only. These are especially useful, as they show the effects produced by powers to bear upon the hulls of vessels under the same conditions as to draft and trim, but differently applied. In endeavouring to collect this information from officers in her Majesty's service, the committee were desirous that the application should be made with the concurrence of the Admiralty, and a circular was accordingly issued to a certain number of officers, which they were requested to fill up and return." He was happy to say that a number of officers in her Majesty's services had interested themselves in this duty, and were making regular records of the performance of various vessels in her Majesty's fleet.

THE GRANITE ROCKS OF DONEGAL.

At the meeting of the British Association in Manchester, Mr. R. H. Scott read a paper "On the granite rocks of Donegal, and the minerals associated therewith." He gave a short account of a mineralogical tour made by him in company with Professor Haughton, in the course of the summer, the results of which seemed to throw some light on the possible origin of granite. The district visited was Donegal, which county consists mainly of gneiss and mica slate, and is traversed in a N.E. direction by an axis of granite. This granite is of a peculiar composition, containing two felspars, one orthose, but the other not albite, as in the granite of the Mourne mountains, but oligoclase—a mineral whose occurrence in the British Islands had only been noticed within the last twelve months. Professor Haughton, to whom this discovery is due, was unfortunately unable to attend the meeting. The facts were briefly these:—The granite contains oligoclase and quartz, which combination appears to be a proof that the rock never was in a melted condition, as in that case these two minerals would have acted on each other, and formed common felspar. It lies in beds corresponding to the general lie of the strata of the country, and in its character is essentially gneissose; and, lastly, at points inside the area of the granite, metamorphic rocks (limestones and slates) are found with their bedding, which is nearly vertical, unchanged. These bands run for a distance, in one case, of nine miles across the country. The condition of these rocks is very similar to that of the same rocks outside the granite area, and it is a point of great interest to determine how they got there. The solution of this offered by the authors of the paper was, that the whole of the rocks had originally been stratified, and had been subjected to some actions which are termed metamorphic. The result of such action was to convert some into granite, some into gneiss, and some into crystalline limestone, and mica schist, without very much altering their relative positions. The possibility of granite being produced by other means than simple heat, seemed to them to be proved by the occurrence of felspar in quartz vein, which are usually admitted to have been filled by means of infiltration. Mr. Scott stated that there were several points in connection with these granites which showed a close relation between them and the granites of Norway. The whole question required a careful chemical and mineralogical examination, which could not be concluded for some time. Among the types of rock found in Donegal is a syenite, the felspar of which is oligoclase. The origin of this rock the authors are disposed to attribute to the addition of limestone to the granite. A similar syenite occurs at Carlingford, but contains anorthile, a felspar which would result from the admixture of a larger quantity of limestone than is necessary to produce oligoclase, and has been proved by Professor Haughton to have such an origin. The anorthile syenite never occurs unless limestone is present in large excess, which is not the case in Donegal. In conclusion, Mr. Scott mentioned that the district described by him was very rich in minerals, some of which were extremely rare, and that he entertained no doubt that a more careful examination would largely increase their number.

---

* Read in the Mechanical Section (G) British Association Meeting.

The president said that Mr. Marshall, Mr. Scott, and other gentlemen would certainly compel the elder geologists to a great extent to modify some of their original conclusions as to granite. Much progress on the question would never be made until Professor Haughton, Mr. Scott, and others, closely examined the granite rocks in Germany, Norway, and Sweden, and compared them with those in this kingdom. He much regretted that mineralogy had been dissociated from this section, and handed over to the chemical section; but, such being the case, Mr Scott's communication ought to be laid before the chemical section. He felt so strongly the importance of the question that he would certainly recommend the chemical section to consider it.

PHOTOGRAPHIC MICROMETERS.

SIR DAVID BREWSTER read a paper "On photographic micrometers." He said that upon examining, several years ago, some microscopic photographs, executed by Mr. Dancer, a celebrated optician in Manchester, he was struck with the singular sharpness and opacity of some of the lines in such of them as were copies from engravings. The idea occurred to him of obtaining photographically, by means of the camera "micrometrical scales," or systems of delicate lines, opaque or transparent, and fitted both for astronomical and microscopical purposes. In the "Encyclopedia Britannica" he had stated that Mr. Dancer, of Manchester, had succeeded in making photographic portraits on collodion so small that they were wholly invisible to the naked eye, and that 10,000 portraits might be introduced into a square inch. The film of collodion upon which these photographs were taken was so thin and transparent that it was invisible, and allowed objects to be seen through it as distinctly as if it was the thinnest glass. It was obvious that they might construct, photographically, the various *recticula* or *reticles*, as they had been called, used by Cassini, Bradley, La Caille, and Mr. Wollastas, as well as the net micrometer, the concentric circle micrometer, the suspended micrometer of Fraunhofer, and the lineal and circular micrometers of Cawallo, and others drawn upon mother of pearl.

STREET ARRANGEMENTS FOR EXTINGUISHING FIRES.

MR. J. T. BATEMAN (President of section at recent meetings of British Association) read a paper on this subject, in which he observed that the attention of the public had recently been drawn to the subject in consequence of the serious conflagrations which had taken place in London and elsewhere. Nothing could be much worse, said the author, than the preparation for the extinction of fires which existed fifteen years ago throughout the country, and nothing could be much worse than the precautions taken in London. In Manchester, Glasgow, and some other large towns where there was an abundant supply of water, the management was taken in the hands of the corporation, who made the best possible provision in their power for the extinction of fires. In London the fire-engines were maintained and the fire-brigade were paid by contributions from the various fire-offices, and unless a building was insured in some of the offices which contributed to the expense it was not the interest of the firemen to extinguish a fire. This was clearly a palpable error in the arrangement of such matters, and when the preservation of immense masses of property was left to chance it was a great grievance, which ought not longer to be allowed to exist. Mr. Bateman then described a very simple arrangement in use in Manchester, consisting of a ball barrel communicating with the main pipes, to which proper fitting hose could be attached in a very few minutes, thus avoiding the delay caused by the employment of engines. The greatest requisites were high pressure, large main pipes, ample communication with the main pipes, and a plentiful supply of water. There ought also to be an efficient brigade, the men composing it being stationed at short distances from each other, so that their services might be called into requisition at the shortest notice. Such a system would pay for itself in the reduction of the duty on fire insurance; for where the risk was less the cost would be less also, and the public, on whom the cost of maintaining the brigade fell, would benefit by the reduction in their fire insurances.

RAILWAY AND FIRE ALARMS IN BERLIN.

AT same meeting Mr. C. W. Siemens, a native of Berlin, read a paper descriptive of the system pursued in that city for the above purpose, and from which it appeared that "Berlin is divided into a number of circular districts (each of which contains a number of fire stations), communicating with a central station, from which information is instantly conveyed to all the stations in any district where a fire may have broken out, and within a very few minutes all the engines are on the spot and ready for actual use."

[The above is but a practical application of a long propounded theory, and was, as we understand, anticipated in its integrity by the New York authorities, where the system is equally complete. In this age of electric telegraphs uncommonly simple facilities are presented for its extension to every town in the world, and its absence is the more culpable.—ED.]

BAPTISTERY.

BAPTISTERY (from *βαπτιζο, to wash*), a building, or apartment, designed for the administration of baptism.

In ancient times baptism was performed by immersion, and the place for the purpose was a pond or stream; but about the middle of the third century, distinct or insulated houses were erected for the purpose. In 496, they were attached to the exterior side of the church, and in the sixth century, they were brought within the church; but though there might have been two or more churches in one city, yet, in general, there was only one baptistery; and when it became fashionable to dedicate the churches, that to which the baptistery belonged was dedicated to St. John the Baptist. The baptismal churches in Italy were usually built near rivers and waters. In later times, the bishop of baptismal churches granted licenses to other churches to erect baptisteries, taking care at the same time to maintain his own jurisdiction over the people.

The baptistery was an octagon building, covered with a cupola roof, adjacent to the church, but not forming a part of it.

In the interior was a hall, sufficient to contain a given number of people, on the sides of which was a number of apartments; sometimes, instead of these apartments, rooms were added on the outside, in the manner of cloisters: in the middle of the hall was an actagon bath, which, strictly speaking, was the baptistery, and from which the whole building derives its appellation.

The most celebrated baptisteries are those of Rome, Florence, and Pisa; the most ancient is that of S. Giovanni in Fonte at Rome, said to have been erected by Constantine the Great. The plan of this building is octangular; the roof is supported by eight large polygonal pillars of porphyry under the cupola; in the centre of the floor is the bath, lined with marble, with three steps for descending into it: its depth is about 37½ inches. The baptistery annexed to the splendid church of St. Sophia, at Constantinople, resembled the convocation-room of a cathedral; and was called *illuminatory*. In the middle was the bath, and around it were outer rooms for all concerned in the immersion.

The Baptistery of Florence stands opposite to the principal entrance of the cathedral. It is octangular in form, with a diameter of about 100 feet. In the interior is a gallery, supported by 16 large granite columns; the vaulting is decorated with mosaics, and on the pavement is a large circle of copper, with numerical figures, and the signs of the zodiac on it. The external façades are built of black and white marble, and the three great bronze doors are celebrated for the beauty of their bas-reliefs, and for the marble and bronze figures above them.

The Baptistery of Pisa is circular; its diameter is 116 feet; the walls are 8 feet high, and the building is raised on three steps, and surmounted by a dome in the shape of a pear. This dome, which is covered with lead, is intersected by long lines of very prominent fretwork, terminating in another dome, above which is a statue of St. John. The proportions of the interior are admirable; eight granite columns, placed between four piers, decorated with pilasters, are arranged round the basement storey, these support a second order of piers, similarly arranged, on which rests the dome. In the middle of the bapistery is a large octagonal basin of marble, raised on three steps.

Amongst the guests at the Lord Mayor's ball, on the 11th inst., was Miss Agnes Strickland, the distinguished authoress of the "Lives of the Queens of England."

GAS IN CLONTARF.

A movement is at present on foot to procure the very desirable commodity of gas for the neighbourhood of Clontarf and Dollymount, and several of the householders along the main road and in Castle and Vernon Avenues have subscribed their names to a document for the purpose. Without estimating the project in a pecuniary regard—which, no doubt, will be well digested by interested parties before action is taken—we may remark, that as to its desirability there can be but *one* opinion. During the winter months especially, the Clontarf road is, at night, one of the bleakest and most deserted about Dublin, and from the railway bridge to Vernon-avenue, about a mile and a-half in length, one rarely meets a human being but a solitary coastguard or policeman—the latter too few and far between; the additional protection, therefore, afforded to the inhabitants by a bright gas-light at convenient intervals, could not be too highly appreciated. We trust that our enterprising local companies —"the Alliance" and "the Hibernian" respectively—will at least be disposed favourably to consider the project.

INTERNATIONAL EXHIBITION, 1862.

We are requested to mention, that the National Committee of Architecture, in connection with this undertaking, having, with the sanction of her Majesty's Commissioners, appointed a sub-committee for the purpose of forming a court of high-class decorative art, in which shall be gathered the *chefs-d'œuvre* of all the specified classes of art—excepting sculpture and painting, these having their own separate galleries; all desirous of co-operating should at once communicate with the committee in Conduit-street, London.

THE LORD MAYOR'S BALL.

The present possessor of our civic chair is justly entitled to unqualified commendation both for his suitable maintenance of the dignity of that highly honourable position to which, through the favour of his fellow-citizens, he has for the second time succeeded, and for the munificent manner in which he dispensed on each occasion the hospitalities of the Mansion-house. The ball on the 11th inst., at which his lordship entertained some 2,500 people in honour of the visit of H.R.H. the Prince of Wales—who together with his Excellency the Lord Lieutenant, the Chief Secretary, and a host of nobility, were guests—eclipsed, both in numbers and in grandeur, any similar event; and indeed the citizens of Dublin, and we may add also the people of Ireland, owe a deep debt of gratitude to the respectful compliment thus paid on their behalf to so distinguished a personage as the—presumed to be in the ordinary course of nature —future monarch of these realms. During his royal highness' recent three months' stay in Ireland he has, with little intermission, been occupied with military studies at the Curragh camp, and the event in question may be fairly considered as his introduction to civilian life as far as Dublin is concerned. This again he has left for another sphere, to complete his collegiate course, but we trust—nay, we are bold enough to say we *believe*, judging from his affable demeanour at the ball—not without acquiring some affection for the Irish subjects of his illustrious and amiable mother. English, Scotch, and Irish are becoming better acquainted, and with the growth of that intimacy ancient prejudices pale and become matters of the past; and thus it ought to be, for we are all devoted to one common cause, "peace and progress," and our triple interests are identical. As one of the great contributing media to this desired end, we cannot but recognise the present chief maistrate, who is, to all intents and purposes, what a chief magistrate ought to be, and in all the various relations of life, whether public or private, entitled to unanimous respect. To accommodate so vast an assemblage as was to be collected on this occasion, the ordinary arrangements were somewhat altered. The oak-room, which is generally set apart for refreshments and supper, was appropriated as an auxiliary apartment for dancing, and in the courtyard a temporary shed, 136 feet in length by 20 feet wide, suitably decorated, was erected as a substitute. In the round or "king's" room a spacious dais festooned with Irish poplins, manufactured at the right honourable host's eminent establishment, and otherwise decorated, was set apart for the prince, the lord lieutenant, and other guests of distinction. Extending therefrom at either side was a platform with numerous seats for those who were not joining in "the mazy dance," and elsewhere through the room sitting accommodation was likewise provided. The illumination of this apartment was most brilliant and effective, comprising the letters V.R, Prince of Wales' plume, star of St George, in glass prisms, and a range of jets; and the general decoration, which we understand was committed to the care of Messrs Arthur Jones & Son, of Stephen's-green, was marked by good taste. We may, perhaps, here note a suggestion, that on future occasions of this character means should be adopted for more efficient ventilation, which might be effected at a comparatively small outlay, and is greatly required. The success of this public entertainment, which may be regarded, and no doubt will be recorded, as an *event* in the city annals, is to no small extent attributable to the energetic and business-like action, combined with great courtesy to all, of his lordship's very efficient secretary, Mr. John Martin, T.C., the amount of whose labours on the occasion can hardly be estimated.

THE COMMUNITY OF THE REGULAR OPERATIVE CARPENTERS AND MR. THOS. S. MARTIN.

TO THE EDITOR OF THE DUBLIN BUILDER.

Sir—Through the medium of your valuable journal, and in connection with the letters which have lately appeared in its pages on the subject of employment for the regular operative carpenters of the city of Dublin, we wish to address the following to Mr. Thomas S. Martin, in reply to a letter received by us from him on the 29th ult., and which appeared in the last issue of the Dublin Builder. The letter commences by stating, that "it is with extreme regret that he learned by the Dublin Builder of the 15th inst. that we have a number of men out of employment belonging to our body;" also, that "he has 100 persons employed in his joinery department, and out of that number he has only *two* Scotchmen and *one* Englishman." We presume this one Englishman is his foreman, for whom he sent to London. He further states that "when a deputation of our body waited on him, he told them that he was most anxious to avail himself of our assistance, and to employ us with other men, but that work upon the terms he offered was refused, unless he dismissed all his old hands who had faithfully served him since the commencement of his mills." To these assertions of Mr. Martin we reply, that they are wrong; for when our deputation waited on him he told them to send him a rule-book of our society; we did so accordingly, and another deputation waited on him during the following week for an answer. He told the members thereof that he would not pay the *uniformity rate of wages*, that he would classify the men, and pay them according to their abilities. With this proposition we refused to comply. By means of this arbitrary and unjust classification on the part of Mr. Martin, not only would the labour of the first-class artizans be subjected to an optional scale of remuneration, which might descend even below the regular standard rate of wages now paid by the regular builders, but the less experienced workmen would be reduced to a minimum utterly inadequate to their abilities, or what would be required to meet the necessities of life.

If the system of classification were permitted to become the rule, it would be impossible to assign a limit to the descending scale of wages which he would eventually establish. It is difficult for Mr. Martin to conclude, that the ability of any workman, who has passed through the long period of seven years' apprenticeship learning his trade, could be justly estimated at a less value than the ordinary rate of wages now paid. Even suppose he is engaged on the plainest species of work, its resulting amount during his period of weekly labour will, if assiduously executed, be fully equal to the established rate of wages generally received; but if Mr. Martin is of a contrary opinion, he has his *resource*, without originating any new and arbitrary classification of payment, to meet such a contingency—namely, to *dismiss* him, and engage another man in his place. This is the plain and rational course to adopt; it is one that would be, as far as possible, *satisfactory to both parties*; and this is the best answer to the insidious system of classification, the sole purpose of which is to raise and accumulate capital, to the injury of the operative.

No doubt, capital is necessary for the employment of labour, but also is labour necessary for utilising capital. In one respect they have a common interest—that is, upon the excellence and amount of work done, for upon that depends the gross profit to be realised, out of which is to be derived both profit for capital and wages for labour. So far the employer and workman have a common interest; but then the question comes--the division of the common produce between the two classes of producers. Mr. Martin desires to reduce the wages to the *lowest possible point*, in order that the profits may be as *large as possible*, while we only ask the regular standard wages paid by the regular builders. Without a fixed standard as minimum remuneration for special labour, the artizan is placed at the mercy of his paymaster. No one can doubt that when the master capitalists assume an offensive attitude, by wanting to reduce the rate of wages, the operatives have a perfect right, founded on their inherent interest and honest duty to themselves, to protest against what they consider—as in the present instance is submitted—an act of aggression and usurpation.

Mr. Martin further states in his letter, that "he is willing to employ the regular operative carpenters of Dublin." If so, why does he refuse to pay them the regular standard of wages paid by the regular builders of Dublin? He will *not*, unless we break our rules to please his arbitrary will, which we will never do. He has lately come from Australia, and has got the notions of the new world in his head; he looks on the people of Dublin as Lilliputians, and he is the Gulliver of the day, he thinks he can make 1,000 operative carpenters break their rules and communities, that have been held in Dublin by their forefathers for *two hundred years;* he also thinks that he will, after a time, sweep all the respectable master builders out of the market with his improved machinery. Who will compete with him when he has over 100 persons in his joinery department? What a monopoly in the space of a few months! when our most respectable and longest-established builder has not that number of carpenters employed at the present time. We have seen as great a capitalist as Mr. Martin at a loss by speculating on machinery for preparing wood goods; we have seen Mr. Paulding, of Manchester, the greatest contractor in it, at a serious loss thereby, where he had a large market for his work; for England is a manufacturing country, and Ireland is an agricultural one.

Again, Mr. Martin says, that "joinery works were first established to protect our local trade from foreign importations; that he saw mouldings, greenhouses, &c., upon our quays, so that a trade was fast leaving the country." We return Mr. Martin thanks for his patriotic views. We sent deputations to all our employers respecting the importation of wood goods from foreign markets, as we had steam manufactories in our city before Mr. Martin speculated. We had Mr. Meade and the two Mr. Kellys; these gentlemen went to a great deal of expense in getting up machinery. *They* are *regular builders*, they employ the *regular* operative carpenters of Dublin, and pay the *regular* standard wages; but Mr. Martin's protection establishment from foreign importation of wood goods, we say was established for *self* interest. He, being a timber merchant, and seeing the goods imported from England, had not the profit for his timber, but, having capital, got up machinery for preparing all kinds of work belonging to carpentry, and has men working for what wages he *thinks fit to pay them*, so that now he has the gross profit of timber and workmanship. We, therefore, think that he, as a *mercantile gentleman*, has no right to *monopolise* the trade of the *regular builders* of the city of Dublin.

Signed on behalf of the committee,

John Moork, Chairman.
Patrick M'Donald, Secretary.

CATHEDRAL CHURCH OF ST. MARY, LIMERICK.

In accordance with a promise conveyed in a preliminary notice of the restoration and other works for some time in progress in this venerable structure, we now present particulars:—

After the death, in 1857, of Mr. Augustus O'Brien Stafford, a desire was expressed by some of his friends that a memorial should be erected in this cathedral to his memory, and a committee formed for the purpose, and various plans being considered, it was decided to erect a stained glass window. and Mr. William Slater of London, architect, was employed by the committee to examine the church. At the request of the dean the east window was selected, and Mr. Slater reported that it would be necessary to remove the modern perpendicular window, which was out of character with the rest of the building, and that a portion of the roof, which was much decayed, should be renewed. The committee having adopted Mr. Slater's report, entered into contracts with Messrs. Ryan & Son for a new roof over the chancel and new stone work in the window; and with Messrs. Clayton & Bell for the stained glass. The erection of these works commenced at Easter, 1859, when the cathedral was closed, and were completed in the month of September following. It was then found that the ceiling over the rest of the nave was in such a dangerous state that it was necessary to remove it immediately. On the removal of the ceiling, the decayed and rough condition of the roof became so apparent that a proposition was laid before the chapter to execute some repairs, and to cover the spaces between the rafters with plaster. In a short time £460 was contributed, and in October, 1859, the amount was available for extending the new roof as far as the tower, in accordance with what had been erected over the chancel. In January, 1860, the dean and chapter voted the sum of £305 10s. 7d. for a new roof, and the lord bishop having added the sum of £50, a contract was entered into with Messrs. Ryan & Son. As it was necessary to have designs and specifications for the extension of the roof, the trustees requested Mr. Slater to supply them, and at same time to prepare designs for fitting up the interior of the cathedral, and to report generally upon the state of the building, so that they might have a complete design for the whole to guide future operations. At the time that the committee for the Stafford memorial was dissolved, the reredos under the east window was not completed, as they had only a sum of £25, which was not sufficient for the purpose; but further subscriptions having been obtained, the trustees agreed to complete the same on being handed over £70 10s., the cost of the work in London. The trustees also entered into contracts with Messrs. Cox & Son for new seats for the choristers, and canopies over the stalls, as far as the organ gallery, to be executed in carved oak. The dean having contracted for new seats in the choir, on removal of the old ones the floors of the chancel and choir were found to be in a very bad state, and unless altered, Mr. Slater's designs could not be carried out. The trustees agreed with Mr. Ryan to replace these floors. The trustees directed Mr. Ryan to open the clerestory windows, which had been blocked up in the choir, but open to the nave; and being without sashes, through them a constant stream of cold air passed into the outer part of the church. The opening of these windows has done much to restore the cathedral character to the building. In August, 1860, the bishop consented that the organ gallery should be removed. The dean undertook the removal of the galleries, and opened up the arches which had been blocked with brickwork and sashes. The dean opened the present organ gallery, where the organ has been erected, the lord bishop having contributed £50 towards the work. The dean also provided new stoves, new seats in the transepts, and soldiers' seats; removed all the monumental tablets into the north chapel, and cleaned the walls of the whole building. He also erected an entrance door in the south porch, and other works, which were executed under the constant supervision of the Rev. F. Hamilton. Capt. Brine, R.E., proposed to line the transept roofs with timber to correspond with the nave, without removing the outer roofs. For various reasons these works were not proceeded with, and almost all the subscriptions promised to him were handed over in aid of other works by the persons who had promised them. After the removal of the galleries, Lord Limerick and Mr. Hamilton handed over the subscriptions received by them, to assist the works carried on by the dean. Mr. Slater's attendance was again necessary to review the altered state of the choir, and subscriptions were obtained and applied to—

Extending the floor of the choir,
Providing twelve new oak stall seats.
Deans' and precentors' seats in carved oak,
Continuation of the carved oak canopies over the stalls,
Oak backing for the stalls.

The floors of the aisles were laid with limestone flags, which were almost always damp; on the removal of them, the earth, in consequence of numerous graves, was in a very bad state. It has now been covered with brickwork and Minton's tiles set in cement. Three rows of red marble steps from the Co. Clare have been laid at the entrance to the choir. As additional light was required in consequence of the increased height of the roof, gas pipes have been laid, extending through the church as far as the chancel. The vestry was heated by a stove, with a pipe passed through the window; a fireplace and flue, with an arrangement for conveying warm air into the chancel, has been erected. It was found that the water from the street passed in under the foundations of the east gable, and that in consequence the soil under the chancel floor was quite damp. The foundations have been flagged over and secured. A singular credence arch, with a circular window in the chancel, which had been blocked up, and a stove placed in it, has been opened up, the window glazed, and Mr. J. Peacocke has since replaced the marble slab which had been broken away. The Earl of Limerick finding that one of the peal of eight bells was broken, and the gear of all the others in such a decayed state that they could not be rung, had the broken bell recast, and the whole properly remounted, and has fitted up a neat room for the bell-ringers, with substantial floors. He also incurred considerable expense in having the bellringers taught by a professional man. A corps of young men have gratuitously undertaken the service, and the pleasant sounds of the bells, so famed in poetry, may now be heard after many years' silence. The Rev. Maurice De Burgh and Rev. Frederick Hamilton, in addition to liberal subscriptions, presented a carved oak altar table, chairs, and stools, at a cost of £50. The cost of the altar rail, steps, and encaustic tiles laid on brick floors in cement, has been given as an aid to the restoration. Mrs. C. Monsell, in addition to presenting an altar cover and altar linen, has, with Miss O'Brien, presented two gas standard for the chancel. Miss Baker collected a sum of money to purchase and present alms'-dishes. Lady Limerick has presented embroidered doilies for the alms'-dishes. Lady Inchiquin presented a kneeling carpet for the chancel. Some members of the Arthur family have restored the arches of the tomb in the north transept, which were broken and heretofore concealed by wooden panels. Miss Selina Maunsell collected a sum of money to provide new books for the church. The family of the late Archdeacon of Limerick have obtained a design for a stone pulpit, which they are about to present as a memorial of their father. Mrs. Westropp has directed her nephew, Mr. Ralph Westropp, to erect a memorial to the Westropp family in the south transept, to include a new roof, and new stone window filled with stained glass, and the complete fitting up of the transept, for which designs have been prepared by Mr. Slater, and approved of by the dean and chapter. Some ladies, desirous to make a special gift to the cathedral, have agreed to raise a fund, by subscriptions of £1 each, to present a font, &c. It is also in contemplation to erect, by subscription, a stained glass window in memory of the late Sir Matthew Barrington, Bart., to whose exertions the development of the railway system in Ireland is mainly attributable.

A FEW WORDS ABOUT CEMETERIES.

In earlier numbers of this journal we noted some particulars respecting the great receptacles for the dead, established during the present century in the suburbs of this metropolis, but as the subject is one of very general import, and, moreover, is, to a certain extent, associated with the pursuits of our professional readers, we recur thereto more comprehensively.

The term "cemetery" is of Greek derivation, signifying "a place of rest or sleep," and was applied by the early Christians to common places of interment.

From the earliest ages the disposal of the bodies of the dead has been a necessary, and with many nations a sacred duty. Among some we find that a superstitious veneration for those who had "passed away;" the necessity of funeral rites to secure the future happiness of the deceased; and the crime attached to the violation of the tomb, formed a part both of their civil and religious code. The practice of burying the dead in the earth is probably the oldest, as it is the simplest mode of disposing of them; but the custom of burning the body, and afterwards collecting the ashes, and depositing them in a tomb, or urn, became very general amongst the Greeks and Romans. The Egyptians do not seem to have ever adopted this practice; and even amongst the ancient Greeks and Romans it seems likely that interment in the earth was mostly resorted to by the lower orders. At the present day all European nations deposit their dead in the earth, and the ceremony of burning is extinct.

The situation of cemeteries is of great importance, both with regard to the public health, and from considerations of convenience. Among the Greeks we find that they were usually without the cities. Among the Romans the tombs were generally placed by the sides of the public roads. The early Christians followed the custom of the Romans, but they afterwards transferred their burial-places to the vicinity of the churches, and within towns.

Cemeteries should be placed on high ground, and to the north of habitations, so that southerly winds should not blow over the houses, charged with the putrid exhalations; low wet places should be avoided, and care should be taken that bodies be not interred near wells, or rivers, from which people are supplied with water.

It may not be uninteresting here to state that extra-mural, or suburban cemeteries, formed part of the plan of the celebrated Sir Christopher Wren, for the rebuilding of London after the great fire, "I would wish," says he, "that all burials in churches might be disallowed, which is not only unwholesome, but the pavements can never be kept even, nor the pews upright; and if the church-yard be close about the church, this is also inconvenient, because the ground being continually raised by the graves, occasions in time a descent by steps into the church, which renders it damp, and the walls green, as appears evidently in all old churches." He then proceeds to recommend, that a piece of ground, being purchased in the fields, should then be "enclosed with a strong brick wall, and having a walk round, and two cross walks, decently planted with yew-trees. The four quarters to serve four parishes, where the dead need not be disturbed at the pleasure of the sexton.

"In these places beautiful monuments may be erected; but yet the dimensions should be *regulated by an architect*, and *not left to the fancy of every mason*; for thus the rich with large marble tombs would shoulder out the poor: when a pyramid, a good bust, or statue on a proper pedestal, will take up little room in the quarters, and be properer than figures lying on marble beds; the walls will contain escutcheons and memorials for the dead, and the real good air and walks for the living."

Though the cemeteries which have been formed are pronounced to be only improvements on the places of burial in this country, and far below what it would yet be practicable to accomplish, they have indisputably been viewed with public satisfaction, and have created desires of further advances by the erection of national cemeteries. Abroad the national cemeteries have obtained the deepest hold on the affections of the population. They have been established near to all the large towns in the United States. To some of them a horticultural garden is attached—the garden-walks being connected with the places of interment, which, though decorated, are kept apart. These cemeteries are places of public resort, and are there observed, as in other countries, to have a powerful effect in soothing the grief of those who have departed friends, and in refining the feelings of all.

At Constantinople the place of promenade for Europeans is the cemetery at Pera, which is planted with cypress, and has a delightful position on the side of a hill overlooking the Golden Horn. The greatest public cemetery attached to that capital is at Scutari, which forms a beautiful grove. In Russia almost every town of importance has its burial-place, at a distance from the town, laid out by the architect of the government. It is always well planted with trees, and is frequently ornamented with sculpture. Nearly every German town has its cemetery, planted and ornamented. In Turkey, Russia, and Germany the poorer classes have the advantages of interment in the national cemeteries.

One of the most celebrated cemeteries in Europe is that of Pere la Chaise, but in this, as in all the cemeteries of Paris, it has been a subject of complaint, that the graves of the poor are neglected and little cared for, amidst the splendid monuments and sculptured ornaments which mark the tombs of the higher classes.

The first attempt at a cemetery in London, in imitation of that of Pere la Chaise, was made by the General Cemetery Company, who, in the year 1833, opened to the public their new and extensive burial-ground at Kensall Green. At the entrance there is a handsome gateway, from which a central walk leads to the church in the *consecrated* portion of the cemetery. In this building are solemnized the funeral rites according to the Church of England. In front of the church a large circle is appropriated to many of the more splendid tombs and mausoleums, and beneath it are extensive catacombs.

The establishment of the cemetery at Kensall Green was immediately followed by that of several others in the suburbs of London; one of the most picturesque of these is Highgate Cemetery, situated on the rising slope of the hill behind Highgate Church. Here, the natural beauty of the ground has been tastefully made use of, and the result produced is pleasing, if viewed as a pleasure-garden, though certainly conveying but little of that solemnity of thought and feeling we are accustomed to associate with a burial-place for the dead.

Norwood Cemetery is on the north-west side of a hill to the east of St. Luke's, Norwood. The entrance is an open arch, which, with the lodge adjoining it, are in much better taste than that of Highgate, although, had there been a gateway, the design would have been greatly improved. There are two chapels—one for members of the Church of England, the other for Dissenters—though varying somewhat in design, there is great similarity in their style, which is a sober, but correct Gothic. The principal objection is the injudicious position of these two buildings, which, from being too near together, neither form distinct architectural pictures, nor group so as to form one design. The architect was Mr. W. Tite.

Abney Park Cemetery displays evidence of a simple and pure taste in its buildings and general arrangement. The entrance, if wanting in architectural composition, has something bold and effective in its general appearance. The four piers are lofty and well-proportioned masses, constructed of Portland stone, upon granite plinths, and are surmounted by handsome coved cappings, in the Egyptian style. The lodges are in the same style, and extend the frontage to 118 feet, 40 of which are occupied by the piers and gates in the centre. The effect of this entrance is greatly enhanced by the park-like aspect of the grounds, and the fine old trees with which they are adorned. Nearly in a line with the entrance is the chapel, in the early pointed style, with lancet windows. The architect was Mr. W. Hosking.

The South London Cemetery is one of the most beautiful spots within the vicinity of the metropolis, situate at Nunhead, between Peckham Rye and New Cross. The grounds are most tastefully laid out—there are handsome lodges, a residence for the superintendent, episcopal and dissenters' chapels, and extensive catacombs. The architectural arrangements were superintended by Mr. Bunning.

The West of London Cemetery is situate at Earl's Court, and the buildings, &c., in the Italian-Doric style, are of a similar character to those previously described, and the grounds are laid out in the pleasure-garden manner, so popular with those who have the management and designing of cemeteries. It would be well were a few hints taken from the solemn, beautiful burial-places of the Orientals, in laying out such establishments in this country.

HUMAN LABOR AND EMIGRATION.*

Human labor is the most difficult article for a statesman to secure, and the possession of an abundant population has been held by the deepest thinkers on national wealth, to form the chief riches of a state. The subtlest minds have been at work to discover and apply machinery, which would supersede the ingenuity of the human finger, and multiply the strength of the human arm. The system of Irish agriculture seems to have been productive of an increase in the supply of that expensive commodity, human labor, at a rate which is without parallel, and the causes which placed Ireland so very high among labor-producing states gave to those parts of Ireland which were most rural the larger increase. Thus we find that the increase in the population which took place in the decennial period from 1821 to 1831, varies in the provinces of Ireland just in proportion to the employments of the people: the more they were engaged in agriculture the greater was the increase in the numbers. The total increase in the population (as shown by the census) from 1821 to 1831 was 965,574 persons, being at the rate of 14 per cent, but this increase was not equable over the entire island; thus in the province of Leinster, the increase was 9 per cent., in Ulster it was 14 per cent., in Munster it was 15 per cent., and in Connaught it was 21 per cent. During the following ten years—that is, from 1831 to 1841—the census returns show but an increase of 440,759 persons, but during this period there had been a greater emigration going on which absorbed about one half of the increase; the number of emigrants in this period was 403,459 persons, which would make the decennial increase 844,218 persons. We have no means of judging of the number of emigrants from each of the several provinces; the increase in the resident population during the second decade was 5 per cent. on the population of 1831 (or 6 per cent. on that of 1821). The relative proportions for the different provinces is slightly varied; the greatest increase during this second decade is in Munster. The increase (exclusive of emigration) was in Leinster 3 per cent.; in Ulster, 4 per cent.; in Connaught 5 per cent.; and in Munster 8 per cent.; thus making the increase for the whole of Ireland in the 20 years 19 per cent.; in Leinster it was 12 per cent.; in Ulster, 18 per cent.; in Munster, 23 per cent.; and in Connaught, 26 per cent.

---

* From a paper read by Mr. Fisher at recent Social Science Congress.

The increase which had been going on during these twenty years was all lost in the following ten years. Pharoah's dream was repeated, and the gain of the former period was swallowed up by the leanness of the period from 1841 to 1851, when the decrease in the population of Ireland was 1,623,154 persons. The gain during the former ten years was 440,759 exclusive of an emigration of 403,459 persons; thus making a deficit which would be equal to 2,467,372. Of these we find about one-half (1,240,237) are accounted for by foreign emigration. During this period a very large emigration also took place from Ireland to Great Britain, of which we have no account. This tendency to export our population has continued, and during the ten years from 1851 to 1861 the population of Ireland has further diminished by 787,842 persons, to which if we add the ratio of the increase at the rate of ten years from 1831 to 1841 (which would be about 600,000), would make the increase 1,387,842. The foreign emigration from Ireland, during the latter periods, was 1,230,986. The decrease between 1841 and 1851 was 19·85 per cent for the whole of Ireland, and between 1851 and 1861 it was 12·02 per cent. It was not equally divided among the provinces, as it was effected by the causes which mostly affect agriculture. The decrease for the ten years ending 1851 was—Connaught 29 per cent.; Munster, 22½ per cent.; Ulster 15½ per cent.; Leinster 15½. During the ten years ending in 1861 the decrease was—Munster 19 per cent.; Leinster, 14 per cent.; Connaught, 10 per cent.; Ulster, 5 per cent.

Ireland has now a smaller population than she had in 1811. The loss of population during the past twenty years has more than counterbalanced the increase during the previous thirty years.

If it be the case that a system of agriculture affects the creation or production of human labor, we should follow its indications, and seek to discover the causes which led to a decline in that dearly-raised, and (as experience shows) easily-lost commodity—human labor. It may be remarked that I speak of a people not stinted from the want of a sufficiency of suitable food; but of a people fully developed in their physical constitution, and hardy, robust, and spirited—who had almost too much animal spirits, as indicated by their pugnacity and tendency to quarrel; a race which was admired by strangers for its general healthiness and fine appearance, and which, though deficient in many respects, deserved the attention of the statesmen to raise and educate, rather than the sentence of extermination and banishment that was unconsciously passed on them. That there was a tendency towards thriftiness is shown by the fact that the deposits in the savings banks from 1821 to 1831 were about £1,000,000 sterling, and from 1831 to 1841 they were a similar sum; the total deposits in 1841 were £2,243,426, and they went on increasing until 1855, when they reached £2,921,581. The further fact, that the holders of land in quantities of less than five acres had in 1841 on their farms live stock to the value of nine millions sterling, or what was fully equal to three years' rent of their holdings. These facts show (if it were necessary) that there was a conservative tendency in the minds of the Irish people—that a desire to save had taken possession of their minds. There were many things which indicated that Ireland was not over-peopled in 1845. The inhabitants had a large surplus of agricultural produce to give in exchange for the commodities of other countries, and hence were large consumers of the manufactures of England and the produce of other climes.

DRUIDICAL ARCHITECTURE.

A term applied to a class of structures composed of rough unhewn stones of great size, the erection of which is generally attributed to that family of mankind classed under the name of Celts, more especially to the Druids.

These erections are of various descriptions, some consisting of a single stone, others comprising many hundreds; their arrangement also differs very greatly, yet at the same time there is a general similarity which readily marks their relation. The remains are more numerous in this kingdom than in any other, but they are by no means confined to it, similar erections being found not only in the neighbouring islands, in France, Germany, the Netherlands, Portugal, Sweden, and Denmark, but also in Phœnicia, Palestine, India, Malabar, Persia, and China, and even in the western continent. To account for the existence of these works in such remote regions, their construction has been attributed to the Celtæ. These Celts, or Gauls, as they are termed by the Romans, are supposed to be descendants of Gomer, the son of Japhet, whose posterity were called after his name, Gomerians, a title which is identical with the Cimmerians of the Greeks, and the Cimbri of the Latins.

The monuments erected by the Celts may be divided and classed as follows:—Lithoi, composed severally of one, two, and three stones, to the first of which is applied the distinguishing appellation monolithon, and to the last that of trilithon. They have all the common name of Cromlechs. After these come the kist-vaens, or chests, composed of four stones, and lastly, circles comprising a large number of stones. Further, we have logan, or rocking-stones, tolmen stones, cheese-rings, and cairns.

The most simple of these structures are the monolithoi, or single stones, of which we find a great number in various parts of the British Islands. The first mention of such stones we find, is of that set up by Jacob after his dream, which he named Bethel; the next is that set up by Joshua under an oak by the sanctuary, as a witness unto the Israelites, lest they denied their God. Another stone is spoken of at a later period, called the stone of Abel, upon which the ark was rested; and another, which was placed by Samuel between Mizpeh and Shen as a memorial of the Divine assistance. We read also of the stone Ezel, and the great stone in Gibeon. Many such stones are seen in Palestine at the present day, but not in the places mentioned in the Old Testament. The same kind of stones are almost universal in India, few, if any, of the temples being without them; there are two also in Tyre. It is suggested, that the pillars of Hercules were of this class, and with some probability, as Arrain says, that "Gades was built by the Phœnicians; the sacrifices and ceremonies there performed are all after the Phœnician manner;" and Strabo adds, that there were here two pillars dedicated to Hercules. Plato mentions a pillar connected in some way with the Amazons, and similar lithoi were to be seen at Megara, at Cheronæa, in Thessaly, Ionia, and Mauritania, one also within the walls of Athens. Cyrus erected obelisks over the grave of Abradates, king of Susa, and over those of his wife and officers. Further north we find such stones in Denmark, Sweden, Scotland, England, and in our own country.

Next to the lithoi, or cromlehs, stand the kist-vaens, or monuments of four stones, consisting of three uprights, and one horizontal stone covering the whole; they are often found in or near circles, and are frequently accompanied with barrows of various kinds. Kist-vaen is a Welsh term, and signifies stone-chest, but the term quoit is frequently applied to the same structures, more especially in Cornwall, and there is one near Cloyne, in Ireland, named Carig-Croith, which is interpreted Sun's House. Such monuments are found in abundance, and in every quarter of the globe.

The most remarkable of the circular erections in Great Britain are those of Stonehenge and Abury, both of which are situate in the neighbourhood of Salisbury Plain. The former, about seven miles north of Salisbury, is approached by a broad avenue protected on either side by a vallum, or long mound of earth; this avenue leads into a large circular platform, 300 feet in diameter, enclosed from the surrounding plain by means of a vallum 15 feet in height, with a ditch on either side of it, and, as some suppose, by an inner circle of stones, some few having been found in immediate proximity to the outer circle. In the avenue, at a distance of about 100 feet from the circular ditch, is a large stone inclining towards you as you approach, and a similar one in the ditch at the entrance. Passing onwards in a straight direction you approach a large number of stones composing the temple, more especially so termed, which consists of an outer circle of stones 14 feet in height, seventeen of which still remain, six scattered in various parts of the circle, but eleven on the north-east side, at equal distances from each other, forming a continuous segment of a circle, thus demonstrating the form and position of the whole. This circle consisted originally of thirty stones, surmounted by a continuous impost of large flat stones, which were fitted on to the uprights by mortise and tenon, and formed a complete and regular circle. Within this enclosure is another of a similar figure, and 83 feet in diameter, composed of the same number of stones, which however are of smaller dimensions and without imposts. Within this again were five separate structures, termed trilithons, each consisting of two large stones surmounted with an impost, and having three smaller stones a short distance in advance. These structures were situate, one immediately opposite the avenue, and two on each side of it, leaving an unoccupied space for an entrance. The larger upright stones were more lofty than any of the others, one of them measuring upwards of 21½ feet in height; thus overtopping all the outer circles. In front of the central trilithon is placed, by Stukeley, a low flat stone, supposed to be an altar. The avenue noticed at the commencement of this description is continued in a north-easterly direction for a distance of about a third of a mile, where it separates into two branches, the one leading southward between two rows of barrows, the other in the opposite direction for more than a mile and a half to a spot called the cursus, which is a flat tract of land, bounded on each side by banks and ditches, and at its extremities by barrows or tumuli.

The number of stones employed at Abury and Stonehenge, with their distribution, as given by Dr. Stukeley:—

ABURY.	Stones.
The great circle contains	100
North temple, outer circle	30
North temple, inner circle	12
South temple, outer circle	30
South temple, inner circle	12
The cove and altar	4
Obelisk and altar	2
The eastern avenue	200
The western avenue	200
Hackpen, outer circle	40
Hackpen, inner circle	18
Long stone-cove jambs	1
The Ring stone	1
Closing stone of tail	1
Total	652

STONEHENGE.	Stones.
The great-circle uprights	30
The great-circle imposts	30
Inner circle	40
Trilithon uprights	10
Trilithon imposts	5
Inmost stones	19
Altar	1
Stones within the vallum	2
Large table stone	1
Distant pillar	1
Stone at entrance	1
Total	140

Logan stones, or rocking-stones, as they are less technically termed, are stones, often of an immense size, poised on others, or on natural rocks, in such a peculiar manner, as to move with the slightest touch. They seem to have been erected at various times and places. They were known to the Greeks, and called by them *λιθοι εμψυχοι*, or live stones, also named Petræ Ambrosiæ, from the ceremony they underwent of being anointed with oil. Pliny takes notice of one erected by Lycippus, at Tarentum, and also of one at Cyzicum, which is said to have been left by the Argonants; but the most celebrated was the Gygonean stone, near the Pillars of Hercules, of which Ptolemy Haphæstion relates that it stands near the ocean, and may be moved with the stalk of an asphodel, but cannot be removed by any force. Pliny likewise says of one at Harpava, in Asia, that it is of so strange and wonderful a nature, that if even a finger is laid on it, it will move, but if you thrust it with your whole body, it will not move at all.

These stones are very common in Britain; there are several in Cornwall and Yorkshire, as also in Scotland, where they are called Claca Breath, or stones of judgment; it is known that there existed formerly several in the Island of Iona, which have since been destroyed. In some cases the stone rests on two points, in others on one; it is said that the junction was formed in one instance in Scotland, where the stone had been removed, by a protuberant knob in the upper stone fitting into a socket.

Wring-cheeses, so named from their resemblance in form to an ancient cheese-press, consist of large masses of stone placed one upon the other for several tiers, the whole resting on a base of much smaller dimensions than the superincumbent mass. By some it is contended that they are merely the productions of nature, but it seems more reasonable to suppose that at least some art has been employed in their formation. They are by some termed rock-idols, under the supposition that they were worshipped as gods.

At New Grange, near Drogheda, is a curious sepulchral pyramid of stone, formed of pebble stones, the weight of the solid contents of which amounted to no less than 189,000 tons. The plan of this monument is curvilinear, and covers about two acres of ground, and is surrounded by a number of large unhewn stones, rising about 7 feet above the ground; the height of the pyramid is calculated at 70 feet. A great number of stones, removed for paving and other purposes, led to the discovery of a passage leading into an interior vaulted apartment. This passage began about 40 feet within the body of the work, and is entirely composed of large flag stones; its length is 61 feet, the width 3 feet, and the height varies from 2 to 9 ft. This passage leads into an octangular vaulted apartment, whose diameter is 17 feet, and its height twenty; the vault or dome is remarkable as being composed of overlapping horizontal stones, the upper ones projecting inwardly beyond the lower, sustained in their position by having a large portion of each stone upon the one beneath it, than projects towards the interior: this construction is exactly similar to that of the tomb of Agamemnon, or treasury of Atreus at Mycene. The side of this irregular octagon immediately opposite the entrance, is formed into a niche, as are also two sides at the right and left, similar to the erections called kist-vaens, the last two containing each a rock-bason. This building is, we believe, the only one of its kind existing in Britain.

BALBEC.

Balbec, or Baalbec, a famous city in Syria, celebrated by the Greeks and Latins under the name of Heliopolis, the city of the sun, or Baal. It was surrounded with walls, which were flanked with towers at regular intervals. The principal remains consist of the great temple, a smaller one, called by Mr. Wood the most entire temple, a circular temple of a singular construction, and a Doric column standing alone. The longitudinal direction of the great and most entire temples is east and west. Before the entry to the great temple are two courts and a portico, which face eastwards. After passing the portico, we come to a hexagonal court, surrounded with columns and apartments; we thence enter a quadrangular court, the area of which is also surrounded with columns: on the north or south side of this court are seven apartments, or exhedræ; five are rectangular on the plan, one stands in the middle, having a semicircular exhedra on each side of it. These were probably lodging rooms for the priests. At the other extremity of this court, upon the south, are columns of a colossal magnitude, being the remains of the peristyle of the temple. The shafts are twenty-one feet eight inches in circumference; and the entire height of the columns fifty-eight feet.

The columns are all joined with iron cramps, and without cement, which is nowhere used in these edifices, but the surfaces are so close that there is hardly room for the blade of a knife to be inserted between them. The stones which compose the sloping wall are of enormous size. On the west the second course is of stones from twenty-eight to thirty-five feet long, and nine feet in height; and at the north angle, over this course, are three stones, which occupy one hundred and seventy-five feet seven inches. The shafts of the columns of the great temple consist each of three pieces which are joined with iron pins about one foot long, and one foot diameter. Most of the bases had two sockets, one circular, and the other square. Greek and Roman authors are entirely silent as to these astonishing ruins.

CONDITION OF THE LABOURING CLASS IN KERRY.

In the course of a comprehensive view of "Ireland's agricultural prospects," by the special correspondent of the *Times*, who represented that journal on the occasion of her Majesty's visit, we find the following:—

"Kerry labourers are badly off. Winter wages for men are commonly only 6d. a day, and many men work during that season for diet only, while their families go into the Killarney, Tralee, and other 'Unions.' But in many districts better pay prevails. Mr. Herbert's labourers at Muckross have 8s. a-week the year round, with a rent-free cottage of three ground-floor rooms—with unplastered inside walls to be sure, but palaces in comparison with many of the country cabins in which human beings are condemned to be born, to fare hardly, and to die with every comfort unknown. These better-paid hands live better, dress better, and *are* better than men stinted on lower wages; and if their case is a proof that poor half-starved Paddy will not invariably spend an extra shilling in potheen, as his calumniators sometimes tell us. Lord Kenmare, or his large property, furnishes labourers with plots of ground for keeping cows, not under the control of the farmers employing them; and the distress prevalent in Kerry is, therefore, checked by many cases of tolerably easy livelihood obtained by industrious men. In Killarney itself, it is a fact that the poor are specially dainty about the quality of their bread-loaf."

GRAND JURY "TRICKS OF TRADE."

We have already announced that there is an attempt being made by a committee to effect the reformation of the grand jury laws, the desirability for which may be inferred from the following exposé by Mr. Edward Burke, of Scariff, of some secret workings in the present system:—

"The flagrancies of the grand jury laws are imminently numerous. A protection wall must be built to a road skirting a deer park or a demesne, a bridge near a nobleman's gate must be taken down and re-built of granite, its sections and battlements must be cut stone, its sideways must be flagged, and it must have pillars of approach; but nothing of this for ornament—for decoration—oh no; 'tis all a question of durability and strength. A hill most dangerous to wayfarers must be cut down. The query book will describe it as on the high road leading from A to B; so it may, but it is also within musket shot of Viscount Somebody's grand gate. A most useful road is presented. Lord Anxious subscribed £500, as it goes only through his estate, but how does my Lord Anxious subscribe? He gets his agent to take the contract, and now comes '*the trick of trade.*' Sixpence a perch, along with his lord's subscription, would make the road; but my Lord Anxious gets his agent a contract from the sessions and jury of eightpence, which makes the road without the subscription, so that while his lordship subscribes the public pay his subscription. Oh! *Timeo Danaos et dona ferentes.* Instances are invidious things, but it is in no wise impossible to find a road leading nowhere else than to a gentleman's hall door, kept in repair by public contract; but these are only the small dodges, the slight civilities, the trivial goodnaturedness of grand juries. It is in the scheme of re-presentments they do up the cesspayer. No matter how great the defalcation of the officer, it is re-presented, and the county must repay it! New officers are always the nominees of some potentate of the grand jury; he may swindle a little, peculate a little, plunder a little, his defalcations with the treasurer are looked on as forbearances to the cesspayers. Finally, the deficit is re-presented—paid over again by the public; then the officer closes his accounts. If circumstances don't favour him, he absconds with a few thousand pounds, but no matter, the fiat of re-presentment goes forth from the next assizes, and what the officer pilfered the public must repay. . . . . In the county Mayo, this very year, £11.633 has been re-levied by this process to meet the defalcations of official malefactors. A striking and unanswerable proof of the superiority of elected over self-constituted bodies is found in the results of the medical charities act. Up to the passing of that act grand juries had the control and management of dispensaries. Since then, committees formed of the poor law guardians. What is the consequence? Instead of 80,000 cases relieved (as in the old system) yearly, we have 761,635 tickets attended to at very little greater cost. In fact, as the report (page 14) states, the present dispensary system is as superior to the grand jury system which it has replaced as one thing can possibly be superior to another. What stronger proof can exist of grand jury incompetency? While in their hands the department was an incubus. Taken from them and given to the management of elected bodies, poor law guardians, it becomes at once a powerful adjunct of poor law relief and a great engine of public charity."

DRAUGHTY DWELLINGS.

TO THE EDITOR OF THE DUBLIN BUILDER.

Sir,—Your recent capital article on "*Quantity* and *quality* of ventilation" struck me as being particularly truthful, more especially that portion referring to the construction, in utter defiance of all sanitary principles, of the majority of buildings, domestic included. I unfortunately practically experience the force of your remarks, both in town and country, for my town house is as ill ventilated as it is possible to be, although full of draughts, which meet one at every point; and even with fires in each apartment sufficient (quoting your own words) "to roast an ox," it is impossible to maintain anything like a uniform temperature, and an equable diffusion of *fresh* and withdrawal of *foul* air. Myself and family are consequently nearly all the winter laid up with colds, and despite all precautions, are compelled to shiver out that inclement period; and not much better are we circumstanced in our suburban *refugium*, when "it smells frosty," as it is doing just at present, somewhat too soon to relinquish it for the season. Mr. Editor, you have done signal public service in many respects by the class of information communicated through the pages of your work—so valuable that it deserves most extensive support; and I would make bold to ask you to enlarge on this all-important subject, and enlighten our modern architects and builders on the principles which should guide them in the construction of *habitable* and *wholesome* dwellings.

A Constant Reader.

Notes of New Works.

Mr. Robert Samuel North, of London, has been declared contractor for the completion of the line of railway from Goragh Wood to Markethill, at £90.000, two years being the time allowed.

The construction of the lines from Longford to Sligo, from Streamstown to Clara, and the Liffey branch is being proceeded with by the Midland Great Western Railway Company.

The new church of St. Dympana, Lavy, in the diocese of Kilmore, will be consecrated on the 13th October. It comprises nave, chancel, sacristies, porches, and belfry, and is 105 feet in length by 35 feet in width. A spire, rising to a height of 125 feet, will hereafter surmount the tower. Cost about £1,5[illegible]0; Mr. Ryan, architect.

Messrs. Hammond, of Drogheda, builders, have taken the plot of ground opposite the Amien-street railway terminus, and are erecting workshops, &c.

An enlargement of the church on Obelisk Hill, Killiney, by which the size of the structure will be nearly doubled, has been undertaken. The cost will be about £500.

Messrs. Stringer and Emerson, builders, of Clifden, have contracted for the building of a new church at Renvyle, Co. Galway. Plans, &c., by Messrs Welland and Gillespie, architects to the Ecclesiastical Commissioners.

A new weir and artificial watercourse are to be constructed at Brittas, Co. Dublin, under the direction of Mr. Brazil, C.E.

The new Roman Catholic church, for some time in course of erection at Clare, has been completed.

The first stone of the new Roman Catholic church of Tournafulla has been laid by the Earl of Devon.

The Marquess of Abercorn, in the absence of Lord Clifford (chairman), turned the first sod of the Finn Valley Railway, on the 9th instant.

The new church of Blessinton, Co. Wicklow, has been dedicated. It is advantageously situated on an eminence, and is in the Gothic style, cruciform on plan, about 90 feet in length by 25 in width, and 60 feet across transepts, has roof of open timber work, great east and west windows, belfry at west end, &c.

Gas is to be introduced into the town of Ballyshannon, and a company has been formed for the purpose, who are now seeking tenders for the requisite works, mains, &c.

The foundation stone of the new Roman Catholic church at Lixnaw, Co. Kerry, has been laid and blessed by the bishop.

A new Roman Catholic church is being erected at Mount Courtney, Newcastle west, Co. Limerick. The first stone was laid on 27th ult. by the Earl of Devon, who has granted a site, and contributed largely to the building fund. Mr. Scanlan, Listowel, builder.

A new marble altar has been recently erected in Moneygay Roman Catholic church, Co. Limerick. It was designed by Mr. W. E. Corbett, architect, Limerick, and executed in a very creditable manner by Mr. Kirwan, Bolton-street.

Extensive works, in conjunction with the Constabulary Depot, Phœnix Park, will be immediately undertaken. Plans are in preparation at the office of Public Works

The rebuilding of the houses recently occupied in Upper Sackville-street by the Standard and Colonial Insurance Companies respectively, has been commenced under the directions of Mr. W. Murray, architect; Messrs. Cockburn and Sons, contractors.

The new parish church of SS. Peter and Paul, Moate, is abont to be commenced after designs by Mr John Bourke, architect. It will be cruciform in plan, comprehending nave, aisles, transepts, side chapel, apsed chancel, bell tower, and sacristy; the total dimensions being 110 feet by 25 feet, and breadth across transepts 70 feet. The style selected is a character of Norman.

Miscellaneous.

Obstruction of the Thoroughfares.—On Saturday week two men, named James Keogh and Peter Lynch, were charged at Head Police-office by Constable 146 B with obstructing the thoroughfare in Grafton-street. It appeared that they were in the employment of Mr. Meade, builder, who is carrying on some work in Grafton-street, and that the obstruction was caused by occupying the street with carts of rubbish. Mr. Meade attended, and complained of his work having been stopped by the police. There was no other way of removing the rubbish than that which was adopted.

Mr. M'Dermott said an obstruction in so crowded a thoroughfare as Grafton-street was a cause of great emparrassment, and could not be allowed. It was his intention to write to the Commissioners of Police on the subject. He would not fine the men, but the constable might proceed against them by summons. In the meantime the obstruction should be discontinued.

Pneumatic Despatch.—The last experiments have been carried on with a portion of the tube, and a set of apparatus prepared for the line from the General Post-office to Bloomsbury, and have resulted in proving the complete sufficiency of the disc arrangements for producing the power, as well as in showing that the power may be conveniently and economically applied. The directors have placed them in communication with the Post-office, the railway companies and other parties, with a view to arrangements for the immediate construction of the first section of their works. The extension of the works, to comprise the entire parcel delivery of London, must speedily follow. Single carriages, and trains of carriages, of weight varying from one to three tons, have been successfully passed through the tube, or portions of the tube, at speeds varying from fifteen to forty miles an hour, under pressures ranging between 1oz. and 6oz. per square inch only; and these experiments have been repeated from day to day with uniform results. The transmission of the power from end to end of the tube is apparently instantaneous, the buffing and delivery of the trains under perfect control, and generally the combination too possesses an elasticity in its working which is all that could be desired. As regards economy of power, the engineers have no doubt it will be found that a fair per centage of useful effect is obtained, while in respect to the much more important consideration—convenient application of power—the advantages of the medium employed are too obvious to need remark. On the whole, they are fully satisfied with the results obtained, and are convinced that the company possesses in the new system a means of transmission, which, from the great facilities it affords, must soon come into extended practical use.

Accident.—A night watchman at Rush, on the Dublin and Drogheda Railway, was killed recently by the engine of a train, while walking along the line. No blame is attributed to the driver.

The Director General of the Museum of the Louvre has lately placed a second painting by the celebrated Hobbema in the gallery o the Dutch Masters. This painting represents two water mills with four wheels; a rustic bridge is thrown over a river, and right and left are woods, over which sunshine produces a very pleasing effect. This painting, which formed part of the gallery of the Duke of Mecklenburg, was purchased by the French government for 52,5 0f. The other painting was purchased from M. Nieuwenhuys, in the year 1850, for 18,000f. It represents the interior of a forest. The Louvre possess at present two paintings by Hobbema and three by Paul Potter.

Prize Medal.—Mr. Maclise, R.A., and Mr. L C. Wyon, have been entrusted with the designing and execution of the prize medal, to be given to successful exhibitors at what may be termed the Palace of Industry, next year. The dimensions of the medal will be identical with that given in 1851, as well as the material of which it is composed—namely, bronze.

Harbour Improvements.—A number of labourers are at present employed by the Drogheda Harbour Commissioners in executing certain works on the north side of the viaduct, preparatory to opening a quarry on the ground recently purchased from Capt. Ackland. It is understood that eventually the quarry will be converted into a graving-dock, where vessels can be hauled up, their timbers examined, and undergo repairs if required, instead of their being, as at present, obliged to proceed to Liverpool or elsewhere for that purpose. This cannot fail to prove acceptable to those having an interest in the shipping of the port —*Drogheda Paper.*

The Genius of Irishmen.—"Ireland," says Sir James Macintosh in his dissertation on the Progress of Ethical Philosophy, "may truly be said to be 'incuriosa suorum'" This remark must be understood with considerable reservations. As far as its orators and wits are concerned there is no nation in Europe that is more careful of its intellectual glories. No Irishman requires to be reminded that he is the countryman of Burke. The names of Grattan and Flood, of Curran and Plunket, have actually degenerated into claptrap. The memory of Sheridan and Moore is in no danger of being lost, and Goldsmith is a household word that lives on every lip. Here. indeed, the fault of an Irishman would seem to be in an opposite direction. He claims Swift as a countryman, because Swift, though the son of English parents, first saw the light in Dublin; and he arrogates the genius of Sterne, because Sterne happened to be born when his father, a captain in a marching regiment, was stationed in Clonmel. In philosophy, however, the remarks of Sir James Macintosh is true. A native born Irishman—Johannes Duns Scotus—is generally regarded as a Scot. The birthplace of Hutcheson, the Irish founder of the Scotch philosophy, is unknown. The philosophy of Berkeley, overwhelmed as it has been with misrepresentation, has been vindicated with no Irish pen. The existence of one of his most important works was first pointed out by a Scotchman; and it is an Englishman who has at length superintended its republication, and transmitted it to Ireland as a contribution of the English press. And yet, in earlier times, the Irish genius was more remarkable for dialectic subtlety than for either impassioned eloquence or spontaneous wit. The disputants of the Irish College in the University of Paris were satirised as "Gens ratione furens et mentem pasta chimæris." An Irish tutor harassing a professor of Salamanca with a sorites, was regarded by Bayle as the very type of scholastic subtlety. It was to the uncouth Hibernian figures that prowled about the halls that Gil Blas addressed himself for disputation when prosecuting his logical studies at Oviedo. In short, as Sir William Hamilton remarks, the Hibernian logician was long celebrated in every University of Europe for his logical acuteness, and—tell it not in the Island of Saints—for his pugnacity and barbarism also.

Memorial Window in St. Michael's Church, Kingstown.—A very elegant memorial window has lately been erected in this sacred edifice by the Messrs. O Conner, of Berners-street, Oxford-street, London, and Glenageary, Kingstown, in memory of Major M'Kenna, of the 1st Royals, who was killed by a round shot at the Peiho river in China, in the attack on the Taku Fort, from which our troops had been repulsed a few years ago, but since captured. The memorial is erected by his brother officers in commemoration of his gallant and courageous conduct on that occasion, and the universal esteem in which he was held by both officers and men. There are four compartments in the window representing Gideon, David, with the head of Goliah, St. Michael, patron of the church, and St. Andrew, patron of the regiment. It is a very creditable work of art, and reflects much credit on the Messrs. O'Conner.

Population of Paris.—The following is the movement of the population of Paris and of the department of the Seine, since the quinquennial census of 1856, as shown by that which has just taken place. The population of enlarged Paris, divided into 20 arrondissements and 80 quarters, now amounts to 1,696,000, being 521, 54 more than it was in the 12 arrondissements in 1856. In the department of the Seine the number is now 1,953,000, being an increase since 1856 of 225,581.

The Mayoralty.—It has been estimated that the expenditure of the Lord Mayor (Atkinson) during the year will amount to nearly £8,000, the revenue of the office which he now fills for the *second* time being only £2.000. He has worthily sustained the character of the city for hospitality by the recent ball, and the banquet given by him to Lord Brougham and other distinguished members of the Association for the Promotion of Social Science.—*Saunders.*

Treasurership to the Ecclesiastical Commissioners.—An election for this vacant office will take place on the 10th proximo. It is hardly fair to anticipate the result. but we trust that the past services of an efficient and long-tried servant, said to be a candidate, will receive due consideration.

Hereford Cathedral Restorations —The Dean and Chapter of Hereford have just prepared a statement of the work of restoration at this cathedral already effected, and yet to be completed, which has been distributed among the visitors at the musical festival now holding in that city. From this statement it appears that of the sums borrowed on mortgage (£13,000). under the Hereford Cathedral Restoration Act, from 1859 to 1861, £10,000 has been expended on the external and internal restoration of the north transept and aisles, the south transept, the north aisle of the choir, including Bishop Stanbury's Chapel, the north-east transept, the south-east transept, the south aisle of the choir, the chapter-house and vestibule, the Layde Chapel and vestibule, and Bishop Audley's Chapel, and the external restoration of the north aisle of the nave, the north porch, the south aisle of the nave, and the great cloisters. They have, therefore, £5,000 in hand to meet the balance of existing contracts and the cost of flooring generally (except the choir), repairing and refixing monuments, releasing parts of the roof, repairs of inner stonework. &c. The following additional works are proposed to be executed if funds can be raised for the purpose:—Fitting up and flooring of the choir. the restoration of the external stonework of the tower, lighting the cathedral for congregational use, and fitting up of the Ladye Chapel for service for St. John's parish. These works are estimated to cost £8,000, towards which the Dean and Chapter have a sum in hand, and promises of £3,553 10s. 10d., leaving £4,446 9s. 2d to be provided. They therefore appeal to the public for pecuniary aid, and state that if the funds were supplied the whole of the works in the interior might be completed and the cathedral opened in October of next year.

Progress of English Art Manufactures.—"To the intending purchaser of so important an article of personal adornment and utility, it is of some importance to be informed where he may meet with these more tastefully-embellished watches, and to be thus saved the annoyance and loss of time of a fruitless search. To such we shall be doing a service by informing them that the show-rooms of Mr. J. W. Benson, of 33 and 34, Ludgate Hill, and 46 and 47, Cornhill, contain a rare and most extensive stock of watches, ornamented with exceedingly beautiful designs; indeed, their exquisite taste leaves nothing to be desired by the educated The high repute which Mr. Benson has attained for the qualities of his manufacture stands second to none. Here, then, will be found perfection of workmanship. combined with the highest order of art in embellishment. Mr. Benson's show-rooms are the most distinguished in the City for spaciousness and the unexampled variety of his stock."—*Morning Advertiser.*

Benson's Illustrated Pamphlet, post free for two stamps, is descriptive of every construction of watch now made. Watches safe by post to all parts of the globe.

TENDERS

For alterations and additions to District Lunatic Asylum, Clonmel. Mr. George Wilkinson, architect.

NOTICE.

Post-office Orders and Remittances should be made payable to Mr. Peter Roe, *Printer and Publisher,* 42, Mabbot-street, Dublin.

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the* Dublin Builder," 42, Mabbot-street. *All other Communications should be addressed to the "Proprietor and Editor,"* 17, Lower Gardiner-street.

TO SUBSCRIBERS AND ADVERTISERS.

Subscribers and advertisers to whom frequent applications have been made by circular and otherwise for various amounts of accounts furnished, will have the goodness to remit same to the office, as directed. It must be obvious to all that the character of this journal entails more than ordinary *expense for each publication, and judging from the good feeling manifested towards our mission by all classes, we are quite sure it is only necessary to remind those indebted that a multitude of individual items, however small, serve to form a very important aggregate.*

The Dublin Builder.

Vol. III.—No. 43.

UNREQUITED LABOUR.

THE members of every profession or occupation have usually a certain degree—whether positive, comparative, or superlative—of up hill work to encounter before they attain even half way their ascent of the ladder of fame; but as a general rule, we believe that those who embark in the pursuit of architecture experience more difficulty even in climbing a few rungs of the aforesaid ladder, than have any other of their professional cotemporaries in attaining its summit. A youth who has just emerged from his period of probationship, exulting upon the smooth path that apparently lies open before him, imagines that because he can produce a few "pretty pictures," and "try his hand" at writing a specification, he must be in the fair way of making a fortune, and with very little trouble too—in fact, the foundations of his "castles in the air" are already being formed in his imagination, and he entertains no small opinion of his social and professional consequence. However, after a little experience—that infallible teacher—he finds that he has not been dealing in realities, that the conceptions of his fertile brain are as far as ever from arrival at maturity, and that his "friends," upon whose interest and assistance he calculated with such certainty—if ever they existed at all (?)—have dwindled numerically into a position of exquisite nothingness, and the illusion of his dream is therefore fully dispelled. What, then, is to be his course? He is left to choose between the cheering alternative of either seeking a situation as assistant in the office of some more fortunately born votary at the shrine of "the glorious art," and thereby eke out a bare existence for the rest of his days, or to try his chance in the lottery of competitions, wherein so many of his brethren have been *so* successful. His chivalry has not yet deserted him, and he adopts the latter course, going into it in right earnest, toiling from sunrise till sunset, and not unfrequently even "by the dim light of the midnight lamp." Pretty pictures, perspectives with bright skies of ultramarine, over which our artist plies his brush most unmercifully—but to his own fancy most scientifically—are, with plans, elevations, and sections, produced by the score, neatly mounted, and dispatched to their destination, there to await the "careful consideration" of an impartial committee. The young competitor having now some breathing-time begins to inquire particulars respecting this jury, on whose dictum a favourable or an adverse verdict may depend. He finds, to his inexplicable horror, the chairman perhaps to be a very noted vendor of "Guinness' stout" and "John Jameson's overproof," together with very many other nice articles to minister to the comforts and the necessities of the outward man; a very respectable man *in his way* no doubt, quoth the architect, but not at all suited to pronounce an opinion on the merits of my, or any other, architectural design. Enquiring still further, it is discovered that a very wealthy pawnbroker is a "highly influential" member of this committee, because he has built some houses out of his superfluous cash, and in such a style, too, as would amaze (truly so!) even an architect or builder. This gentleman, moreover, can discourse very freely too about the various orders of architecture—can absolutely discern "Gothic" from "Classic," and is thoroughly acquainted by practical experience with every department of a building. Such a one as *this* will assuredly prove very weighty on the adjudication, and the youthful competitor strains every nerve to gain him over. Very many others, in different spheres—all, however, somewhat akin in point of competency to decide such a question, and we need not paint their several portraits now—constitute this "highly intelligent" committee. Before such a strange medley as this are to be paraded the results of many days (perhaps weeks) of incessant labour and study, and a decision of *some* kind is finally arrived at, which, in nine cases out of ten, is in gross contradiction to all sense of justice and reason. The cast drawings are returned to their owners, with or without, as may be, even the courtesy of "thanks," and serve as a pleasing (?) reminiscence of "unrequited labour." From the foregoing, which is not an overdrawn picture, but under special circumstances capable of being viewed in many lights, various considerations may arise, the principal of which is the suggestion of a *remedy*. In our own columns and those of our cotemporaries there have been very many offered, still the evil is as present as ever, and the numerous schemes proposed to obviate it have proved as futile as attempts to accomplish "perpetual motion"—a subject of which, by reference to a recent number, it will be seen we treated rather fully.[*] "The prevention" would, however, in most cases prove as bad as "the cure," for if there were not at least the *semblance* of competition, and the accompanying "unrequited labour," monopoly would follow, and the voices of the less fortunates be paralyzed from appealing even to public sympathy for perpetrated injustice. Our junior friends in the architectural profession will do well to weigh carefully "the doctrine of chances" when they are about to expend time and labour which may prove unrequited; and though it *may* occasionally occur that there has been some little fame acquired even by an *unsuccessful* competitor, who has made a creditable display, yet it becomes questionable after all may he not, in competing at all, be wasting "fragrance on the desert air," and, "while grasping at a shadow, lose the substance."

ANTIQUITIES IN BUTTEVANT, COUNTY OF CORK.[†]

BALLYBEG is about half a mile from Buttevant; the remains of the Augustinian abbey stand at the gorge of a winding and romantic glen, through which the turnpike road from Mallow to Buttevant passes; its situation must have been remarkably picturesque, when forests clothed the lofty and abrupt hill sides, when the horn of the hardy hunter woke the morning echoes through its rocky passes, as he chased the red deer by the banks of the gentle Mulla.

The present remains show it to have been once strongly fortified. Its massive belfry looks more like a castle keep, and the remains of stern looking towers, which formerly flanked the abbey enclosures, speak of troublous times and treacherous onslaughts; a portion of the east and west ends of the church, the cloister walls, ruins of two towers, and of columbarium, or dove-cot, are all that at present remain of this once splendid structure, the extent and magnificence of which is still attested by the fragments of walls, and sculptured stones dug up by the peasantry on the surrounding lands. Of the east end, fragments of the chancel walls alone remain; in Smith's time the east window existed, but there is now no trace of it; a farmer has built his house and offices across the centre of the church, and the west end is occupied as a cow-house! The west gable has a lofty Early English couplet of graceful proportions, with large inward splays; the lancets are divided internally by a very fine banded shaft having a moulded base, and a bold and richly carved cap of the peculiar foliage of the period. A strange feature exists in this portion of the building—four massive piers have been built at some period subsequent to the original erection, two of them in the western internal angles, upon which vaults are turned, converting this end of the church into a fortified structure. You can ascend to the top by a stairs constructed in one of the piers. The vaulting is ornamented with some grotesque heads; it crosses the couplet window, destroying its effect. There are circular holes in the vaulting, as if a peal of bells had been hung in the upper part. This tower, or belfry, was certainly erected sometime subsequent to the original building, as these piers are not bonded into the original masonry, but merely built against the walls. The cloisters were on the south side of the church, and appear to have been of large extent. The enclosing wall still exists, and retains the corbels that carried the beams of the lean-to-roof over the arcade, no portion of the masonry of which at present remains—neither cap, base or portion of shaft by which I could determine its character. About twenty yards from the west end of the church are the remains of a lofty square tower, which was connected with the conventual buildings, and evidently built for defence. The wall were massive and of excellent workmanship; the lower storey of a similar tower stands about forty yards from the east end, close to the Doneraile-road; the finish of the quoins and a handsome pointed doorway evidence the care bestowed on its erection.

The Columbarium.—About twenty yards from the south-east corner of the chancel is a low circular tower, about 28 feet in height, the walls of which are perpendicular, having no inward inclination, or batter. Its internal diameter is 15 feet 7 inches; thickness of the walls 3 feet 9 inches; its internal circumference is 70 feet; it had two doors, one at the east and one at the west side—the west one is perfect, but the cut stone jambs of the east one, having tempted the cupidity of a neighbouring farmer, were abstracted and it is now an unsightly breach. The interior is exceedingly curious, the inside face of the wall having been built in square compartments and in regular tiers, one over the other, to a height of fifteen feet, where they are terminated by a projecting string-course; the first tier commencing at eighteen inches from the ground. There are eleven tiers of pigeon holes, thirty-two in a tier, which each average eight inches square, and are from ten to eleven inches in depth; they are formed of small square stones, hammer-dressed, yet neatly fitted, and bonded well into the solid wall; between each tier is a course of stone, seven inches in thickness, and the small piers between are ten inches wide, the horizontal courses between the tiers are formed mostly of two courses of thin stone, and the diminutive piers of two and three cubical stones; yet the whole is carefully bonded and well built, in fact it is the neatest and most curious specimen of hammer-dressed work I have ever met with, either ancient or modern. The height internally to the string-course is 15 feet 6 inches, from which starts the beehive-shaped roof of masonry, the upper part of which is formed of flags overlaying one another, and leaving a circular opening of about three feet six-inches in diameter, so as to give ingress and egress to its feathered inhabitants. This roof does not exhibit its domical form externally, as the walls are carried above the top of the vaulting, a level platform being formed on the top, the raised wall forming a parapet round it, and having rude gurgoiles to carry off the rain water; the whole height of the building externally is 27 feet 6 inches. A curious external feature is an apparent mode of communication with the abbey buildings. About fourteen feet from the ground, at the north side, is a doorway which leads to the platform above mentioned; at one side of this doorway is a fragment of wall projecting about four feet, and pointing towards the S.W. corner of the chancel; lower down there does not appear to have been any connection with the tower, as the masonry exhibits no such feature, so that it would appear to have been a portion of a gallery of communication carried upon arches to some part of the domestic buildings. The interior appears to me to have been subjected at some period to the action of fire, as the lime-stone of which the whole is built exhibits a white and calcined appearance I am at present personally aware of but one other specimen of this class of buildings existing in this country; it is adjoining the Cistercian abbey of Kilcooly, and presents some different features, both as to design and construction from that at Ballybeg; but I have been informed of the existence of one or more of these buildings in the county of Kilkenny. I find that some difference of opinion exists among antiquaries respecting the foundation of Ballybeg, some of which opinions I now subjoin.

---

[*] See page 439, *ante*.

[†] From a Paper read by R. R. Brash, architect, before Kilkenny Archæological Society.

Archdall states that Phillip de Barry founded a priory here for regular canons following the rule of St. Augustine, and dedicated it to St. Thomas, the favourite saint of that age. He endowed it in the year 1229, in remembrance of which his equestrian statue in brass was erected in the church.

According to Ware, Ballybeg was a priory of regular canons of St. Augustine, dedicated to St. Thomas founded by William de Barry, and endowed by his son David, in 1237.

The Abbe MacGeoghegan copies Ware to the effect that at Ballibeg, near Buttevant, in the county of Cork, a priory was founded for regular canons of St. Augustine, by William Barry, in 1237, and endowed by his son David.

Dr. Smith writes that at Ballybeg, on the other side of the river, a small walk from Buttevant, was a monastery of Augustinians, founded anno 1237, and dedicated to St. Thomas, by William de Barry, being endowed by his son David.

Both of these last statements are manifestly in error, for we find in Lodge's "Peerage" that David de Barry was possessed of the lordship of Buttevant at that period, and that he was not the son of William but of Robert. whom he succeeded. It is true that William was the eldest son and heir of Phillip de Barry; but being a favourite of King John, he resided in England, and supposed to have assigned his Irish estates to his younger brother, Robert.

Mr. Crofton Croker, in his valuable and interesting work, "Researches in the South of Ireland," in his notice of Ballybeg, has fallen into an error respecting the columbarium. He describes it as the "stump of an ancient round tower;" to which it bears no resemblance (except in its circular form), having no batter, being built of common rubble masonry, having two doorways on the ground level, and being of much greater diameter than our cloichtheachs.

The field in which this dove-cot stands is called by the neighbouring peasantry the "pigeon-field," a name sufficiently corroborative of the uses I have ascribed to this building. Many stories are here related of money-seekers and dreamers of "crocks of gold," &c. One or two have been authenticated to me, and are given by Mr. Crofton Croker in his "Researches."

One of them relates to the discovery in the pigeon field of a sepulchre, the interior of which was lined with slabs having figures of the apostles quaintly carved thereon, and containing a stone coffin. Of the remains of this tomb I could discover no traces. I heard that the slabs were thrown about and broken, their ultimate fate being to repair the road, and that the stone cist was many years used by a neighbouring farmor as a pig-trough!

The other story relates to a blacksmith who dreamed three successive nights of "a crock of gold under a big flag in the abbey," and who accordingly commenced excavating among the mouldering remains of the ancient fathers until he exhumed a stone coffin, containing a skeleton, a cross, a bead of precious metal, and a plate of the same, on which was incised a representation of the crucifixion. These valuable relics met the fate of most of our native antiquities, having been disposed of by the finder to a goldsmith in Cork, who remorselessly melted them down.

We find that the dove-cot or pigeon-house was a very general appendage to ancient religious houses. In the surrender of the abbey of St. John, Kilkenny, in the reign of Henry VIII., we find the last abbot, Richard Cantwell, siezed among the other buildings, tenements, &c, "of a water-mill, a pigeon-house," &c.

Tumuli.—A little to the north of Buttevant, beyond the turnpike, the old road between Charleville and Buttevant strikes off in an easterly direction, crossing the Awbeg by a bridge partly ancient and partly modern, the arches at one side being pointed and the masonry of antique character and apparently coeval with the neighbouring monastery. At a late period it was considerably widened; but the arches of the modern portion are semicircular, which has an odd effect. A short distance from the bridge, on the height, in a field by the roadside, is "Knockane-na-m-buachaillidhe"—that is, "the mound or hillock of the boys"—an ancient, conical, earthen tumulus, about fifteen feet high and sixty feet in diameter. A deep excavation has been made in the west side of it, as we were informed, by gold-seekers. A similar tumulus, and of corresponding dimensions, stands a short distance from the above, called "Knockane-na-g-caillinidhe," or "the mound of the girls," nearly half of which has been cut away in making a new road. These were in all probability memorial tumuli, erected to commemorate some bloody conflict and the fall of two chiefs or heroes.

At Kilmaclennan, about two miles from Buttevant, is an immense mound of irregular outline, the remains of a once noble tumulus or barrow. The aged countryman who was my cicerone stated he remembered it in his younger days complete, with a moat on the top. The moat he explained as "a flat green little field." He said it was opened about fifteen years ago by the Rev. Mr. Connery, parish priest of Buttevant, who informed the people that he first heard of it in Paris. What was found in it "he was not sure"—that is, he was completely ignorant; but the gold-seekers came afterwards, and excavated and ransacked the whole mound, and the farmers now are carting away the materials of which it is composed. The original height of this tumulus is only conjectural; its present outline is broken and irregular; its greatest height about eighteen feet; the material of which it is composed, earth and small rubble.

Nearly in the centre is a rude cist, which is now entirely uncovered. It is rectangular, formed of four upright stones composing the sides and ends, with a massive table stone covering all. It at present rests but on two sides and an end, the other end having been forced out by the riflers.

The following are the dimensions of the stones:—No. 1 side stone, length 9 feet, height 6 feet; No. 2 side stone, length 7 feet 6 inches, height six feet; No. 3 end stone, length 4 feet, breadth 6 feet; No. 4, end stone, length 4 feet 6 inches, height 5 feet 6 inches. The covering stone measures 9 feet 9 inches in length, by 7 feet 6 inches in breadth; the average thickness of these stones is from 15 to 18 inches. What was found at the opening of this tumulus I have not been able to ascertain. It is evidently sepulchral, and must have contained some primæval remains.

It is to be regretted that a vast number of these sepulchral tumuli have been destroyed, and there contents scattered and lost, through the ignorance or avarice of individuals. It would be desirable if this and kindred societies took more active steps to disseminate, among our gentry and farmers, the value and importance of monuments of this class, that when their removal is unavoidable, they may be instructed as to the necessity of having a competent person on the spot to investigate and report upon them.

It would be also desirable if a fund could be appropriated for the examination of such of these tumuli as are accessible; or if one or more members took upon them the opening of one each every year, I am sure the results would be most gratifying to those concerned, and our museums would be enriched by many an article of ancient art, calculated to throw light on the dim past and to illustrate the history, habits, and religion of the early habitants of our land.

Our ancient annals and literature teem with reference to the sepulchres of the mighty dead, to the fields of conflict, to the spots where heroes and chiefs and kings have fallen. With such lights on his path, the well-directed efforts of the antiquary cannot fail of being crowned with success.

THE ABSOLUTE STRENGTH OF TIMBER.

THE strain occasioned by pulling timber in the direction of its length is called *tension;* it frequently occurs in roofs, and is therefore worthy of consideration.

The absolute strength of a fibre, or small thread of timber, is the force by which every part of it is held together, which is equal to the force that would be required to pull it asunder; and the force which would be required to tear any number of threads asunder is proportional to that of their sum; but the areas of the sections of two pieces of timber composed of fibres of the same kinds are as the number of fibres in each; and therefore the strength of the timber is as the area of the sections.

Hence all prismatic bodies are equally strong: that is, they will not break in one part rather than in another.

Bodies which have unequal sections will break at their smallest part; and therefore, if the absolute strength which would be required to tear a square inch of each kind of timber be known, we shall be able to determine the strength of any other quantity whatever.

The following table is taken from Muschenbroëk's experiments; he has described his method of trial minutely; the woods were all formed into slips fit for his apparatus, and part of the slip was cut away to a parallelopiped one-fifth of an inch square, and therefore the twenty-fifth part of a square inch in section; the absolute strengths of a square inch were as follow:—

	lb.		lb.
Locust tree,	20,100	Pomegranate,	9,750
Jujeb,	18,500	Lemon,	2,950
Beech oak,	17,800	Tamarind,	8,750
Orange,	15,500	Fir,	8,330
Alder,	13,900	Walnut,	8,130
Elm,	13,200	Pitch pine,	7,650
Mulberry,	12,500	Quince,	6,750
Willow,	12,500	Cypress,	6,000
Ash,	12,000	Poplar,	5,500
Plum,	11,800	Cedar,	4,880
Elder,	10,000		

M. Muschenbroëk has given a very minute detail of the experiments on the ash and walnut, stating the weight requisite to tear asunder slips taken from the four sides of the tree, and on each side in a regular progression, from the centre to the circumference. The numbers of this table, corresponding to the two timbers, may therefore be considered as the average of more than fifty trials made on each; and he says that all the others were made with the same care, and therefore there is no reason for not confiding in the results.

Practical Observations.—The following observations on wood will be of great use to the practical carpenter, in making a proper choice of timber, according to the purposes for which he may want to employ it:—

The wood immediately surrounding the pith, or heart, is the weakest; and its inferiority is so much the more remarkable as the tree is older. Muschenbroëk's detail of experiments is decidedly in the affirmative. M. de Buffon, on the other hand, says that his experience has taught him that the heart of a sound tree is the strongest, but he gives no instances. It is certain, from other experiments, on large oaks and firs, that the heart is much weaker than the exterior parts.

The wood next to the bark, commonly called *white*, or *blea*, is also weaker than the rest; and the wood gradually increases in strength as we recede from the centre to the blea.

The wood is stronger in the middle of the trunk than at the springing of the branches, or at the root; and the wood of the branches is weaker than that of the trunk.

The wood on the north side of all trees, which grow in the European climates, is the weakest, and that of the south side the strongest; and the difference is most remarkable in hedge-row trees, and such as grow singly.

The heart of a tree is never in its centre, but always nearer to the north side, and the annual coats of wood are thinner on that side. In conformity to this, it is a general opinion of carpenters, that the timber is stronger whose annual plates are thicker. The tracheæ, or air-vessels, are weaker than the simple ligneous fibres. These air-vessels are the same in diameter and number of rows in all trees of the same species, and they make a visible separation between the annual plates. Therefore, when these are thicker, they contain a greater proportion of the simple ligneous fibres.

All woods are more tenacious while green, and lose very considerably by drying after the tree is felled.

The *compression of timber* is another consideration worthy of attention.

In considering strains of this kind, it is absolutely impossible to conceive how a piece of timber that is perfectly straight can be bent, crippled, or broken, by any force whatever acting at the extremes. But suppose the smallest force whatever, acting in the middle, on a direction perpendicular to the length, this force will be sufficient to give a small degree of curvature; and if a strong force be supposed to act at the ends at the same time, each pressing the timber in the direction of its length, these forces may instantly contribute towards breaking it.

It is easy, therefore, to conceive that if a piece of timber be the least bent whatever, or if the fibres of that timber be not quite straight, there is a certain force which, if acting at the ends, will break it.

The first writer who considered the compression of columns with attention, was the celebrated Euler, who published, in the *Berlin Memoirs* for 1757, his Theory on the Strength of Columns. The general proposition established by this theory is, that the strength of prismatic columns is in the direct quadruplicate ratio of their diameters, and the inverse ratio of their lengths: he prosecuted this subject in the *Petersburg Commentaries* for 1778, confirming his former theory. Muschenbroëk has compared the theory with experiment, but the comparison has been very unsatisfactory; the difference from the theory being so enormous as to afford no argument for its justness; neither do they contradict it, for they are so very anomalous as to afford no conclusion or general rule whatever.

We may observe, by the way, that we learn that purlins are able to carry twice the load when notched into the rafters, that they carry when mortised into them, which is the most usual manner of framing them. So would the binding joists of floors; but this would double the thickness of the flooring. But this method should be followed in every possible case, such as bres-summers, lintels over several pillars, &c. These should never be cut off and mortised into the sides of every upright; numberless cases will occur which show the importance of the maxim.

We have seen that it depends entirely on the position of the pieces in respect of their points of ultimate support, and of the direction of the external force which produces the strains, whether any particular piece is in a state of extension or of compression. The knowledge of this circumstance may greatly influence us in the choice of the construction. In many cases we may substitute slender iron rods, for massive beams, when the piece is to act the part of a tie. But we must not invert this disposition; for when a piece of timber acts as a strut, and is in a state of compression, it is next to certain that it is not equally compressible in its opposite sides through the whole length of the piece, and that the compressing force on the abutting joint is not acting in the most equable manner all over the joint. A very trifling inequality in either of these circumstances (especially in the first) will compress the beam more on one side than on the other. This cannot be without the beam's bending, and becoming concave on that side on which it is most compressed. When this happens, the frame is in danger of being crushed, and soon going to ruin. It is therefore indispensably necessary to make use of beams in all cases where struts are required of considerable length, rather than of metal rods of slender dimensions, unless in situations where we can effectually prevent their bending, as in trussing a girder internally, where a cast-iron strut may be firmly cased in it, so as not to bend in the smallest degree. In cases where the pressures are enormous, as in the very oblique struts of a centre, or arch frame, we must be particularly cautious to do nothing which can facilitate the compression of either side. No mortises should be cut near to one side; no lateral pressures, even the slightest, should be allowed to touch it. We have seen a pillar of fir, 12 inches long and 1 in section, when loaded with three tons, snap in an instant when pressed on one side by 16 pounds, while another bore 4½ tons without hurt, because it was enclosed (loosely) in a stout pipe of iron.

In such cases of enormous compression, it is of great importance that the compressing force bear equally on the whole abutting surface. The German carpenters are accustomed to put a plate of lead over the joint. This prevents, in some measure, the penetration of the end fibres. M. Perronet, the celebrated French architect, formed his abutments into arches of circles, the centre of which was the remote end of the strut. By this contrivance the unavoidable change of form of the triangle made no partial bearing upon either angle of the abutment. This always has a tendency to splinter off the heel of the beam where it presses strongest. It is a very judicious practice.

The joinings practised in carpentry are almost infinitely various, and each has advantages which make it preferable in some circumstances. Many varieties are employed merely to please the eye. We do not concern ourselves with these, nor shall we consider those which are only employed in connecting small works, and can never appear on a great scale; yet, even in some of these, the skill of the carpenter may be discovered by his choice; for, in all cases, it is wise to make every part of his work, even in the smallest details, as strong as the materials will admit. He will be particularly attentive to the changes which will necessarily happen by the shrinking of timber as it dries, and will consider what dimensions of his framings will be affected by this, and what will not; and will then dispose the pieces which are less essential to the strength of the whole, in such a manner that their tendency to shrink shall be in the same direction with the shrinking of the whole framing. If he do otherwise, the seams will widen, and parts will be split asunder. He will dispose his boardings in such a manner as to contribute to the stiffness of the whole, avoiding at the same time the giving them positions which will produce lateral strains on truss-beams which bear great pressures; recollecting that although a single board has little force, yet many united have a great deal, and may frequently perform the office of very powerful struts.

Our limits confine us to the joinings which are most essential for connecting the parts of a single piece of a frame when it cannot be formed of one beam, either for want of the necessary thickness or length; and the joints for connecting the different sides of a trussed frame.

Much ingenuity and contrivance has been bestowed on the manner of building up a great beam of many thicknesses, and many singular methods are practised, as great nostrums, by different artists; but when we consider the manner in which the cohesion of the fibres performs its office, we shall clearly see that the simplest are equally effectual with the most refined, and that they are less apt to lead us into false notions of the strength of the assemblage.

LIME LIGHT AT SOUTH FORELAND.

ON a headland some 3½ miles to the eastward of Dover, are situate two lighthouses, well known as the Upper and Lower South Foreland Lighthouses. The Upper Lighthouse, which is fitted with a Fresnel apparatus, was recently the scene of Professor Holmes's experiments with the electric light.

The light now used, however, is obtained from the ignition of a piece of lime by submitting it to the intense heat evolved by the compound flame of hydrogen and oxygen gases, in the proportions in which they form water. The lime does not burn, but simply becomes brilliantly illuminated, without undergoing any chemical change. The light, therefore, is independent of the atmospheric air, and does not deteriorate it. The light produced is the most intense known, with the exception of the electric light, from which it differs, however, in some important particulars. It is steady and continuous, and its volume may be increased at pleasure. Drummond was the first who applied the lime light to purposes of practical utility; and by his experiments it was shown that its range was practically unlimited, for he connected the shores of Wales and Ireland by the light at Holyhead, a distance of 64 miles; and afterwards obtained a like result at the summits of Ben Lomond and Knock Layd, a distance of 95 miles. His light, however, wanted these two special properties: volume, without which no light is adapted to the means at present possessed for its distribution; and secondly, continuity, which he could not command. For these reasons it was condemned by Stephenson as unsuited to lighthouse purposes. In fact, with the appliances then obtainable, he could come to no other conclusion, the duration of the light being under no control.

It has now been maintained in the South Foreland Lighthouse as a first order coast light since the 26th of last month with success. It is exhibited there, we understand, upon trial, and the period of probation has been settled at three months by the Trinity Board; and upon its fulfilling the conditions requisite for a first-class lighthouse probably depends its extensive adoption for coast lighting.

The Fresnel apparatus in which the light has been placed is not considered by its exhibitors the one best calculated to show the full power of the lime light; but its brilliancy is, notwithstanding, strikingly apparent, when contrasted with the ordinary coast lights.

Another important adaptation of this peculiar light is now in course of trial. The value of a powerful light on board of those vessels of the navy, which from their magnitude and high speed render additional precautions necessary against collision, cannot be too highly estimated. Each vessel fitted with such a light becomes in effect a floating lighthouse—a conspicuous warning to other vessels approaching it. Life and property to an incalculable extent may, by means of this light, be rendered comparatively safe. Each vessel may carry a light at the mast head, fulfilling a double purpose of a warning beacon and a look-out light, illuminating the surrounding water, and giving the vessel the means of avoiding collision with others. Such lights are also applicable to signalizing, to convey intelligence at night or in thick weather from one ship to another, and as such specially adapted for fleet signals. An application of this kind is now under consideration and trial, with a view to combine, if possible, the mast-head lamp and signal lamp in one, at the same time producing an economical and efficient lamp, adapting itself to the code of night signals now employed in the navy.

The methods of obtaining the gases admit of alterations for the better, not so much in the mechanical means used for producing them from their present sources, for these are very simple, but as to the sources themselves from which they are obtained. The hydrogen is at present obtained by the decomposition of water by the agency of zinc and sulphuric acid. A simple apparatus, however, is in course of construction for obtaining it by the decomposition of steam passed through red-hot cast-iron borings. The hydrogen can be obtained by these means very rapidly, and at a moderate cost; whereas its production by the present method is both costly and tedious, to say nothing of the objections that must always exist to the use of sulphuric acid in large quantities.

The oxygen gas is obtained by simply heating the per-oxide of manganese to redness, in cast-iron retorts. The process is simple enough, but very slow, the gas leaving the manganese very unwillingly, and 8 cubic feet only being produced from 10 pounds. The cost of firing is, therefore, considerable. There is a method which has been in practical operation of obtaining this gas from nitrate of soda, which is far speedier and less costly. The gases pass from the retorts into gas-holders in the usual way.

The lamp is of brass, and consists of a circular base, 7½ inches in diameter, and 1¾ inch in height, with an aperture in the centre, through which the lime wicks pass. In this base are contained two annular chambers for holding the gases. These chambers are separate and distinct, into one of which the hydrogen passes, and the oxygen into the other from the gasholders. From these chambers the gases are supplied by separate tubes to small mixing chambers, 5-8ths of an inch in diameter, and ½ an inch in depth, into which the gases are admitted by means of two separate cocks, one for each tube. The chambers are filled with from 16 to 20 very fine wire safety guages, through which the two gases have to pass on their way to the jets, which are screwed into the tops of the chambers. By these means the gases are thoroughly intermixed before their ignition at the points of the jets.

Within the aperture in the base is fitted a brass tube, 22 inches in length and 3⅝ inches in diameter inside. This tube is of cylindrical form, corrugated at the upper end in order that each corrugation may be opposite to the centre of one of the eight panels of the Fresnel apparatus. In the middle of each exterior corrugation is cut an aperture of about 7 inches from the base of the lamp. This aperture is about 2¼ inches long and 1 inch wide, and opposite one of the jets in every case. Within the external tube just described, a screw for putting the lime in motion is worked by a clock placed below the lamp: this screw passes through a nut, upon which rests an inside octagon tube of brass, of 89 inches in length. Upon each of its surfaces, which are flat, a metal case containing the lime is fastened every evening before lighting. These cases, which are open in front, are about 1 1-8th inches in breadth at the back, and are dovetailed so as to overflap the edges of the lime, which is in section the segment of a cylinder, so as to correspond exactly in shape with the corrugations of the external case. Each lime case when fastened to the interior tube, as above described, fits closely into one of the corrugations through the aperture, in which is exposed a surface of lime 2¼ inches long and 1 inch wide, upon which the flame impinges.

When the lime-wicks have been inserted ready for lighting the gases are turned on and lighted, and motion is given to the screw which raises the nut on which the tube carrying the lime-wick rests, keeping a fresh surface of lime always exposed to the action of the flame. No further attention is required during the burning of the lamp.

The lantern of the lighthouse at the South Foreland is similar in every respect to that of the North Foreland, the only difference being in the mode of lighting by the substitution of an oxyhydrogen lamp for the oil lamp as heretofore used. The contrast of the two lights is remarkably striking, the one being of the ordinary orange colour, and the other pure and colourles,, and of extreme brilliancy. The lamp is supplied by the two gases through tubes, which are carried up a tube in the centre of the lighthouse, the gas-generating apparatus and the gasholders being in a contiguous outhouse or shed.

THE CONSTRUCTION OF CATTLE SHEDS.

IN order to make the feeding of cattle advantageous, it is most important that the cattle sheds should be placed in the most convenient situations with respect to the fields from which the food is to be brought. In large farms, movable sheds with temporary yards may be erected according as different fields are in grass or roots, and a great saving of carriage thereby effected, both in the bringing the food to the cattle, and carting the dung unto the land; a clay bottom should be selected, in a high and dry spot, if possible, and it should ever be borne in mind that, with cattle, as with human beings, cleanliness, free ventilation, and perfect drainage, are indispensable to perfect health and a sound condition of the body.

Cattle sheds are most cheaply constructed when placed against walls or other buildings. If they are to be erected in an isolated situation, the expense of the double shed will be much less than that of the single one, to contain the same number of cattle.

Every building of this description should be capable of being well aired, by a free ventilation; and so constructed as to require the least possible labor in giving the food and clearing away the dung; the stalls should be so placed as to keep the cattle dry and clean, with sufficient drains to carry away, and reservoirs to receive the ordure. The greater number of the air-holes should be in the roof;

and if the building have gables, there should be a window in each, as high as possible, with moveable boards, or air flights, as in granary windows, which may be easily opened or shut, by means of a small rope. These precautions will not only conduce to the health of the cattle, but tend to preserve the timbers, which, from the alternate wetting by the breath, and drying, would otherwise soon go to decay.

In single sheds, the cattle are, in many parts of the country, fastened to stakes about three feet distant from each other, ranged in a line parallel to the wall, at the distance of about 18 or 20 inches from it, thus leaving sufficient space for laying down the food; but this plan is inconvenient, as it obliges the feeder to pass between the cattle when he feeds them, and is consequently attended with loss of time, and is sometimes dangerous.

The best construction is that which admits a sufficient space for a passage before the cattle, for the feeder to pass along with a wheel-barrow, when he distributes their food. In single sheds, 3 feet will be sufficient for the width of this passage; and in double sheds, the heads of the cattle should face each other, and the breadth of the passage need not be increased beyond 4 feet.

Where cattle are fed from the outside, through holes left for the purpose, many inconveniences may arise from wet weather, a severe frost, or a heavy fall of snow; but when fed within, no change of weather can have any influence on their feeding; particularly if due care be taken to keep the provender dry and under cover.

In single sheds, it would be convenient to have a provender-loft above the cattle, for holding, occasionally, hay and stray; a loft of this kind might be provided with flaps in the flooring, furnished with hinges, which, when opened, would afford an easy access for putting in the fodder from the cart, and enable the feeder to throw it into the racks when required. In this case the roof may be supported by posts or pillars, about 3 or 4 feet high, on the top of the wall, and 8 or 10 feet distant from each other; the flaps may be lifted by rings, and be made stationary in any required position, by a catch.

In many places cows and oxen are bound to stakes, without any stalls or divisions between them. In some parts cows are bound in pairs, with a slight division between them; in others, they are not bound, but every cow or ox has a separate stall, divided from the rest by wooden rails, so that they cannot get out, and so narrow that they cannot turn round. Many feeders think the cattle thrive better in stalls of this description, than when they are bound. At each stake there should be a trough for holding provender, and between these two troughs there should be another for water, common to the cattle on both sides: this water-trough, which, as well as the others, may be of stone, and of one piece, may be supplied by a pipe from a cistern or reservoir; and over them should be a perpendicular rack, for straw or hay. But though the double stalls, here recommended, are much used for milch cows in different parts of England, they have, in general, only one provender-trough for each cow, and none for water.

In paving stalls for cattle, the declevity is in general too great, which occasions them to stand uneasy. The best mode is similar to that of paving stables. Wood has lately been used with advantage for paving stalls.

In many places, it is the practice to fasten the heads of the cattle between two stakes; by which they can neither lie down in comfort, nor dislodge or destroy those tormenting vermin, which frequently prey upon them. No animal can thrive when confined in this manner.

As the dung of cows and oxen is of a liquid nature, it may perhaps be carried off by an iron grating, placed behind each animal, as nearly as can be, in the spot where it usually drops, and immediately over the stall drain, or over a wooden spout, which being continued in a sufficient slope, to a pit or reservoir without, will, with the assistance of water occasionally thrown down, empty itself therein. Should any obstruction occur, the aid of a rake or a hoe, fitted to the drain, may be easily applied; especially if the drain be only covered with a strong plank, which may be taken up when necessary. The greater part of the dung being thus carried away, the remainder will be easily removed. Such a contrivance would save much labor, and facilitate the keeping of cattle clean; it would also be the means of saving a great deal of litter, when scarce or dear. On this part of the subject it may be observed, that the waste of urine and dung, too often seen in even well-conducted farms, is much to be deprecated and lamented—everything of the kind is valuable, and should be conducted to proper reservoirs judiciously constructed and arranged for the purpose, to be afterwards used on the land.

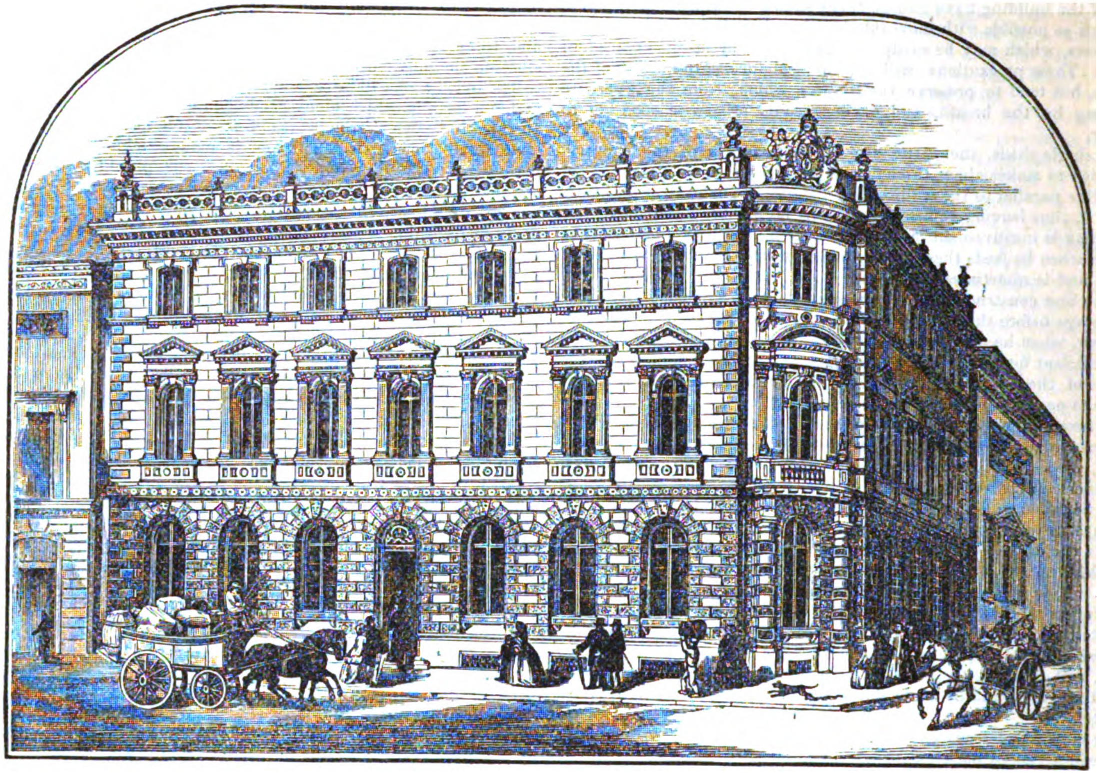
Where a great number of cattle are kept, the erection of sheds or feeding houses on a circular plan, proves very economical, and saves much labor, though a little more expense in the first cost. In this form of building, the animals stand all round with their tails towards the external wall, leaving a sufficient passage or gangway behind, for them to pass to and from their stalls; proper openings are also to be left in the wall, for discharging the dung, which may fall into covered pits on the outside. The openings should be so contrived, as to be capable of being shut up in severe weather. The area, or space in the middle, is converted to the use of feeding and attendance; and, to render the plan complete, there should be a room above, to store up the different sorts of food that the cattle may require.

The oblong plan likewise admits of much room and convenience, and is a form in which many cattle houses have been lately erected. In this kind of shed, the length of 50 or 60 feet affords room for a great number of cattle. The roof is made shelving, 14 feet in the highest part, and 6 or 7 in the lowest. The place for the reception of the cattle is separated from that wherein the dung is to be deposited, by a wall, or other convenient division, and may be about 18 or 20 feet within, to afford good room. The stalls are 12 feet long, and from 4 feet to 4 feet 6 inches wide; leaving gangways at the heads and behind the cattle, 3 feet or 3½ feet in breadth. Each stall has two doors, the one for admission of the cattle, the other for the persons who attend them; and when the buildings are of great length, it may be convenient to have additional doors at each end. There should likewise be a water-trough in each stall, and where a stream can be made to run through the whole range, it is productive of great advantage. The boxes, or mangers, for particular sorts of food, as well as racks for hay, are also necessary to render these buildings complete. The bottom of the stalls may be formed of strong planking, laid so as to have a very slight descent, and perforated with holes for the passage of the urine into the reservoir. There should also be openings in the wall, behind the cattle, between every two stalls, of about 2 feet square, for discharging the dung, with proper shutters fitted to them. Each stall should likewise have a wooden window, of about the same size, for the admission of light and for free ventilation, placed as high as the house or shed will admit. The reservoir for the dung or urine should extend the whole length of the building.

IMPROVEMENT OF THE HARBOUR OF DROGHEDA.

Since the appointment of the Drogheda Harbour Commissioners improvements have been made in the navigation of the Boyne, such as few other harbour boards in Ireland could boast of. Some of the present Commissioners recollect when there were several fords across the river, and when no vessel could come up to the quay, except what were called Preston flats; and even these frequently got fast in the mud, and could not be moved without the action of two or three tides. The flats alluded to drew about seven feet of water, and at the present day steamers drawing thirteen and a-half feet can go out and come into port readily. This and various other improvements cost the board, on a rough calculation, about £30,000, and they think it the best laid out money that has ever been expended. The Commissioners are now, however, about crowning all their enterprise in an undertaking which, when carried out, must prove of vast importance to the shipping interest and prosperity of the town. There are to be found in the Boyne obstacles which do not exist in any other river in the country. Its course from Drogheda to the sea is only four miles, and it is as tortuous along that distance as the Serpentine which flows into the Thames. The Commissioners wish to get rid of this tortuous course, and make the river a straight one; a project which eminent engineers have over and over declared to be absolutely necessary for developing the trade of the port. I quote the following passage from the last report of the Boyne Commissioners' Resident Engineer, Mr. Patrick Donor, in which he treats of this grand undertaking:—"I know of no other river similarly circumstanced where a vessel can lie at low water with such safety as in the Boyne; but from its serpentine form I am of opinion that the present mode of dealing with so important a river is tantamount to a waste of the funds, as after a century spent in dredging, such as has been last summer, its course would not be materially altered. I would, therefore, most respectfully suggest, for the consideration of the board, the desirability of opening a cut or canal, commencing between the White and Black Towers on the south side of the river, at Branagan's Point, from thence through the slob land of Mornington Bed, entering the river on the north-west side of Maiden Tower. This would do away with the present circuitous and zigzag course, and give a direct run to vessels from the harbour to the bar; and I am convinced no effectual move will be made in the navigation until this alteration in the river's course be accomplished. This new cut would be the means of drying up all the slob land on both sides of the river, from Tom Roe's Point to the stage—nearly eight hundred acres!—which is at present covered at high water."

At a recent meeting of the Drogheda Harbour Commissioners, the subject was introduced, when it was remarked that the Wexford and Dundalk Harbour Commissioners contemplated borrowing from £100,000 to £150,000 each to improve their rivers; and why not Drogheda? It appeared that Mr. Donor's estimate for the new cut, or canal, is about £50,000. After a lengthened discussion a resolution was carried to the effect that Mr. Smith, the engineer of the Clyde, be employed by the Drogheda Harbour Commissioners to make a survey, and report on the state of the river Boyne.—*Saunders.*



IMPERIAL FIRE INSURANCE OFFICE, LONDON.

IMPERIAL FIRE ASSURANCE OFFICE, LONDON.

A contemporary, at one time speaking of the establishments of this class in London, appropriately remarked, that "what the club is to the street architecture of the West End, the assurance office is to the city;" and for the subject of our illustration we have selected one of the most important edifices devoted to assurance purposes in the metropolis of Great Britain. It stands on the delta formed by the union of Threadneedle and Broad Streets, and therefore occupies a triangular piece of ground—the latter façade being, however, considerably longer than the other. The character of the elevation is sufficiently expressed in the woodcut to render minute description superfluous, but we may draw attention to the sculptured keystones on the ground floor, opens which symbolise the city, power, fire, water, &c., respectively, and together with the armorial devise of the company, were executed by Mr. J. Thomas, sculptor. The principal staircase, which is stated to be of very elegant design, leads to the various floors, on the ground of which are the offices for town and country departments of the *fire* office, whereas those of the *life* branch, a highly decorated board room, with other apartments are on the first floor; the second comprising a foreign office with strong room, resident manager's suite of apartments, and accommodation for clerks, porters, and the *cuisine* in the basement. The cost of erection, including fittings and furniture which are of suitable character, was about £15,000, which would seem to be a very small sum. Mr. John Gibson of 13, Gt. Queen-street, Westminister, was the architect; Messrs. Piper, the builders.

We hope to be enabied to present some other illustrations of street architecture in London, and in doing so shall select the best available subjects.

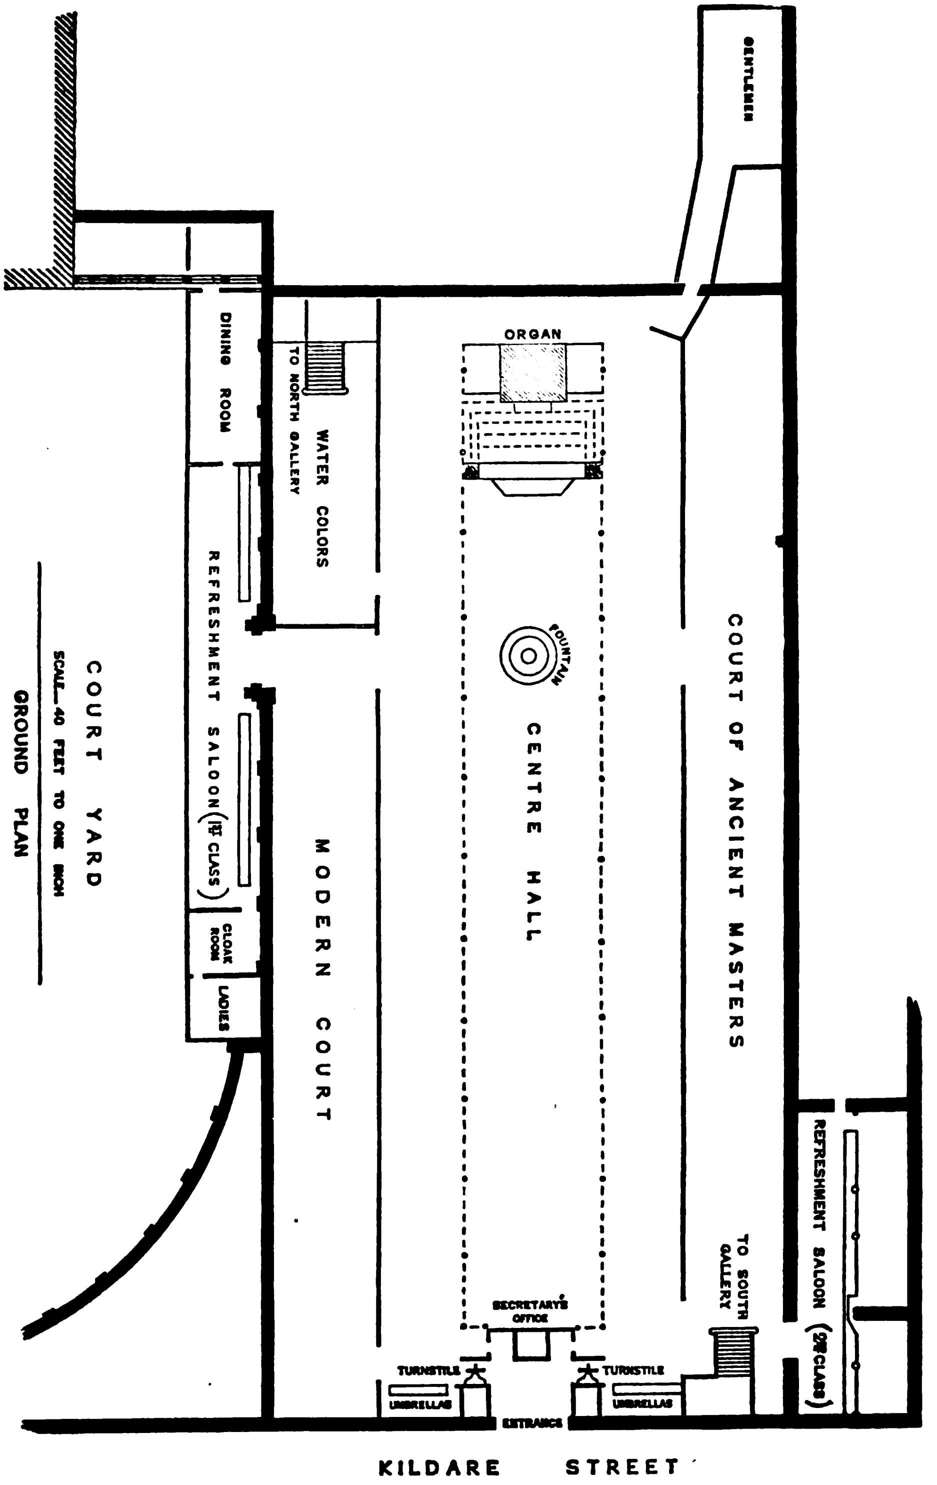
COMING AUCTIONS OF TIMBER AND OTHER BUILDING MATERIALS.

At Dublin, on the 10th inst., Mr. Thomas H. Carroll will have an auction of wood goods at his stores, Sir John's Quay; and on the 17th Messrs. John Martin & Sons will hold a similar sale at North Wall. A more general auction, comprising both timber in baulk and cut, ready made carpentry, slates (which at present are exceedingly scarce), sewerage pipes, &c., &c., will be held by Mr. Crooke on the 3rd inst., at 2, Hendrick-place, near Queen-street; and on Tuesday, 8th inst., he will hold an important sale of building materials, timber, &c., at Mr. W. Burke's yard, North-wall. At Liverpool, on the 10th and 11th insts. (as likewise announced by advertisements herewith), will be important sales of mahogany, Mr. Challoner, broker, from whose circular relating thereto we take the following:—"The next auction sales will include 6 cargoes, viz., 1 of City St. Domingo, 1 of Porto Plata, 1 of Honduras (Belize), 1 of Mexican, 1 of Santana, and 1 of Laguna. The trade will do well to pay a visit here *before the sale days*, and so the better mature their minds for business at Auction. I do not venture to tell them their business, but if I were a wood buyer, I would next month buy mahogany freely, cut it up the following month, and so hold a large seasoned stock, to insure the very best work and cheapest in the world. It is very sad that people will not exercise their common sense, and more extensively use the best and cheapest (because of the ample tare) wood in the age we live in, besides being most readily worked, namely, mahogany. I perceive that an eminent professor has been employing himself before the association in Manchester to tell us, by-and-by, about wood, and among others, mahogany. Why, the Spaniards, centuries back, told us, and that, too, practically, that it (mahogany) was better than their own oak, and Spanish oak is known to be the best in Europe, and they established this fact at the time they themselves were the best shipbuilders in the world, and now, at length, our naval men agree with the Spaniards, and 16,000 loads, similar to the mahogany for sale on the 10th and 11th proximo, are supplied this year by one house, for the dockyards."

Timber.—At Messrs. William Kelly and Co.'s sale on Thursday there was considerable disposition to buy evinced by the trade. The attendance was large and respectable, and the sale is considered to have been the best of any of the autumn sales. There were sold:—

12,159 pieces of Miramichi and St. John deals and battens, from 12 to 24 feet long, at £14 15s. to £15 10s. per 120 of 12 feet 9 x 3.
971 pieces of first quality pine plank at £27 10s. to £35 5s. per ditto.
419 pieces of second quality pine plank at £21 10s. to £26 15s. per ditto.
239 pieces Miramichi pine deals at £21 5s. per ditto.
600 pieces of Quebec spruce deals at £17 per ditto.
240 pieces Quebec second quality spruce deals at £16 per ditto.
840 pieces of third quality Quebec spruce deals at £14 15s. per ditto.
1,417 pieces of red deals, 16 to 22 feet long, at £24 2s. 6d. to £25 per ditto.
765 pieces of red battens, 16 to 22 feet long, at £22 15s. to £23 per ditto.
60 pieces of red pine timber at £3 7s. 6d. per ton.
30 pieces of birch timber at £3 10s. per ton.
19 pieces of ash at £3 10s. per ton.
12 fathoms of lathwood at £7 7s. 6d. per fathom.
2 lots of Quebec board timber at £3 12s 6d. and £3 15s. per ton.
1 lot of small-sized pine at £2 12s. 6d. per ton.
108 pieces of under-sized Memel at £3 5s. per ton.

M. Zwirner, the architect by whom the work of completing the cathedral of Cologne has for many years been conducted, died on the 22nd ult.



GROUND PLAN OF FINE ARTS EXHIBITION BUILDING, ROYAL DUBLIN SOCIETY.

THE DUBLIN EXHIBITION.

We have made frequent allusion since the inauguration of the Exhibition of Fine and Ornamental Art, now being held in the agricultural hall of the Royal Dublin Society, to the general features of its various departments; but for those at a distance who have not yet had an opportunity of visiting the building, and who might desire to be acquainted with its arrangements more clearly than mere description could convey, we insert herewith an illustration of the ground plan correctly drawn to scale, and from which an idea thereof, and of the extent, may be formed with facility. The collection secured for this Exhibition reflects the highest credit both on the contributors and on those officials and members of the committee who in such good earnest exerted themselves in the undertaking from its earliest stage, and we are happy to find—though at first we were somewhat apprehensive of the reverse—that in a pecuniary point of view the result has far exceeded their most sanguine expectations. It may not be inappropriate here to mention that it is contemplated by many of the exhibitors and habitual frequenters to present Mr. Henry Parkinson, the efficient and courteous secretary, with a suitable testimonial, which we trust will be as important as his worth deserves.

NEW ROMAN CATHOLIC CHURCH, CITY QUAY.

Recently we announced that a large church was proposed to be erected on the City-quay, where, as most of our readers are aware, there is a very densely populated locality, chiefly inhabited by the lower classes—coal heavers, seamen, &c. The Rev. Mr. M'Cann, a curate in the parochial church of St. Michan's, undertakes out of his private purse to supply the requisite funds for the erection of a commodious structure for the requirements of so large a congregation, and the building was actually progressing, according to plans obtrusively furnished by a builder in this city, when some differences relative to the contract arose, and the works were temporarily suspended. Fortunately, therefore, the perpetration of as ugly, unsuitable, and barn-like a church as ever was built in the wildest district in Ireland was thereby prevented, and the services of Mr. Bourke, architect, being subsequently obtained, a new design, of which the following are particulars, was decided upon. Instead of a long ill-proportioned parallelogramic block, with walls some fifty feet high, a flat ceiling, and a distorted portico, surmounted by what some, drawing largely upon their imagination, might term "a pediment," and other monstrosities, as shown on the first *designs* (save the mark), the plans will now comprise nave, chancel, side chapels, sacristy, and porch, and the elevation, of Gothic design, simple but effective, will at once proclaim the purpose of the structure. The general dimensions of nave are 130 feet by 34 feet in the width, the height to apex of roof, which is of open timber work, being 51 feet. Towards the quay the elevation will present a gabled end with pyramidal pitch, two moulded entrance doors, and a five-light lancet window, the chancel at opposite end being lighted by a three-light window. A belfry rising to a height of 85 feet will form a prominent feature. On the 24th ult. the corner stone was laid by the most Rev. Dr. Cullen.

A LOCAL COMMITTEE FOR THE EXHIBITION OF 1862.

On the 21st ult. a meeting was held by the Committee of Manufactures of the Royal Dublin Society for the purpose of adopting such measures as would secure the adequate representation of Ireland at the great exhibition in London in May next. Dr. Sayers presided.

Mr. Waldron, M.P., explained that the *Times* had accused Dublin of being the most apathetic of any other city with reference to this undertaking, and the committee above-named thought they should adopt some initiatory steps to induce manufacturers to come forward liberally, and remarked that "recollecting the immense advances that Ireland had made since 1851, it would be very deplorable, indeed, if there was not at the coming exhibition a proper display of Irish products and manufactures."

Mr. Gilbert Saunders thought that "as there were no great centres of trade or manufactures in Ireland, the appointment of trade committees was not desirable. For the purpose of applying for space and doing other necessary matters, a *local* committee would be found more expedient."

Mr. Gresham expressed a hope that the present opportunity would *not* be lost of securing, as far as the committee could by its exertions, a full representation of Irish industry at the Exhibition of 1862. He considered that any failure in the matter would be very lamentable indeed.

Mr. Fry believed that such persons in Ireland as wished to exhibit had already made application for space. He did not see how the meeting could render much assistance in the matter.

Mr. Maunsell, as hon.-secretary to the society, stated the position of the case. The Great Exhibition of 1862 had taken a deep hold on the public mind. The Exhibition would represent the various departments of the manufactures and industry not only of the Continent of Europe, but also of the colonies and America at large. While considering the demands for space at the exhibition, the promoters of the project seemed to think that the applications from Ireland were *not as ample* as the state of industrial and manufacturing enterprise in Ireland justified, and the attention of Ireland, and *of Dublin particularly* was called to the matter. He believed this was done in a kindly spirit towards this country, for the purpose of stimulating it to exertion. Anything done in such a matter as this by a single person was badly done as compared with what could be effected by association, and the committee of manufactures deemed it best to call this meeting in order, by organization of some sort, to give a stimulus to manufacturers, and aid the movement in an effective manner. After the circular sent in March last by the Royal Commissioners, Lord Talbot de Malahide was appointed to represent the society on the committee of advice, but nothing, he believed, was since done. Ireland, in the various departments of manufactures—poplins, laces, embroideries, ornamental carvings, furniture, saddlery, damasks, linen, cutlery, &c.—could make a most important and creditable and valuable display, and it ought to be the object of the committee of manufactures to promote such a display as much as possible. *Only nine days now remained* for making applications for space at the exhibition, and he conceived the best course to be for the committee to sit daily until the close of the month. The speaker concluded by moving the following resolution, which passed unanimously:—"That the committee of arts and manufactures should sit from day to day for the remaining period, during which applications for space could be made, and by publishing advertisements, affording information, taking charge of and forwarding applications for space, and adopting such other means as may be thought best, endeavour to have carried out such an exhibition of the products of Irish manufactures as may best maintain the character of the country for progress and development in the arts of industry."

PUBLIC SCHOOL BUILDING IN IRELAND.

From the recently published report of the Commissioners of National Education we find that "at the close of the year 1860, the number of schools in operation was 5,632, being an increase in the schools in operation of 136, for the year 1860, as compared with the year 1859;" also that "grants were made at various times amounting to £8,299 3s. 3d. towards the erection of 37 ordinary national schoolhouses, not yet opened, which will contain in the whole 62 separate schoolrooms. In addition to the ordinary national schools not yet built, there are in course of erection seven model schoolhouses of various kinds, containing in the whole 20 schoolrooms. When these 54 buildings shall have been completed, they will afford accommodation to 7,655 additional children. Of the above 47 grants for the erection of ordinary schoolhouses, 12 were awarded during the year 1860, involving liabilities to the amount of £2,982 15s. 7d. The number of schools struck off during the year 1860 was 98, of which 82 had been previously in operation, and nine had been suspended; the remaining seven were simply cases in which grants for building had from time to time been awarded, but for various reasons have now been cancelled."

ANCIENT IRISH HISTORY.

The following review of the above-named work, by Professor Curry, appeared in a recent number of the *London Morning Herald*:—

"A remarkable work has just been brought out in Dublin, and as it is the only novelty at present fixing local attention, a line in reference to its character may not be out of place—the more especially as it is likely to attract the notice of archæological students in England and elsewhere; nor may less profound readers fail of deriving information from its pages, the variety of its contents being sufficiently ample to embrace a large range of differing tastes. The title of the book is 'Lectures on the MS. Materials of Ancient Irish History;' and, besides the detailed account which it furnishes of ancient Irish and other MS. (many of which, and the most valuable, were stowed away unnoticed in libraries, public and private, at home and abroad), it treats minutely of ancient historical and imaginative tales, of the remains of the early Christian period, of early ecclesiastical MSS., and of the so-called 'prophecies.' It is astonishing to what an extent the prophecy mania raged, and still rages, in Ireland. Amongst prophets whose predictions were believed in with implicit faith were Conn, King of Ireland, surnamed of the Hundred Battles; Fionn M'Cooil, the renowned chief of the Finnian heroes; and other laymen of note in history and tradition—so that the saints had not all the honour of inspiration to themselves. Most of the prophecies were directed against the English sway in the country; and such was the impression which the impostures made upon the popular mind, that the English in their turn availed themselves of them to aid in establishing their authority, and impressing the Irish with the notion that resistance to their power would be worse than futile. Sir George Carew, Lord President of Munster, in the reign of Queen Elizabeth, did not disdain to stoop to this expedient."

INSUFFICIENT WORKHOUSE ACCOMMODATION.

At a recent meeting of the Guardians of the South Dublin Union, a resolution to the following effect was proposed:—"That in consequence of the want of accommodation in the school building, and the fact of some of the dormitory being occupied by the officers of the union, the plans for a new building, which had been submitted to the board, should be adopted." There was no *seconder* to this, and an amendment, duly seconded, was moved—"That the consideration of the matter be postponed for six months," the speaker urging that the expense of the proposed building was too great, and that the ratepayers were too heavily taxed to bear any additional burden which was not absolutely necessary. Another amendment was then proposed—"That a portion of the plan in question be approved," but it was lost by a majority of 13 to 5.

The first amendment was adopted.

THE MATER MISERICORDIÆ HOSPITAL.

Though we have on former occasions noticed the progress and features of the large pile of building for some time in course of erection at Eccles-street, in this city, and intended as an hospital to be presided over by the Sisters of the Order of Mercy, we may appropriately, on the occasion of the opening, which took place on the 24th ult., recur thereto and quote description from our contemporary the *Freeman*:—

The principal or north-west façade, facing Eccles-street, is nearly 300 feet in length, and is divided into five compartments by slightly projecting pavillions at the ends, and by a great central projection over 70 feet in length, having in the middle portion a recessed portico, with massive Ionic columns, 3 feet 6 inches in diameter, and forming together, with four adjoining pilasters, a frontispiece crowned by a great pediment, which overtops the rest of the building. Behind this will be the cupola, rising 120 feet from the surface. Two approaches to the ground floor lead into spacious waiting halls for out-patients of both sexes; opposite these are the approaches to the dispensary for out-patients; and on either side are doctors' rooms, with private consulting rooms, ward dispensaries, &c.; and in the rere of all is a spacious laboratory, with all necessary accessories. Passing through the corridor right and left, the temporary reception wards are approached, together with the bath-rooms for patients on entering. When the entire shall have been completed, the corridor referred to will pass round the entire building, looking out on the enclosed quadrangle. On the wings on ground floor will be, on the male and female sides, spacious wardrobes, fumigating rooms, hospital stores, heating apparatus, entrance halls and staircases from recreation grounds, servants' rooms, and refectories, together with lifts for beds and for the prepared food for the patients. The rere of the ground floor will contain the great kitchen, 70 feet in length, the larder, stores, oven and bakehouse, laundry and drying-rooms, vapour baths, together with a boiler and engine-rooms for raising water to the tanks on the roofs. The new water works bill will enable the architect to avoid the outlay necessary for the pumping apparatus, and will also relieve the good Sisters from a great yearly tax in the expenditure required for the working of a steam pumping engine. The second floor is approached by two circular stairs of moulded granite. Passing through the portico to the entrance hall, which is richly furnished with mosaic pavements, niches, pilasters and lofty domed ceiling, on either side are the public reception rooms great linen dispensary, accident wards, convalescent rooms, &c. The apartments on both the upper stories, will be used at present as general wards, until the completion of the entire building. As before observed, the corridor, twelve feet in width, with lofty groined ceilings, will branch round both wings, and will terminate in the chapel at rere. Opposite the entrance hall is the grand staircase, which requires to be seen to be fully appreciated; behind the grand stairs and communicating with it is the beautiful apartment 50 feet by 34, adorned with Corinthian columns, and which is now used as a temporary chapel, to be applied in future to the general public uses of the establishment. On either side of this apartment are cross corridors leading to the operation wards, baths, &c., on both stories, and over it are the pathological museum and an operation theatre altogether unequalled in this country. On both wings in the upper stories will be the great wards for both sexes, extending, from front to rere, 330 feet, having in central projections the staircases, *tisaneries*, baths, closets, &c. In the rear of the building will be 28 spacious private rooms for pension patients, with central corridors terminating in the chapel, which will occupy the central portion of the rere of the building, and will be cruciform in plan, divided into nave and transepts, the latter of which will have aisles with arcades and lofty domed ceiling. The nave will be set apart as a choir for the community, and will communicate with the projected convent at rere by a corridor entered through a campanile, which will rise 90 feet above the surface, and which will also form the vestibule of approach from the convent to the hospital wards, through two quadrantal corridors branching right and left. It is expected that the two upper stories when completed will give ample accommodation for 500 beds, and which, together with the ground floor, if used in a period of calamity, would give accommodation for 700 beds.

It is to be regretted that there is one drawback to the imposing appearance of the chaste and massive façade. An ugly excrescence rises from the roof behind the portico and causes disappointment in the minds of those who may be unaware of the causes. This excrescence is in fact the base of a cupola of pleasing and original design, intended to be the grand crowning ornament of the building, and to serve not only as a clock and bell tower, but also to be in connection with the campanile at rere, the chief medium of ventilation.

A proposition was made at a recent meeting of the Midland Great Western Railway Company to subscribe £21,000 to the construction of the Westport extension of the Great Northern and Western line, and was most unfavourably received.

THE MANUFACTURES OF IRELAND.

On the principle of "Better late than never," we are glad to see, even at the last moment, some stir on the part of the Irish manufacturing interests as regards the representation of their country in the Great Exhibition of 1862. The skill and industry of the Sister Isle furnished some excellent contributions to that of 1851, and perhaps no country in the world has progressed more in proportion during the decade which has since elapsed. Irishmen have become of late years more practically alive to their own interest than they were formerly, and it seems to us almost unaccountable that such apathy should have been shown on the present occasion. A very extraordinary statement was made at the meeting of the Royal Dublin Society, which took place on Saturday, which, although it is not sufficient to account for the delay, may perhaps be taken as a curious illustration of the indifference prevailing in Ireland upon matters of material importance. The Lord Mayor of Dublin was asked to convene a meeting for the purpose of taking steps to secure some representation of Irish manufactures at the next World's Fair, and that functionary declined because he did not intend to be an exhibitor. The Lord Mayor of Dublin is, we believe, a silk and poplin manufacturer, and it is of course a matter altogether for his private judgment whether or not to exhibit the products of his manufactory. But his refusal, as Lord Mayor, to discharge what we must consider to be his duty, because as a private individual he had no direct interest in the matter, seems to be entirely inexcusable. As the chief magistrate of a city, interested to a considerable extent in manufacturing industry, it was, we should have thought, one of the incidents of his office to aid in seeing a proper representation of that interest on an occasion so remarkable. Lord Mayors are in the habit of commencing and presiding at meetings relating to questions much less germane to the interests with which they are *ex officio* supposed to be identified. Municipal functionaries are generally believed to be the mouth-pieces of the community over which for certain purposes they preside. Surely the adequate representation of the industrial art of Dublin and of Ireland was as important a matter for the Lord Mayor of Dublin, and one as worthy of his attention, as the Galway contract, in favour of which this very Lord Mayor appeared at the bar of the House of Commons some few months back. If Dublin is interested in steam-packet communication with America, if it be essential to her material prosperity that a particular steam-packet company should be propped up by Government funds, it is of no less moment that the buyers of the world should see what she is capable of producing in the way of manufactures. A good "stand" for his wares is highly prized by the shopkeeper, and it would be very extraordinary if Ireland were to reject that offered to her for productions in the Exhibition of 1862. We are glad to find from the tone of those who spoke at the recent meeting that the full importance of all this is now recognised. The encouragement resulting from the last Great Exhibition will no doubt have a very perceptible effect upon the forthcoming one. Not merely in poplins, lace, linens, and other manufactures, which are peculiarly their own, but in a great many walks of art, Ireland has achieved great eminence. In designing and ornamental carving the national cleverness has been conspicuously shown. The mineral productions of the country are remarkable; and in a great many branches of art Irishmen ought to occupy a foremost position. Before the rest of the world we ourselves should be a little ashamed to see so important a part of the United Kingdom miserably represented. It would look as if we had a Cinderella in the family, and we should feel it as a kind of reproach to us. People from abroad would hardly believe that she was a voluntary Cinderella. We do not wish to see her one. She is as clever, as handsome, and, if she pleases, can be as well dressed as her two sisters, and we wish to present her in her most becoming toilette to all the princes and potentates who will be here in 1862.—*Globe.*

ROMAN BRIDGES.

The Roman bridges are described by Bergier, as possessing all the requisites met with in a modern bridge; they consisted of piers, arches, butments, carriage-ways, and raised banquettes or foot-paths separated from the road by a railing, and sometimes furnished with a cover to shelter passengers from the weather. Their solidity and proportions prove they must have been constructed on sound principles.

The superintendence and care of bridges was always an important object with the Romans; it was at first committed to the priests, who thence obtained the name of *pontifices*; afterwards it was given to the censors and curators of roads; and at last the emperors took it into their own hands. In the middle ages, the building of bridges was esteemed to be an act of religion; and about the close of the twelfth century, St. Benezet founded a regular order of hospitallers, under the denomination of *pontifices*, or bridge-builders, whose province it was to erect bridges, appoint ferries, and entertain travellers in hospitals built on the banks of rivers.

Of the bridges of antiquity, that built by Trajan across the Danube, near the town of Warbel, in Hungary, is allowed to have been the most magnificent. It was destroyed by Adrain, but some of the piers may still be seen.

The remains of a bridge, bearing as strong marks of ruined magnificence as any of antiquity, are to be met with at the bottom of a hill, on which the town of Narni is seated, on the road between Loretto and Rome. This bridge was built by Augustus, to join two mountains, between which flows the river Nera, and to enable the inhabitants of Narni to pass on a level from one mountain to the other. It was of an extraordinary height, and its whole length, 850 palms (637½ feet). It consisted of four large unequal arches.

The next considerable Roman work of this kind is the *Pont du Garde*, about three leagues from Nismes; which serves the double purpose of a bridge over the Gardon, and an aqueduct for supplying the people of Nismes with water. The bridge, which consists of six arches, is about 465 feet in length, and supports a second series of eleven arches, which are continued beyond the extremities of the bridge, and form a junction with the slope of the mountains on either side; it is about 780 feet long. Over these is a third series of 35 arches, much smaller than those below, 850 feet in length, supporting a canal on a level with the two mountains, along which the water is conveyed to Nismes by a continued aqueduct. This extraordinary edifice is built with very large stones, held together by iron cramps without cement. The whole height is 190 feet above the lower river.

The bridge of *St. Esprit*, near Lyons, is of Roman origin, and has long been deemed one of the finest and boldest of the ancient bridges of France. Its whole length is upwards of 800 yards; it is very crooked, bends in several places, and makes many unequal angles, particularly in those parts where the river has the strongest current. The arches run from 15 to 20 fathoms in width. The feet or bottoms of the piers consist, in their lower parts, of several courses of footings jutting out like steps; and are each protected by two pedestals, projecting from them. Between the large arches are smaller apertures, like windows, reaching nearly to the tops of the pedestals, about the middle of the pier. This mode of construction was adopted with a view to break gradually the mighty force of the Rhone; the several courses of steps, jutting out from the piers, oppose and break the stream by portions, and prevent it from operating with its whole force upon the fabric at once; and when the flood rises so high as to cover the steps and pedestals, the small arches or windows, allow the water to pass freely, which otherwise would have choked in the upper part of the great arches, and endangered by their being forced up.

The city of Valenza de Alcantara, in Spain, is celebrated for its ancient bridge over the Tajo, or Tagus about 25 miles from Madrid, built in the time of the Emperor Trajan; and, as appears from an inscription over one of its arches, by the people of Lusitania, who were assessed to defray the expense. It is 200 feet above the water, and though consisting of only six arches, is 670 feet in length, and 28 in breadth. At the entrance of the bridge is a small chapel dug in the rock by the pagans, who dedicated it to Trajan; but when the Christians obtained possession, they consecrated it to St. Julian.

Near the old town of Brioude, in the Lower Auvergne, or department of the Upper Loire, is a stupendous stone bridge, of one arch, the largest with which we are aquainted. It is attributed to the Romans, and stretches over the whole stream of the Allier. The extremeties of the arch rest on a natural rock, which occasions the spring on one side to be lower than on the other; it is formed of squared stones in two ranks; the rest of the fabric is of rubble-work. The span of the arch is 181 feet; its greatest height, from the level of the water to its intrados, 68 feet eight inches; and the bridge, 13 feet.

ON THE CHEMICAL CONSTITUENTS AND GROWTH OF TIMBER.

Trees, and all other vegetable productions, are organized bodies, the constituent parts of which are resolvable into their original elementary forms.

The *inorganic* substances, which enter into the composition of every plant, and which are by its innate properties converted into its organized as well as inorganized components, are derived from the soil by the roots, or by parts performing analogous functions; and also from the atmosphere by the leaves.

These substances may be primitive or secondary; that is, they are either in their primeval inorganic state, or they have returned to it from having once been organized, either as animals or vegetables.

The elementary substances essential to all plants consists of carbon, hydrogen, and oxygen; but to these is frequently added nitrogen; and sulphur, phosphorus, silica, soda, potass, lime, &c., are also found in different parts of a fully-developed plant. Of all these *inorganic* substances, oxygen forms more than a third of the bulk, hydrogen a little more than one fifth, and nitrogen in varying quantity, but never much exceeding three per cent.

The *saline* or mineral constituents of plants consist of the carbonates of potash, soda, lime, and magnesia. *Sulphates* and *phosphates*, of potash, soda, ammonia, lime, and magnesia, some *chlorides* and other substances which are derived from the soil and can be freed from the organic matters by the action of fire.

Chemists have reduced 1,000 lbs. weight of the several undermentioned substances, all equally dry, to ash by burning, with the following results:—1,000 lbs. of elm timber, yieldinging 19 lbs. of ash; 1,000 lbs. of poplar, 20 lbs.; 1,000 lbs. of willow, 4½ lbs.; 1,000 lbs of beech, 1½ to 6 lbs.; 1,000 lbs. of birch, 3½ lbs.; 1,000 lbs. of oak, 2 lbs.; 1,000 lbs. of pine, 1½ to 3 lbs.; and 1,000 lbs. of ash, 5 to 6 lbs.

It will be perceived from this list of substances, that trees require only a small proportion of mineral nutriment, from which circumstance it has been doubted whether its presence be not merely accidental, but, from the constant and unvarying quantity of mineral matters found to exist in certain substances, this supposition does not appear to be well founded. Under the same circumstances it should be observed, that trees will succeed where corn and other vegetables, which require a greater proportion of mineral aliment, would naturally perish.

If we examine the cross section of a tree, we shall find it to consist of three principal parts: the pith, the wood, and the bark. The wood and the inner bark consist of a number of vertical tubes which convey the juices or liquids, up and down, from the roots to the leaves. These tubes are traversed by the medullary rays, which extend in straight lines from the centre to the circumference. The medullary rays connect the pith or cellular substance of the tree with the outer bark, and when they are cut in a sloping direction they produce the beautiful-varied appearance called *figure* in the wood.

From their hardness and compactness the medullary rays may serve, in some measure, to resist the pressure of the accumulating annual rings, and to keep open the tubes for the passage of the sap in the interior of the tree for a longer period than if they did not exist.

The important office of the leaves is to inhale the gaseous food contained in the atmosphere; they are, in fact, an expansion of the twigs of the tree, and their bases the elongations of the tubular vessels in the wood. The leaves are full of tubes or vessels, particularly on their under sides, which comunicate with the inner bark. The sap ascends from the roots through the tubes or vessels of the wood, and is distributed in the woody fibres of the leaves, whence it is returned by the pores in the inner bark to the roots. In the daytime, the leaves absorb carbonic acid from the air, which becomes decomposed, and the oxygen given off, at night, this process is reversed, although in a slower degree than in the former instance; about one-third of the entire quantity of carbon required by the tree is thus extracted from the atmosphere As the sap descends, it forms another annual ring or layer of sapwood, and inner bark, by which the bulk or circumference of the tree is increased, and goes on increasing year after year. By counting the number of these so-called annual rings, which are very distinct in some species, it is supposed the age of the tree can be ascertained; but we are inclined to doubt this hypothesis, when we consider the immense number of rings in some trees which bear no comparison to the time they may be supposed to have been growing. Although the sap of the tree is most active in the spring and during the period of vegetation, it has been ascertained that it is never altogether stationary, except during severe frosts.

The annual rings present a great difference of character in different species of trees: in resinous woods, such as the cedar, larch, and pine, the rings are very distinct, while in the beech, and some others, they are so small as scarcely to be discerned. They also differ in their structure in different woods: in the softer kinds of woods their structure may be termed spongy, while in the oak, elm, and other closer-grained woods, they are hard, compact, and very distinct.

The pith, which seems to perform an important part, like the marrow in bones, while the tree is young, appears afterwards to lose much of its office in the growing economy of the tree; for, as the inner layers or rings become indurated, and formed into heart-wood, the pith is nearly or altogether extinguished, and the tree in this state consists only of heart-wood, sap-wood, and bark. The sap-wood, becoming heart-wood, as the layers or rings increase, and the outer surface of the bark dries, perishes, and falls off.

From the elasticity of the increasing rings, great pressure is exerted upon the heart-wood, which, when the trees becomes of considerable bulk, must materially, if not altogether, prevent the circulation of the sap in the inner portion of the tree; and, following this chain of reasoning, it might, we think, be shown that the *free* growth of a tree, and the full development of the leaves depend on the accelerated circulation of the sap, arising from this pressure through the whole area of the sap-wood, bark, and leaves, when the easily-compressed cellular substance of the pith has ceased to act.

The tardy circulation of the sap in old trees arises either when the pressure has been removed by the tree becoming hollow, or when the process of hardening has so far proceeded as to bear no proportion to the quantity of the sap-wood in which it is enveloped. The smallness of the leaves, and the short and stunted shoots, which are produced on the branches of old trees, or such as are said to have done growing, may thus be accounted for. When the induration has reached its extreme limits, the proper time has arrived for the tree to be cut down.

The hardening of the sap-wood, and the consequent premature age of the tree, may arise from other circumstances than those of mere old age: ungenial climates and situations check the free circulation of the sap, and the new layers of wood and inner bark are thus imperfectly formed, or greatly attenuated in substance and the tree shows all the signs of age, at a period when, had it been reared under different circumstances, it would have still appeared young and vigorous.

External accidents, by which water is admitted into the solid substance of the tree, projuce the same injurious though more rapid effect of rotting, and the consequent premature decay of otherwise valuable, sound, and flourishing trees. as it is attributable to ungenial situations. Such accidents should be carefully guarded against, or, where they occur from storms which break the branches, the best remedies should be speedily applied.

Hedgerow timber is particularly exposed to injuries of various kinds, and the practice of planting valuable trees in such situations should be sparingly adopted, or altogether avoided. It has been the common practice to store hedgerows with timber trees, as thick as chessmen on a board, to the mutual injury of the growing crops and the trees themselves; while waste corners and pieces of ground, suitable for the trees and profitable only when planted, are left vacant in their native barrenness, although a wise Providence has so constituted the majority of trees, that they will flourish upon, and indeed prefer, situations that are altogether unfit for the production of corn and other vegetables.

If this fact remained unknown to our forefathers, when the science of chemistry was imperfectly understood, there is now no reason why we should continue a practice at once opposed to nature, experience, and science, attended as it is, moreover, by a constant loss in a pecuniary point of view.

BIOGRAPHY OF GIOVANNI LORENZO BERNINI.

THIS architect was born in 1598, and died in 1680. His father, Pietro Bernini, a Florentine, was a painter and sculptor of more than common talents. Giovanni's first work in architecture was the great central altar of St. Peter's, remarkable for its twisted columns; its novelty, singularity, and the difficulty of its execution surprised, and had many imitators. By desire of the Pope, he adorned with niches the four great piers which support the cupola of St. Peter's. He was employed in the construction of the palace Barberini, particularly in that of the stairs, the great hall, and the principal front. The front has on the lower floor a Doric, very well understood; but the application of so many cornices, and the great arched windows, do not add to the beauty of the structure. The front of the Propaganda Fide is also the work of Bernini: that building threatened ruin, to prevent which he erected a battering basement, which increased at the same time both the beauty and strength of the structure. Urban VIII. wishing to complete the front of St. Peter's, which, according to the design of Maderno, required, at its extremities, two steeples, gave the commission to Bernini. He designed and executed the fine fountain of the Piazza Navona. For Prince Ludovisi, he begun a great palace, which in its principal front presented five faces; this edifice was afterwards converted into a great law-court, called *Curia Innocenziana*, one of the finest palaces in Rome. Alexander VII. gave him many works to execute, among which is the piazza before St. Peter's. By order of this Pope he planned many buildings, among which is remarkable, the palace of Santi Apostoli. The very elegant church, of an elliptic figure, of the Novitiate of the Jesuits, is likewise his. Louis XIV. and Colbert his minister, both admirers of the fine arts, ordered Bernini to make drawings for the palace of the Louvre, for which building the first architects were stimulated; these drawings pleased so much, that the monarch sent him his portrait set in gems, and wrote very engaging letters to the Pope, and to Bernini himself, that he might go to France to execute them. In consequence of which, though an old man, he left Rome, and went to Paris, where he was received as if the only man worthy to work for Louis XIV. When Bernini had seen the front of the Louvre, by Perault, he said publicly that his coming to France was useless, where there were architects of the first class. This trait does more honour to Bernini than all his abilities as an architect. In fact, with regard to architecture, which he was sent principally for to France, he did nothing. He made the king's bust, and during the eight months he staid in France, he was paid at the rate of five pounds a day; and received at last a gift of 50,000 crowns, and an annual pension of 2,000, and a pension for his son, whom he took with him, of 500. When he returned to Rome, in gratitude to his Majesty, he made an equestrian statue, which was placed in Versailles. Under Pope Clement IX. he embellished the bridge of St. Angelo with an elegant iron balustrade.

Large schools have been built at Moate, Co. Westmeath, adjoining the new convent house, erected by the Sisters of Mercy. The foundations are being prepared for a parish church in the Gothic style, and 78 feet in length by 31 in width; comprehending nave and aisles, with an arcade of five bays on either side. A tower, 126 feet high, will be added.

A new school-house and dwelling for the Sisters of Charity are to be built at Caher.

A new Protestant hall is to be erected in the town of Longford. Proposals were to have been lodged on 28th ult.

The works on that portion of the Irish south-eastern line, in the direction of Ballywilliam, are reported to be in a forward state.

The Galway Harbour Commissioners have passed a resolution to select a site for a new graving-dock, and a committee of three have been appointed to give effect to the object.

The church of Kenawley, Co. Fermanagh, is to be enlarged. Architects, Messrs. Welland & Gillespie, Ecclesiastical Commissioners.

Various works are to be executed at the churches of Granard, Co. Longford, and Sellerna, Co. Galway. Same architects.

The following tenders for the construction of six of the new forts on Portsdown and its western approaches have been accepted by the Government:—For Wallington, that by Messrs. Lee & Sons, Nine Elms, Vauxhall, London; for Fareham and Newgate, that by Messrs. Wilson, Great Suffolk-street, Borough, London; and for Nelson, Southwick, and Wedley, that by Messrs. Treadwell, Parliament-street, Westminster.

Tenders have been invited by the Corporation of the City of Dublin for the loan of £300,000, required for their waterworks. No rate of interest is specified, leaving that to be fixed by the lenders. The security offered to borrowers is of the most satisfactory character, and this view of it is vouched by the highest legal opinions. There can be no doubt but that the money will be easily obtained on such undeniable security as the corporation can offer.—*Freeman.*

A novel tramway has been introduced near Newcastle. It consists of blocks of cast iron about 18 inches square and four in thickness, the surface being chequered with small oblong pieces protruding so as to give horses good footing, but not causing the slightest obstruction to the wheels of vehicles. The blocks are laid upon a firm substratum of compost, and will be on a level with the other portions of the road.

Mr. John Owens, of the Royal Engineer Branch of the War Department in Ireland, has been presented with a handsome testimonial, accompanied with a beautifully illuminated address, by the civil officers of the Royal Engineer Department in the Dover district, where he was stationed since his return from foreign service in 1847 to the present year. The address congratulates Mr. Owens on his promotion to Dublin, and expresses the esteem and respect of those with whom he has been for many years officially associated.

One of the hewn stones remaining whole amid the ruins of Baalbec is sixty-seven feet long, fourteen feet broad, and nine feet thick. Its weight is about 560 tons.

Mr. Alderman Cubitt, the head of the well known eminent building firm of Cubitt & Co., and the present Lord Mayor of London, has been invited by a deputation of the City Liverymen, and an extensively signed requisition, to allow himself to be placed in nomination for the same office for 1861-62, when in all probability, owing to the great decennial Exhibition then to take place, as also the Prince of Wales attaining his majority, he will be raised to the dignity of baronet. It is thought, moreover, that for the latter reason, the Lord Mayor (Moylan) of Dublin will also have the same honour conferred on him, and the same official in York likewise, the only three *Lord* Mayors in the kingdom.

The attractions of Nice will be increased during the winter by an exhibition of the fine arts, which is to take place during the months of December and January. Preparations for it have already commenced.

A recently published return shows that on the 1st of January, 1860, the total value of telegraphic plant in France amounted to 1,900,000fr. In 1858, it was 7,200,000fr., and in 1857, 5,900,000fr. Total length of the wires on the 1st January, 1860, was 42,527 kilometres (26,579 miles), to 38,422 in 1858, and 33,705 in 1857.

MR. BENSON'S WATCHES.—"We have seen several watches from this well-known firm, and can speak with confidence of their exquisite workmanship and artistic finish. They keep time with very great precision, and have been declared by competent judges to be well worth the money. Parties wishing them can be supplied through the post-office."—*Glasgow Examiner.*

Benson's Illustrated Pamphlet, post free for two stamps is descriptive of every construction of watch now made. Watches sent by post to all parts of the globe.

J. W. Benson, 33 and 34, Ludgate Hill, and 46 and 47, Cornhill.

Miscellaneous.

Museum of Irish Industry.—The distribution of prizes and certificates to students of this institution, and the opening of the session of 1861–62, will take place on the 3rd inst. at 8½ p.m. The Lord Lieutenant will be present, and Sir Robert Kane, F.R.S., president, will deliver an inaugural address.

South Dublin Penny Bank.—The following is the statement of accounts for the week ending 23rd September, 1861:—number of depositors, 187; amount lodged, £26 11s. 8d.: number of new accounts opened, 16: number of withdrawals, 32; amount withdrawn, £10 18s 10d.; total number of depositors since the 1st January, 1,689; total amount lodged since 1st January, £598 2s. 4d.; balance in bank to credit of depositors, £303 3s.

Ely Cathedral.—The reconstruction of the lantern of this cathedral, as a memorial of the lamented Dean Peacock, will be commenced in a few days, designs having been prepared by Mr. Gilbert Scott. The intention of the friends of the late dean to enter on this work was announced some months since; but as the estimated expenditure was from £5,000 to £6,000, some difficulty has been experienced in providing the requisite funds. Sufficient promises of support having, however, now been obtained to justify the commencement of operations, they will be prosecuted with energy, and Messrs. Freeman & Son, of Ely, will commence the erection of scaffolding, &c., next week. The new lantern, like the existing one, will be of oak cased with lead, but windows will be introduced harmonizing better with the rest of the building. Mr. L'Estrange, an amateur artist of considerable taste and skill, is proceeding with the painting of the ceiling of the nave, a series of gigantic medallions, representing the Creation and other scenes from early Scripture history, being in course of execution. New school buildings for the choristers are also in progress.

Building Ice Houses.—"T. J. B.," Newtownmountkennedy, asks—"What is the best plan of building or making an ice house? I have built two in different situations, filled them well, and in the following June have not found one pound of ice. I hope to obtain some information from your numerous readers."——The site of the ice house has as much to do with the keeping of the ice as the building of it; the site should be perfectly dry, and not exposed to the sun's rays at any time of the day. The well may then be sunk in the dry soil eight to ten feet deep, and built round with either stone or brick; a drain with an air-tight trap should be made in the bottom. The wells may rise above the surface about four feet, and the best roof is timber and thatch A passage should be made to the ice house eight or nine feet long, and have doors both to the ice chamber itself and the front of the passage. In such houses we have seen ice keep well throughout the summer. You will see an excellent ice house of the above description in your neighbourhood, at Bellvue, Delgany; the ice has never been known to fail in it.—*Farmers' Gazette.*

Cottage Walls getting Green.—"An Improver" asks—"What would you recommend for washing the walls of cottages, near the sea side, to prevent them getting green. Oil paint is too expensive. I saw an advertisement for the style of thing in a London paper some time ago, but cannot remember the direction."——Washing the walls down with vitriol and water mixed, so that the water may be tolerably acid to the taste, will destroy the green moss, and prevent it growing for some time.—*Ibid.*

Lucifer Matches.—Mr. Gore, a recent writer on this subject, gives some astonishing statistics respecting this branch of manufacture. The firm of Messrs. Dixon employ 400 workmen, and generally have on hand £8,000 or £10,000 worth of timber. Each week they consume one ton of sulphur and make 43,000,000 matches, or 2,160,000,000 in the year. Reckoning the length of a match at two and a quarter inches, the total length of these would far exceed the circumference of the earth. Another calculation has been made, that the whole length of waxed cotton wicks consumed every year by one London manufacturer in the production of "vestas," would be sufficient to reach from England to America and back again. The magnitude of the figures relating to the English manufacturer of matches is, however, insignificant when we turn to the Austrian production. Two makers alone, M. Pollak, at Vienna, and M. Flirth, in Bohemia, produce the amazing number of 44,800,000,000 matches yearly, consuming twenty tons of phosphorus, and giving employment to 600 persons. The low price at which these necessaries of life are produced is equally astonishing. M. Flirth sells his cheapest boxes at one penny per dozen, each containing eighty matches. Another maker sells the plain boxes at twopence per 100, and 1,400 matches for one farthing; whilst a third maker sells a case of fifty boxes, each containing 100 lucifers, for fourpence. The imports of matches into the United Kingdom are of the value of £60,000 yearly, representing the enormous number of 200,000,000 daily. The daily consumption is 50,000,000 more than the above number, or upwards of eight matches each day for every individual in the kingdom.

Literature and Art.—The neighbourhood of St. Paul's Cathedral has for centuries been the favorite haunt of literature and the chosen abiding-place of booksellers. Old London-bridge used at one time to bear away the palm for bookshops; and the signs of "The Looking-glass," "The King's Head," and "The Three Bibles," are famous in bibliopolic annals. When the houses on the old bridge were pulled down, however, the ousted venders of learned wares rushed impetuously to Paternoster-row; and those who could not find room there ensconced themselves in Amen-corner and Ave Maria-lane. Great are the conscript "Fathers of the Row;" world-famed are such names as Longman, Whittaker, Blackwood, Blackie, and Van Voorst. Sweet are the odours of hot-pressed octavos, and gift-books bound in morroco by Hayday. Much sweeter would those odours be were it not for that abominable stench which for any time this half century has issued from the tallow-melters, whose factory has been permitted to render oleaginous and wellnigh unbearable the approaches to St. Paul's and "Learning's long lane." The "Row" has been in a blaze: a tremendous conflagration has swallowed up tons of tallow, illustrated works in quires, volumes bound and volumes in boards, newspapers, periodicals, ledgers, and daybooks; besides imperilling the costly stock of silks belonging to one of the great "drapiers of Paul's-churchyard." Imperilling silks, do we say? Why, was not Wren's great dome in danger too? What an incineration we might have had! Remember that the framework of the cupola is of wood; remember that the amount of woodwork in the stalls of the choir—in the organ-loft; remember the vast thorough draughts for the flames to rush through that would have been afforded by the huge emptiness of our most magnificent and most naked cathedral. Literature has suffered to some extent by the fire in Paternoster-row; but what an irreparable loss might Art have suffered had the cruel flames crept up to the pediments and architraves of Wren's great work! Surely it is time for Paternoster-row and the congeries of nasty, straggling, fire-breeding lanes and alleys between Little Britain and the Old Bailey, to be pulled down. Some of these days it will be to late to cry "Wolf!" and the cathedral may have gone by the board through sheer inertia and parsimony on the part of authority. By judicious demolitions a noble space might be cleared on the western and northern side of St. Paul's—a space which would give us reason to be ashamed when we compared it with the Parvis Notre Dame at Paris, or the Izaak's Ploschad at St. Petersburg. On the north and the west our Blackwoods and Blackies erect palaces for bookselling purposes as sumptuouas s those of the Pawsons and other great Manchester warehousemen, on the southern side. Item: this is not the first time that learning has been in the fiery furnace in the same neighbourhood. In the old times the booksellers used to keep their "back stocks" in the vaults of St. Paul's; and twice running, at the partial cremation of the cathedral in James I.'s time, and at its total destruction in Charles II.'s reign, the booksellers' stocks were burned. There were no illustrated editions "Lallah Rookh" in those days, but, then, there were no comfortable policies of insurance to cover the loss of any amount of "back stock."—*Illustrated London News.*

Mahogany.—A hundred and fifty years ago this wood was almost unknown to English commerce. In 1724, the Prince of Wales, afterwards George II., ordered the staircase of Marble-hall, Twickenham, to be constructed of mahogany, which was perhaps its first application to home embellishment. In the same year a West Indian captain sent a few planks to Dr. Gibbon, who was erecting a house in King-street, Covent Garden. The wood being too hard for the carpenters' tools, it was laid aside as lumber; but when the house was finished a cabinet-maker was engaged to make some necessary furniture, and seeking among the stuff in the yard for wood suitable for the purpose, he found the foreign planks; his tools being somewhat sharper than those of the carpenter, he met with more success, and the first article made from the mahogany of Jamaica was a candle-box for the doctor's kitchen. This was so much admired that Woolaston, the cabinet-maker, was instructed to make a boreau for the drawing-room. The boreau became famous, and people of taste came purposely to see it. Woolaston made a fortune, as it became the fashion to sit on chairs, and to dine off tables of mahogany.—*Our English Home*

Exhibition at Florence.—The most successful department of this undertaking is said to be the sculpture gallery, in which Magni, of Milan, has two clever groups of "A Girl feeding a Goat with Grapes," and "A Young Lady in a Swing," worked by a small boy, probably Cupid, from his contempt of garments, though he has no wings. Mr. Power, the American sculptor in Florence, has repeated his subject of "A Boy with a Shell to his Ear." There is an excellent "Sleeping Ishmael," "Eve with the Apple," a "Boy Asleep, with his hand on a dog's head, and a new "Lying Gladiator." In alabaster vases and statuettes Barbetti of Florence bears the palm. There is a bronze repetition of the "Castaway," the statue of the London Exhibition in Trafalgar-square last summer. A pair of magnificent carved doors in wood, also by Barbetti, and some ivory carvings by Giusti, of Siena, stand at the end of this gallery.

Patent Heliographic Printing.—The object of this invention is to extend the application of photography, by substituting for the salts of silver (used in the ordinary printing of a photograph) an imperishable and cheap material, "printers' ink," and printing the impression at the printing press now in use, thereby, rapidity of production, and, consequently, cheapness, will be the result.

The Working Power of Coal.—Professor Rogers estimates that nearly one-sixth of the total annual produce of our coal mines is used for the production of mechanical power alone, from which a power equal to that of 66,000,000 able bodied men is obtained. Each acre of a seam yielding three feet of pure fuel is equal to about 5,000 tons, and possesses a reserve of mechanical strength equal to the labour of 1,600 men during their whole life; and each square mile of that same bed contains 8,000,000 tons of fuel, which is equal to 1,000,000 men labouring through twenty years of their ripe strength. Upon the same calculation, the total annual coal production of the United Kingdom (65,000,000 tons) is equal to the strength of 400,000,000 strong men, or more than double the number of adult males now upon the globe.

American Railways.—In the United States no train is allowed to leave a station until the preceding train has left the station beyond. The engine driver and stoker have a kind of roof over their heads which protects them from the weather, and enables them more conveniently to look out ahead. A cord connected with the engine-bell runs through every carriage. The breaking of axles on sharp curves is provided against by the use of Bissel's patent truck. Every passenger carriage will hold about sixty people, and is furnished with velvet or plush spring seats, while the floors are covered with oil cloth. The backs of the seatshave circular pivots by which they can be so adjusted that passengers can ride with their faces or their backs to the engine. The carriages have a filter containing iced water to enable passengers to quench their thirst; and if these filters are not provided, waiters attend to the passengers and furnish water gratis. Boys are allowed to travel by trains to sell lemonade. Almost every train has one or two dressing-rooms attached to it. In winter a lighted stove is in every carriage. On many railways there are sleeping carriages, which contain comfortable couches. A smoking carriage is attached to every train. A special carriage for passengers' luggage is provided, and nothing is given out without a counter check.

To Preserve Cut Flowers.—Most people like to to preserve bouquets of natural flowers. Many methods have been recommended, but they fall short of the object to be attained. In short, the water becomes putrid, and is obliged to be renewed at least once a day, without checking the alteration of the flowers, which commence soon after their separation from the plant. The following method, which has completely succeeded, consists in introducing a spoonful, more or less, of powdered charcoal in the water contained in the vessel, and immersing the lower extremity of the stems of the flowers in the charcoal. By this proceeding the most beautiful results are obtained, as the flowers are preserved without sensible alteration, without it being necessary to renew either the water or the charcoal, or by giving them any other attention. The water is preserved quite clear in the vessel.—*Cottage Gardener.*

The New Library in the Middle Temple.—The benchers of the Middle Temple are busy making preparation for the inaugural ceremonies attendant on the public opening of their handsome new library. They are intended to take place in the early portion of this month; and it is stated that his Royal Highness the Prince of Wales will take a leading part in the ceremonial. It is intended to make his Royal Highness an honorary bencher on the occasion.

Coal Imports and Manufactures.—The *Belfast Newsletter* has the following:—"To judge of the rate of our local manufacturing production by the importation of coals at Belfast—usually considered a fair test—it would seem to have been somewhat greater since the commencement of the present year than during the corresponding period in 1860, inasmuch as the coal import this year up to the present time shows an excess of 10,385 tons. It is certain that our spinning mills, weaving factories, printing and bleaching works, &c., have their engines running longer time than in the majority of cases of those on the other side of the Channel; but we are certain that the increase in the arrivals of coals at this port must for once be otherwise accounted for than by any conjectural extension of manufacture. We know that, on the contrary, there has been a considerable falling off in production, as compared with last year."

Spanish Railways.—Agents of the Spanish Government are now in the neighbourhood of Birmingham, endeavouring to negotiate for the supply of iron rails to the extent of 12,000 tons, besides about 50 locomotive engines and some 600 railway carriages. The nature and extent of the trade of Birmingham with Spain is now of considerable local importance, there being strong indications that the Spanish Government will become large customers for railway engines and carriages. During the first seven months of the present year Spain has taken an increased quantity of English machinery, besides coal, culm, and other articles.

Materials for Paper.—Flax holds the first place among the fibres, which, from their strength, flexibility, and other practical qualities, are fittest for the manufacture of paper. Flax has hitherto been grown in India in large quantities, but almost entirely for the sake of the seed. Various means have, from time to time, been used to extend the cultivation of this useful plant in India, and it has been produced in the Punjab of a quality equal to that of the best kinds received from Russia. The plant which stands next to flax for the quality of its fibre, is the rheca of Assam and other parts of India. This plant grows to a height from three to four feet, and being a perennial, the expense of cultivation is less than that of most plants. It will bear cutting down three times in a season; the first crop yielding course, the second and third fine fibres Probably about ten per cent. of useful fibres may be extracted from the stems of this plant. The Neilgberry mettle, the muidar, the well-known jute of commerce, the safet, bariala, the ambaree, the hemp, the sunn, the jettee, the pine apple, the meorva, the agave-Americana, the fournuaya gigantea, the plaintain, the yuaca gloriosa, the phornium tenax, or New Zealand flax, &c, may also may be employed for the same purpose. All these, except the last enumerated, are indigenous to India, and contain fibres which may be more or less usefully applied to the manufacture of paper, and to textile fabrics.

TENDERS

For Building Protestant Hall, Longford, according to plans, &c., by Mr. James Bell, jun., architect.

Halligan	£1,430	0	0
M'Clan & Co.	1,420	0	0
John Mullin (accepted)	1,400	10	0

TO CORRESPONDENTS.

F. Brothers. London (Cannot positively ascertain; believe Clonmel; under cover to the architect named, will find him); J. P. (Always glad to receive from country readers authentic intelligence of new works in their localities).

[In reply to several queries respecting the proposed asylums, we hear that nothing *definite* has been arranged yet. There *may* be a competition.—Ed.]

THE ARCHITECTURAL MUSEUM,
SOUTH KENSINGTON MUSEUM, W.
ADDITIONAL PRIZES.

Two Prizes of £5 5s. each (given by Mr. MacColla) are offered by the Council of the Architectural Museum for Designs for Gothic and Classic Tile Pavements.

The competitions, already advertised, for Stone and Wood Carving, Modelling, Metal Work, Painted Glass, and Coloured Decoration, are still open.

For particulars apply to the Attendant in the Gallery of the Architectural Museum; at the Offices of "The Builder" and "Building News;" or by letter to the Honorary Secretary, at 13, Stratford-place, W.

A. J. B. Beresford Hope, President.
Geo. Gilbert Scott, Treasurer.
Joseph Clarke, Hon. Sec.

LIFE ASSOCIATION of SCOTLAND

NOTICE OF REMOVAL.

The Head Office for Ireland has been Removed from No. 60, Upper Sackville-street to Temporary Premises at

No. 57, DAME-STREET, DUBLIN,

during the Erection of The Association's New Buildings, Nos. 40 and 41, Dame-street.

THOMAS MACKIE, Secretary.

ROYAL DUBLIN SOCIETY.
ART EXHIBITION, 1861.

EVERY DAY, 10 o'clock to 5 o'clock, and every EVENING (except Saturday), 7.30 o'clock to 10½ o'clock. Admission SIXPENCE, except on FRIDAYS, when the Charge will be One Shilling.

ROYAL DUBLIN SOCIETY.
ART EXHIBITION, 1861.

By Permission of the Colonels Commanding and the Officers of the several Regiments,
MILITARY BANDS
Will Perform during this Week as follows:—
TUESDAY (this) EVENING, 1st October, 87th R. I. Fusiliers.
WEDNESDAY EVENING, 2nd October, 1st Battalion Rifle Brigade.
THURSDAY EVENING, 3rd October, 11th Hussars.
FRIDAY EVENING, 4th October, 15th K. Hussars

THE PUGIN MEMORIAL

(Pugin Travelling Fund).—The donations now amount to about £1,100. At least £1,500 will be required. Contributions are earnestly solicited, and will be received by

J. Clarke, 18, Stratford place, W. } Hon. Secs.
T. Bury, 50, Welbeck-street, W. }

FENDERS AND FIRE IRONS.

J. EDMUNDSON and CO. call attention to their beautiful new designs in the above. They also invite inspection of the following, being a few of the leading articles comprised in their Stock of House Furnishing Ironmongery, viz.:—

Drawingroom Grates. Kitchen Ranges,
Warranted Table Cutlery,
Electro plated Forks and Spoons,
Electro-plate Tea and Coffee Sets, &c.
Dish Covers, Tea Trays, Bronzed Tea Urns,
Moderateur Lamps,
Iron Bedsteads, with Bedding,
Baths, Gasaliers, Hall Lamps. Gas Brackets, &c.

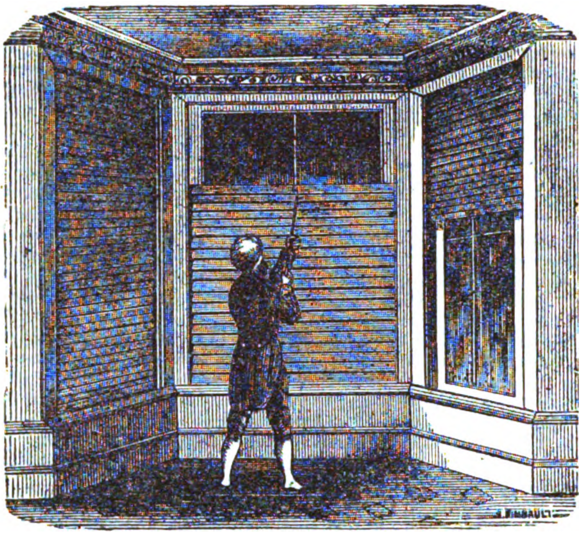
J. E. and Co. are Agents for Milner's Fire Proof Safes, Bradford's Washing Machines, &c.

Ironmongery, Gas-Fitting, and Gas Apparatus Establishment,

34, 35, and 36, CAPEL-STREET, DUBLIN.

IRON CASTINGS—Castings of every description for Gas and Water Companies, Millwrights, Builders, Plumbers, &c., made at

SEVILLE IRON WORKS, SEVILLE-PLACE, DUBLIN.



CLARK'S

PATENT SELF-COILING REVOLVING SHUTTERS,

FOR SHOP FRONTS AND PRIVATE HOUSES.

THE MOST SIMPLE, SECURE, AND CHEAP SHUTTER EXTANT,

In Wood, Steel, or Iron, 2s. 6d., 3s. 6d., and 5s. per Foot super.

The Engraving represents the Shutters being opened without the aid of Machinery of any description.

BRASS SASH-BARS, STALL-BOARD PLATES, &c., &c.

To Her Majesty's Board of Works.

15, GATE-ST., LINCOLN'S-INN-FIELDS, LONDON.

TO ARCHITECTS AND BUILDERS.

Stained Glass.

FLAT LEAD, WINDOW, AND PATENT METAL SASH MANUFACTORY,
107 & 103, MIDDLE ABBEY-STREET, DUBLIN.

M. & R. SILLERY

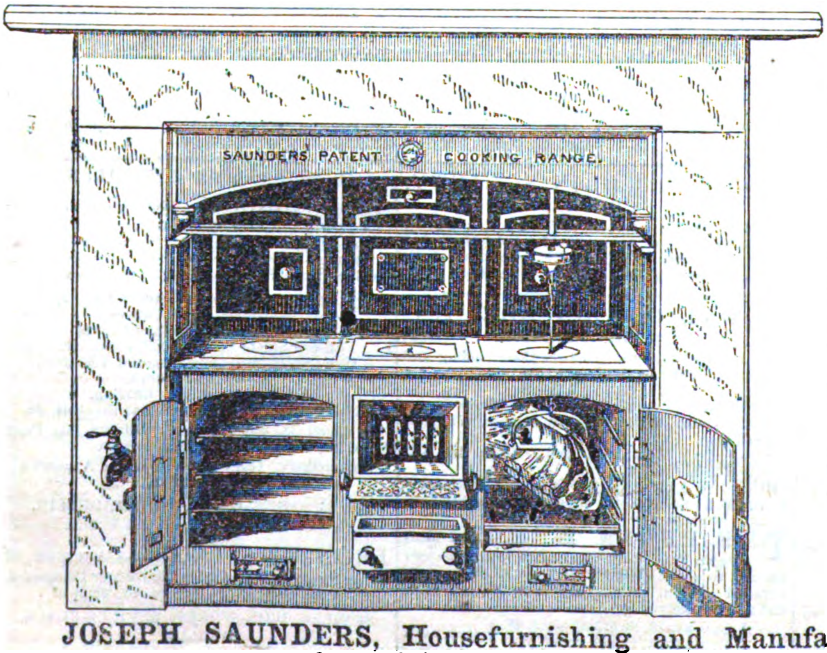
Beg to inform parties requiring the above, that they have erected EXTENSIVE MACHINERY for facilitating the execution of STAINED GLASS, and are now prepared to furnish all descriptions of Work fully 30 per Cent. lower than any other House in Dublin, also of superior Designs and Finish, and respectfully invite an inspection of their Patterns.

PANES, per Foot super.	s.	d
White Enamelled Ground and Clear Ornament	0	8
Ditto, richly coloured	1	6
Enamelled Flocked Patterns for obscuring the view, suited for Water-closets	1	4
Ornamental Enamelled White Panelled ..	0	10

BORDERS, per Foot Lineal.	s.	d.
White Enamelled Ground & Clear Ornament from	0	3
Ditto, coloured	0	7
Ruby Ground, with Bright Ornament	1	3
Ditto, Blue	1	6
Rosettes, from	0	1

Embossed Patterns on Ruby and Blue, with Bright Ornaments—a new and beautiful Description of Work for Panels in Doors Quarries and all other Descriptions of Ornamental Stained Glass, suited for Ecclesiastical and Domestic use. Ruby and Green Signal Lights, and all descriptions of Bent Glasses for Carriage and Car Lamps, in Stock and to order.

SAUNDERS' PATENT KITCHEN RANGE.



SAUNDERS PATENT COOKING RANGE.

ECONOMY OF FUEL.
SIMPLICITY OF CONSTRUCTION.
PERFECTION IN COOKING.

This Patent Range is a perfect combination of the open fire and hot-hearth, and possesses many advantages that are not obtained in any other Cooking Apparatus. The roasting is performed in a newly constructed roasting screen, and in a *bona fide* manner before an open fire (meat baked in an oven is well known to be unwholesome and objectionable). The fire box which contains the fuel has two open fires—one in front of the Range, and the other quite visible in the roasting screen opposite the meat roasting; it is also constructed to consume the greater portion of its own smoke, which passes through red-hot orifices surrounding the fire-box, and escapes in a bright flame under the hot-plate, boiler, and ovens, giving off all the heat due to perfect combustion, acting as a certain cure for a smoky chimney, and effecting the greatest economy of heat and fuel.

The roasting screen is convertible into a baking oven by inserting a sliding plate made for that purpose.

This Patent Range is either fitted with a bottle jack, which gives the meat the natural rotary motion before the open fire (as shown in the above drawing), or is supplied with the usual railed iron stand and double dripping pans. It is made in various sizes and forms, and contains all the necessary requirements of a perfect Cooking Apparatus.

Numerous highly respectable references can be given to parties having this range in use, and every information can be obtained from

THE PATENTEE & MANUFACTURER,

JOSEPH SAUNDERS, Housefurnishing and Manufacturing Ironmonger,
33, DAME-STREET, DUBLIN.

The Dublin Builder.

Vol. III.—No. 44.

SIR WILLIAM CHAMBERS.

RETURNING to our occasional biographies of eminent deceased architects, the subject of this sketch claims special notice, and may fairly be regarded as second to none of any of the celebrities contemporaneous with him in the last century, and born of British parents. William Chambers is said to have been descended from an ancient family in Scotland, Barons of Tartas in France, and possessed of property at Ripon in Yorkshire, but was by birth a Swede, having made his entry into the world in Stockholm, whither his parents, partly for mercantile pursuits and partly relative to the recovery of a sum of money advanced by an ancestor to a former king, had repaired some years previously. The boy William, however, was sent to England very young, and in Yorkshire received his education, which does not seem to have been important, as when but a mere lad he made voyages in a mercantile capacity to the East Indies and China, imbibing in the latter place a fancy for its characteristic architecture which he subsequently turned practically to account. His present occupation, however, not proving congenial to his feelings, he determined on an expedition to Italy to cultivate the muses, and remained there for some time engaged in studying architecture from the remains of antiquity—the substantial memorials of the genius of the great masters, Michael Angelo, Palladio, Scamozzi, &c., &c. At the age of 18, young Chambers returned to London to pursue architecture as a profession, and, through the medium of a private friend, Mr. John Carr of York, became introduced to Lord Bute, whose influence subsequently procured him the appointment of drawing-master to the Prince of Wales, afterwards King George III., and finally he became chief architect to that monarch. Next we find him honored with the commands of royalty to lay out the grounds at Kew, for which purpose he designed buildings and temples in European and Asiatic styles; engravings of which were published, as the author informs us, "by Royal bounty." Mr. Chambers became Comptroller at the Office of Works, and subsequently succeeded Whitshed Reene as surveyor general. About this time the project of building a bridge at Blackfriars was in contemplation, and a competition—in which the subject of our memoir unsuccessfully joined—took place therefor, resulting in favour of the designs furnished by Mr. Mylne. The establishment of the Royal Academy of Arts in London in 1768 was mainly due to the exertions of Mr. Chambers, who filled the first treasurership of that Institution under the Presidency of Sir Joshua Reynolds. In 1771 the King of Sweden conferred on Mr. Chambers the order of the "Polar Star," and King George the honor of Knighthood, from which period we style him, as is right, *Sir* William Chambers.

Amongst the numerous works of this great architect, Somerset House is about the most remarkable for symmetry and beauty of design, but he was also engaged throughout the kingdom by various noblemen and gentlemen—viz., Lord Clive, the Earl of Besborough, for whom he built a villa at Roehampton, in Surrey, with a portico singularly correct and elegant; Lord Abercorn, a mansion at Duddingston, near Edinburgh; the Earl of Wilton, Wilton, near Salisbury; Lord Charlemont, the beautiful marble casino at Marino, near this city, &c. Sir William associated with, and was much esteemed by the celebrities of the time, comprising Goldsmith, Johnson, Garrick, Reynolds, and others, and occasionally visited with his professional brethren a club called the Architects' Society, which met at "the Thatched-house" Tavern. A fatal malady—asthma—seized upon him, and for some time previous to his death he had to adopt artificial means of breathing; but death ultimately released him from his sufferings on the 8th of May, 1796, in the 71st year of his age, and he was interred with all honours in Westminster Abbey. Mr. James Gandon, the eminent architect of our Custom-house, Four Courts, western portico of the Bank, Queen's Inns, &c., and editor of the fourth and fifth volumes of "Vitruvius Brittanicus," was pupil of Sir William Chambers, as also was Mr. Edwd. Stevens, who died in Rome in 1776, Mr. John Yenn, Thomas Hardwick, and Robert Browne.

ARMOUR PLATES.*

In presenting this paper to you, I would especially guard myself against any undue merit or assumption, and rather rest the justification upon a desire to provoke discussion of this institution, feeling that it is necessary some attempt should be made to render this important manufacture of thick plates perfect, that we may send forth to meet the enemy, not the wooden walls of old England, but impregnable iron, and iron-cased vessels which may defy them; and it is by our meeting together thus, and freely discussing such subjects, that greater perfection in the arts and manufactures are arrived at. We cannot but feel that this is a remarkable period—it is one, not of private competition, but a competition of nations, and we must feel that, having entered ourselves and made a fair start in this great national race of competition, we are bound to lay our heads together and to take care we, beyond all question, win the race.

> "England must ever rule the waves."

Before proceeding further, it may be at least interesting to refresh our minds with a slight historical sketch of "Iron and its manufactures," and we shall endeavour to do so in a concise manner:—

Dr. Ure remarks—"Iron is capable of being cast or wrought into any form; of being drawn into wire of the finest texture and of any length, and of being formed into plates and sheets, which may be bent to carry out our constructions and to fulfil all our wants, even to caprice." Iron is of equal use to the arts, to agriculture, and to warfare; from a needle to the scythe, from the ploughshare, watch-spring, sword, or the cannon, to pipes and conduits for the conveyance of gas or water to supply our towns and cities with these modern luxuries, and other its general application for our intellectual advancement. There, however, is no doubt that the working of iron has been known from the earliest period. We find it said of the Cyclops working at the forges of Etna—

> "The workmen lift their arms in turn with mighty force."

Did time permit I know of no subject that would create a greater interest than to trace the gradual advances which have been made from the earliest period to the present time. To start with the reduction of iron, and its general adoption to the wants of man, or to examine the changes that have taken place in the process of its manufacture, from the calcination and smelting of the ores to the puddling, forging, and finishing of wrought-iron; and I cannot but feel that our social condition, commercial prosperity, and mechanical position are due more to the geological structure of our island than to the high moral qualities of the Anglo-Saxon race. We have the physical advantages arising from our stores of metallic ores, limestone, coal, and other minerals, which enable us to supply not only our own wants, but to minister to those of others; and I cannot but refer to that passage of Scripture happily applied to describe the blessings which such a peculiar position as ours confers on its people. In Deut. viii. 9, we read—

> "A land wherein thou shalt eat bread without scarceness; thou shalt not lack anything in it—a land whose stones are iron, and out of whose hills thou mayest dig brass."

There cannot be a doubt that the present position is a remarkable and peculiar one for the iron manufacturer. He finds the ores in exhaustless abundance, interstratified usually with the coal and mountain limestone necessary for their reduction, and in few countries do these essential materials occur in such abundance, or so near together as to give large and profitable productions. We find that between the sixteenth and seventeenth centuries the art of casting iron had arrived at a considerable degree of perfection, and we find extant the remains of blast furnaces which formerly belonged to the kings of England. Mr. Mushet has attempted to deduce the period of the erection of two of these furnaces in the Forest of Dean to have been about 1550, in the time of Edward VI. Now up to this period, wood calcined, known as charcoal, was the only material employed in smelting, but the large consumption of this material created a scarcity and gave a check to the iron manufacturer, which was increased by special Act of Parliament, prohibiting the cutting down of wood for such purposes, and exempting only the forests of Sussex from its general decree. Hence at this time the blast furnaces of the country decreased three-fourths, and the production, which was in 1740 from 180,000 to 200,000 tons, reduced to about 18,000 tons.

We find in 1621 James I. caused the Great Seal to be affixed to letters patent, granting to the then Lord Dudley power to use pit-coal in the manufacture of iron, and it appears his lordship was only able at this time to make about three tons per week; and we find about the year 1760 that Smeaton was the first to introduce great improvements in the blast by substituting large cylinders with closely fitting pistons for the bellows.

---

* From a paper read by Mr. Thomas W. Rumble, C.E., before the Society of Engineers.

It is to such men as Smeaton, Truran, Crane, Calvert, Neilson, Rogers, and others, we owe our present position in reference to the manufacture of crude pig-iron; but among other names that stand pre-eminent in the manufacture of wrought-iron, we must not forget that of Henry Cort, a man who expended £20,000 in perfecting his inventions for the puddling and rolling of iron into bars and sections. When we consider his inventions have conferred an amount of wealth on this country equal to six hundred millions sterling, and work to no less than six hundred thousand of the working population, we have reason, indeed, to place his name prominently in the list of great benefactors to this country. Again, the pen would fail to convey the boon that has been conferred upon the manufacture and people by those men who have brought to the present perfection our tilts, steam-hammers, bloom compressing machines, shears, and other mechanical contrivances, giving increased power, and enabling us to produce and give to the world the greatest possible results and advantages at the smallest possible cost, and thus to open out the stores of a merciful Providence to additional myriads of our fellow mortals.

It is quite unnecessary here to run through a recapitulation, or to touch upon the many improvements that have taken place, or even to enter upon that popular controversial subject "the utilisation of the waste or gaseous products from the blast furnaces." It does not come within my province, and I leave it for the abler pens of my brother members of this institution to do it that justice the subject deserves.

In viewing the strength of iron as a material little can here be said. Important progress has of late been made in the adoption by practical men of correct principles as to the action of the particles of a beam in resisting fracture, the knowledge of which principles had formerly been confined to a few mathematicians. They relate chiefly to the action of the straining force, and its combination with that of the bending force, which latter, at one time, was the only circumstance considered. One of their results is, that the neutral axis of a beam, as it is called, is not, as it used to be described, a place of no strain on the particles, but it is truly a place where, although the strain in a horizontal direction, due to the bending force, is nothing, the strain due to the shearing force is a maximum, and consists in a tension in one diagonal direction, and a compression in another, each making an angle of 45 deg. with the horizon.

The late Robert Stephenson, when referring to this fact, proposed a very ingenious method of improving it experimentally. On the one side of an unloaded beam he caused a series of small circles to be drawn; when the beam was loaded, each one of those circles became an ellipse, whose diameters were measured, and found that near the upper side of the beam each ellipse had its longer axis vertical, and its shorter axis horizontal, and thar near the lower side of the beam it was the reverse, for the shorter axis was vertical and its longer axis horizontal; and that at the neutral axis of the beam each ellipse had its longer and shorter axis sloping at an angle of 45 deg. Without going further into the matter, or considering in detail the various strains of tortion, tension, or compression, it may be as well to give the mean of some reliable experiments upon iron and wood. Now, the tensile strength of iron plates is found to be about, say, 50,000 lbs. per square inch, and that of wood as follows:—

Ash	17,000 lbs	Showing Iron to be	2·94	times the stronger.
Teak	15,000 lbs.		3·33	
Fir	12,000 lbs.		4·16	
Beech	11.500 lbs.		4·34	
Oak	10,000 lbs.		5·00	

So that malleable iron plates are five times stronger than oak in tension, or that strain bending to pull them apart. And another point worthy of notice is, that we find the strength of iron plates to resist indentation or pressure by a blunt instrument with a hemispherical end, is nearly in the ratio of the thickness, while that of oak is in the ratio of the square of the depth. From experiments conducted by Mr. W. Fairbairn, we learn the mean bursting strength

Of a ¼-inch plate to be	16.779 lbs., and
Of a ½-inch plate to be	37,728 lbs., while

the experiments on oak were—

For a 3-inch plank	17,932 lbs., and
For a 1½-inch plank	4,406 lbs.

So that a ¼-inch thick is able to resist a force equal to that requireing an oak plank of 3 inches. Hence the superiority of iron over wood for the purposes of ship building, and there is no branch of industry in which the use of iron is of greater importance—for in it we have strength, ductility, and comparative lightness.

We are thus led to a cursory glance at the progress made in the production of our fine ships, even though they may not have the jolly old bows and wooden walls of former days. We find from the various statistics that between 1800 and 1807 vessels composed of iron plates were constructed and used for canal navigation, and that in the year 1820 the late Aaron Manby not only projected, but constructed a sea-going iron vessel which was navigated by, then Captain, now the late Admiral Sir Charles Napier from London to Havre and on to Paris, and for many years run as a steamer on the Seine; between Paris and Rouen. From this time little appears to have been done until 1830, when, owing to many circumstances, iron as a material for ship-building began to develop itself, and has since gone on with an increasing demand. From 1822 to 1830 we may look upon iron ship-building as purely experimental, and it was undoubtedly the experiments of Mr. Fairbairn, John and McGregor Laird that led to the new era in the history of ship-building. It may not be out of place here to mention "in passing" that it was by a series of interesting experiments conducted by Captain Johnston and Professor Airey, that a remedy was first provided in the adjustment and correction of the compass on board of iron ships, and we cannot but instance such vessels as the first iron steam vessel that crossed the Atlantic or the *Vanguard* which ran foul of a reef of rocks on the west coast of Ireland, and of which Mr. Clarke said, "had she been built of wood instead of iron she could not have been saved." Again, there was the *Royal George*, a vessel plying between Liverpool and Glasgow, which fouled on a rock near Greenock with a dead load of about 150 tons, and resting nearly on her centre, and was left high and dry nearly a whole tide without sustaining injury. We may ask, what wooden vessel could have remained in that position without breaking her back? We might again refer to Her Majesty's Royal Brazilian mail steamship *Tyne* which was wrecked on the 13th January, 1857, between Portland and St. Albans. Also we might ask, had the screw steamer the *Canadian*, lost on the 4th of June of this year by striking an iceberg near Belle island, been constructed of wood, could she have lived the 35 minutes, or any of her passengers been saved?—no, she must have instantly foundered.

We now come to the durability of iron ships, and on this point a second thought is scarcely necessary, for time sufficient has elapsed to establish the fact that iron ships last longer, fit for service, than those constructed of wood. It was at first thought that the action of salt water would produce rapid exidation, and hence speedy decay. Indeed this has been we may say the cardinal objection, the stumbling block to the construction of vessels of this most invaluable material. There can be no doubt that, in this respect, we have put on our glasses and magnified the evil. This we are bound to acknowledge, when we find vessels—iron vessels constructed some 15 or 20 years past—still in existence, and what more do they cost to keep in repair than those of wood? They all require an occasional coating of paint or other anti-corrosive matter, to neutralise the effect or action of the atmosphere. Ships, like our keys or other bright domestic instruments and implements, will keep bright and free from oxidation by use, again when the form of construction is taken into consideration, the many ways we have of bracing and staying the weaker parts, a second thought cannot but prove how infinitely stronger and more durable are our vessels constructed of iron. Although it must be admitted that the ignorance and carelessness of some who have professed, and professed only, to be iron shipbuilders, without having the knowledge or appliances, has aided and materially strengthened the idea with the unskilled and those who confound strength with weight, and security with thickness, that iron vessels must be naturally weak; and we can but hope that such men are fast leaving it to those who are fully qualified, and determined faithfully to carry out the work.

We cannot then for a moment doubt the advantages arising from the use or application of iron for such constructions, or gain to the commercial interest by having a larger amount of stowage room. There cannot exist a doubt that its application is as desirable in the Royal Navy as the merchant service, and would have been generally adopted, but for the fear of the effect of shot upon iron plates and its consequences. Shot at high velocities would pass clean through the hull, but the danger and damage is not so great from such projectiles as from a half-spent shot, when the ripping and splintering would take place some feet on every side. This is the chief danger to be apprehended. Such objections, however, are not to exclude this material from being brought into general use even in our navy. The difficulties are to be overcome by experiments, experience, and perseverance. As Longfellow says:—

Are you in earnest? seize this very minute.
What you can do, or think you can,
  Begin it.
Boldness has genius, power, and magic in it.
 Only begin it; the mind grows heated.
 Begin it, and the work will be completed.

If we only turn our eyes over the blue waters of the Atlantic towards the Cove of Cork, and see that magnificent experiment and child of our Scott Russell and the late I. K. Brunel riding like a duck upon water: after what she has gone through, what shall we say is impossible? she has many faults it is true, and from her cross section must in my opinion always roll, which her performance has proved. Yet as a mechanical construction, I am fully convinced, she is the best and strongest yet afloat.

There is, indeed, a wonderful change in the progress of ship-building, and it may not be too much to say, we are at this very minute, though in transition, laboring to accomplish even the rendering of iron ships of war shot proof, if we have not already accomplished the same.

It is true, too true, we received the challenge from our friend the Emperor of the French, who had and has an idea of creating an ocean fleet of iron-cased vessels (pre-conceived by Colonel Paixhan in 1821, nearly forty years since), and when they launched the *La Gloire*, we received the challenge to enter ourselves in a great competitive race for superiority in the construction of ships of war, and having entered we intend to win, and carry off the laurels, if it be possible to render invulnerable armor-casing for our ships, made from iron or other materials.

Our first experiments for the purpose of testing the resistance of iron plate for ships of war against musketry, canister, and grape-shot were performed on the 6th November, 1849, at Portsmouth, under the direction of Captain now Rear-Admiral Chads. But the question of iron-cased vessels only appears to have been taken into the serious consideration of our Board of Admiralty early in 1859, though the first thick-plate experiment took place on the 21st August, 1858, during the time Sir John Pakington presided over that body; and strenuous were the efforts made by our leading naval architects to design such a vessel as should answer all the requirements of the case, giving speed, stability, and due regard to the fighting qualities necessary. Many and various indeed, were the ideas submitted, embodying a construction for war ships differing materially to any ever before constructed, all the designers keeping in view the fact that, if we were to fight, we must "To arms, and force to force oppose." The result of this great competition was the production of the *Warrior*, to be followed by the *Black Prince*, vessels well fitted to bear the flag of Old England and to maintain our supremacy upon the waves of the deep, even were she placed in juxtaposition with the *La Gloire*. It is unnecessary here to refer to the dimensions, accommodation, or construction of the two ships, for it must be readily admitted they will bear no comparison. The *La Gloire* was to be impregnable, but we might ask what British officer would think of exchanging with her the war compliments of shot or shell, when he had the *Warrior*, with superior speed, and the Armstrong guns under his command? and we cannot (though diverging from our province) but ask, even supposing the *La Gloire* to be invulnerable, how long would it take to carry her by the good old English system of boarding.

LIVERPOOL SCHOOL OF SCIENCE.

During our visit some months since—and at the time recorded in these pages—to the Free Libraries of Liverpool and Manchester, we were made acquainted with the fact, that a school of science was in progress of formation in connection with the former establishment, and we have now to announce its inauguration on the 10th inst., the Mayor presiding, and Earl Granville, the Chancellor of the Exchequer, Mr. Fairbairn, C.E., Mr. W. Brown, and numerous others taking part in the proceedings. The secretary read a comprehensive statement explanatory of the object of the institution, describing it in the abstract to be for the purpose of "aiding the industrial classes and others, of both sexes, in procuring instruction in natural history, geology, chemistry, mathematics, geography, mechanical and experimental physics, the school being supported by voluntary contributions, students' fees, and government grants."

Earl Granville deemed it a very high honour and a singular gratification to have been named in connection with the Mayor of Liverpool and Lord Stanley, a nobleman of different politics from himself, as patrons and vice-patrons of the new institution. He moved that it is highly desirable that the means of obtaining instruction in the leading branches of science should be extended in Liverpool. The Exhibition of 1851 showed that however eminent we are in certain branches of science, other nations were fast competing, and some almost distancing us. It was impossible but that some present should have been across the Atlantic, and remarked the progress in the application of science to art by that great nation at a time when they were happily engaged in the arts of peace, and not as now suffering some of the worst calamities of war. He paid a high tribute to the generosity of the Chancellor of the Exchequer, who, rigidly careful of the country's money in other matters, was just if not generous in his support of education and the cause of science. His lordship believed that the exertions of the department of science and art had been most useful in the diffusion of sound scientific instruction throughout the country, and had immensely improved the character and capabilities of science. The result of this extension of scientific knowledge must, in his opinion, tend in an enormous degree to promote the welfare and prosperity of the country. His lordship, in conclusion, drew attention to the local advantages which the pupils of the School of Science had in a town and port like Liverpool, where the products from all parts of the world were collected, and where some of the highest engineering illustrations were also to be found.

Mr. Fairbairn, C.E., President of th[illegible]ritish Association, seconded the resolution, tracing the prog[illegible] of science chiefly in connection with engineering works.

The resolution was then put and [illegible]ried.

The Right Hon. W. Gladsto[illegible] moved "That the School of Science about to be established [illegible] eminently calculated to promote the beneficial objects enumerate[illegible] in the report," and paid a warm tribute to the munificence of Mr [illegible]V. Brown, who in addition to the erection of a free library and m[illegible]um, had given a building also for the School of Science. He n[illegible]d the effect of chemistry upon manufactures, and of geology u[illegible] mining industry, the increase of the supply of gold, and the gene[illegible]dvancement of the wealth and comfort of mankind. The most sc[illegible]tific works had been frequently suggested by the contemplation of [illegible] most humble objects. Watt had gathered his idea of constructi[illegible] a pipe of peculiar strength from scientifically examining the she[illegible] a lobster. To Sir I. Brunel the common earthworm suggested [illegible]hames Tunnel; and Wedgwood derived his most beautiful designs [illegible]templation of natural objects. Following out this train of thought, th[illegible] in tracing the origin of the oar, the wheel, and the plough, ascri[illegible] the first to the motion of the birds' wings when cleaving the air, the second to the figurations of a peculiar kind of hawk, and the third to an intelligent observation of the habits of that very humble but useful animal the pig. The contemplation of natural objects and the application of the experience so gained had brought men from the humblest stations to the foremost positions—for example, George Stephenson and Hugh Miller. The hon. gentleman, in eloquent language, denied that the cultivation of science tended to foster intellectual pride, and contended that though, the truths of science did not lie in that highest region of our nature which was reserved for Gospel revelation, they were yet subsidiary to that revelation, and that the founder of the Liverpool School of Science was entitled to cheer himself with the belief that he had not only been contributing to the intellectual advancement, material progress, and innocent recreation of his fellows, but had been subserving to a high moral purpose, and aiding the work of the teacher of religion. In conclusion, Mr. Gladstone expressed a hope that the institution would progress in a manner worthy of the town of Liverpool.

The Hon. Algernon Egerton, M.P., seconded the resolution, which was carried unanimously.

Mr Wm. Brown moved a resolution pledging the meeting to support the institution just inaugurated.

Dr. Lankester supported the resolution. He described the nature of the studies pursued at the National Schools of Science. It might be said that Liverpool had hitherto got on very well without much knowledge of science; but he asserted that all the great and magnificent works which Liverpool could boast—all her wealth and the greatness of her commerce—were but so many monuments of the triumphs of science.

The Mayor of Manchester also spoke in support of the resolution, which was adopted, and the meeting soon afterwards separated.

OF NICHES AND STATUES.

Architecture, as D'Aviler observes, is indebted to sculpture for a great part of its magnificence; and as the human body is justly esteemed the most perfect original, it has been customary, in all times, to enrich different parts of buildings with representations thereof. Thus the ancients adorned their temples, basilicæ, baths, theatres, and other public structures, with statues of their deities, philosophers, heroes, orators, and legislators; and the moderns still preserve the same custom, placing in their churches, palaces, houses, squares, gardens, and public walks the busts and statues of illustrious personages, or bas-reliefs and groups, composed of various figures, representing memorable occurrences, collected from the histories, fables, or traditions of particular times.

Sometimes these statues or groups are detached, raised on pedestals, and placed contiguous to the walls of buildings, by the side of flights of steps or stairs, at the angles of terraces, in the middle of rooms, or of courts and public squares; but most frequently they occupy cavities made in walls, which are called niches. Of these there are various sorts; some for the reception of statues or groups, being formed like arches in their elevation, and either semi-circular, semi-elliptical, or square in their plan; others used for the same purpose are of a parallelogramical figure both in the plan and elevation; and others, for the disposal of busts or vases, are circular or oval, square or oblong in the elevation, and either sunk squarely or spherically into the walls.

The proportion of the former sorts of these depends on the characters of the statues, or on the general form of the groups placed in them; the lowest are at least a double square in height, and the highest never exceed twice and one-half of their width. With regard to those intended for busts, they are always proportioned nearly alike, being made to fit the shape of the things placed in them, either a trifle above a square in height, or circular or oval, more or less elevated. The manner of decorating high niches, if alone in a composition, as they are in the principal front of the Old Louvre at Paris, is generally to enclose them in a decoration or panel, formed and proportioned like the aperture of a window, which is adorned in the same manner, and bears the same proportion to the architecture they accompany as a regular window would. The niche contained in them is more or less recessed, and is carried quite to the bottom; but on the sides and at the top there is a small space left between the niche and the architrave of the panel. When niches are intermixed with windows, as they were in the front of Old Somerset House, towards the river, and as they are at St. Paul's; they may be adorned in the same manner as the windows, provided the ornaments can be of the same figure and dimensions, but when the space between two windows is not sufficient to admit of this, it is much better to make the niches entirely plain, or surrounded only with rustics, than to contract the aperture, and by that means make the decoration narrower than those of the windows, as Inigo Jones had done at Old Somerset House, or than to adorn the niches in a different manner, as Sir Christopher Wren has at St. Paul's; for both these expedients are irregular, and occasion confusion. The tops and bottoms of these plain niches must level with the tops and bottoms of the apertures of the windows, and neither be raised above nor sunk below them, as D'Aviler teaches; for on this, and on all other occasions of the like nature, a continuity of straight horizontal lines must constantly be aimed at; it being certain, that whenever the eye of the spectator is forced to dance up and down, and hunt, if I may be allowed so to call it, for an outline, the operation is always painful, and the images raised in the mind are always confused. To this, in a great measure, may be attributed the general dislike to the Horse Guards in St. James's Park, which is a building of so complicated a figure, both in plan and elevation, that it is impossible to form a distinct idea of the whole at once.

The same kind of plain niches may likewise be employed in narrower intercolumniations; but care must withal be taken not to squeeze them in between the columns or pilasters. And therefore, when the interval is not sufficient to afford room for a well-proportioned niche, and a space on each side between it and the columns of at least two-thirds of a module, it will be better to have no niches at all.

The size of the statue depends upon the dimensions of the niche; it should neither be so large as to seem rammed into it, as at Santa Maria Maggiore in Rome; nor so small as to seem lost in it, as in the Pantheon. where the statues do not occupy above three-quarters of the height of the niche, and only one-half of its width. Palladio, in arched niches, makes the chin of his statues on a level with the top of the impost, so that the whole head is in the covered part. In the nave of St. Peter's, at Rome, the same proportion has been observed, and it has a very good effect. The distance between the outline of the statue and the sides of the niche should never be less than one-third of a head, nor more than one-half, whether the niche be square or arched; and when it is square, the distance from the top of the head to the soffit of the niche should not exceed the distance left on the sides. The statues are generally raised on a plinth, the height of which may be from one-third to one-half of a head; and sometimes where the niches are very large in proportion to the architecture they accompany, as is the case when an order comprehends but one story, the statues may be raised on small pedestals, by which means they may be made lower than usual, and yet fill the niche sufficiently, it being to be feared lest statues of a proper size to fill such large niches should make the columns and entablatures appear trifling. The same expedient must also be made use of whenever the statues in the niches, according to their common proportion, come considerably larger than those placed at the top of the building. A trifling disparity will not be easily perceived, on account of the distance between their respective situations; but if it be great, it must have a very bad effect, and therefore this must be well attended to and remedied, either by the above-mentioned method, or by entirely omitting statues at the top of the building, leaving the balustrade either free, or placing thereon vases, trophies, and other similar ornaments.

Some writers there are who give to these ornaments the preference at all times, alleging that it is absurd to suppose horses and men constantly standing on the roofs, or stuck up in the niches of a second or third story, in situations shocking and frightful to the imagination. De Cordemoy advises by all means to avoid placing statues too far from the ground, and Le Clerc is for having nothing but tutelar angels on the tops of houses.

To me there appears something ridiculous in this affectation of propriety; and, I believe, it may in general be established, that whenever the image is so different from the original it represents as not to leave the least probability of its being ever mistaken for the real object, this strict adherance to propriety is very superfluous.

The character of the statute should always correspond with the character of the architecture with which it is surrounded. Thus, if the order be Doric, Hercules, Jupiter, Pluto, Neptune, Mars, Esculapius, or any male figures, representing beings of a robust and grave nature, may be introduced; if Ionic, then Apollo, Bacchus, Ceres, Minerva; and if Corinthian, Venus and the Graces, Flora, or others of a delicate kind and slender make may properly have place.

Niches being designed as repositories for statues, groups, vases, or other works of sculpture, must be contrived to set off the things they are to contain to the best advantage; and therefore no ornaments should ever be introduced within them, as is sometimes injudiciously practised; the cove of the niche being either filled with a large scallop shell, or the whole inside with various kinds of projecting rustics, with moulded compartments either raised or sunken, or composed of different coloured marbles; for all these serve to confuse the outline of the statue or group. It is even wrong to continue an impost within the niche, for that is of considerable disadvantage to the figures, which never appear so perfect as when backed and detached on a plain smooth surface. An excess of ornaments round the niche should likewise be avoided, and particularly masks, busts, boys, or any representation of the human figure, all which serve to divert it from the principal object.

The depth of the niche should always be sufficient to contain the whole statue, or whatever else it is to contain, it being very disagreeable to see statues, or any other weighty objects, with false bearings, and supported on consoles or other projections, as is sometimes done; and in the case of niches, the side views become exceeedingly uncouth; for in these a leg, an arm, a head, in short, those parts alone which project beyond the niche, appear and look like so many fragments stuck irregularly in the wall.

CATHOLIC SCHOOL AND CHURCH ACCOMMODATION IN CONNEMARA.

On the authority of the respected pastor of the district, through a letter recently addressed to a Catholic morning contemporary, we present the following particulars respecting the scholastic accommodation for children of his persuasion:—"Eight years ago there was neither a stick or stone on the elevated site on which now stand the magnificent Convent of Mercy and St. Joseph's Female Orphanage. In the former, fifteen nuns reside, and in the second 35 destitute, homeless orphans are fed, clothed, educated, and trained to be good servants. These elegent buildings occupy an elevated position on the summit of a lofty mountain. The Most Rev. Dr. M'Hale, Archbishop, and Mr. Thomas Eyre of Bath, respectively contributed £1,400 and £800. The nuns have charge of three schools—two free schools, and one for the childern of gentlemen, merchants, ship brokers, and farmers. The aggregate daily attendance is over 212 girls and 50 males, under five years of age. Boys over that age go to our other schools. The Franciscan Monks keep a large school, in which will be found over a hundred boys every day in the week. The teacher at Aughrusmore has on her roll 103 girls. The third school is at Cleggan-quay. This is one of the finest school-houses in the province; it was built at the expense of Henry J. Wilberforce, Esq., so well known for his liberality. He is the owner of the large island of Boffin and a large estate in this parish and in Ballinakill. Last week P. M'Cauley, Esq., J.P., put the clergy in possession of this beautiful school-house, and it is now in full operation. In the Clifden district, besides the nuns' and monk's schools, there are five others—one at Streamstown, the second at Kingstown or Ballyconree, the third is at Erislanen. The Catholic school-house in this last-named place was so bad that the clergy were obliged to run the risk of building a new one. The walls are now built, it is a pity to leave them unroofed. The landlord, W. J. Burke, Esq., of Dublin, has leased the site in perpetuity. We come to a long, small old chapel. Two thirds of the flock are outside, bareheaded and kneeling, some of them are bald, others are grey-haired; many women and children are outside, too—the rain comes down plashing on all. A beautiful new building has been in progress about ten weeks in the Rev. Mr. Flatley's district. The walls are built, the side walls measure 96 feet in length, and 20 in height. They are pierced with lofty Gothic windows, the width of the church is 27 feet in the clear. All is ready for the roofing, but the means are all exhausted. £150 would enable him to take from the pelting showers the groups of young and old on whom we saw an hour ago the deluding rain descending."

Some of the directors of the Great Southern and Western Railway (says the *Nenagh Guardian*) including the chairman of the company, and other leading members, with the secretary and engineer of the Castleconnell company, visited Nenagh recently to select a site for the station-house of their line in this town; adding that it believes it is intended to erect it in Church-street; and, trusting that the company will shortly commence the work, as it would afford employment at a time when it is much needed by the tradesmen and labourers of Nenagh.

Repairs and improvements are proposed to be done to Lucan Church under the Ecclesiastical Commissioner's architects.

DECAY OF STONE AT THE PALACE OF WESTMINSTER.

The following is the report of the committee appointed to inquire into the Decay of the Stonework in the New Palace of Westminster:—

TO THE RIGHT HON. WILLIAM COWPER, M.P., CHIEF COMMISSIONER OF WORKS, ETC.

Sir,—We, the undersigned, being the committee appointed "to inquire into the decay of the stone of the New Palace of Westminster, and into the best means of preserving the stone from further injury," have the honor to submit to you the following report, in which we have adopted as the objects of our inquiry the several points referred to us by your letter of appointment and instruction, viz.:—

"I. The extent and position of the decay.

"II. The causes to which it is attributable, taking into consideration the composition of the stone, and the influence exerted upon it by moisture and by the acids diffused in the London atmosphere.

"III. The best means of preserving the stone from further injury.

"IV. The qualities of the stone to be recommended for future use in public buildings to be erected in London."

1. In proceeding with the important inquiry thus entrusted to this committee, we beg to state that we first made a careful inspection of the whole of the buildings, and that after this inspection we proceeded to obtain such evidence as appeared to us best calculated to facilitate the inquiry entrusted to us by examining a considerable number of witnesses who had been connected with the building from the commencement, or who had been concerned in the various processes which had been actually tried for arresting the decay which had occurred; and also another class of witnesses, who had suggested various theoretical remedies for the same purpose.

2. We delegated to a sub-committee, specially appointed, an examination and inquiry into the condition of other buildings erected in the metropolis, in which magnesian limestone had been used; and we particularly called the attention of the scientific chemists, who had been appointed on the committee, to several points peculiarly within the limits of their acquaintance with chemical subjects.

3. We also considered it expedient to invite by advertisement the attention of chemists and others to the subject submitted to the committee, requesting that any plan or suggestion for the prevention of decay, or for arresting its progress, might be brought under our notice.

4. Having thus premised the course the committee thought it expedient and desirable to take, we now proceed to report *seriatim* on the subjects brought under our notice by your instructions, and in the order adopted therein.

I. "The extent and position of the decay."

5. It is extremely difficult to give any very exact account either of the extent or actual position of the decay. It seems from the evidence that it first began to make its appearance in the portions of the palace at Westminster executed at the commencement of the building, about seven years after their execution; and yet, in some of the most recently executed portions—viz., those towards Old Palace-yard, facing Henry VII.'s Chapel, the decay appears to be as obvious as in any other part of the building.

6. In the earlier works—viz., those towards the Thames, the decay is most apparent in the lower portion of the building, and in this portion the decay is confined to what may be called the "zones," or general levels, which would seem to suggest that it depends as much upon position in the building as upon the use of particular beds of stone from the quarries employed.

7. The same remark applies to the part of the palace fronting the approaches to Westminster-bridge, where the decay of the lower portion is considerable; but in the newest work, facing Henry VII.'s Chapel, the decay occurs in positions which are more varied, and under circumstances which it is exceedingly difficult to appreciate

8. We have examined with much care the upper portions of the building, and we cannot perceive that the decay has made any important inroad upon those much more exposed portions, where decay might more reasonably have been expected. The decay, however, occurs again to a considerable extent in the inner courts, which are sheltered in a great measure from external influences, and perhaps the very worst specimen we have noticed is to be found in the small archway leading to the Reporters' Gallery, near the entrance to Westminster-hall, a part of the work as much sheltered as in the nature and circumstances of a public building it could well be.

9. The general result of our observations, confirmed by the evidence, would seem to suggest that the stone used in the Palace of Westminster is much more likely to decay in damp and sheltered situations than where it is exposed to the full action of atmospheric influences. In the east and north fronts, before adverted to, the worst symptoms occur in the ashlar between the upper and lower mouldings of the plinth, and under the first cornice, where the exposure is inconsiderable; but the dampness arising from the drip of the mouldings and from the action of capillary attraction, in cases where projections hold the moisture, appears to exercise an important influence on the condition of the stone itself.

10. It does not appear to us that the decay is attributable, as is commonly supposed, to the stones in the building not being placed upon what is technically called their natural bed, or in the same relative position as they occupied in the quarry: thus, stones which are found horizontally in the quarry appear to have been often placed perpendicularly in the building, and used for purposes of the most delicate decoration without any injurious result. As an instance of this fact we may point out the elaborately carved shields of arms under the range of the first-floor windows; the stones used for those shields, though universally placed perpendicularly to their natural position in the quarry, present, so far as we are aware, few, if any, symptoms of decay.

11. The extent to which the decay on the whole surface has proceeded it is not very easy to estimate. At the present moment the actual decay is doubtless considerable for a building so recently erected; but the change of color in the stone itself, and the "fretting out of the surface," which are suggested as the first symptoms, lead us to apprehend that there may exist much more mischief than at present is actually apparent.

12. One of the witnesses examined, however, and whose judgment as a practical man is of considerable value, is of opinion that the decay, after proceeding to some depth in the stones, stops of itself; that an induration of the surface takes place, and that no further decay ensues. The committee would willingly accept this opinion, if they considered it well founded, but they cannot conceive that it is true to any considerable extent, notwithstanding there may certainly be some few indications which lead to the belief that in some cases it may be correct.

13. At present the decay appears for the most part on the plain surfaces, while the finer and more elaborately wrought portions of the building, unless under projections, are not seriously affected. And, however disappointing and disfiguring these defects may be, especially in a building so recently erected, the committee are of opinion that at present the decay does not affect the stability of the structure.

II. "The causes to which the decay is attributable."

14. This part of the inquiry naturally leads to a reference to the evidence which has been obtained by the committee on the subject of the stone itself. The result of this evidence may be thus briefly stated. The stone recommended by the commissioners for this building was that from the quarries of Bolsover Moor and its neighbourhood, and this stone was actually contracted for in the first instance. Before the work began, however, it was found that blocks of sufficient size could not be procured from those quarries, and in consequence one of the commissioners was appointed to proceed to the spot, to ascertain whether other quarries might not be discovered furnishing stone in beds of greater thickness and of larger dimensions. These conditions were found in the quarries of Anston, and the stone of greater thickness procured from these quarries has been used, not only in this building, but in all the other buildings constructed of magnesian limestone in the metropolis, after the quarries of Bolsover Moor had been abandoned, for the reason above stated.

15. The recommendation of the Bolsover stone in the report of the commissioners was founded on its similarity to that used in the Norman porticoes of Southwell Minster, which were stated in the report to be in a high state of preservation. Evidence has since been adduced, in a letter from Mr. Scott, to be found in the appendix, which renders it probable that the stone of this minster was really obtained from the ancient quarries at Mansfield Woodhouse. The latter quarries were reopened, and a considerable quantity of stone from them (exceeding 20,000 cubic feet) was made use of in the Palace at Westminster; but in their turn they were relinquished from dissatisfaction as to the size of the blocks, though we have it on evidence, confirmed by our own observation, that the stone used from these quarries has stood remarkably well.

16. The evidence brought before your committee on the subject of the stone obtained from the Anston quarries is very conflicting; the contractor and his principal foreman stating that the stone was, with slight exceptions, extraordinarily good, while other witnesses maintain that even in the quarries themselves there are stones in a state of actual decomposition; and one very important witness, a foreman employed at the Palace of Westminster, asserts he knew that certain beds in some of the quarries were liable to decay, and that he abandoned them in consequence. With reference to the selection of stone, the committee venture to remark that it is much to be regretted that the offer made by one of the commissioners, particularly well acquainted with the selection and working of stone, to examine that used in the Palace at Westminster for the moderate salary of £150 per annum, was not accepted, owing to some difficulty in regard to the party who was to be held responsible for this unimportant amount, and that the matter was left to persons who admit they had little or no prior experience of this description of stone, though they evidently entertained suspicions of the durability of some of it which they were employing.

17. With reference to the very natural and important question of the actual causes of the decay of this stone when exposed to the London atmosphere, the committee take the liberty of referring to the report of the chemists, who were members of the committee to whom this question was specially referred. This will be found in the appendix.

III.—"The best means of preserving the stone from further injury."

18. This part of the inquiry referred to the committee naturally divides itself into two questions—namely, as to the steps that have hitherto been taken, whether experimentally or otherwise; and as to those that are to be recommended for adoption hereafter. With regard to the first question we have ourselves examined with care the result of what has been done at the palace itself, either experimentally on the river front, or, as in the inner courts, by actual coatings or washings over large surfaces. With regard to the second question, our inquiries have been earnest and elaborate, and we have examined many witnesses and given much time to the consideration of the various propositions obtained by advertisement or otherwise. As will be seen in a subsequent part of the report, we finally referred this question to the further consideration of the professional chemists who were on the committee.

19. On the first question, the committee are decidedly of opinion that it is not necessary nor desirable to proceed with any general coating, painting, oiling, or washing of the whole building. It is quite obvious, in their judgment, that a very large proportion of the stone does not require any such application; but that what is wanted is some efficient process which should be applied to the surface of any stone that begins to show symptoms of decay, with a view to arrest its progress. The committee believe that the persons to whom the care of the building is entrusted ought to watch it, and note in the very earliest stages wherever decay is perceptible by efflorescence, change of color, crumbling, or slight decomposition.

20. In cases where the decay is important, and evidently occasioned by the fall of rain on an upper projecting or exposed surface, protection should be afforded by a covering of sheet zinc or lead; and if hereafter any composition should fortunately be discovered by which the decaying stone could be at once covered or coated, and the injurious influences of the atmosphere prevented from further acting upon it, the difficulty would be solved. In some cases the decayed stone might be cut out and replaced by a new one. With regard to the processes which have actually been applied, whether experimentally or extensively, your committee are decidedly of opinion that the discovery of a proper mode of treating stones in a state of decay has not yet been made, and there is no evidence whatever on the building itself to induce them to believe that the decay, where decay has arisen, has been arrested or that permanently the decay has been prevented by any of the processes yet applied.

21. With reference to the second question, we found ourselves unable, after much labor, to come to any definite conclusion; and we finally requested the chemists in the committee to examine and report upon it; but those gentlemen state, as appears by their report in the appendix, that the nature of the inquiry is so extensive, and that time is so important an element in the solution, that they are unable to give any opinion upon the subject. They further state that they spent five whole days in the examination of only one suggested remedy, but they are unable, notwithstanding, to give any opinion on even that one suggestion. They allude to secret processes, regarding which they say they can offer no opinion, but they express a doubt of the applicability of any suggestion which would demand the veil of secresy for protection. Concurring in this view, it may be further noted that even if such applications were found successful in sample or experiment no security would be afforded for a corresponding success in any subsequent large operations. They recommend that a series of experiments should be conducted under chemical supervision for a considerable period of time, and the committee are most reluctantly compelled to coincide with them, and to urge upon the Government the adoption of such a course.

IV.—"The qualities of the stones to be recommended for future in public buildings to be erected in London."

22. On this head of the inquiry the committee have been unable, in the time allotted to them, to go into any very extensive examination. It is obvious, however, that although some varieties of magnesian limestone are an excellent and durable material, when not exposed to the deleterious influences of the London atmosphere, yet that in London it is subject to causes of decay which renders it an undesirable and unsafe material for the construction of public buildings.

23. It is equally obvious that Portland stone, well selected, has been used in buildings in London from the date of St. Paul's downwards, under circumstances of great exposure, and with most successful results. Portland stone is a material to be obtained in any quantity and in blocks of any size, beautiful in color and texture, reasonable in price, not by any means so hard as the Anston stone, and yet with a power of resisting the influences of the London atmosphere that leaves but little to be desired. It must be remarked, however, that Portland stone should be carefully selected, an operation which would be the most satisfactorily effected by an agent at the quarries.

24. On this subject the commissioners could of course bring much personal experience to bear; but after the valuable explanation of the principles upon which the decay of stone depends in populous places, as given by the chemists, in their report before referred to, the committee refrain from repeating those conclusions, in which, however, they entirely concur.

25. During the inquiries of the committee, one of their members, Mr. Burnell, who is well acquainted with the architectural and engineering works in France, undertook, at his own expense, a journey to Paris, to inquire into the practice of the French architects engaged in the government works in that metropolis. There, the stone used, the "calcaire grossier," though a carbonate of lime of tertiary age, and therefore of very different mineral composition from our magnesian limestone of the much older Permian age, seems to suffer from decay in a comparatively pure atmosphere, and where wood is chiefly used as fuel.

26. From the evidence of Mr. Burnell, it does not appear that French architects or chemists have been more successful than ourselves either in the use of materials not subject to atmospheric influences, or in the application of processes for arresting decay, when it has once begun. The opinions of the most scientific chemists and architects in France on this subject have, however, in this way been obtained, and it is extremely probable that the inquiries undertaken by them, simultaneously with those undertaken in this country, may hereafter lead to some successful result.

27. The committee have to thank the Government for the facilities given to Mr. Burnell in this important part of the inquiry, by providing him with an introduction which obtained for him the active assistance of her Majesty's Ambassador at the Court of the Tuileries.

28. The committee delegated, as before stated, to a sub-committee the duty of examining the various buildings in London in which magnesian limestone from the Anston quarries has been introduced in the external architecture. The report of this sub-committee forms part of the appendix, and we beg to refer to that report as confirmatory of our opinion of the uncertain character of limestone, and the risk attending the use of it in London.

29. In conclusion, the committee venture to recommend that the architect of the Palace at Westminster, assisted by scientific chemists, should examine and record the actual state of the stonework of the building at the present moment; that experiments should be made by their direction, under various conditions of height, exposure, and aspect, with such preservative materials and agents as the chemists may suggest from time to time, and that researches should be continued into the effects of the various alkaline silicates, the phosphates, and other substances which have been brought under the notice of the committee, or suggested in Germany, France, or elsewhere; that where decay arises from damp, means should be taken to protect the stone, as has been before suggested; that any stone extensively decayed should be removed and replaced; but that in particular the earliest symptoms of decay should be carefully watched, and examined, with the view to the application of some immediate remedy. The committee believe that a very large portion of the stone in the Palace of Westminster is of a very durable nature, and they entertain a confident expectation that a remedy will soon be found to arrest or control the decay when it has unfortunately begun to appear.

INSTITUTE OF BRITISH ARCHITECTS.

PRIZES AND MEDALS FOR 1861.

The following has been determined on by the Council.

INSTITUTE MEDAL.

That the silver medal of the Institute be awarded to the author of the best essay on either of the following subjects—

1st. The proper application of wrought and cast-iron constructively and artistically.

2nd. The application of timber work in England constructively and artistically, from the year 1400 to the present time.

3rd. The introductien of Italian architecture into England.

4th. The principles of the application of iron-work in the construction of floors and roofs, illustrated by examples.

These medals are open to all members of the profession, without limitation as to age.

SOANE MEDALLION.

That the Soane Medallion be awarded for the best design, well illustrated by a sufficient number of drawings, for:—

A museum of sculpture and pictures, ancient and modern, with lecture-room to hold 500 persons, and library to hold 5,000 volumes.

The successful competitior, if he go abroad within three years after receiving the medallion, will be entitled to the sum of £50 at the end of one year's absence, on sending satisfactory evidence of his progress and his studies.

The competition for the Soane Medallion is open to all members of the profession under the age of thirty years.

THE PRESIDENT'S PRIZE.

That the prize of ten guineas offered by the President, be awarded to the author of the most approved set of architectural drawings consisting of plan, elevation, and section executed in the best manner, in color, and shaded, and occupying not less than a sheet of Imperial paper. The scale to be one-fifth of an inch to the foot. The subject to be a building of an admirable example, or of original design, such as a chapel, a pleasure house for a garden, a park gate entrance lodge, a moderate-sized villa, or a small market house and room above.

The above prize to be open te all students, whether of the Institute or not.

That a prize of books be given by the Institute to the author of the design that may be considered the second in merit.

MR. TITE'S PRIZE.

That a prize of ten guineas announced at the ordinary general meeting held on the 5th November, 1860, as having been offered by Mr. Tite, M.P., F.R.S., Fellow, be awarded to the author of the best set of sketches or suggestions, in the Italian style of architecture, for public buildings adopted to modern wants, *e.g.*, churches, town-halls, railway stations, public offices, &c., in England.

The competition is open to all associates and students of the Institute. Each competitor is to send in not less than two, and not more than three, sets of sketches.

SIR FRANCIS E. SCOTT'S PRIZE.

That a prize of ten guineas, offered annually by Sir Francis E. Scott, Bart., for the term of five years, be awarded to the author of the best set of sketches for a building of moderate dimensions, devoted to civic or domestic purposes, in accordance throughout with the advance of modern civilization, and designed in harmony with the constructional and ornamental principles that prevailed in the architecture of England, France, Germany, and Flanders, from 1200 to 1500, and in that of Italy, from 1250 to 1400.

The competition is open to all associates and students of the Institute. Each competitor to send in one set only of sketches.

MR. ALEXANDER'S PRIZE.

That a prize of ten guineas, offered by E. Alexander, Fellow, will be given for the best essay on the "Four Ancient Camps near Swindon, Wiltshire—viz., Blunsdon, Uffington, Liddington, and Barbury"—showing how, without injury to the ancient remains, works of a temporary character might be added, to render them available for defence by rifle volunteers and others; taking advantage of the resources of modern science, the railway, telegraph, &c., and of the large engineering works at Swindon.

This competition is open to all members of the profession.

STUDENTS' PRIZE.

(For Students of the Institute only.)

That the subject of the design for the students' prize in books for the year 1861, be—"A dispensary suited for a manufacturing town."

STUDENTS' MONTHLY SKETCHES.

(By Students of the Institute only.)

The following subjects have been selected for the sketches for 1861, and they may be taken in any order, attention only being requested to their being forwarded to the honorary secretaries at as regular intervals as possible:—

A base of a column seen from above.
Canopy.
Corbel.
Mouldings (with sections).
Pinnacle.
Scroll-work in stone or plaster.
Acanthus leaf.
Cross.
Cornice.
Scroll-work in iron or wood.
Capital, moulded, seen from below.
Ditto, foliated.

Further particulars respecting conditions may be obtained from the Honorary Secretaries to the Institute of British Architects, Conduit-street, Regent-street, London, W.

A splendid aquarium has been inaugurated in the Jardin d'Acclimatation in the Bois de Boulogue. The building is a long gallery, terminated at each end by pavilion-formed vestibules, painted in fresco, after the Aquaria of Herculaneum. The gallery is 150 feet long, the glass cases forming one side of it, and the other being left in obscurity. Salt and fresh water fish, crustacea, and other natives of the sea and river, are here in profusion, swimming around the rocks, or attaching themselves to the bottom or to aquatic plants.

CATHOLIC YOUNG MEN'S SOCIETY.

We understand that this society, for some time located on Lower Ormond-quay, has concluded arrangements for the premises on which now stand the old Dominican Church in Denmark-street, and which will be converted into a suitable building for the society's purposes, with spacious reading and lecture rooms, library, &c. Mr. John Connolly (Princes-street) is the builder.

THE OAR.[*]

Probably the most ancient mode of propelling boats through the water by hand-labour was by means of oars of nearly the same shape, and worked in the same manner, as those now in use. And to all appearance there is no likelihood of a change, for although many savage tribes work their canoes and other narrow boats with hand-paddles, and attain great speed with them, yet seamen of civilized nations, whose boats are mostly of a more burdensome character, and whose bodies are encumbered with clothing, have, without exception, given preference to the oar, as an instrument of greater power, and worked with more convenience.

And, truly, there is no more beautiful instrument than an oar, when we consider its simplicity, the ease with which it is worked, and the readiness with which its position is accommodated to the ever-varying motion of the boat and the sea's surface. It has often been proposed—indeed, it is a favourite notion with theorists—to propel life-boats by rotatory paddle-wheels and screws, such as those of steamers; but the proposition is altogether an impracticable one, and its trial could only result in failure.[†] Where great power and velocity of motion can be applied, as by steam, undoubtedly the rotatory form is the most convenient mode through which to apply it, and accordingly, both screws and paddle-wheels work advantageously, until the rolling or pitching motion of a ship becomes very violent, when great waste of power ensues; for instance, when a ship rolls so deeply that the paddles are alternately too deeply immersed, and spinning round in the air; or if a screw ship, when she pitches so much that the screw is raised to the water's surface, or lifted above it. When, therefore, it is considered how much more violent is the motion of a boat in a heavy broken sea than that of a ship, it will be readily conceived that a fixed machine, such as a wheel or screw, even if it could be worked on so small a scale by steam power, would do so at a still greater disadvantage. Whereas the oar, obedient to the quick eye and ready arm, varies its position with every motion of the boat or wave, and in skilful hands is always working at "full power."

But there is another point of importance not to be lost sight of. A paddle-wheel or screw cannot be worked in a life-boat by steam power, but must be so by means of a crank worked by hand. Now it is known to every one that the muscles of the human body are strengthened by use, and that, therefore, persons engaged on any particular bodily labour have those muscles especially strengthened that are constantly brought into play. Thus, a sailor would stand little chance in a walking-match with a professional pedestrian; whilst the latter would as vainly attempt to overtake the former in a race over his ship's mast-head. It follows then, that, apart from its other advantages, the oar is possessed of this especial one, that it is in daily use by the only class of men on the coasts who are available to form the life-boat's crew—viz., the hardy race of fishermen and boatmen who earn their daily bread on our shores.

An oar being, then, the only instrument by which a life-boat can be propelled, too much care cannot be bestowed on it. Its size, weight, length, material, width of blade, balance, mode of attachment to the gunwale; its height above the water, and above the thwart on which the rower is seated, and the distance of the thwarts and oars apart, are all points of much importance on which the speed of the boat, or its power to make way against a head-sea, much depend.

An oar is a simple lever, of what is termed the second order—that is, wherein the weight or body to be moved lies between the fulcrum and the motive power; the water being the fulcrum of the lever, the gunwale of the boat the point at which its power is applied to the moving body or weight, and the rowers' arms being the source of power.

Fir oars have always been considered the most desirable for life-boats, as they do not bend so much as ash oars, and as they float much lighter in the water, and will therefore better support any persons in it in the event of accident. Experiments have been made by the National Life-boat Institution to test the relative strength of oars, when it was ascertained than an oar made from a good white Norway batten, or from a white Baltic spar, will bear as great a strain as any other, each being as free of knots as possible.

The length of an oar must of course be proportional to the width of the boat, and it should be so poised on the gunwale that the rower can raise or depress it or move it in any direction with the smallest effort. An oar should be not less than five inches wide in the blade, or it will expose so small a surface to the water as to cut through it, and so work on a too yielding fulcrum, with comparative loss of power.

---

[*] Life-boat Journal, Vol. iv., No. 42.

[†] We confess to be amongst the "favourite notion theorists," who would take exception to this conclusion, as the same principle by machinery and hand-power respectively would be a mere mechanical equivalent, and therefore must, in common sense, be as practicable, to a certain extent, in the one as the other.

The height above the thwarts, of the thowl or rowlock in which the oar works on the gunwale, should be sufficient to enable the rower to lift the blade well above the waves by depressing the loom or handle; but, on the other hand, it must not be so high as to require him to raise his arms above the level of his chest in rowing, in which case he will row with much less force, and be much sooner fatigued. A height of eight inches from the thwarts to the oar on the gunwale will be found a suitable average.

Lastly, the mode of confining the oar to the gunwale of the boat is of much consequence. The most common modes, in ordinary boats, are rowlocks and double pins, between which the oar works; but as an oar is liable to jamb in the rowlock or between the pins, when rowing in a rough sea, and thereby to get broken, or to damage the gunwale, the oars of life-boats have generally been worked in a rope grummet or ring, over a single iron thowl-pin: a further advantage of this plan being that it enables the oars to lie along the outside of the boat when not in use, and thus saves the necessity of unshipping them and getting them inboard on going alongside a wreck, which is a great advantage.

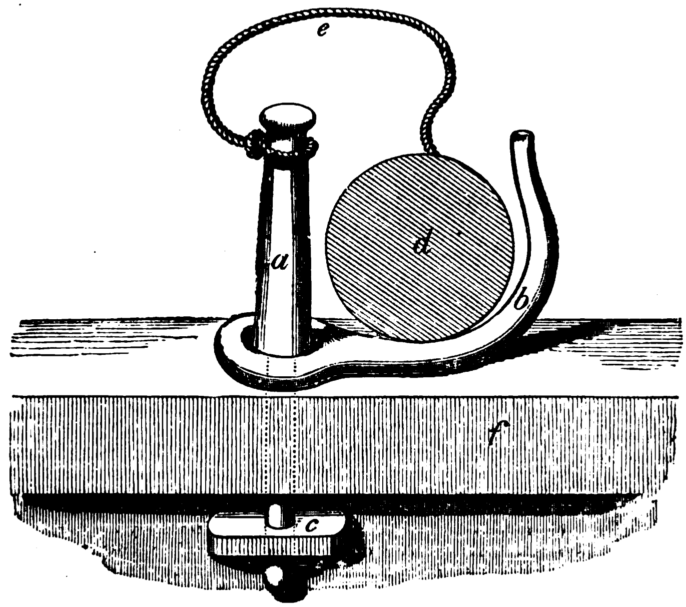
A new description of swivel-crutch, intended as a substitute for a grummet, has recently been planned for the National Institution's life-boats, by its inspector, Capt. Ward, R.N., which is found to have the advantages of the grummet, and to be more convenient in some respects.

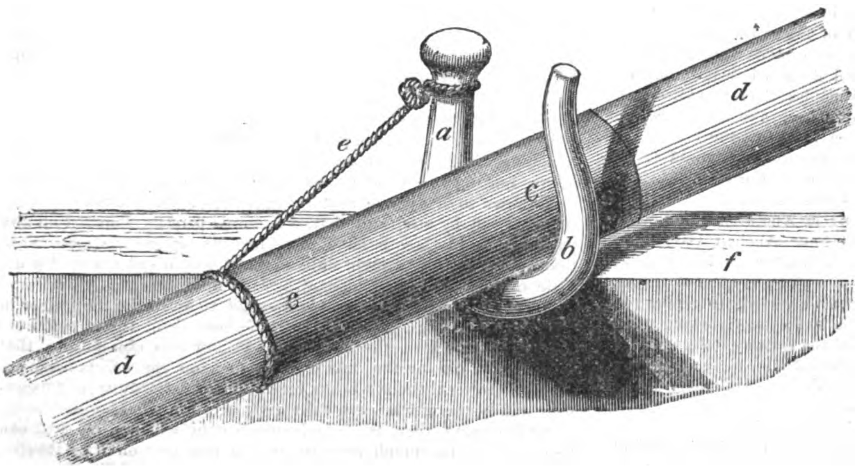
As it will be found to be a very useful kind of crutch for general use in boats, we subjoin a sketch of it.

Figure 1 represents the inside of a boat's gunwale, with a section of the oar (*d*) within the crutch, the latter supported on the gunwale in the position in which it remains whilst the oar is in use. *a* is an ordinary iron thowl-pin; *b*, the crutch, also of galvanized iron, which revolves round the thowl as an axis; *c*, a clamp or chock, which receives the lower end of the thowl; *e*, a short laniard with a running eye, which is slipped over the head of the thowl whenever the oar is required to hang over the side; *f*, the gunwale.

Figure 2 shows the oar when let go by the rower and allowed to hang alongside outside the gunwale. *a*, the thowl; *b*, the crutch; *c*, the leathering on the oar, to prevent chafe; *d*, the oar, as hung alongside; *e*, the laniard spliced round the oar, below the leathering, and nailed on to prevent its slipping round or along the oar; *f*, the gunwale.

The principal advantage of the swivel-crutches over grummets is, that they are of a more durable character, are fixtures, and so not liable to be mislaid or lost, and retain always the same size and shape, whereas a grummet is liable to stretch by use, when the oar will work too loosely in it.





IMPROVED WET GAS METER.

Consumers of that useful and now almost universally adopted commodity, "gas," would hail with pleasure the maturity of an invention which should prove an efficacious check on the present unsatisfactory meter system, whereby the public are completely at the mercy of gas companies, and, without the opportunity being afforded them to test the truth of the registry on which is founded the charge for the article, must pay whatever is demanded. It may be remembered by some of our readers, that in earlier numbers of this journal we devoted attention to the exposition of some of the fallacies that distinguish the present system—the absence of guarantee of correctness in the meters, and the absurdity of meter rent at all, which latter, in a commercial point of view, is as unjust as it would be for the proprietor of a business concern in the city to charge for the delivery (within the boundary at least) of goods purchased at his establishment. However we may take exception in this and other regards to the guiding principles of the Dublin gas companies—who, though nominally rivals, are evidently pulling a cord which none others can lay hold of—we must not be understood to cast any imputations on their wilful *intentions* to wrong the public, and make them pay for what, even according to their tariff, they have not received full value; but as we live in an age when possibilities of error should be made *im*possibilities, it becomes our duty both to expose the disease and suggest the remedy. In London a certain degree of protection is secured to consumers by a recent parliamentary enactment,* which imposes upon gas companies the task of having their meters adjusted in conformity with a fixed standard, and a seal attached by a district inspector denoting that same have been duly tested. Whether this law may or may not extend to Ireland we are at present unable to say, but in any case it must be obvious that if the construction of the meter be either radically erroneous or even partially so, the precaution would be of little practical use during the intervals of inspection. The chief claim for preference before the ordinary meters now in vogue of the patent in question—a diagram of which we annex—is, that it is alleged to substantially maintain "the water level," and for years, too, without requiring any attention. We need scarcely dwell on the importance of such a desideratum if there be truth in the allegations set forth, on which we should not feel ourselves—in the absence of practical experiment—justified in offering a positive opinion.

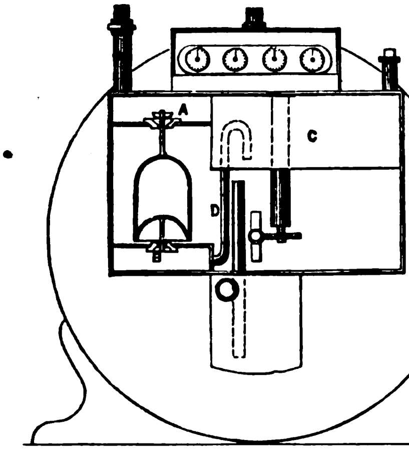
The following particulars will further explain the nature of the invention, which we may remark is that of Mr. Henry Shaw, of Lower Ormond-quay in this city—whose "patent railway brake" was recently illustrated and described in these pages; Mr. James

---

* 22 & 23 Vict., cap. 44.

Meacock, of 7, Snow-hill, London, being the wholesale agent and manufacturer:—

Description of Shaw's Compensating Inverted Valve.



"This diagram shows a front elevation of an ordinary wet meter with the improvement—viz., *c* the reservoir, *d* the supply pipe, and *b* the inverted valve. This valve is in connexion with the ball-float, and is raised and depressed with it: when raised to its seat forms a perfect security against water entering the meter; and when open it will admit such supply of water from the reservoir as will float the ball to its proper level, and no more. The means by which the water line may remain undisturbed, either by the pressure of the gas when first being turned on, or by the action of the wheel in motion, is simple and efficacious; the 'opens' or holes through which the water passes from the one chamber to the other are minute, and no quantity of water can pass while the pressure from the gas, going on, is being equalized in both chambers; and also the motion of the wheel can in no way affect the still water of the float chamber, which secures a steadiness to the light.

"The reservoir may be made sufficiently capacious to hold a supply of water for years, and when emptied will give notice by the going out of the light, caused by the shutting of the valve *a*. The inverted valve *b* is protected from injury by submersion in the pure water, and the concavity of the bottom of the float within which the upper parts of the valve are guarded. The entire range, or fall, of the valves does not exceed the one-tenth of an inch, or what may be equal to a difference of one per cent. each way from the standard measure."

The same objections respecting the effect of atmospheric influence would seem to apply to this in the same ratio as other meters, and if so, the chief claim of the inventor would be materially affected.

INTERNATIONAL CONGRESS.

It appears that the fourth session of the International Philanthropic Congress is to be held in London next year, on the occasion of the Great Exhibition. Among the noblemen and gentlemen who have expressed their concurrence are, Lord Brougham and the Council of the National Association for the promotion of Social Science, the Earl of Shaftesbury, the Earl Ducie, the Earl Fortescue, Lord Ebury, Lord Raynham, the Right Hon. W. Cowper, M.P., Sir Thomas Phillips, Alderman Mechi, Mr. Harry Chester, Mr. Samuel Gurney, M.P., Mr. Edwin Chadwick, C.B., Mr. Henry Roberts, Mr. George Godwin, F.R.S., Mr. T. Twining, Dr. Sutherland, F.R.S., and Doctor Southwood Smith, F.R.S.

ROYAL NATIONAL LIFEBOAT INSTITUTION.

Referring to the performances of the crews of this highly laudable institution engaged on the Irish coast, the following is to be found in the recently published report:—

"A reward of £4 was voted to the crew of the Dundalk lifeboat, belonging to the Institution, for rescuing, after several shore boats had made fruitless attempts, a ship keeper, who had been left on board the barque *Frederick*, of Dublin, which during a heavy gale of wind was totally wrecked on Dundalk bar on the 13th ult. A reward of £7 was also granted to five policemen and one civilian, for swimming off a great distance at much risk of life, in a heavy sea and a strong ebb tide, and saving the lives of two persons who had been capsized from their boat, off Lahinch, County Clare, Ireland. It was stated that two of the constables had on several previous occasions very laudably exerted themselves in saving life. The constables had also received a reward of £1 each from the Inspector-General of police. Mr. Synge had received the silver medal of the institution, in acknowledgment of his exertions in saving life from a wreck on the Irish coast. The demands on the funds of the institution continue, we regret to say, to be very heavy; and payments, amounting to £1,000 on lifeboat establishments, were ordered on Thursday to be made. It is earnestly hoped the public will continue to strengthen the hands of the committee, so as to enable it to carry on, during the ensuing winter, the important and philanthropic operations of this truly national institution. Orders were given for the sale of £500 from the small funded capital of the society, to enable it to meet the heavy demands on its funds."

THE CHANNEL RAILWAY.

However problematical an enterprise may at first sight seem to be, it nevertheless, if endowed with the elements of feasibility, is entitled to impartial consideration, and we should therefore have no right, because difficulties never before surmounted beset its path, to assume its accomplishment impossible. Science has achieved many victories over foes hitherto deemed invincible, and even in the present age we may expect to see great revolutionists and pioneers of improvement arise, who in their own peculiar sphere may take rank with a Watt, an Arkwright, a Rennie, a Telford, a Stephenson, or a Brunel, whose consummated works would, when projected, have been fairly regarded by our forefathers as the offsprings of an overheated imagination. Many of our modern sceptics, too, would, in similarly complimentary style, classify *us* if we hazarded an opinion as to the practicability of a Londoner being transported by rail direct to the French capital without incurring the necessity of changing from rail to steamboat, and steamboat again to rail; but this *we* may, and most probably our children *will* live to see it notwithstanding, or for aught we know the Irish capital may be included in the chain. The project to connect England and France by means of a submarine structure is nothing new, it has occupied much consideration of the respective governments, and designs were prepared and submitted by several parties, *some* perhaps more enterprising than scientific. Mr. Chalmers, therefore, whose recently published work* with this purpose in view is now before us, can lay no claim to originality of conception, but how far he merits an attentive ear before his compeers becomes a question into which we now proceed to enquire. Some dozen schemes—seven of which were by Frenchmen and five by Englishmen—had been previously mooted, and respectively comprised submarine tunnelling, submerged tubes above or below the bed of the ocean, and a mammoth bridge; the practicability of the former being probably suggested by the successful construction of the Thames Tunnel. Mr. Chalmers, however, adopts a submerged tube of circular construction, which would be directly placed between the South Foreland and Cape Blancnez, a distance of eighteen miles, firmly held down by great iron boxes filled with rough stones, the whole surrounded by an embankment also of stones 150 feet wide at base, 40 feet high, and from 40 to 120 feet below level of low water; the ventilation to be effected by *three* shafts, one mid channel and the other two about a mile from each shore, thus rendering the distance between each air aperture some 4½ miles. A double line of rails is provided for, sustained by a horizontal flooring of girder construction; the ceiling of the tube is horizontal, and, together with the former, acts as a strengthening tie or brace. There is likewise a vertical partition between the "up" and the "down" lines.

The projector estimates the cost at £12,000,000 sterling, and the time occupied in completion to be *three* years. Thus in possession of heads, we come to examine details more closely—first, as to the practicability, not of constructing it (for this must be admitted), but the means to be employed in laying it, whether in part or whole; secondly, if the provision for ventilation be sufficient; and thirdly, with reference to vibration. To construct a perfectly watertight tube, 18 miles in length and some 30 feet diameter, and to put all its component parts together on land, would present no great difficulty to our modern iron masters; but when once completed, it must naturally occur that the machinery requisite for successfully submerging the monster in its integrity into its marine bed, would cause to pale before it into contemptible insignificance that employed in raising the Britannia Bridge, or in the launching of the *Great Eastern*. On the other hand, assuming that it is to be fixed in portions, how are these to be constituted under water into a compact whole? To these questions the author supplies the following:—

"The tube will be constructed in lengths of 400 feet each, and launched and towed to their positions: each length will be furnished with temporary bulkheads: there will also be interior divisions to regulate the space to be filled with water in submerging: for, during this operation they will be made to retain a portion of their buoyancy, and be drawn down by means of chains passing through pulleys attached to massive anchors on the bottom of the Channel: the chains will be made to indicate, by change of colour or otherwise, the progress of descent: the anchors will be four in number, and so placed that their respective chains will be attached to the outer corners of the end boxes: the length of tube will thus be secured at its four extreme corners; and the other ends of the chains will be connected with machinery on board vessels, which machinery, when set in motion, will have a uniform speed, causing the tube to descend in a perfectly horizontal position; and, as the pulleys through which the chains pass will be so arranged as to retain the portion of chain that passes through them—allowing no back-slip, the tube in descending will gradually acquire the steadiness of the bottom of the Channel, getting rid of the unsteady motion of the surface. When a length of tube has been safely submerged, a supplementary chain having previous to submersion been attached thereto, will disengage a key that secured the submerging chain to the corner of the box; and being also attached by a longer branch to the submerging chain, the submerging chain will by this means be brought back to the surface; for the latter being then slack will drop into a recess below the pulley (which revolves only one way), through which it can be withdrawn without the pulley revolving."

---

* The Channel Railway. By James Chalmers. London: Messrs. Spon, Bucklersbury.

Referring to the immersion of the tube and its staunching under water, the projector explains his design, which, in the absence of a diagram with referential letters, we thus interpret:—"In commencing to submerge a length of the tube, a wire cable attached to the end of a bolt is passed through the projecting portion of a flange covering upper half of tube, while *one* length of the tube is on the surface of the water, the end of the bolt being previously fastened inside the *other* length of the tube already in its place and loaded down; a strain is kept on this cable—in nautical phrase it is kept taut—while the tube described on surface is descending; and, on nearing its position, the bolt guides the flange till the projection rests on the cone surrounding the bolt holes in same; the projecting upper half of flange being a semicircle, overlaps and rests on flange, guiding the ends of the tubes together when they are joined. The *one* tube being in its place and loaded down is empty inside of the bulkhead, and the *other* tube having been brought into its place in the manner already described, by means of strong plate glass dead lights in the bulkhead, aided by powerful reflecting lamps, when the flanges come together, then a valve near bottom of tube is opened, allowing the water between bulkheads to escape, and the end pressure on the *other* tube forces the flanges together with a power of about 2,000 tons, or 500 lbs. per square inch of bearing surface; and the flanges having some elastic substance between them, a water-tight joint is thus effected. Workmen then pass into the division between the bulkheads, and by bolting flanges together make a permanent joint; while this is being done the *other* tube is loaded down, and when sufficiently so the bulkhead is removed and the operation repeated at other end, which is also furnished with a bulkhead and valve same as described, and so on till all are joined together. After the joint is made the bolt is withdrawn and the hole stopped. The tubes are joined to the ventilators in same manner as to each other . . . . and the wire cable is attached previous to their being placed in position. The work of joining the tubes will commence at mid channel ventilator, and proceed towards those near extremities on ascending gradients, the water inside tubes flowing towards deep sea ventilator, where it will be pumped out."

The actual *practical* mode to be adopted in *accomplishing* that described above is not by any means clearly defined, and the reader is left very much to his *own* judgment as to how *so* and *so* of the author's proposition is really to be effected. We cannot assume that this junction of the tubes in the bed of the sea where the smallest leakage defect would hereafter prove a most disastrous calamity, and where such impediments are naturally presented to workmen employed thereon, is *quite* so easy a matter as the author seems to suppose.

We are equally sceptical respecting "the ventilation," which at least should be as complete as in an ordinary land tunnel, wherein sometimes the atmosphere is oppressive enough; precaution against similar objection being doubly—trebly—necessary in this instance for obvious reasons. The deep sea ventilator is undoubtedly a gigantic construction, 132 feet in diameter at bottom, tapering, and with a lantern elevated considerably above high water mark, to which two others of smaller proportions, and placed about a mile from the respective shores, act as accessaries; nevertheless, without going into actual calculations—which perhaps the author *may* have *rightly* done—we apprehend that much more efficient provision than that suggested would be found to be required; and not by any such complicated and expensive construction mid-channel—which is decidedly objectionable for many reasons, and would lead to probabilities of accident—but from the ends *only*. Furthermore, our opinion as regards the vibration is precisely opposite to that of Mr. Chalmers, who says "the noise in this tube can be reduced to a minimum, unlike tubular bridges suspended in the air; the sound and vibration of the iron will be deadened and neutralized by the equability and elasticity of the pressure without; and as the situation of the roadway will admit of a perfectly united rail, the sensation travellers will experience on entering the Channel railway, will be akin to what we feel *after walking on a gravelly road with thin shoes, when we step upon the downy sward of a smooth green lawn.*" Our author here evidently digresses to the poetic, though we should have no objection to his indulging a little in that strain, if it were accompanied by reason; but there is nothing to justify any other supposition, than that the vibration, instead of being *diminished*, would be intensely *increased* by the embanking in—as proposed—of the tube in "a mass of rough stones," in a few years converted into a "solid, impermeable mass," through which a train would rattle to an unbearable extent. In short, Mr. Chalmers' project has not yet solved the problem satisfactorily, though the public are doubtlessly indebted to his enterprise for suggestions which may be improved on either by himself or others. We may here appropriately give place (without desiring at present to offer any opinion upon its merits) to the particulars of one of the projects included—though not referred to as specially as others in Mr. Chalmers' work—in the enumeration on other page, and which was submitted conjointly by Mr. Richard Turner, of this city, and his son, Mr. Thos. Turner, architect and C.E. (then of Adelphi, London), of Belfast. These gentlemen propose the route to be between Dover and Cape Crisnez, about the same mileage as the route adopted by Mr. Chalmers, but manifestly less advantageous as regards communication with the interior of France:—

"The projectors purpose to cross the channel by a tube laid on a level bed 96 feet under low water, formed in continuation of existing lines of railway, made by excavating the shallows adjoining shores, and filling in the deepest portions with the ballast found on the coast. This tube to be secured by gravitation, and covered by a mound of Ballast, so the submarine roads within the tube will be as firm and as steady as a rock. The tube to be made on land in docks, constructed for the purpose on the spot, in lengths from 10 to 1,500 feet, and as each length is formed it is to be rolled forward through the dock along the level surface prepared for its reception. The dock would then be emptied and another length formed and connected to the one preceeding, and so on to the end until the channel is crossed. Each length of the tube would be constructed on a carriage with wheels, and thus rolled along the level bed by means of a chain railway. The carriage would form part of the tube, and would therefore remain with it, and be embedded in the mound of ballast. Each length of the tube would of course have a temporary stopped end, to be staunchly secured in the dock openings, so as to prevent the water from entering while the succeeding length is being made. The tube is proposed to be elliptical in form, and to be constructed of cast and wrought iron plates, forming a double casing with cellular arrangement between, and the spaces filled with bituminous substance. The interior of the tube thus formed to be lined with brickwork in hydraulic cement (see transverse section.) Thorough light and ventilation would be provided, and complete drainage secured. These are generally the ideas of the projectors, and they have since been engaged in making models and plans to develop their views more fully, and explain the details for the performance of this most important work."

THE EXHIBITION BUILDING, 1862.

Participating in the general interest associated with this great national undertaking, we have given frequent notices of the progress of the building, and will continue to do so to completion, whether from personal observation or otherwise. In the following account, collected from a comprehensive article in our able cotemporary, the *Building News*, will be found the latest particulars:—

Notwithstanding the chronic disorder with which the building trades have been unfortunately so long afflicted, there has been no hitch in the great work which Messrs. Kelk and Lucas are, with untiring energy, pushing forwards at South Kensington. Everything goes on there with steady mechanical regularity. Two months ago we thought the site crowded with materials—gigantic stacks of bricks, forests of leafless timber, and tons upon tons of stubborn metal—but it was bare compared with the sight which now meets our eyes. The huge scaffolding, reared to fix the nave and transept ribs, which excited our wondrous admiration a few weeks ago, is dwarfed into comparative insignificance by the framed polygonal wooden towers, strutted and bolted into one unyielding mass, from which the vertebræ of the colossal domes are to be adjusted. One of these splendid specimens of scaffolding is completed, and the other nearly so. They are alone worth a visit to South Kensington, and are built in eight or nine stages or floors, with projecting landings, where the large ribs will come. Braces, halved and bolted together, make the whole work as solid as a block of granite.

Entering the building, we are astounded as we stand in the centre of the temporary frame, and look upwards at the seeming confusion with which the ponderous timbers interlace each other, whilst at the extremities of it the iron columns, some 2 feet in diameter, backed by smaller companions, stand ready fixed for the ribs which are to give shape and size to these conspicuous features.

Right and left of us the transept ribs are being fixed, but the accumulated scaffolding altogether precludes any appreciation of the work done. Proceeding westwards into the nave, we come suddenly into a quiet spot where the roar of mingled labor ceases, and which the onward progress of the travelling scaffold leaves perfectly unincumbered and finished, with the exception of the glazing. We can here grasp at a glance the whole form of the central avenue, realize its size, and appreciate its effect. It is 100 feet high by 85 feet wide, and has been carried out, without alteration, as Captain Fowke designed it. The ribs rest on coupled columns, and carry joists and boarding which bind the whole securely together. The light enters by clerestory windows immediately under the rib springings, and above the roof of the adjoining galleries. The completed portion at once naturally provokes a comparison with its predecessor, and it at once attests its superiority in the absence of those diagonal ties which proclaimed the inherent weakness of the 1851 construction. Here the ties exist in the peculiar forms which constitute the design. In the possession of diagonal, instead of horizontal light, Captain Fowke's design possesses also a decided advantage, whilst the arched roof carried out the whole length of the building enlarges the best architectural feature of the former building. It is grander also on account of its increased size. The double row of galleries on either side are likewise finished, so that nothing but the diminishing perspective lines of the nave, ending in the expanding dome, is wanting to the unfurnished effect of this portion of the building. Emerging from this tranquil spot, where the roar which arises from the distant mingled work reached us but indistinctly, we see truck after truck moved along the tramways to the travelling scaffold, bearing portions of the overarching ribs. They are fashioned, after Captain Fowke's peculiar principle, of three thicknesses of timber breaking joint and bolted together, and braced outside in the spandrels formed by the principal rafter, having internally a polygonal-arched shape, and externally the ordinary roof slope. A more soundly constructed or cheaper roof it would be difficult to design. About two-thirds of each side is hoisted at a time, and the centre pieces are then supplied and bolted together by the workmen on the scaffold. Immediately the ribs are fixed the rafters are secured to them, and the diagonal boarding laid. The sashes are supplied, and the "traveller" moves forward on its especial tramways to where fresh columns are awaiting their loads, and leaves all behind it complete. Ahead of the traveller, gangs of workmen are busy laying down the four lines of rail for it to move upon. Trenches are being dug, piles driven and sawn off, sleepers and rails laid, on to which the huge scaffold-framing glides steadily to take up a new position for its mighty work. All this time the little engine is screaming, the tackle glides snake-like along the ground, men wave blue and red flags, and materials of every description are run up to their appointed places.

Passing a large batch of shanties, black with coal-dust and smoke, whence issues, amidst the roar of the forges, the dead groan of the heavily-hammered metal, our ears are greeted with the hissing sound of the steam saws and the stifled shriek of the planing machine, mingled with the dull rattle of the engine bands. Farther on we find that another hoisting engine has been fixed with its "crab," around which the rope comes and goes almost without intermission. Stacks of bricks and heaps of mortar are now scarce about the site. The 8,000,000 are nearly used up, but instead we have iron columns, struts, and girders, trussed girders, and stacks of timbers. As we approach the western end, where the carpenters are busy building the scaffolding of the other dome, we see that the double row of galleries on either side of the main avenue are finished, or nearly so, the entire length. The roofs are on and the boarded floors are being laid. The corresponding galleries, which join them from either side of the entrance hall in Cromwell-road, are likewise in a very forward state. Turning into the north-western transept we soon gain the *annexe*, and find its entire length and breadth—some 1,000 feet by 200 feet—completed. The lightness and elegance of these four open galleries is at once apparent. The roof is a modification of that over the main avenue, or rather that is an amplification of this one. The timbers forming the polygonal arch are bolted together, but in this case the central portion of each roof is glazed, stiffening pieces instead of braces are used in the spandrels, and the springings for the arches are very nearly on the floor of the galleries. It has a very handsome appearance, and kindles a feeling of regret that it at least is but a temporary affair, to be removed with the contents it will shortly shelter. This *annexe*, as our readers will recollect from former descriptions, runs parallel with the western wall of the Horticultural Society's grounds, between it and the Prince Albert's-road. A corresponding site on the opposite side next the Exhibition, has been, on account of the continuous cry for space, looked at with longing eyes by the Commissioners, and there does not seem any doubt about their gaining possession of it and furnishing thus some 200,000 feet of additional accommodation for intending exhibitors.

The lowest arcades of the horticultural grounds will also be finished and used by the Exhibition Commissioners. An additional floor, devoted to dining-rooms, will be built on them, from which the luxurious first-class man will look over the magnificent grounds, studded with gay flowers, and adorned with terraced lawns, lined with the, perhaps, finest range of terra-cotta arcades in the world. His view will be stopped by the magnificent conservatory, which has not yet had justice done to its artistic or scientific qualities, whilst immediately in front of it will be the memorial of the Great Exhibition, whose marvellous success stimulated the erection of the present building, and altered the whole character of the South Kensington estate.

Retracing our steps, and proceeding to the southern side of the nave, we see that the brickwork at the south-eastern angle, which has always been the most forward portion of the work, is complete, with the exception of the towers, and that the carpenters with the roof are following closely upon the heels of the bricklayers as they migrate westwards. The roof of the picture-gallery is partially fixed, and countless principals in course of framing are occupying the workmen under the shadow of the walls. The roof is of peculiar construction, but it is the same, if we mistake not, which has been successfully used in portions of the South Kensington Museum. The following description will perhaps explain the principles of its construction:—The two principal rafters are separately trussed, as we would truss girders. They are then placed one against the other, and a band of iron connects their centres. A vertical piece of framing on each side hides the truss. The central portion of the roof between this framing is glazed, and the remainder of the roof is masked by a sweeping curve, which connects the underside of the vertical framing with the wall surface on which the pictures are hung. This picture-gallery will form, when completed, a splendid feature of the building. It will extend the whole length of the Cromwell-road front, and be consequently 1,150 feet long by 50 feet broad. As we approach the south-western corner of the building, passing the three lofty arches which are the entrances from Cromwell-road, we arrive at the least finished portion of the work, where the workmen are some six weeks behind their companions at the opposite end, but there is no doubt in any one's mind about the final completion of the whole building by the stipulated time in February. It is now more than half done. In the corresponding period of the year 1850 the first piece of ironwork only was delivered for the Hyde-park building. The exterior has still a large shapeless appearance, and it is more difficult to judge of its ultimate effect than it is of any portion of the interior.

ARRANGEMENTS FOR THE DUBLIN WATERWORKS.

The committee have directed the requisite surveys of the line of pipeway, and of the two reservoirs, to be made by and under the direction of the City Engineer, Mr. Neville. Mr. Carter, who made the surveys for the parliamentary plans, has been engaged, with other assistants, to survey the reservoirs and take the levels of the whole line; and the committee being anxious with the least possible delay to give the requisite notices to the Board of Works, which are preliminary to the official valuation of the lands to be purchased and taken, engaged Mr. J. J. Byrne, of this city, to survey and map the entire line of pipeway from the tunnel to the Circular-road, under the direction of the City Engineer. The maps of all these lands are now nearly completed, and in a very few days the committee will be able to lodge them with the Commissioners of Works, in accordance with the requirements of the act, and procure the appointment of the official valuator. Some stormy discussions have taken place in the Town Council subsequently, with reference to the project, between the promoters of the bill and the opponents respectively, but which are outside our province—after the quantity of space already occupied—further to record.

ART ACQUISITIONS TO THE BRITISH MUSEUM.

Further discoveries of antique marbles have been made at Cyrene by the expedition under the command of Lieuts, Smith and Porcher, who have, as noticed in the *Athenæum* (from which journal we collect these particulars), already sent a valuable consignment of similar relics of Art to the British Museum. What the Trustees intend to do with these works it is difficult to surmise, the hideous sheds which have for some years disfigured the grand portico in Great Russell-street being almost filled with the beautiful sculptures Mr. Newton brought home. Some of the new marbles, which were in fragments, have within the last few days been put together and may now be seen, on application, at the British Museum. They consist of a splendid statue of Apollo, about seven feet high with the lyre in one hand, resting on a stump, round which circles a serpent. The head of the god, which, as is most common in statues of the period in which it was executed, is rather small, has a noble and dignified expression; the hair is clustered and knotted behind, crowned with laurel, which last is characteristically somewhat stalky, that is, the leaves are small in proportion to the size of the stalk sustaining them. The original surface of the whole work is in a wonderful state of preservation, being very clear and white and sharp. The one hand resting on the lyre, the other has been thrown up above the head, as in the statue of the Apollino; the figure is naked above the hips, where the drapery is gathered in free folds, to fall to the feet, which are sandalled, the sandals bearing a great heart-shaped shield or stud holding the thong between the toes. These extremities are rather large, and therefore a little out of proportion. The lyre is a good deal broken, and, as might be expected, imperfect; it is decorated with a row of small shields along the frame, such as the Amazons are usually represented as holding on their arms. There are holes in the bow for metal strings. On the stump by the side of the statue is a bow and quiver. A statue of Bacchus rather smaller than the preceding, does not equal it in design or execution, being liney, and is decidedly later in date. This work is also naked to the hips, the robe, however, returning behind the back and drooping from one shoulder in front. It is perfect in preservation, with the exception of one arm lost and some very trifling injuries to the draperies; with the remaining arm the statue holds a bunch of grapes. A small statue of Jupiter Ammon, represented, as on the coins of Cyrene, horned, and, as such a unique example in sculpture, we believe. Amongst these works are also two other small statues, one certainly representing Juno; these are hardly so meritorious in design or execution as even the Bacchus. Far superior to these are two minor statues, and several finely wrought fragments, notably one of a leg, a portion of a draped male figure and six hands, all of which are worthy of attention. To us the most interesting of all these discovered remains is a small but most admirably designed group of a nymph struggling with a lion; the boldness and vigour of the execution of this small work are also considerable. Two well carved figures of boars and a score of less important fragments make up the list of statues in this interesting addition to our national collection.

ORCHARD HOUSES.

Referring to an article on this subject, which recently appeared in the *Gardeners' Chronicle*—an excellent horticultural organ—the following practical remarks have been elicited from an eminent authority:—

" *Orchard-Houses should be all Glass and Wood or Iron.*—I am at this moment building a house 100 feet by 24, all glass roof, sides, and end, and no bricks (how I hate them—ugly, heavy, clumsy things), and no boards. The roof, of course, is of glass, in pieces 20 inches wide; the sides are of longitudinal bars, grooved to let in glass, with a glazed shutter 2 feet in width. The sides are supported by light oak pillars (I should have preferred iron), the roof by light iron pillars inside. It is a leading idea with me that large orchard-houses should be as light and fairy-like in their structure as possible. No bricks, no stone, no cement should be used in building them; all should be glass. There can be no architectural beauty in a structure of glass. The first Crystal Palace was a stack of glass, the present is the same; so that the builder ought to give to all such structures a lightness of construction *sui generis*, and so please the world by a combination of extreme lightness with much strength.

" *Roof Openings.*—Although Mr. Pearson found these necessary in his cucumber house on account of red spider—which, by the way, can always be kept away by the proper application of sulphur—for orchard-houses of the width of 30 feet and under they are perfectly unnecessary. They break the agreeable continuity of a large spanned roof, and are, I repeat, useless. I have an opening under each gable of my 24-feet wide house of about a foot deep unglazed; it is quite amusing to watch the two currents of heated air making their egress when the sun shines. To observe this more accurately, as we cannot see air, I have suspended at each end a piece of cotton wadding. When the weather is cloudy and still, they hang perpendicularly and motionless, but as soon as the sun breaks out, they are carried out by the heated air, so as to be horizontal. From a thermometer placed in the centre of the house, and about 18 inches from the apex of roof, shaded from the sun, I find the temperature is, on the average, 6 degrees higher above than below, the thermometer below being 5 feet from the ground. This increase of heat should not be lost, and I intend to train a vine or two all through the houses just under the ridge board.

" *Pavements.*—Pavements of brick, stone, or slate absorb much moisture, and give it out very slowly, so that in walking in your orchard-house in early spring or in autumn, such pavements feel cold and uncomfortable, and are probably dangerous to delicate constitutions. In my opinion there is nothing equal to gravel. A path made with it, well sifted and of a binding nature, is always dry and agreeable, and seems to give out a healthy atmosphere in which it is a pleasure to breathe."

FINE-ART GOSSIP.

Mr. G. C. Scott's design for the reconstruction of the lantern of Ely Cathedral, which is to be considered a memorial to the late Dean Peacock, who himself did so much for the preservation and restoration of the noble church over which he presided for so many years, is (says the *Athenæum*) to be commenced forthwith. The estimated cost of the work is about £61,000; promises of subscriptions sufficient to justify the commencement of this work having been received, no further delay will occur. Like the existing lantern, the new one is to be of oak, cased in lead; and a grand improvement in the aspect of the entire edifice is anticipated from the fact that Mr. Scott has designed the openings in it in better keeping with the character of the general architecture surrounding it than is now the case. The decoration of the ceiling of the nave, by Mr. L'Estrange, with a series of circles containing Old Testament subjects, inclosed, is advancing, as is the new choristers' school.

On the same authority we are told that the eminent stained glass manufacturers, Messrs. Lavers and Barraud, of Endell-street, Bloomsbury, are rapidly progressing with the execution of the large west window in stained glass for Christ Church, Hants. This is the gift of Admiral Walcot, M.P., to the Abbey Church, and may be said to form part of the extensive restorations made therein under the charge of Mr. B. Ferrey. It is of a perpendicular character, divided into four stages or rows, of six lights each; the total height is 32 feet 6 inches, the width, 12 feet 4 inches. The three lowest stages are traversed by upright mullions, perfectly straight. The head is filled in with tracery, in the central top-light of which is represented Our Lord, with his arms extended in the form of a cross, the triangle and the dove embodying the presence of the Holy Trinity and forming the crown, as it were, to the subject of the entire work, *Te Deum*. In the side portions of this head are disposed the Heavenly Host, a crowd of Ministering Angels, &c. In the smaller intervening spaces are placed the Alpha and Omega, the Martyr's Crown and Palm. In the next lower tier of lights are placed the Prophets, Saints and Martyrs, with appropriate emblems. Beneath this are the Apostles, grouped in threes, in each of the four middle compartments, illustrating the Holy Church throughout the world. Next to the Apostles, and completing this line of compartments, are represented two Bishops of Winchester, St. Swithin and William of Wykeham. In the next and third tier the subjects illustrated are, " When thou tookest upon thee to deliver man," &c., and " We believe that thou shalt come to be our Judge;" the former being illustrated by the Birth of Our Lord in the stable at Bethlehem, the Adoration of the Shepherds, and Offerings of the Wise Men; the latter, by Our Lord sitting in Judgment, surrounded by Angels blowing trumpets and groups of beatified Saints. Beneath these, and forming the foot of the whole work, are six smaller panels or divisions, containing busts of the four Evangelists; and on the outermost spaces St. Ambrose and St. Augustine, each writing, and inspired by an Angel reciting the *Te Deum*. The general arrangement is by Messrs. Lavers and Barraud; the design by Mr. J. M. Allen.

PATENT HELIOGRAPHIC PRINTING.

FOR THE PRODUCTION OF PHOTOGRAPHIC REPRESENTATIONS IN PRINTERS' INK.

The object of this invention is to extend the application of photography, by substitution for the salts of silver (used in the ordinary printing of a photograph), an imperishable and cheap material, " printers' ink," and printing the impression at the printing press now in use; thereby rapidity of production, and consequently, cheapness will be the result.

By photography the most elaborate and minute design can be copied of any desired dimensions, and by the heliographic printing the impressions of those designs can be multiplied, and at the same time preserve the delicate pencil of the sunbeam as the graphic agent.

If then the photograph can be thus printed in printers' ink with the same facility as a drawing on lithographic stone, made in the ordinary manner, or on a metal block, for the purpose of printing by the ordinary letter-press, without the preliminary cost of engraving or drawing, there can be no reason why the most beautiful designs and drawings should not be sold at a price but little above the cost of the paper on which they are printed.

Therefore, the advantages to be derived by the introduction of this patented process may be considered with reference to the following:—

First.—It enables the photographer to give a perfectly faithful reproduction of the scene or object he may desire, without omitting the most minute detail, and if he wish, print on it a graduation of tints and colours with a certainty that these productions are not liable to fade.

Secondly.—The perfect reproduction of manuscript drawings by means of photography, and the transferring of them perfect on to lithographic stone for surface printing, or on metal blocks to print in combination with type, opens a new field to the artist, the architect, the surveyor, and the mechanical draughtsmen, instead of having to rely upon the abilities of the lithographic artist, or wood engraver, to reproduce their design, and render to it the faithful character of the original, the patent heliographic printing process supersedes their labours, and offers peculiar and unique resources.

Copies of architectural drawings, old or new maps, plans, and drawings of complex machinery, which would require much time and talent on the part of the draughtsman, would be available as soon as wanted, and the copy may also be enlarged or diminished from the scale of the original. As soon as the various professions are satisfied of the resources offered by this new art, it will be become an indispensible appendage to every well-regulated publishing and lithographic establishment, as well as government offices.

Thirdly.—For the reproduction of valuable old and rare paintings and engravings of the olden masters. By heliographic printing processes we can produce a faithful transcript of the original, preserve the style and execution, by this means improve the taste, and form a correct judgment of their works; whilst the choicest of our modern works of art, the publishing price of which is beyond the reach of the general public, can be reproduced and published of any desired dimensions, placing the richest of our pictorial illustrations within the reach of all.

Fourthly.—Heliographic printing and copying by means of photography does not require the originals to be in printers' ink (recently printed), they copy alike from written documents or old printed matter and faithfully reproduce any number of impressions in fac-simile and in printers' ink. This art will be invaluable to the antiquary, to the librarian, to the curators of museums, to the legal profession, and to the Government for the preservation in fac-simile of valuable documents which are of so much value that the loss by risk or accident, such as fire, &c., &c., would be productive of great inconvenience and injury. Members of the legal profession are afforded a quick and economical means of having reproduced in fac-simile important documents, wills, &c., superior to any other mode of obtaining duplicates at present in use, and curators of museums will find in this art an endless resource for the reproduction of fac-similes of valuable literary curiosities for the benefit of the curious in such matters.

Fifthly.—The proprietors of extensive publishing, printing, and lithographic establishments will, by the introduction of the principle of the heliographic printing processes, be enabled to extend the resources of their business. As an example, the publisher of a work, by merely furnishing a copy of the book required to be re-published, its pages can be copied by this process and made into surface printing blocks, including the engraved illustrations, if any, in a durable material—zinc, and can be of enlarged or reduced dimensions, to answer as a 12mo, 8vo, or 4to, saving the price of re-setting, reading, and the engraving of the illustrations. The advantages to the lithographer are so varied and important that it is needless to dwell upon them; suffice it to say that they are intimately interested in all that is stated, and also will be enabled to enrich their productions by copying by the process from the works of the best landscape, portrait, ornamental, and map engravers, and are in possession of the means for the reproduction of photographs of external objects to illustrate books of all descriptions, as well as those gems of science and art, stereoscope pictures, printed in colours of a more permanent character than is now obtainable, and will be able to produce them at one-tenth the present cost.

Sixthly.—Map and chart publishers will, as a necessary consequence, avail themselves of a means whereby they can have at a cheap rate many sized maps from one original. And the Ordnance Survey of the kingdom will furnish material for the production of detached maps of cities, and provincial towns, counties, parishes, townlands, estates, and forms for the purposes of the Landed Estates Court, and for the registry of deeds, or for sale at a moderate rate to the public.

And lastly.—Many advantages will be derived by the traveller, the philosopher, and the man of taste by this new art enabling them to reproduce their works for publication at a moderate cost. The botanist and the naturalist will be enabled to retain fac-similes of all objects whether flowers, leaves, trees, insects, or animals of any description that interests them most. These in general will not only contain a correct representation, but sufficient detail to afford a view of their distinctive character. In fact, every one who loves to study nature, either in her outward form by art, or to observe and trace her in the more obscure walks of science, must feel interested in so valuable a discovery, where, strictly speaking, art and science go hand in hand.

The sinking of the Artesian well at Passy has occupied six years, at a cost of £40,000. The result is, however, beyond all previous calculations.

The Birmingham Music Hall, which originally cost £12,000, has been recently disposed of by private contract for £3,400.

Note.—In the descriptive particulars accompanying illustration of the **Imperial Assurance Office**, London, and which appeared in our last number, we should have mentioned that Mr. Paul Askin, of 19, Talbot-street, is agent for the company in Dublin, and as may be seen by our advertisement columns "an acknowledgment" of prompt and satisfactory settlement of claims is recorded.

Miscellaneous.

Lighting Kingstown.—The Secretary of the Hibernian Gas-light Company has addressed a remonstrance to the Town Commissioners of Kingstown respecting the inconvenience experienced by the company in lighting the public lamps only until *one* a.m.; adding that if the present system is to be continued an extra rate of five shillings per lamp must be charged. Mr. Sullivan moved a resolution at recent meeting "that the lamps be kept lighting in certain portions of the town during winter months, viz.—in George's-street, Kingstown Avenue, York-street, and the Cross Avenue, in fact, all the localities where small dealers live, whose occupations oblige them to be up at an early hour. He suggested that a committee be appointed to deliberate on the matter and report to the board." Subsequently, however, the amendment of Mr. Masterson that "a committee be appointed to compute the expenses of keeping the lamps lighted until dawn, 4 a.m., was agreed to." [The extinguishing of the public lamps at the hour named is certainly most objectionable.—Ed.]

Bray Commissioners.—A meeting for election of four commissioners in lieu of those who go out by rotation, takes place this day.

Memorial to Sir H. Pottinger, Bart.—A very handsome monumental tablet of white Carrara marble has just been finished, and will shortly be erected near Mount Pottinger, county Down, to the memory of Lieutenant-General Sir H. Pottinger, Bart., late Ambassador to China. The memorial, which is an elaborate piece of workmanship, and has been executed by Mr. T. Gaffin, sculptor, of the Quadrant, Regent-street, is surmounted with the family badge, and at the base, beautifully carved in solid marble, is the Order of the Bath, supported by a Chinese mandarin, habited, and holding a scroll; and on the other side a Scinde soldier, habited and equipped, and in his hand a Scinde firelock. The following is a copy of the inscription:—"Sacred to the memory of Lieutenant-General the Right Hon. Sir Henry Pottinger, Bart., Knight Grand Cross of the Most Honorable Order of the Bath, and one of her Majesty's most Honourable Privy Council, late Minister Plenipotentiary and Ambassador Extraordinary to the Emperor of China, Governor and Commander-in-Chief of the colony of the Cape of Good Hope, and Governor and Commander-in-Chief of the Presidency of Madras, in the East Indies, &c. Born at Mount Pottinger, county Down, Ireland, on Christmas-day, 1789, and died at Malta, on the 18th of March, 1856, aged 67 years. During his active career of 53 years, from Midshipman to General, he filled many of the most prominent offices under the Crown, with distinguished advantage to his country and great credit to himself; and his unbending integrity, high sense of honor, and generosity of character and disposition, secured him the unbounded respect and esteem of all with whom he became associated in the public and private relations of life. On concluding his successful treaty with China, in the year 1842, he was destined for the Peerage by her gracious Majesty Queen Victoria I., but lost this high distinction through the same hostile influence which was exerted in vain to prevent Parliament rewarding his eminent services to the State. This memorial is placed here by his only surviving brother, William, A.D. 1861."

The Gurney Memorial.—Yesterday afternoon, in the Broadway at Stafford, were opened for the public use a set of drinking fountains, which, together with a handsome obelisk, have recently been erected in memory of the late Mr. Samuel Gurney. The memorial consists of a beautifully proportioned obelisk in grey granite, forty feet in height, executed by the Cheesewring Granite Company, from the designs of Mr. John Bell, the eminent sculptor. On two sides of the base are drinking fountains—the water flowing from boldly-sculptured groups of water lilies in white marble; and on a polished slab forming the front of the base is the following inscription in gold:—

In remembrance of
SAMUEL GURNEY,
Who died the 5th day of June, 1856,
Erected by his fellow-parishoners and friends.
"When the ear heard him, then it blessed him."

Four very handsome lamps, erected by Mr Casselton, of Stratford, stand at the corners of the structure. The height of the obelisk is forty feet, and it contains about sixty-five tons of granite.

The foundation stone of a new Presbyterian church was recently laid at York-street, Kingstown, by Charles Hopes, Esq., of Merrion-avenue Blackrock, Elder of the Church, and its oldest member, who was presented with a silver trowel as a memento of the occasion. The site is nearly opposite to that on which the old church stood, and has been obtained from Lords Longford and De Vesci, in the only place about Kingstown where it could be had in perpetuity. There is a frontage of 160 feet, and the depth is about 200 feet, so that room has been left for a manse, which may be erected at a future period. The estimated expense of building amounts to nearly £5,000. The new church will be a Gothic structure with a fine spire. The building will be completed in about a year, and will afford greatly increased accommodation. Mr. Cockburn of Great Brunswick-street, is the architect and builder.

A Work of Art.—There is now at Messrs. Pictor and Son's yard (Box, Chippenham, Wilts) evidence of the benefit to Art derived from the ever-memorable Exhibition of 1851. A cemetery memorial was sent from Southampton by a young man then comparatively unknown to fame. The *Daily News* wrote a most flattering report of the monument, placing great emphasis upon the various points which the exhibitor had endeavoured to illustrate, and the memorial was, by permission of the artist, subsequently engraved in the *Illustrated News*. A lady of Madrid, in turning over the *Illustrated News* volume some time since, happened to have her attention arrested by the engraving in question, and, instead of employing Spanish talent to carry out the design on a large scale she at once communicated with the artist from whose brain the original idea emanated, ordering him to execute a memorial nearly 20 feet in height. The work is in course of execution, and will be one of the finest examples of mediæval architecture. The plan of the base is triangular; the sub-plinth is richly moulded, and the step immediately above it has in the centre the monogram of "V.B.L.," on either side of which, in circles, is carved a chaste arrangement of the ivy leaf. At each angle will stand figures of Faith, Hope, and Charity, nearly life-size. The corbels on which they are to placed are exquisitely finished and designed. The tendrils of the vine corbels are delicately carved, and the other corbels exhibit some artistic arrangements of the rose and lily. Between the niches, which are to receive the groups of statuary, are arched-shaped spaces for the reception of statuary-slabs for inscriptions, and running round is an ornamental moulding of ball flower and foliated ornament. Springing from six angels, exquisitely carved, carrying shields, ribbons, &c., starts an ogee hexagonal shaped dome, richly crocketted and tiled, terminating at the apex with a calvary cross, around and from the arms of which depend a celestial crown. It is not expected that the work, of which we have given a faint description, will be in a complete state, fit for exhibition, until at least a month hence. The gentleman to whom the execution of this monument is entrusted is Mr. Baker, of Park Street, Camberwell, London. He has placed the masonry work in the hands of Messrs. Pictor and Sons, of Box, whose superintendent, Mr. Gardiner, has most ably carried out, *con amore*, all the details appertaining to his department. We may add that the stone has been selected from the best that Messrs. Pictors' quarries can produce, which is a sufficient guarantee for its quality, soundness, and durability.—*Bath Chronicle*.

Genius and Art.—More knowledge is now necessary to cause a man to be considered a painter than our fathers dreamed of before the Art-treasures of the Continent were open to our study. In America, a man rises to fame and fortune presently if he can give on canvas a lively representation of the woods or prairies which surround him, or the daily life which passes before his eyes; and not only does he think and say that Europe can teach him nothing, but his patrons are too apt to be of the same opinion. So were many people in England when Dr. Walcot (Peter Pindar) brought Opie up from a Cornish cottage, and exhibited him in London as a heaven-born genius. Opie had the sense to perceive, in course of time, the importance of study; but the want of it kept him below his capacity as a painter, and spoiled him in a way which could scarcely happen again.—*Miss Harriet Martineau, in Once a Week*.

A New Clock for the Great Exhibition.—The Commissioners of the exhibition of 1862 have given directions to Mr. Benson, of Ludgate Hill for the construction of a clock, to be fixed in the building now in progress of erection at South Kensington. The clock will be second in size only to the great Westminster clock. The dial is to be from 15 to 20 feet in diameter, and will be placed immediately over the centre arch of the grand entrance in Cromwell-road. The movement will measure at the base 12 feet by 8, or nearly 100 square feet, and will be about 25 feet in height. It will chime the quarters on four bells, and strike on a fifth, weighing about 45 cwt. The whole will be inclosed in a glass case, and as no cost or pains will be spared in its construction, it will, when completed as at present designed, form a very attractive object, in every respect worthy of the building "in which it will be located, and of the reputation its manufacturer has earned for himself."

Minerals.—The value of the minerals raised in the United Kingdom during the year 1860 was £26,404,459, against £24,226,526 in the preceding year—increase £2,177,933. The value of the tin, copper, lead, silver, zinc, pig iron manufactured from the ores of these metals raised during the period was £16,939,717, against £15,447,086 in 1859—increase, £1,492,661.

Perfection of Art in Watch Manufactures.—"The stranger in London cannot fail to be struck with the magnificent establishments of goldsmiths with which the City abounds. Such displays as are presented to the eye are rarely to be met with in any other city in the world; indeed, whole fortunes are concentrated in their windows. Foremost among such establishments is that of Mr. Benson, 33 and 34, Ludgate Hill, and 46 and 47, Cornhill, which may truly be called the Home of Art. Everything exhibits the most perfect taste; and, while the beautiful is thus cherished, the useful is always carefully studied. Mr. Benson has gained a high position for the superior manufacture and artistic designs of his watches especially"—*City Press*.

Benson's Illustrated Pamphlet, post free for two stamps, is descriptive of every construction of watch now made. Watches safe by post to all parts of the globe.

Cartes-de-Visite.—The following is an extract from an extremely interesting and well-written article in the current number of that beautiful serial, *The Art Journal*:—"It seems but the other day that photography itself first appeared amongst us, sent as on a fresh sunbeam, and took its place with the most recent of the arts; and now we see several distinct classes of photographs, to each of which may be assigned the rank of an independent branch of photography. These *cartes-de-visite* in themselves constitute what we may even entitle an art. They multiply national portrait galleries *ad infinitum*. They produce the family portraits of the entire community. They form portrait collections on a miniature scale, but with an unlimited range, and in every possible variety—family collections, collections of the portraits of friends, and of celebrities of every rank and order, both foreign and of our own country. Nobody now needs to enquire what such-or-such a person may be like, or to be left to such surmises as written descriptions may convey of features and figures that cannot be actually seen. An ubiquitous *carte-de-visite* can always find its way with certainty and speed, and it is the best of all possible introductions, as it is the most agreeable of reminiscences. When our friends leave us, they leave with us these precious images which we can always and everywhere carry about with us, to feast our bodily eyes with their graphic representations, as memory is able to treasure up and to pass in mental review incidents that the past has taken with it, and words whose echoes have long ago died away. And when fresh connections are formed, or when new links are added to old chains, the ever-available *carte de-visite* is ready to make known to us here at home, in *propria persona*, a far-away new daughter-in-law, or the number one (or the number whatever you please) of another generation. We now look with commingled surprise and scorn at the painful efforts at family portraiture that preceded the photographic era, and which resulted in either pallid libels, brush-produced upon ivory, or black paper reductions of shadows in profile, cut out with scissors, and closely allied to architectural sections. These black paper enormities admonish us that but a single step intervened between that first tracing of a much loved shadow on the wall at Corinth, and the almost breathing and sentient portrait of the *carte-de-visite*. And let us be duly grateful to him; the same sun that inspired the Greeks with the happy thought of fixing a shadow, now gives us our perfect portraits—portraits that would have turned the very brain of Apelles himself, and which in common justice we ought to have called, not photo but heliographs. And not only in the case of black profiles and feeble miniature "likenesses" does the *carte-de-visite* at once effect the most marvellous of revolutions in collections of family portraits, but also in comparison with the highest orders of miniature pictures the little sun-portraits are well able to maintain their reputation. Thorburn gave up his miniatures just at the right time, as if influenced by a prescient impulse that an artist more potent than even himself would soon be at work, executing first-class miniatures for the million, and reproducing them with a corresponding ease and rapidity. Elaborately painted miniatures now are artistic curiosities, few in their numbers, and rather calculated to associate the present with the past, than to convey ideas in conformity with the spirit of an age that looks forward with so ardent a gaze. Very beautiful little objects are those miniature paintings, when they are really the work of true artists, and they always will be regarded with a loving admiration; but reversing the process that acclimatises plants, they have grown into exotics, while the *cartes-de-visite* are favourites that find a congenial soil in every spot and flourish in every region, multiplying their numbers daily by tens of thousands."

A New Diving Dress. An unsuccessful attempt was made in 1859 to substitute scientific machinery for the simple mode of operation of the native diver. A complete diving-dress and apparatus were brought from San Francisco by a party of Americans, none of whom, however, had much practical experience of such an undertaking. It was hoped that the "scientific" adventurer, safe in his metal helmet and garments of gutta-percha, would be able to ransack those unexplored banks which lie at such a depth as to render them unaccessible to the Indian. The first and only attempt that was ever made to realise this idea broke down in the most signal manner. The most courageous of the party, who had volunteered to make the first descent, no sooner reached the bottom than he made frantic signals to be drawn up again. The instant he was restored to the upper world and taken out of his unwieldy case, he declared, with considerable warmth, that he would never again consent to be the victim of the speculative tendencies of his Yankee fellow-citizens. Unlike the rash diver of whom Schiller had sung, he ever afterwards adhered to his resolution, and nothing could induce him to make a second attempt to penetrate the "secret of the sea." As may be imagined, the discomfiture of the foreign innovators caused general satisfaction amongst the followers of the old traditions of the Buceo.—*St. James's Magazine*.

A link of communication between the important towns of Carrickmacross, Bailieborough, Shercock and Kingscourt, and their seaport, Dundalk, has long been felt to be wanting, and the proposed junction line between Carrickmacross and the Dundalk and Enniskillen Railway, completely fills up the gap.

The Dublin Builder.

Vol. III.—No. 45.

THE OPENING OF THE SESSION.

AS usual there is "a bustle" throughout the kingdom, consequent on the opening of the respective scientific, artistic, and professional institutes, and promises of a vigorous campaign are already apparent. For the initiative in this, as well as in almost every other regard, we must look to the emporium of the world—London—and there, the Architectural Association has had its opening meeting and *conversazione*, and the Royal Institute of British Architects will hold *its* meeting on the evening of the 4th inst., Mr. Tite, President, occupying the chair, and delivering inaugural address; Mr. Scott, R.A., the eminent mediæval architect, is afterwards to read a paper on "the conservation of ancient architectural monuments and remains." The president (Mr. A. W. Blomfield, M.A.) of the association delivered an inaugural address, in the course of which, after referring to the numerous perils and vicissitudes through which the association had passed, he glanced at the forthcoming Great Exhibition, remarking that it cannot fail (if time be used properly) to produce a good effect in developing what he apprehended to be the great end and object of the association, viz:—"Mutual assistance and improvement in prosecuting the study of architecture as an art," and referring to the proposed "diploma," proceeded in the following terms:—

"The subject has naturally excited much interest amongst ourselves, more especially as I believe it was by the association that such a proposal was first started. Many (I believe I may say a large majority) confidently foretell that such an examination, when fairly set going, will have the effect of raising the standard of the profession, and of excluding ignorant and incompetent persons from practising as architects. This result is no doubt much to be desired; but as I have already publicly expressed my opinion, with the reasons for that opinion, and found myself in a small minority, I will not enter on the subject now. I cannot help noticing, however, that in the course of the various discussions which I have read and heard, several theories have been alluded to as acknowledged truths which have struck me with extreme surprise. For instance, I have heard it casually stated, as a matter of course, at one of these discussions, "That a young architect should study every style, in order to be ready to meet the possible wishes of his client." Now, of course, in pronouncing this theory to be simply monstrous, I have no wish to set a limit (especially in this direction) to the study of all that is great and good in art of every period and every clime, but the idea of attempting to carry out the theory of practising every known style, to me, I must confess, suggests nothing so vividly as the conjuror's inexhaustible bottle, which is always ready with a modicum (and that sufficiently bad, be it remembered) of any liquor that may be asked for. The counter theory is that a man must be full of one style, just as a bottle must be full of one wine to give it really good."

After a comprehensive review of various other topics of interest, the president read a letter from Mr. G. G. Scott, architect, from which we extract the following:—

"I cannot help thinking that yours, as a junior society, has the means of doing fully as much good as the senior institution, and that without in any degree clashing with it; for there is no reason (but the reverse) why many of your members should not be Associates or Fellows of the Institute. You have, however, in your own society more ample means of actual and practical self-improvement than we have; and as ours is an art, the education to which ought never to stop, and which needs continual rubbing up to prevent retrogression, I think the society which does most to promote what may be called the self-education of its members, is the one most practically useful; nor do I think this one jot more needed by or appropriate to young architects, than those more advanced in age and practice. We all need it equally, for, as I said before, our education should be constant and irrespective of age, but it is the good fortune of younger men to have fewer hindrances to it, and to have minds more fresh and more susceptible of it, so that they should 'strike while the iron is hot,' 'make hay while the sun shines,' and work themselves up to the highest degree of perfection and artistic skill they can, while opportunities and susceptibilities are favorable. It would do us all good, if we could be put through a course of elementary art of one kind or another every year, just as soldiers have to do with their drill. We old fellows cannot do so, and are, therefore, in danger of retrogression. Younger men, in some form or another, can do so; and such a society as yours might greatly facilitate it. I do not think the oldest and most established members of your society should think it beneath them to practise together at stated period, those branches of drawing, modelling, &c., &c., which tend to make a man a true artist, not in the sense of being a landscape painter or skilful representer of buildings (useful as these accomplishments are), but rather those kinds of art which make a man a skilful architect in the highest sense—*e.g.*, the drawing and designing of sculpture ornament; of figures as used in architecture and as combined with architectural ornament, of animal life (both natural and imaginary) as used in the same way; the drawing and designing of painted decorations, with and without figures and animals; the designing of mosaic work, pavements, and inlaying; the designing of metal-work in manners suited to the different metals and differing modes of treating them; and lastly, modelling, and the actual execution of any of these works."

The president then concluded his highly valuable address, for which he received with acclamation the thanks of the meeting in these terms—

"Fourteen or fifteen years ago, when Mr. Ruskin wrote that beautiful simile of the Mountain Ridge, the culminating point of Gothic art, up to which all had been progress and after which all was decline, he expressed a doubt whether the stir he saw going on was a real awakening or only a movement among dry bones. Since that day, something more tangible has been done, his call has been answered by some at least. A band earnest, if small, and though small, ever increasing, have girded themselves for the work, and are again pressing steadily onwards. After the long night in the trampled plain, they are again climbing the mountain side; the mists are rising, they see clearly before them the point where the travellers of another day began to descend, and to their upward gaze a new morning is already gilding the summits of more distant and more glorious heights. Their paths may not be, cannot yet be, identical; but though they work apart now, if all have the common end of truth in view, then just as the different schools of architecture in France, isolated but working for one common end, ultimately united to produce the matchless buildings of the 18th century, so the true workers of to-day, or rather perhaps their successors of a future generation, must at length meet in a more glorious noon of art than the world has ever yet seen. Meanwhile, let us each and all endeavour to take our part honestly and earnestly in the onward movement, jealously guarding each upward step, but careful that each step be upward; and above all, let our march be temperate without extravagant sallies, or attempted short-cuts, for we have no valley of rest before us, no halting-place half mountain high; no, nor even the old ridge of the lowlier pass; what we seek must be the snowy peaks and the cloudless mountain top, and as in life so in art, our watchword must be 'Excelsior!'"

In the provinces, Liverpool usually foremost, has been forestalled by its Glasgow brethren, though we doubt not that the former will speedily be in the field, and the Architectural Society of the latter city held its opening meeting last week with some attendant *eclat*. The "Sussex" and the "Yorkshire and Lincolnshire" societies have also commenced their labours, the Archbishop of York presiding at the latter, and delivering the following trite remarks:—

"He had always felt the value of this institution, and the great and important benefits it had conferred on the Church and on architecture in general. Certainly when one looked back on what was the tone of Church architecture twenty-five or thirty years ago, when it had reached so low a level, it was through the medium of these societies that that tone had been raised, and at present they had nearly obtained that level and state in architectural building which was reached in earlier days. Even in the life of present architects, he had known an instance in which, on the architect being reminded of a certain church he had built, he said, "Is it possible I could have been the author of such a monstrosity as that!" The architect of the parish church at Leeds—grand as that is—was perfectly conscious of many defects in it, and these defects would have been remedied had he built it ten years later. Certainly it was most remarkable that there should have been such a debasement and degradation in taste, considering the magnificent and splendid models our architects have. On taking one of the bishops of the American church to Fountain's Abbey, he expressed his delight at seeing these monuments of past times, and asked if these were the products of the dark ages, could the present age produce anything like it? It appeared at present that all they had to do was to copy models, form their own taste upon them, endeavour to appreciate them, as well as to manifest that excellent appreciation of beauty, in proportion and in point of grandeur, which had distinguished others."

It is refreshing to see the "ecclesiastic" and "the layman" uniting in the furtherance of so noble a cause.

MR ALLAN POLLOK AS A *FARMER* AND AN *ENGINEER*.

Some of the gigantic steadings erected by this enterprising Scotch agriculturalist on his vast territory in the west of Ireland, have been fully described in previous numbers of this journal, but as our contemporary, the *Agricultural Review* in a comprehensive sketch, brings to light much additional interesting matter respecting the general farming and engineering operations carried on under same auspices, we give the following therefrom :—

"We take Mr. Pollok's *farming* then his *engineering*,* and his doings as a landlord, just as we find them—the same as we might do with any other unfinished operations. No one of any powers of observation can survey Mr. Pollok's works without being interested, amazed, and interested. Difficulties which would have paralysed the energies of almost any other man have been smoothed down; obstacles which would have appalled most men he has walked over with easy step; and now harmony reigns where confusion seemed but lately to be safe in perpetual dominion. We can conceive of no better example of this kind of overpowering confusion than that presented by a large estate just vacated by its numerous tenantry. Hundreds of houses in all stages of ruin; garden walls, field fences, march ditches and dykes; stock yards choked with docks and nettles; swamps undrained, or worse, badly drained; *skulls* of land exhausted of whatever fertility they ever possessed in the hands of hopeless tenants-at-will; roads, worse to be dealt with than no roads all; cairns of stones, and gravel pits; bogs unevenly cut, and fields laid out in defiance of rule and measure. Farms— ay, townlands, and even parishes, in this state, presented no very inviting job for the engineer who was to lay all out in a few symmetrical fields, every inch yielding the highest rate of produce. The engineering has been done; and now the plough, in turning over one furrow, may traverse several townlands in which no mark of home or hearth of man is to be seen, any more than if the furrow were that of a ship on its way in the ocean. Preparatory to the laying out of the land for such an exhibition, much had to be done besides squaring fields and consolidating farms. The land had to be drained, and this on so large a scale that it became a matter of expedition and economy to set up large tile factories on the estate. Thousands of acres have been thus drained, and the climate itself improved by the superabundant moisture of the soil being allowed to escape by underground channels to the sea, instead of rising in vapour from the surface. The eye that saw the necessity for tile-factories and brick-yards saw also that other extensive manufactories must be established; and thus some of the more immediate relations of agriculture to commerce and manufacturing industry are exemplified, without leaving the one estate in the westmost county in Connaught; extensive forges, carpenters' shops, mills, gas works, and a number of other and kindred establishments which are usually to be found only in considerable towns, soon sprang into being there; and, at an early period in the progress of remodelling the estate, the monthly wages bill amounted to £4,000. Thus the carts, ploughs, harrows, gates, and all other implements and machines required in carrying out the most advanced system of farming, are made and kept in repair on the estate. Twelves farms have now been provided with building, some of these farms being on a scale requiring byre accommodation for 700 head of cattle, besides stabling for the complement of horses. These buildings, as might be expected from the manner in which everything is gone about, are finished in the most commodious and convenient manner; not only supplied in every part by pipes with water from cisterns, but lit with gas. The farm of Ganavieen is 4,000 acres in extent; and the steading thereon is unequalled by anything in the country. The inside of the cow-shed measures 210 by 168 feet, and is set off in parallel sections, with the animals facing each other in the opposite rows. The feeding is supplied from the alleys in front, and the manure removed, and bedding supplied by means of a passage three feet wide, behind the stands. The cows are chained to upright posts, and the food placed in vitrified fireclay troughs. The polled cattle and plough bullocks are fed in loose boxes, and the younger description of stock kept in an open shed, the roof of which is supported by upright metal pillars against the inside of the court-yard wall. The stables occupy a separate department of the covered structure, and stalls, loose boxes, harness-rooms &c., for thirty-six horses are provided. This is furnished with a registered corn feeding meter, from which a definite quantity of grain can be taken for each, and the daily consumption is easily ascertained by means of a hand or indicator easily checked. The barn is situated in the centre of the building, with the machinery on the left. The straw and chaff rooms are on the ground floor, from which straw for bedding, and chaff for mixing with other feeding materials, can be readily removed as required. The mill wheel, turned by water, not only threshes the grain, shakes the straw, lifts the corn by means of elevators to the granary overhead, where proper machinery is at work for winnowing, packing and weighing it, till ready for delivery to the mill, but the power is also made available for crushing bones, beans, and oilcake, cutting hay, straw, and chaff, slicing mangels, turnips, and potatoes, cleaning grass and other agricultural seeds, and many other uses, which largely economises manual labor. A shed, 14 feet in width, along the outer wall, is apportioned for implements, cart-shed, tool-house, artificial manure depot, &c.; and between this and the main building is a vacant space of 27 feet in breadth for the ordinary purposes of traffic. The manure pit is situated in the centre of an open yard, to the rere of the cow-shed, and a large tank, lined with cement, is attached, for the reception of the urine, the contents of which are incorporated with the dung, previous to application, or pumped upon a huge heap of bog mould, intended for top-dressing, or more frequently as manure for cabbages. The haggard is situated on a raised surface, on a level with the threshing department of the barn, and contains the produce of 250 acres of corn, in addition to several hundred tons of hay. Both these are made up in ricks 70 yards in length by 4 in breadth, and supported by means of metal stands, connected by means of malleable iron bars. The wheat, oats, and barley are built in consecutive links, suited to the dimensions of the barn. If there be among our readers any having the capital, the enterprise, and the skill requisite to meet the landlord's views, they may be looking forward to a location on the Lismany estates."

THE DUBLIN WATERWORKS.

We were amongst the best wishers for the project for an improved supply of water to this city, to be finally and satisfactorily developed, —which it may be assumed now is in the fair way of being attained, thanks to the amazing ability and energy of Dr. Gray chiefly, who, almost singlehanded, fought a host of assailants in a series of pitched battles, and finally vanquished all — but really, now that all that was desired has been attained, it seems a pity that "a split in the camp" of the opponents, and consequent personal invective should be permitted to occupy so much space in the columns of some of our contemporaries, which might be devoted to much more generally interesting matter. The further after discussion of the waterworks proceedings—opposition or otherwise—must be surely regarded as "a bore," except by the former conclave, some of whose members now seem to display about as much *animus acerbus* as did the fabled Kilkenny feline warriors.

THE GRAFTON-ST. CASUALTY—KEMPSTON'S HOUSE.

Still harping on this truly worn out question, we are obliged to record, that an application will be made in a day or two in the Common Pleas on the part of defendant (Butler) to amend defence, with the view, we believe, of making it more conclusive so as to prevent further litigation. Mr. MacDonagh, Q.C., M.P., will appear for defendant, and Sergeant Armstrong, with other council, for the plaintiff (Kempston). The protracted character of this case, the several trials, motions, &c., &c., by which such costs were involved and lodged in the pockets of the long robe gentlemen as would have built the house over and over again, suggests to mind the old saying that it is "an ill wind that blows nobody good."

We had previously announced that the house in College-green belonging to Mrs. Hayes, stationer, had been taken by the Ulster Banking Company for a branch office, and it is now about being adapted to that purpose, according to plans by Mr. Murray, architect. The front will be tastefully finished and capped by a balustraded parapet. Mr. James Freeman is the contractor.

The Roman Catholic church for some time in course of erection at the North Dublin Union Workhouse is nearly completed. It is a mere parallelogram on plan—some 70 feet by 80 feet in clear, and 16 feet high to wall plate—and adjoins the dining-hall. Mr. Wm. D'Esterre Smith was the architect; Mr. James Freeman, the builder.

The new Roman Catholic church of Killyleagh, which is said to be an edifice of great architectural beauty, was opened on the 20th ultimo.

A new residence for a minister is to be erected in connection with the Independent Church at Sligo. Tenders will be received up to 1st December.

The new Catholic church of Castleblaney, for some time in course of erection, has been dedicated.

An anatomical school is to be added to the Queen's College, Belfast, and tenders are being sought up to 18th inst. for a building suitable for same, and according to plans prepared at the office of Public Works.

A Catholic church has recently been built at Lavey, in the diocese of Kilmore. It was opened for divine worship last Sunday week.

Mr. Hemans, C.E., has been inspecting the course for a proposed line between Bundoran and Sligo, and reports that it might be cheaply constructed, and, moreover, that the Midland Company would thoroughly approve of the undertaking.

A washing establishment is to be constructed at the Curragh Camp.

---

* Our contemporary omits—we are sure through inadvertence—that in the engineering operations Mr. Pollok was ably assisted by Mr. William Maxwell, Agricultural Engineer, Ballinasloe.

THE *BUILDING NEWS* AND THE DUBLIN EXHIBITION.

Our able London contemporary has paid this city—we believe—a first visit, and judging from the tone of two descriptive articles in the publications for 18th and 25th ult. respectively, has acquired rather good impressions thereof and of the inhabitants likewise. We wish journalists generally, who wield that most potent of all sceptres, "the pen," and who are often apt, on mere hearsay, to condemn everything "Irish"—because it *is* so—would more frequently come and judge for themselves, and the result would ultimately be the total annihilation of that prejudice and rancorous spirit, of which even still—though happily much less than heretofore—a spark that only requires in certain quarters to be fanned into a flame, exists. The contemporary in question has been recently the subject of a special notice in these columns; pursuing its mission, an independent and comprehensive course of action has always distinguished it; we admire the ability of its conductors, and instead of regarding an enquiring visit with that invidiousness which narrow-minded people would attribute, where the character of avocations is identical, we hail with much pleasure the likelihood of a more intimate acquaintanceship arising therefrom.

The following is collected from the articles in question:—

"With a prospective view to the second great example of this species which will gladden our eyes at Kensington next year, and like the electric light, put out the glare of all lesser stars; it may be worth while to glance at the contents of the 'Exhibition of the Fine Arts and Ornamental Art,' held in the New Hall of the Royal Dublin Society. It is somewhat remarkable, however, that the word 'industry' or 'industrial art' does not occur in the above description, nor does any expression equivalent to 'art manufacture,' lead one to suppose that the simply useful, and often humble, articles exhibited would find a place amongst the purely 'ornamental art' of the Exhibition; but this is corrected in the contents of the catalogue itself. The building in which all this refreshing quantity of art is collected is somewhat of a temporary nature, and is erected in the Royal Dublin Society's grounds fronting Kildare street, being intended chiefly for periodical agricultural exhibitions. Of the building itself we wish to say as little as possible, only our readers should not confound it with the building of the 'Great Dargan Exhibition,' as it is called, of 1853, which stood also upon the Society's grounds (but upon that part fronting Merrion-square), and which is no longer in being. We are glad to observe, however, two buildings growing up on the site, resulting, perhaps, from the good seed sown there; the one, now nearly complete, being a museum of natural history and mechanical science combined, and the other intended to be devoted entirely to the fine arts. A fine open space still remains for a noble connecting central building, which we hope will one day shut out the dreary front of the house which the Royal Dublin Society inhabits, but which derives no small amount of honor and respect from the celebrated names and worthy deeds connected with the history of its walls.

"On her Majesty's birthday (24th May) the Exhibition was opened, and seems to have gone on prospering ever since, and will we trust have, as the Council expect, considerable influence for good on the general taste of the public, which, to judge at least from the selection of pictures, made by the prizeholders of the Dublin Art Union* (we believe), and exhibited on screens in the Central Hall, would be highly desirable.

"It is curious to notice the result of a small body of the public taken at random—such as art-union prizeholders—being called upon unexpectedly to exercise their choice in various degrees: some, to a small extent, with a fair amount of judgment; others, for a large prize, failing to show the least shadow of artistic common sense. We should be glad to feel that these annual tests prove satisfactorily a steady advance in public taste, but this time alone can show—though every effort towards bringing about this desirable result should be heartily encouraged.

"The Central Hall of the Exhibition is devoted to the usual groups of statuary in marble and plaster, fountains in metal and glass, intermixed with manufacturers' cases of specialities, such as linens, lacework, and embroidery, jewellery and bog-oak carvings, with metal castings, household furniture, &c. As might be expected, the usual organ at the end is not omitted, and this one was built for, and gained a medal at, the Paris Exhibition, much to the credit of Messrs. Bevington, who appear to have afforded great gratification to immense numbers by their combination of 'double diapasons,' 'swell manuals,' 'claribels,' and 'tremulants.' Carpets and hangings occupy the side walls and galleries; while small flags and decorations generally complete the *touts ensemble* of an 'exposition.' In the side 'courts' on the left is to be found a tolerable collection of modern pictures to the number of about four hundred, besides about the same number of water colors, miniatures, and crayons; while on the right, a long gallery extending as far as these two modern courts together—in fact, the whole length of the building (some 230 feet)—contains a collection of over five hundred examples of the old masters.

"In addition to these we notice, in one of the galleries upstairs, what is to us a special source of attraction, of course—a series of architectural drawings, and also some monumental carvings and tablets from the hands of artists well known and appreciated in our Conduit-street exhibitions.

"The catalogue in most respects seems a careful production, and contains valuable but brief notices of all the artists and their productions, which appear in the gallery devoted to the ancient schools—but very properly not of those of the modern school. Yet why, when such careful distinction is made, such curiously arbitrary classification should be allowed as appears in a few instances, we cannot imagine. For example, Turner may perhaps for practical purposes, and if desirable in any special arrangement of ancient masters (as in juxtaposition with Claude in our National Gallery), be considered an ancient master for the nonce; but why the name of Danby, or how Mr. David Roberts should come under this designation, we cannot discover; especially when Etty, and Wilkie, to say nothing of a host of others long since departed, appear in the list of modern artists, and as such have no biographical account given of their lives and works. To be sure a sort of apology is appended in a note, which says—'As their pictures occur in the same saloon (as those of the ancient masters), it has been thought better not to admit them here.' Of course not admit them, but why not hang them in their proper position? It seems curious to read amongst the R's—Raffaelle, Rembrant, Reynolds, *Roberts*, Romano, Rubens, or Cuyp, *Danby*, Dolci higher up in the alphabet. The name of Wilkie occurs in both lists, so that like some animal of doubtful gender, or some sponge or other debatable substance which naturalists differ as to its classification with animals or vegetables—Wilkie seems to be considered a sort of connecting link between the two schools of ancient and modern art, by being at once a member of both! Again, what becomes of the completeness of a gallery of modern paintings, where Holman Hunt, Millais, Wallis, and other disciples of pre-Raffaelliteism are unrepresented?

"The architectural drawings, which number only from 30 to 40 frames, range from 266 to 338 in the catalogue, apparently without any cause, and are placed on the line of sight or on the floor,* as it happens. It is true that the collection on the whole is but a poor one, and composed almost exclusively of competition drawings, and 'projects' for various churches and convents in Dublin and elsewhere in Ireland. As such they have probably been pretty well seen and criticised before, but still, being admitted, they surely deserved to be more carefully treated, and if the number tickets had dropped off the frames a very little trouble would restore them, so that the catalogue might not be quite useless for the want of any reference figure at all. Notwithstanding these strictures, however, it must be confessed that the catalogue is on the whole well arranged and generally correct.

"Amongst the best designs exhibited in this department of architectural drawings, we may notice a series bearing the well-known name of Pugin—now Pugin and Ashlin—some of which have been engraved. The suggestion of a new Roman Cathedral and Augustinian Monastery at Dublin seems to have furnished an opportunity to Messrs. Pugin to produce some fine drawings, as also their design now being carried out at Cork (we believe for the church of St. Peter and St. Paul), and a church at Maynooth, to be dedicated to St. Patrick. We doubt if we shall admire the roof of this church at Cork, as shown in the drawings. In this respect, at least, we think we should prefer the design No. 272, by Mr. S. J. Nicholl, of 126, Marylebone-road—also a competition drawing, and one which, being exhibited in Conduit-street if we recollect right, gained the first silver medal of the Society for the Encouragement of the Fine Arts last year. Mr. Nicholl also exhibits photographs of a chapel at Kensal-green, and, in conjunction with Mr. Wilson, a chapel at Leyton, in Essex. Several designs are grouped together under the well-known name of Mr. Goldie, and amongst them (No, 327) a beautiful drawing of the church of SS. Peter and Paul, at Phibsborough, Dublin, which we published in our impression of 6th September last. The general grouping of the various features of the apse and transepts around the base of the tower, which itself is designed with a great deal of feeling, is really very picturesque. The plan of this church is also very cleverly adapted to the site. The design of a church (again to be dedicated to SS. Peter and Paul, who seem to be in luck's way just now), at Berne, we think hardly so good, although it seems to have gained a gold medal somewhere in 1856.

---

* It may not be amiss for us to interpose in correction, "the Art-Union of Ireland" and "the Shilling Art-Union of Dublin" respectively, not as above stated, which was a separate institution, when in existence.—Ed.

* Our readers will remember our taking exception, in one of our notices of the Exhibition, at the palpably disadvantageous manner in which some of the best of the architectural drawings were placed.—Ed.

"Designs for St. Andrew's new church at Dublin are exhibited by Mr. Carroll of that city, Mr. Atkins of Cork, and Mr. Lynn of Belfast; the latter, however, seems to be the favored one, as it is marked 'first in order of merit,' but none of them appear much above common-place. There is a peculiar open aisle or arcaded screen, however, with flying buttresses from it to the covered aisle, which we could hardly understand from Mr. Lynn's drawing, and which drawing, by the way, is somewhat 'shady' in its details, and seems got up rather too much with a view to 'effect' upon a committee. Mr. Geoghegan exhibits his new method of shoring-up walls, as used in the reconstruction of the Royal Bank, Foster-place, and published by a contemporary. No. 328—design for a railway hotel—is a poor sketch, even for a student; but the drawing marked No. 267—design for pedestal to the Moore Testimonial—and others in the same frame, are *simply frightful*, and ought never to have been exhibited at all.

"Before we quite dismiss the architectural drawings, we must refer to a sketch in the Water Color Gallery, professing to show Captain Fowke's design for the Irish National Gallery. Surely nothing more is wanting to urge the Dublin public to protest as heartily against this suggested 'job' as the general public here protested against Captain Fowke's meddling with our buildings in Trafalgar-square. The extent of the architectural ability of this favored son of fortune is pretty evident to all of us now, and will be evident to all the world when they come to visit us at Kensington next year. If we mistake not, the hanging of this design for the Irish National Gallery will effectually prevent its ever being carried into execution.

"Mr. Carroll, a Dublin architect, exhibits (No. 350), two architectural models, but they are placed far away from his drawings of the buildings to which they refer. The practice of showing models is one which should by all means be encouraged. Connected with our present subject, we notice a mural monument to the Rev. Geo. P. Brown, designed by Mr. Goldie and executed by H. Lane (we presume of Dublin)—No. 58. There is a great deal of novelty in the arrangement of details. Messrs. J. Hardman and Co. exhibit groups of figures for architectural ornamentation, but with this we nearly exhaust all that is to be found in the way of architectural carving or decoration in stonework. We cannot but think a great deal more might have been shown, especially when we note the name of Deane on the general committee, and remembering the skilful architectural carving of Irishmen at our Oxford Museum, to say nothing of what may be seen by the same hands in the new buildings, not far from the Kildare-street Exhibition itself, we were led to expect a great deal more in this department of ornamental art. In metal work also, Messrs. Hardman exhibit, and Mr. Skidmore, through his agent, Mr. Mooney; but we are again disappointed to find so little to see.

"Of course large quantities of those Irish specialities, bog-oak carvings and arbutus inlay work, &c., must be expected, worked up into all kinds knicknacs—of useful and useless—but very few of these are above the common run, which one sees in our cheap jewellery shops everywhere—*ad nauseam*; and after all, compared with similar work in Germany and Switzerland, these bog-oak carvings will hardly hold pre-eminence, though still they are quite pretty enough and sufficiently low in price always to command a large sale—in fact, form a really important industry, employing a great number of artistic hands and educating them for greater works of genius. Messrs. Goggin (290), O'Connor (210), and others exhibit these articles. Some very good speciments of wood carving applied to furniture, however, are to be found under Nos. 72 and 59, but we shall be disappointed if Dublin does not send better examples to Kensington next year—works where more idea as well as bolder execution will be found. In furniture generally, within the last few years, we may be said to have considerably advanced, not only in artistic design and execution of cabinet-work, but in textile fabrics and the manner of making up and hanging them. In carpets also, and other floor coverings, though perhaps not so much as in curtains and hangings generally, is this improvement to be found, and some examples of really good patterns are to be seen under the name of Fry and Co. and others in the Central Hall. The names of Minton, Wedgwood, and others are well represented in the Central Hall of the Exhibition. Let us hope the Irish imagination may ally itself to superiority of execution, for the purpose of astonishing ourselves and our neighbours in the forthcoming trial.

"Messrs. Edmundson exhibit a great variety of gaseliers, and one especially which we should like to see more of—a way of setting gas jets round a central bowl, which we fancy must be effective when lighted, and may be made very ornamental when not.

"It is quite refreshing to turn to the numerous cases of India work, and the manufactures of China and Japan, where, even with the wildest drawing and greatest absurdity of form, there is always an artistic element which atones for every fault. Let the makers of papier mache only consider this, and see if a little money expended in obtaining art assistance might not even now avail to help this manufacture out of the very low position which it holds amongst the industry of the country. Of all the great variety of articles exhibited it is of course impossible to speak, and we have gone over the chief points which concern architects and their clients particularly. We are not aware if any special days have been set apart as students' days for sketching, but, if not, we trust some means have been used to make this unusual collection available for special study to the students of the Royal Dublin Society School of Art.

"Glancing at the picture galleries, we may first observe, that while we are glad to see such a numerous collection of works of the old masters, contributed chiefly by Irish proprietors, we cannot help regretting that no attempt is made at chronological or any other arrangement, except the fitting of one frame into another, and so covering up every inch of wall space. The committee very properly guard themselves from being supposed responsible for the names which fond proprietors attach to the frames, but making all due allowance for this, there is food for study to those not quite worn out with picture-seeing at the end of the season. Amongst the 514 pictures exhibited, there are sufficient examples of all the schools to have made a really valuable and instructive series, commencing with Paolo Uccello and Botticelli, ending with Rubens, Ruysdael, and Jordaens, leaving the Kauffmans, Gainsboroughs, and Reynolds, to form the commencement of a modern series. Among the 400 pictures in the Modern Gallery, we are glad to observe some of the foreign schools well represented, especially that of Dusseldorf. There is a charming picture by Mr. Catterson Smith, P.R.H.A., called 'A Portrait,' but is something more—a merry little face inside a guardsman's helmet, and next a big sword. Mr. J. R. Marquis, who gives some charming bits of Irish scenery, shows also some Norwegian landscape. We observe C. Hasenflug has, in No. 82, shown considerable skill in 'catching a sunbeam' and making the most of it. The picture is styled 'Ruins of the Cloisters of Walkenrind.' 'Snow at the entrance, with gleam of winter sunset in the interior,' of a few arches and vaults in a state of green old age and picturesque decay forms a good architectural study. We are not aware whether, after the Exhibition is over, the Sotherby collection will be dispersed or not. At any rate the Dublin Committee is to be congratulated on having temporarily attached it to their other series.

"In concluding our remarks, we wish to observe, that whatever of approval we have ventured to express, or whatever of reproach we have felt compelled to throw upon the exhibition arrangements, or the character of its contents, has been entirely with a view to the advancement of true art, and its proper application to manufactures; so that no one who has the same aim as ourselves will regret if we have hit the mark, and been able to point out errors which in future may be avoided. It is as much in the interest of the forthcoming Exhibition, as we said at the outset, as in the present one that we have thought it our duty occasionally to be severe; but we desire the Royal Dublin Society, and the promoters of the Exhibition of 1861, to believe that *we quite appreciate the noble efforts which they have made, and heartily thank them, in the name of the artistic world, for the valuable collection they have produced.* May the results be such as will bountifully reward their patriotic labors!

This project is now *de facto* a matter of the past, being formally closed on the 31st ult., after an uninterruptedly successful run of five months, during which 190,000 visits were paid to the building, 145,000 of that number being paid for at the door. The financial success of the undertaking may readily be estimated by the following facts, collected from the report read by the assistant-secretary at the closing:—

"The expenses of the exhibition, it is needless to say, have been great, but the receipts also have surpassed expectation, and the committee trust that when the cessation of their labours shall enable them to publish their balance sheet, the Royal Dublin Society will not only retain these galleries and other additions made to this building—which have cost at least £1,500—but will also have a moderate surplus applicable to the useful and national objects of the institution. Taking into account the difficult and uncertain character of the enterprize, the committee feel they have reason to congratulate the Royal Dublin Society and the subscribers to the guarantee fund, whose public spirit alone rendered the undertaking practicable, on so favourable a termination of their labours and anxieties. The pretensions of the exhibition were moderate, challenging no comparison with former displays; it was sought merely to bring together such a collection of works of art as would tend to instruct and elevate the public taste and show the progress which Ireland has made in the Fine Arts and in manufactures connected with them, and at the same time to provide a source of innocent and intellectual enjoyment, the means of which are neither so abundant or accessible in this city of Dublin as the friends of improvement and civilization would desire. In all these respects the committee venture to think the Exhibition has been eminently successful, and the results may well encourage our fellow-citizens in future years to engage in a similar undertaking, with the full confidence and hope of a like prosperous issue."

THE TELEGRAPH CABLE BETWEEN MALTA AND ALEXANDRIA.

In announcing the successful laying, after a delay of more than two years, of this cable, the *Mechanics' Magazine* has the following:—

The electrical portion, or "core," of this cable consists, throughout its whole length, of exactly equal parts, by weight, of conducting and insulating material, every nautical mile being composed of 400 pounds of each substance. The conductor is a strand of seven wires of the purest copper (six wires laid round one wire); and is about four times larger, in sectional area, than the conductor of any previous cable, except that of the International Company from England to the Hague. The insulator is a combination of gutta-percha and Chatterton's compound, pressed firmly round the copper in six alternate coatings, three of compound, and three of gutta percha, the latter being of the highest quality attainable at the period of its construction. The copper strand is also embedded in a layer of compound, in order to produce perfect solidity, and to prevent the possibility of tubular interstices between the conducting and insulating materials.

Having being submerged in the Regent's Canal during three days, in lengths of 2,000 yards, it was tested for insulation by the government electrician, and by others on behalf of the Gutta-Percha Company, in the following manner. The copper or positive pole of the battery was connected to an earth plate, sunk in the canal, and the zinc, or negative pole was attached to one extremity of the silk-covered wire, composing the helix of the galvanometer. The conductor at one end of the coil of core, subjected to the test, was then united to the other extremity of the galvanometer's coil-wire, and the conductor at the further end of the core was carefully insulated; the amount of escape or loss constituting deficient insulation was thus indicated by readings on the dial of the galvanometer, showing the angles of deflection marked by its needle during the passage of the current through it, and every coil that was found to be inferior to an agreed standard was at once rejected.

Besides the test in cold water, as above described, each coil of core was subsequently tested similarly, *three times*, in water of the uniform temperature of 75 degs. Fahrenheit, after twenty-four hours' immersion—firstly, before the application of pressure; next under hydraulic pressure of 600 pounds to the square inch, in Reid's pressure tanks; and thirdly, when the pressure was removed; and it is worthy of note, that, in every instance the insulation was about 15 per cent. higher under pressure than before its application.

The core was finally tested by Messrs. Siemens with their own instruments and battery power. Their plan of testing is founded on the principle that all substances in a greater or lesser degree resist the passage of electricity along them, and it, therefore, consists in a mode of stating the values of insulator and conductor respectively by simple numerical expression of their respective powers of resisting conduction, given in units of an ascertained standard, the standard unit in the present case being the resistance of a column of mercury one metre in length, and one square millimetre sectional area taken at the freezing point of water; the results are obtained by comparison of a known and purposely definite resistance (made up of these units) against the unknown and required resistance. The system is carried into practice by constructing a series of coils of silk-covered wire, capable of being combined or disjoined at pleasure, each coil having a different and progressive resistance to conduction expressible in units. These coils are made use of in connection with the battery and galvanometer arrangement, well-known as "Professor Wheatstone's Bridge."

Each coil of core, immediately after being tested, was again placed in the canal until it could be transferred to the works of Messrs. Glass and Co., and from that time until its final submersion in the sea, the entire cable has been continuously covered with water, except only while passing through the sheathing machines and during its progress out of the works into the paying-out ships. The padding around which the external wires are spirally laid consists of the best Russian hemp saturated with Archangel tar. There are three gradations in the thickness of the external wire, which, in all instances, is of the best bright charcoal iron. The deep-sea portion is surrounded by eighteen wires of the gauge No. 11. In the middle portion, intervening between the deeper water and the shore end, the external wires are twelve in number, and of the gauge No. 5, while in the shoal water, near Malta, Tripoli, Benghazi, and Alexandria respectively, there are twelve wires of No. 3 gauge. The diameter of the core is half-an-inch. That of the completed cable is for the deep-sea portion 7-10ths of an inch, for the middle part 9-10ths of an inch, and for the shore end 1 1-10th inch.

The completed cable, as it has from time to time issued from the sheathing machines of Messrs. Glass, Elliot, and Co., has been the subject of constant and assiduous examination, under the care of M. De Sauty, the chief of their electrical department. The battery power employed to test the completed cable at Greenwich has varied from 144 to 200 cells of Daniell's, and the instruments in use have been the horizontal galvanometer, constructed as already described, and also another form of horizontal galvanometer, in which the needle is suspended by a single fibre. The results obtained by these apparatuses have been from time to time compared with those taken on delicate tangent and differential galvanometers respectively, added to which the unit system of Messrs. Siemen's has also been in operation at Messrs. Glass, Elliot, and Company's works during the whole period of manufacture. It is only bare justice to the Gutta-Percha Company, to Messrs. Glass, Elliott, and Company, and to the *employés* of both those firms, to say that they have throughout the progress of this work, displayed the most indefatigable zeal and anxiety, by any and every means to secure perfection of manufacture, and to regain for the science a portion at least of public confidence.

SHAKSPEARE'S DWELLING—WHO'LL BID?

By recent announcement in the public journals we find that "New-place, Stratford-on-Avon—the spot on which Shakspeare passed the last twenty years of his life, and where he died—was not only for peremptory sale on the 25th ult., but the attraction of its 'extensive frontage in the centre of the town' was held out invitingly to *speculative builders*. Mr. J. O. Halliwell urged upon the wealthy admirers of the immortal bard to purchase the property, the sum of £1,500 being probably enough to secure it, proposing himself, as soon as the subscriptions are sufficient to cover the expenses of purchase, to transfer the property to the Corporation of Stratford-on-Avon, on the express condition that the public be always freely admitted, and that no erection of any kind be ever permitted in the gardens. Some years ago it was proposed to raise a monument here to the memory of the poet—but Shakspeare wants no monument but that of his works. The only suitable monument would be one outside the gates of New-place, recording to posterity in enduring marble the honored names of the fifteen through whose interposition the sacred spot has been preserved from the auctioneer's hammer, as we are happily enabled to chronicle as a fact, as the New-place was, through the highly commendable exertions of Mr. Halliwell, secured by private contract on the 22nd ult. for £1,400, half which amount has been already subscribed—Mr. Sheridan, M.P., and Mr. G. L. Prendergast, author of a "Concordance to Milton," contributing £100 each. All honor to these worthy spirits!

NEW MANUFACTURES FROM HUMAN HAIR.[*]

At the meeting of the British Association for the Advancement of Science at Manchester, I offered a few observations on the manufacture of human hair, as an article of consumption and general use, and submitted for inspection some beautiful specimens of articles made from human hair, of a very massive and heavy texture, like pilot-cloth, or that used for travelling or mountain wear. It is, however, capaple of being spun into fine goods, like alpaca, which is but of comparatively recent use. Truth goes farther than fiction. My sister conceived the idea, and caused the collection of about 3,500 lbs. of human hair, in a few months, in Liverpool, by one female, who was merely assisted by her husband and son in carrying it out, receiving from £1 to £2 per week. We had two shawls made from it—cotton warp—(exhibited to the Section). It is is extremely warm and durable clothing; and with care and attention any quantity of the stuff can be obtained. It would appear fabulous to say that 100,000 bales might be obtained from Egypt, and 100,000 from Asia—perhaps 500,000 or a million bales annually, from all parts of the world, even within twenty-one years, and of all sorts, both long and short, all of which is at present wasted, and not enumerated in the articles of commerce or general consumption. I am authorised to state that this hair has been in the possession of Messrs. R. W. Ronald and Son, of Liverpool, for some years, who will afford 100 lbs. weight to any applicant on receipt of a post-office order for £2 15s. (The items making up this sum, commission, &c., are enumerated.) The article is as collected; and heavy foreign sheep's wool, in dirt and grease, being 6d. to 14d. per pound shows its cheapness for consumption generally. The Manchester goods are exchanged for long hair in Germany, which is sold in London, at £4 4s. per ton; but the very shortest is applicable for cloth, and 10d. to 1s. per lb. is a safe price for imports. These 3,500 lbs. are in seven bales, insured in the Manchester Fire Office for £200; so any one can test their existence by policy No. 180,631. The manufactured goods may be shown at the International Exhibition in 1862; and if hair were collected in factories, the value could be quarterly divided, and added to the savings-banks deposit. I would suggest that specimens of these hair-manufactures should be placed in every museum in the kingdom, and trust that the Smithsonian Institution of America will give the question their ablest support. Is not the long hair of the Chinese mixed with silk and worked up by the common people?

---

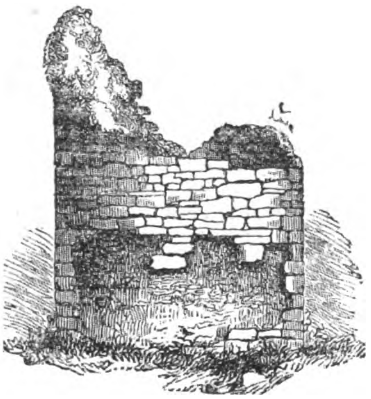
KERRY ANTIQUITIES.

THE three accompanying illustrations together with the descriptive matter of some interesting antiquities in the Co. Kerry—an *ultima thule* of the green isle,—are presented through the kind favour of the Rev. Jas. Graves, Honorary Secretary to the Kilkenny Archæological Society, the latter being collected from two valuable papers read before that body by Mr. R. Hitchcock.

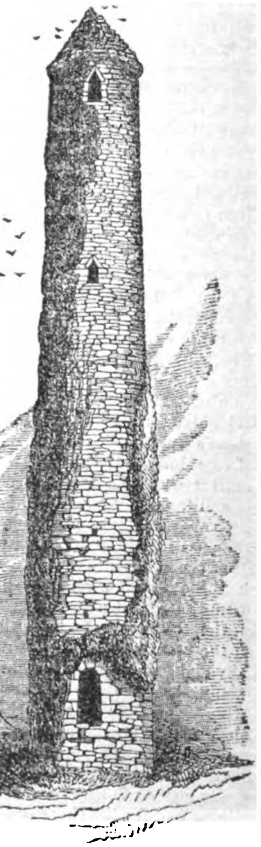


ROUND TOWER, AGHADOE.

Tower of Aghadoe.—What remains to us of this tower stands at a distance of about sixty feet from the north-west corner of the old church, and in the same cincture with the church. The diameter inside is seven feet. The highest part of the tower now standing is about 19 feet from the present surface of the ground; but, as will be seen from an inspection of the sketch, the greater part of the tower is not so high. The stones of which it is built, as well as the style of masonry, seem different from those found in the adjacent old church, both being much superior. A learned friend has favoured me with the inspection of a sketch of a portion of the tower, made by him in the year 1846, showing the cyclopean structure of the exterior facing, and the rubble work of the interior. The old church, like most of our ancient ecclesiastical edifices, is built almost east and west, and still exhibits abundant proofs of its former architectural beauties, particularly in the doorway. It is composed of different kinds of stone, some of which must have been brought from a distance, as none like them are to be found in the neighbourhood. A little to the south of the church, in a square enclosure, are the ruins of a *round* castle, named the "pulpit," having a flight of stone stairs in the thickness of the wall, and indications of there having once been an immensely strong floor of wood in the middle height. One of the ancient Ogham inscriptions has been found in the immediate vicinity of the Round Tower of Aghadoe, and seems to have very early attracted the attention of antiquaries. This stone is still carefully preserved, though much mutilated, in Lady Headley's garden, at Aghadoe House.

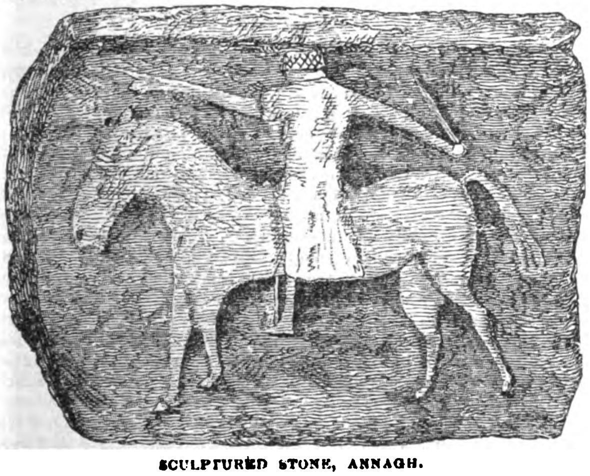
The author then proceeds to cite several eminent authorities, in whose published works notices of this structure are to be found. Amongst them are the following:—

Smith merely mentions the existence at Aghadoe of "the stump of one of the round towers;" but in his "Prospect of the Lake of Killarney, taken from the North," he gives an interesting view of "the ruin'd church," round tower, and round castle. The tower does not here appear so dilapidated as it is now. It may be worth remarking here, that Smith, whether through mistake or not, represents numerous tombstones at the *north* side of the church. This is remarkable, as that side of a church-yard is not considered a favourite one for interments. Weld says, "the tower of Aghadoe was constructed with hewn stone; but, exposed during the lapse of ages, on the summit of a lofty hill, to the influence of the elements, it has yielded to the shocks of time, and at present is in a very perishable state. Its shattered remains are not more than 15 feet in height." A writer, in the third volume of the "Dublin Penny Journal," says—"the turaghan or round tower, stands 54 feet from the north-west angle of the church, and is called the 'pulpit' by the peasantry; all that remains of this ancient structure formed only a part of the basement, not reaching to even where once stood the door. The height is about 12 feet. It measures in its outer circumference 52 feet; its diameter within the walls is 6 feet; and the thickness of the walls 3½ feet. Its masonry is greatly superior to that of the church; the stones are large, regular, and well-dressed. The cut-stone or facing of the north-west side has been all taken away for the erection of tombs in the adjacent burying-ground. Within and without, spoliation has been at work effectually, aided by those worst of pests, the gold seekers; fellows whose unhallowed dreams are most fatal to our antiquities. This tower must have fallen before the last century, but no notice of it in its erect state has survived." Lewis thus mentions the tower:—"Near them are the ruins of an ancient round tower, of which about twenty feet are yet standing." The "Parliamentary Gazetteer of Ireland" contains the following:—"The turraghan and the cathedral, at the mutual distance of 54 feet, crown the summit, or dot the table-land, of the hill; and are surrounded by a thickly tenanted burying-ground. All that remains of the turraghan—called the Pulpit only by the peasantry—formed but part of the basement, and does not reach even to the aperture of the door. Its height is about 12 feet; its exterior circumference is 52 feet; its diameter within the walls is 6 feet; and its thickness of wall is 3½ feet. The stones of which it consists are large, regular, and well-dressed, and exhibit a style of masonry quite superior to that of the cathedral; but they have been peeled from the north-west face for transmutation into tombstones; and the whole ruin wails beneath the inflictions of 'the gold seekers,' and other prosaic spoliators of ancient buildings. The tower, to which this melancholy fragment belonged, must have fallen before the commencement of the eighteenth century, but is not noticed, in its unfallen state, in any record." Mr. Windele gives a very satisfactory account, and says—"The Turaghan, or round tower, stands 60 feet from the N.W. angle of the church, and is called the 'Pulpit,' by the peasantry. All that now remains of this ancient structure is the basement, reaching from the sill of the door downward. The height is about 15 feet. It measures in its outer circumference 52 feet, the diameter, within the walls, is 6 feet 10 inches; the wall is 4 feet 6 inches thick, which measurement diminishes on the inside, above the level of the present floor, three inches. Its masonry is greatly superior to that of the church. The stones are large, regular, and well dressed. The greater part of the facing stone of the north side has been unfortunately taken away, for the erection of tombs in the adjacent burying-ground. Within and without, the spoliator has been effectually at work, aided by those worst of pests—the gold seekers; fellows whose unhallowed dreams are most fatal to our antiquities. This tower must have fallen previously to the last century; but no notice of it, in its erect state, has survived. It has not hitherto, we believe, been excavated or examined. The labour of doing so, we apprehend would be very considerable, as it is quite filled up with the debris of the fallen part, but the effort, it is hoped, may yet be made." In this, and two of the three last extracts, I believe the term "pulpit" is incorrectly applied to the Round Tower. In all the old accounts, written before guides were so numerous and dishonest as they now are, we find it given to the round castle; and it is to this building that I myself have heard the name applied.



ROUND TOWER, RATTOO.

Rattoo Tower.—The dimensions are as follow—circumference outside, 47 feet; height of doorway from ground, 7 feet; height of doorway, 5 feet 8 inches; breadth at bottom, outside, 2 feet 1 inch; inside, 2 feet and half an inch; breadth at top, where arch turns, outside, 1 foot 8½ inches; inside, 1 foot 8 inches; diameter of tower inside. 7 feet 4 inches; thickness of wall at doorway, 3 feet 9 inches. Round the doorway, outside, is a cornice or ornament, and just over it is also some species of ornament, both, however, invisible from where I took my sketch. Inside are three storeys, or sets of stones, all around, projecting, and between each of these storeys are one or more single stones, also projecting, as if for assistance in ascending. There are four windows or apertures at the top of the tower, facing the cardinal points, one of which and a smaller one under it appear in my sketch. The tower stands on a sort of platform of masonry, and in the building of the tower lime mortar is visible. The doorway, I think, faces the east. This tower is, indeed, a stately looking monument, and, with its mantle of ivy, is calculated to strike the beholder with a sort of awe, which he cannot soon forget. Lewis, in his "Topographical Dictionary of Ireland," thus mentions this Round Tower:—"There are no remains of the castle, but those of the abbey still exist, and, together with the adjoining lofty round tower, which is still entire and clothed with ivy, form an interesting and picturesque group." The "Parliamentary Gazetteer of Ireland" states, that "the pillar-tower is now partly dilapidated;" but this is truer of many other towers in Ireland, the tower of Rattoo being almost quite perfect, having lost only a little of its conical cap. Dr. Petrie gives the following pretty detailed description of this tower:—"The Tower of Rattoo, which, like that of Clondalkin, is still perfect, is remarkable for being placed on a terrace or platform connected with a causeway, which extends in a line opposite its doorway. The Tower is formed of roughly-squared, hammered sandstone, the entrance doorway alone being chiselled. It measures 47 feet 9 inches in circumference at its base, and 92 feet in height, the wall being 3 feet 10 inches in thickness at the doorway. The doorway is semicircular-headed, the arch being formed of three stones, and it is ornamented with a flat band, 9 inches in breadth. It is 5 feet 4 inches in height, 1 foot 8 inches in width below the arch, and 2 feet 1 inch at the sill. The Tower is divided into six storeys, that at the top containing, as usual, four large apertures facing the cardinal points. These apertures have sloping jambs, and are, externally, angular-headed, but are quadrangular internally. The intermediate storeys between the uppermost and the second, or doorway storey, are each lighted by a single aperture; but, in consequence of the Tower being enveloped in ivy, their exact situations cannot be determined, with the exception of one in the fifth storey, lately exposed by a storm, and which is angular-headed, and faces the east. The lowest storey is filled up to the level of the doorway. It will be perceived from the section above given, that between the floors of each of the storeys, rough corbel stones project from the wall about the middle of its height; and this is not an uncommon feature in the interior of the Towers, such corbel stones, in one example—that of the Tower of Ardmore, in the County of Waterford—being sculptured with animal and human heads, and other ornaments." Mr. Wilkinson, in his work on the Practical Geology and Ancient Architecture of Ireland (1845), has the following tabular remarks on this tower, which he erroneously sets down as in the county of "*Clare!*"—"Usual height,—conical top nearly perfect,—four large openings at top,—angle-headed outside,—square-headed inside,—door circular-headed, usual size, and usual height above surface of ground." *Construction*—"hard quartzoze sand-stone,—cut stone band round the door, 9 inches wide and ¾ inch projection." Mr. Wilkinson has some good general remarks on the Round Towers.



SCULPTURED STONE, ANNAGH.

Sculptured Stone in old Church of Annagh.—The stone which is the subject of the present notice lies inside against the south wall of the church. It is a block of coarse red sandstone, the same material of which the church is built, and which the adjacent mountain range furnishes; and measures in length 18 inches at one side, and 15 inches at the other; in breadth, 16½ inches at one end, and 15½ inches at the other; and the greatest thickness is about 7 inches. On the face of this stone is rudely sculptured, in bold relief, the figure of a man on horseback, holding in his right hand something like a sword or dagger. What the other hand holds, I cannot exactly say, as it, as well as the greater part of the sculpture, particularly the two heads, is evidently unfinished. The hand, however, seems to be extended at full length, and not holding the horse's bridle. I think the leading idea of the figure that of a warrior pointing forwards, as if to encourage his followers to action; this agrees with the posture of the horse, which seems to be in motion. A sort of saddle, or saddle-cloth, appears under the horseman, but I can see no trace of stirrups, though, as just mentioned, I do a little of a bridle and mouth-piece. The dress is of the frock shape, mitred or seamed from nearly the waist downwards. The resemblance between this equestrian figure and that on the seal of Strongbow may be worth mentioning here, although the latter is turned the opposite way.

A friend, writing to me on the old figure in Annagh church, says:—"The people have a foolish legend, that if the stone were removed, it would be brought back again by supernatural means; but there is no real history attached to it, that I could ever learn." This, to my mind, makes the stone an object of greater interest for our speculations, believing, as I do, that the equestrian figure on it is of ancient date.

Of the history of Annagh church I have not been able to find any account, though I have made some search; but, judging from the style of the building, which in general is plain, and in which there is no lime mortar, though situate in the centre of a limestone district, it is evidently an ancient work. There is, however, a well-finished Gothic south entrance doorway, of very good proportions. Like most of our old churches, this one at Annagh is built nearly east and west. A little to the west, on a tongue of land, is "Tonakilla fort," apparently an obsolete burial-ground, in which are several graves and small gallauns, or pillar-stones. Traces of a *causeway* from the fort across the slob to the mainland are still plainly discernible. About the same distance from the church, to the north-west, stands another group of gallauns; there are also some forts in the neighbourhood of the church. The following is the only mention (quoted from Lewis's "Topographical Dictionary") I have been able to find of this sculptured stone:—"About half a mile distant [from Blennerville] are the ruins of the old church, with the burial-ground, in which is a stone bearing a rude effigy of an armed horseman." It may be interesting to ascertain, if possible, what hero of old the monument in Annagh church commemorates. If conjecture is allowable, I would say that he was probably some old chieftain of the district—it may be a king; but, at present, conjecture is all that I can offer.

ZION CHURCH, RATHGAR.

THIS church, which has been for some time completed, was this day opened for Divine service. It is situated on the road leading from the main Rathgar-road to the Dodder, and is a conspicuous feature. The plan is cruciform, and the style of architecture Mediæval Gothic, after designs by the late Mr. Welland, the then architect to the Ecclesiastical Commissioners of Ireland. This body, however, did not extend their usual auspices to this church, the funds for erection—some £10,000—having been provided by bequest of the late John Gold, Esq., an eminent stockbroker in this city. Limestone is employed in the construction of the building generally, but Caen stone is used for the dressings and decorative portions. The interior, which will accommodate about 850 persons, has fittings of stained deal, and an open timber roof stained and varnished. The tower, with its pyramidal tiled roof, contributes much to the general effect of the building. Preparations are making for heating the building by means of hot water. Messrs. Cockburn and Son were the builders.

NATIVE RAILWAY CARRIAGE MANUFACTURE.

WE are pleased to see that this branch of trade has not altogether left us, nor is it confined exclusively to the workshops of a single public company in this city. At No. 10, North-wall, may be seen some new railway carriages, constructed chiefly of teak, and of admirable workmanship, just turned out from the extensive machine carpentery mills of Messrs. John Martin and Sons, to order of the Dublin and Wicklow Railway Company.

"AMATEUR" ECCLESIASTICAL ARCHITECTURE.

A MODEL CHURCH OF THE 19TH CENTURY!

Ne sutor ultra crepidam, is a popular maxim that it would be well for the community generally, and for the artistic credit of the age we live in, if certain of the laity—and ecclesiastics too—bore more constantly in mind. It may be possible partially to reconcile the fact of a wealthy dunderhead perpetrating a monstrosity in the shape of a domestic gazebo, and paying "through the nose" for his whims and fantasies; but it is not so where the quacking system comes to be applied to ecclesiastical structures—which are public property—and of late years unfortunately, these would-be "church doctors" have become very numerous, and *more* unfortunately have had plenty of patients to experimentalize upon—a system which it has always been our especial care to expose, and whether found existing amongst priests or parsons we alike accord to each their deserts. But we are forced to remind our readers that some of these "doctors" have a *peculiar* way of having their *own* way, and to shield themselves from the consequent odium, they nominally secure an architect's services, who, instead of being permitted to pursue a course of independent action, and exercise his skill and taste to the best of his ability, becomes perverted into a mere creature of his learned—and probably reverend—client, and must do *whatever he is told*, however repugnant to his feelings. In the columns of our daily contemporaries, are to be constantly found most earnest "appeals for funds," the "present church accommodation" is graphically shown to be "most inadequate to the requirements of a largely increasing congregation," and the smallest donations in aid of the good work will be most thankfully received, &c. A committee is most usually formed to aid in transmitting "the begging-box" through every available channel, but as the composition of the former being generally of a very heterogenous character, its members' notions of architecture are usually held in supreme contempt by the worthy pastor, who would fain impress on each the necessity of observing the proverb we above quoted, however disregarding himself the maxim that those who *preach* ought to *practise*. Now, we are never disposed to question unduly "good intentions"—though we may pause for a moment to consider their very unenviable concomitant—but with all due respect for them, we cannot concede that they ought always to screen from blame a party, who rejoicing in their plenitude, falls into the error of vandalizing an existing structure on the one hand, or raising a hideous block of nothingness on the other.

In a recent No. we congratulated our citizens on their being accidentally relieved from the perpetration of one of these proposed monstrosities in the erection of a great barn church on City-quay, after an obtrusive builder's design;[*] but we regret to say, as bad—if not a worse—specimen of architecture, is now in course of completion unfortunately in one of our most important and populous suburbs. Midway on the Rathgar-road may be seen a calp stone pile—intended, we presume, for a Roman Catholic church—presenting on plan a parallelogram, some 105 feet by 90 feet in the clear, walls 50 feet high, roof of ordinary pitch, an apsidal termination at one end, a portico being designed to occupy the other. Our readers will perhaps say there is nothing so extraordinary in *this*; but peeping internally what do we find, a nave 45 feet in clear and 50 high, with a *flat ceiling*, *square headed* clerestory windows, an arcade of *eight semicircular-headed* arches, with piers 7 *feet* 6 *inches wide* and 4 *feet thick*, separating nave from aisles; the latter being 19 feet wide and lighted *from above* by *skylights* in roof, with *flush lights in ceiling*. *O tempora! O mores!* what a church of the nineteenth century! But we desire distinctly to note, that neither should the able and worthy architect—whose name it must be admitted is, unfortunately for his professional character, associated with such an abomination—responsible for the paternity of "the design," nor are we in any way indebted to him for the particulars recorded in the above notice. Another huge pile, and quite as ugly, comprising in plan that of a Grecian cross, with great dome at intersection, has been for some time completed—the portico excepted—and at a considerable cost, under the *same enlightened auspices* on Rathmines-road in *same* district. How can journalists be too loud in their praises of those who, while ministering to the cause of religion in rearing structures to the Most High, simultaneously contribute to the advancement of national art?

THE KILKENNY AND SOUTH-EAST OF IRELAND ARCHÆOLOGICAL SOCIETY.

Having at various periods availed ourselves—and we do so in the production of the present number likewise—of the opportunity afforded, of obtaining from the transactions of this highly laudable institution, some of the valuable papers read at its periodical meetings; and in consequence, confessing ourselves—and our readers too—debtors to the society in no small degree, we feel that a special review of its history and proceedings will be esteemed by all as a mere graceful acknowledgment of favours and possibly contribute to more extended appreciation. It appears that this society originally having the appellation of "Kilkenny Archæological" only, was instituted in the early part of the year 1849, to preserve, examine, and illustrate all ancient monuments of the history, manners, customs, and arts of our ancestors, more especially as connected with the County and City of Kilkenny. At first consisting of but a few persons, and those confined to one locality, it rapidly extended its influence; persons of all ranks and classes contributing to its support; the members now numbering over 600, residents not of Kilkenny alone, but of various parts of Great Britain and Ireland; and at their own request enrolled, comprehending many individuals well-known in the literary world.

The limits of the society however becoming extended beyond the original boundaries, some corresponding change of name was felt to be desirable, and at a general meeting in March, 1858, it was unanimously resolved, that The Kilkenny and South-East of Ireland Archæological Society should be the future title of the Association, and that its principal, but not exclusive, sphere of operations should extend from Kilkenny as a centre, to the South-Eastern Counties of Ireland.

At its quarterly meetings, papers on Archæological subjects are read, reports of corresponding members received, and objects of antiquarian interest exhibited. Local secretaries and corresponding members have been obtained in many parts of the country, whose duty it is to inform the society of all antiquarian remains discovered in their districts, to investigate local history and traditions, and to give notice of all injury likely to be inflicted on monuments of antiquity, in order that the influence of the society may be exerted to preserve them. A sum of upwards of £140, contributed specially for that purpose, has been expended in the preservation of the ancient and beautiful Abbey of Jerpoint, in the County of Kilkenny. A library and museum have been formed, and many valuable donations have already been received. A pamphlet, with illustrative woodcuts, supplying brief hints and queries intended to promote the preservation of antiquities and the collection and arrangement of information on the subject of local history and traditions, has been printed and circulated. The society's "Journal" (imperial 8vo.) for the years 1849 to 1861, has been issued, forming six handsome volumes with numerous illustrations—it is published quarterly—each number containing the proceedings of the previous meeting. These volumes comprise papers of general interest on the history and antiquities of Ireland, and are now in the hands of the members. Amongst the contributors are several distinguished Irish archæologists.

But although the exertions of the society have so far been successful, yet much remains to be done. The raths, Tumuli, and early earthworks of the south-east portion of Ireland, would richly repay examination; original manuscripts, tending to throw much light on the history and antiquities of the various counties within the scope of the Society's operations, exist in abundance, and are well worthy of publication; the castles, abbeys, churches, crosses, and other ancient monuments of the district, many of them fast crumbling to decay, all demand illustration.

However desirable—both in a national and an archæological regard—may be the various objects above enumerated, we must remind our readers that they can only be effected *by a large accession of new members*, for, the subscription having been fixed at so extremely low a standard, united and general co-operation alone can enable the society fully to accomplish its mission.

The names of those who desire to join the society will be received by the Rev. James Graves, Duncannon, Co. Wexford—who since its establishment has proved not only a zealous officer but valuable contributor to its transactions—and by the local honorary secretaries.

CORK SCHOOL OF ART.

The students of this school—as always has been their wont—have distinguished themselves again at a recent display. Ten drawings have been selected for national competition, and 21 medals obtained. Her Majesty's Inspector, Mr. Eyre Crowe, has just visited the school, and it is announced to be progressing both numerically and otherwise. By the report for 1859–60 we learn, amongst other matters, that "with occasional changes and fluctuations, the school has been successful and efficient in its operations. Its utility has been felt and acknowledged by various classes, who avail themselves of its advantages—students, teachers, artizans, operatives, and competitors for civil appointments. Whilst all the classes have been worked so as to render the Institution as locally useful as possible, the number of medals and other distinctions awarded are the best proof that it continues to hold its high position amongst the other Schools of Art as a Prize-taking Institution. Since October, 1860, it has been entirely under the care of Mr. James Brenan, in whom the Committee have the fullest confidence. Under his efficient management all the classes have been diligently and systematically conducted, with steadily increasing numbers; and the mechanical class has become an important and successful feature in its operations."

---

[*] See page 646 ante.

The Master states that "the class for mechanical drawing has been moderately attended, not so well as he should have expected in a city like Cork, where there must exist a demand for workmen able to make plans, elevations, working drawings, &c.; but hopes that in a short time the manufacturers of Cork will see the importance of inducing their operatives to attend this class.

Also that "an arrangement has been entered into with the Board of National Education, Dublin, by which a certain number of pupils from the National Schools of Cork may attend the evening classes of the School of Art, free of all expense."

We hope soon to have the official statement of progress during current year.

CHURCH OF SS. PETER AND PAUL, MOATE.

The foundation stone of a new Roman Catholic Church, as above designated, was laid on the 27th ult., and the building, which will be erected after designs by Mr. John Bourke, architect, is provided to be cruciform on plan, with nave, aisles, transepts, apsidal chancel, side chapels, baptistery, tower, &c.; the dimensions in clear being 110 feet by 52 feet, by 68 feet across transept; height to apex of roof 60 feet. The Norman style is observed throughout, and the nave is to be separated from aisles by lofty arches springing from cylindrical columns with characteristic capitals and bases. At intersections of transepts and chancel with nave, four great arches are introduced, which will have a very imposing effect. Light will be obtained for the nave and aisles by semicircular headed doublet windows in clerestory and flank walls; and for the transepts through triple windows; the chancel and western gable being also perforated. A tower with spire rising to a height of 105 feet from ground line will terminate one of the aisles. We have very few good examples of this style in Ireland, and are glad to see symptoms of its revival.

DEDICATION OF A CATHOLIC CHURCH AT ATHLONE.

We previously alluded to the fact that a large parochial church, to be dedicated to St. Mary, was in progress of erection at Athlone, and it is so far advanced towards completion as to admit of the ceremony taking place on the 16th ult. The site of the building is exalted and advantageous, though in proximity to the old church, which was in every respect unsuitable. Early English was adopted for the architecture, and the interior comprises nave, aisles, transepts, chancel, side chapel, sacristy, porches, organ-loft, baptistery, tower (with stairs to organ-loft), and spire, 190 feet high; measuring in the clear 130 feet by 57 feet, and across transepts 66 feet. The west front contains a moulded door underneath a great window of five lancets, each alternate opening being filled with glass, and the intermediate opens being intended to receive figures. This window, which forms a triple lancet on the interior, is furnished with slender columns, and the upper part of the gable is filled with a recessed wheel window. The chancel and side chapels are lighted by richly traceried windows filled with stained glass, and the central window contains an exceedingly artistic representation of the Nativity of our Lord, and has been procured from Caen in Normandy. The transepts are lighted by triple windows of graceful design, and the aisles and clerestory are lighted by double carped lancets. Cylindrical columns of Wicklow granite, supporting richly-moulded arches, divide the nave from the aisles; four great arches from the junction between transepts, chancel, and nave. The roof is of open timber work, with carved tracery. Mr. John Bourke was the architect.

ORIGIN AND CONCLUSION OF "BLACK MAIL" IN CARLOW.

In the beginning of Edward the Second's reign, the captain of the Kavanaghs left in possession of part of Carlow by the Earl and Countess of Norfolk, kept that portion as his own, and got possession of a great part of the counties of Carlow and Wexford, and called himself MacMurrough. The O'Tooles and the O'Byrnes, who occupied the Dublin and Wicklow mountains, which are conterminous with the county of Carlow, became his allies; and growing in strength, they kept all the country between Carlow and the east coast—which is thirty miles and more—as their own; and so, adds Baron Finglas, "began the decay of Leinster." The possession of the Dublin, Wicklow, and Carlow mountains by the three tribes of the O'Byrnes, O'Toole's, and the Kavanaghs, in effect cut off the communication of the English with their settlements in Wexford and the South of Ireland. They hindered the passage of the king's judges and officers, who might otherwise have circulated in the parts beyond the Barrow, and thereby exiled the ministrations of the king's law out of Carlow, situate in the midst of Leinster." "Whence," says Sir John Davis, "grew that Irish bye-word, that they dwelt by west of the law that dwelt beyond the Barrow, which is within 30 miles of Dublin." From his position on the hills that approach the Barrow at Leighlinbridge, MacMurrough commanded the passage to that place, and from the days of King Edward III. until the end of the reign of Henry VIII., MacMurrough was paid a yearly stipend of 80 marks from the king's exchequer, being in fact so much "*black mail*" paid to him for liberty to pass towards Leighlinbridge, and to abstain from harrying the English settlers in his neighbourhood. When this payment was not duly made, as sometimes happened from want of funds in the exchequer, he proceeded to enforce it by attacking the English inhabitants in the counties in the locality. It may be easily conceived how deeply galling to the English government was this state of things. Accordingly, in the following reign, when King Richard II. landed at Waterford with 4,000 cavalry and 30,000 archers, he marched through the Kavanagh's territory, and accepted their fealty and submission.*

EMBANKMENT OF THE THAMES.

The readers of this journal have been already apprised that a committee of enquiry, recently constituted, investigated, at considerable length, the particulars of numerous designs submitted for this project, and from the published evidence given before it by the several projectors, we collect the following, relative to the design of our respected fellow citizen, Mr. Richard Turner of Hammersmith Works.

Mr. Richard Turner, examined.—As nearly as possible I comply with the terms of your advertisement in the three desiderata of, first, the *sewage;* secondly, the *spacious thoroughfare*, and thirdly, the *improvement of the river.* I will first refer to the street traffic. This road (*pointing to a model*) is 33 feet wide. This is the existing wharf wall; this the level of the water with the road 33 feet wide, and at a height of three feet above it; the road to be continued throughout round the stores, and to come out on this street. But if they choose to take the goods at once direct from the barges, they could do so without coming through these stores, and set off to any part of the metropolis; that next the river is 27 feet wide, and the top road is 90 feet wide; and then on the side I overhang 5 feet in addition to aid for shops; as millions of people would be upon this road, they would require, from time to time, refreshments and to purchase many things; there would be a good trade at those shops. This would be a fine promenade overlooking the river; it will become purified comparatively into a beautiful pellucid stream. I propose to dredge along here, which would not cost anything to signify, because the gravel would be required in this embankment. This embankment is 150 feet altogether in its width into the river. I propose this to be the sewer (*pointing to the model*); but at the same time that is capable of modification. It can be either nearer or deeper from the surface as may be found most useful or desirable; but I thought this the best position to place it in, inasmuch as manholes might be introduced from the surface; but being a cast-iron metal sewer, a cylinder of eight feet diameter, it is not likely to require anything to be done to it. The sewer might be increased from six feet to nine, coming from Victoria-street, Westminister, and by the time it comes to the city it might be nine feet in diameter. So far as the present wharfingers are concerned, they would be greatly benefited by these new arrangements, and when completed it will be then seen what an immense improvement it is over the present primitive system; and therefore instead of any renumeration coming to them, it must come the other way, for every one of them would be benefited amazingly, particularly if you give them all this land, even though you retain the streets. They would have no control over the high level street; but at the same time it forms a convenient cover to them for their goods. If they were to give us something for it, we might possibly finish it for them. At the front and rear, it is all covered with glass and ironwork, and that makes a complete store of it from side to side. The lower part would be for heavy traffic; the one above for teas, spices, and light goods, which require to be lofted, and they would come across and be lofted by these foot bridges, In that way they would have valuable stores. With the Temple Gardens we do not interfere prejudicially. The authorities there behave most generously, for they invite all the community to the enjoyment of those Gardens; we do not disturb their view, but rather make it pleasing, This (*pointing to another model*) is 35 feet high, and the pillars are 50 feet apart, and though our street runs longitudinally by the inhabitants of the Temple, it does not do them any harm, but forms an interesting prospect for them. The four acres of ground reclaimed would be a great boon to them. They would do the ornamentation, and if they gave it to me to do, I would do it nicely for them. In that way they would have a capital winter garden, and the centre would suit for the drilling of their own volunteers; it would be a nice promenade, and supposing a thunder shower came on, all the garden visitors could go there for shelter and be very comfortable.

Chairman.—How much do you take from the river in your general line?—I propose 150 feet from the present line of the river; that would not be the maximum projection, because there would be some places so as to render the curve of the river more pleasing to the eye, where it would be perhaps 180 feet; but I begin at Westminster Bridge, and we come down at both ends by ranges of wide, handsome steps upon a noble esplanade 1645 feet in length coming to Whitehall Place, communicating with it, and also with the new 90 feet street at Whitehall Place end where it terminates, the effect of which would be very good.

---

* From a paper by J. P. Prendergast, Esq., relative to the Barony of Idrone, County of Carlow.

There would be no carriage way on it?—None; but if desirable that could be added. The Duke of Buccleuch and his neighbours I thought would be annoyed if there was a street opposite their houses, and the necessity for horse traffic there did not seem to me to exist, as it divided so much and diverted at Charing Cross in so many other directions, I thought it best to avoid introducing its continuance here. This esplanade would be only for pedestrians, so that there could be no possible objection to having that there, particularly as we would interpose a high railing in front between their terrace and this esplanade. Still they would have a good view of the river over that 70 feet esplanade.

You propose to come to Whitehall Place and there begin your road?—Yes, only the top level street, 90 feet wide. It would begin to dip then from Waterloo Bridge and gradually get under the new railway bridge, at Hungerford. The high level street terminates at Whitehall Place. But in Scotland Yard where there is a great deal of traffic, I do not deprive them of their water; on the contrary, I make it more convenient for them. I give them the facility of getting in and out freely, as I have no locks or dock gates, at this or any of the entrances for barges; I carefully avoid all complicated machinery. We do not interfere with the property in those docks; and again at Whitefriars we leave them not only uninjured, but greatly benefited. We have four 50-feet openings, through which the barges could go in sideways and we have a bridge to cover the opening at once.

Capt. Burstal.—That would not take a 60 feet barge in sideways?—No, but we could make a 60 feet opening if it were wanted. We can make the girders strong enough to give an opening of 80 feet. The wharves would be approached in that way; the opening would be covered by the bridge, which might be a rolling bridge, for which we have a patent.*

Chairman.—A bridge across those openings?—Yes.

What would become of the traffic during the time?—The bridge is drawn in a moment. I have brought a model of the bridge. That would occur only here and there, where our barges must be allowed to go, for the purpose of preserving the wharves in their present integrity. Our 90 feet road commences at Blackfriars and goes along to Whitehall.

Where are the people to go to when they get to Blackfriars Bridge from the westward?—I would be glad to hear that the Commission would entertain the road beyond Blackfriars Bridge into Cannon-street; but I understand by the advertisment of the Commissioners that it was to end at Blackfriars Bridge. All the streets along here (enumerated by the witness) have lateral communication for equestrians.

That is to the high level street?—Yes, but for pedestrians every street, lane, and alley we communicate with, both to the top and the bottom streets, and see how much that would increase the value of that property.

Have you made any estimate?—I have gone into that with a good deal of attention and care, and being connected with iron works I have proposed that nearly all should be iron *(pointing to the model)*, these pillars are three feet in diameter, filled solidly within with lias lime concrete. The under pillars are nearly 5 feet square, but at the bottom they have flanges which makes them 7 feet 6 inches. This would be the passanger railway, and that would be a goods railway, but this would be solid *(pointing to the model)*. I have brought a model of the railway by which I proposed to cross the channel to France *(producing the same)*.* It is the same principle here. There is a double line of railway there, and as this would be at a low level under the surface, we have a lift, so as to allow people to descend or ascend by stationary engines who do not wish to go down by the steps. I suggest that the trains should be drawn by chains and pulleys and work hydraulic cranes along the wharves, and the lifts up and down, inasmuch as there would be people going down every five minutes, and we should, I believe, to a great extent, on this line, upset the omnibus traffic.

Have you contemplated any engineering difficulties in making a railway below the level of high water?—There would not be the slightest difficulty that I can anticipate. There is a company behind my back worth several hundred thousand pounds, ready to come forward at once. I could give any guarantee that within two years you would have the whole completed. I would have three relays of workmen from end to end within the twenty-four hours. I would make the coffer-dam by the metal piles and face plates to begin with, and within that they would execute this work very rapidly under roofs that would be moveable and lit by gas at night so as to work all nights and days.

In the meantime the trade would be stopped?—No; I would undertake that every wharfinger should say that his trade was not interfered with. We would give every facility for conducting the trade; we have the barges well provided for; we utilize every inch of ground which we reclaim. I consider that we meet all the desiderata of a spacious thoroughfare, providing for the sewerage, and improving the navigation, and we dredge outside here to a considerable depth, so as to float the barges at low water, and never to see dry or bare banks any more.

Mr. Thwaites.—What is your estimate?—My estimate is £930,000, including the two railways; or it is 360,000 less than that, omitting the railways; but I thought that the railways would sell for £700,000, and therefore it would be a good speculation to embark £360,000; but that includes everything given up ready for use, the bridges and all the et-ceteras. Messrs. Holdsworth, who are great iron people in England and Scotland, would be ready to undertake it.

I do not believe that there would be one farthing to pay for compensation; I would undertake to say that we would conciliate every one to our plan. I have reason to suppose that; I never asked them about compensation, but I think that compensation would be the other way,—that when the works were done, the benefit would be such that they would be entitled to pay for being improved so much. But that would be wisely left to hereafter.

Chairman.—Do you think, if the road were this height, with the enormous traffic this would have to sustain, it would remain in good order 50 years?—I believe it will remain for centuries quite perfect; it would be equal to the bridge at Westminster, and it would be constructed very much on the same principle. These are of iron, but they would be filled in with concrete, and they are of immense size; those girders are double, and then there are solid girders above them, and then wrought-iron joists with buckle plates for sustaining the ballast.

Chairman.—Have you had communications with the wharfingers?—Yes.

Do they approve of a solid embankment?—I made this plan as I thought best to suit their requirements, and I fully believe, if so carried out, it will do so more perfectly than any other mode proposed for simplicity, stability, and utility, and for accomplishing all other purposes required by the Thames embankment, and as to the various dimensions I have suggested, they, of course, are quite easily capable of being modified either to less or more, as may be deemed advisable. But I submit that the general principles embrace all that can be wished for in the most efficient and permanent manner.

MONUMENTS AND MEMORIALS.

It is proposed to erect at Galway a memorial to the late Earl of Eglinton and Winton, as a token of public appreciation of the services rendered during the period of his vice-royalty towards the establishment of Galway as a transatlantic port.

The Committee of the M'Ennery Testimonial Fund, are about to receive designs in competition for a monumental memorial to the late Roman Catholic Dean of Ardfert, bearing the above name. We understand that a lithographed plan of the site is in course of preparation, and may shortly be had by intending competitors.

A sum of £20 will be given for the approved design for a pedestal and base on which is to rest, in the town of Banbridge, a statue to the late Captain Crozier, R.N., Mr. Joseph R. Kirk, R.H.A., sculptor. Photographs of the statue are being prepared for distribution; and the statue itself may be seen in course of completion at the sculptor's studio in Jervis-street.

There is a talk at Missolonghi, says the *Patrie*, of erecting there a monument to Lord Byron.

Review.

The Office and Cabin Companion. By J. Simon Holland. London: Atchley and Co.

The purpose of this little book is essentially utilitarian, being designed to present facilities to marine engineers, naval architects, and others engaged in the construction and management of steam vessels, to calculate by reliable data founded on a lengthened practical experience, the precise capabilities of engines of certain construction, whether screw or paddle, and the consequent attainable speed of the ships. It also treats of the expansive and compressive forces of steam; theoretical and nominal horse power; the area of funnels, velocity of pistons, &c., illustrated by some diagrams, and accompanied by copious tables, which would seem to have been very ably and laboriously produced. Referring to the table for finding the true mean speed of a vessel, the author remarks, that "it was calculated as much to ensure accuracy as to save time, the author never having had luck to fall in with a table that gave the apparent speed in a correct manner; one table in much use containing over *thirty-three per cent.* of errors, a fact which in itself shows the advantage of a new work that can be depended on as an authority."

---

* An illustration of this patent principle as applied to the bridge spanning George's Dock was given in the *Dublin Builder* for April, 1860.

* Alluded to in our last number.

Though somewhat outside our province, it requires the exercise of little penetration to see that it must prove a desideratum to the classes above enumerated.

The tombs of Keats and Shelley at Rome are about to be restored. Mr. Severn the newly appointed British Consul in that city has resolved to give them his early attention. They have fallen into great decay. It is proposed to substitute a "Greek Altar," with a medallion portrait on the front of it, for the simple headstone which was placed over Keats' grave in 1821.

In some excavations just made at Acoz, near Chalerio, in Belgium, a number of old Roman tombs, containing coins, arms and amphoræ, were found. The tombs appear to be those of military chiefs; and in the midst of them are a quantity of bones.

Mr. Train has a prospect of success for his street railway in the Pottery district. The trustees of roads in that busy neighbourhood have approved of the plan, and a joint stock company has been formed for the purpose of raising the money necessary to carry on the work. Mr. Train promised to raise £10,000, half the capital required.

Miscellaneous.

DA VINCI'S SKILL IN PERSPECTIVE.—Da Vinci was, by universal consent, a great master of perspective. But the production of very finished specimens of graphical art was the possibility of his time as much as of any other. The first-class draughtsman managed, in one way or another, to do all that could be done: the difference between one period and another lies in the facility of the mode of doing it. Da Vinci wrote on Perspective: the collection of fragments which goes by the name of his work "Della Pittura" contains many references to his work on our subject; of which it is conjectured that manuscripts are still in existence. Ventnri says that Cellini, by his own account had a manuscript in his possession and lent it to Serlio, presently mentioned, who published as much of it as he could understand. This statement is void by indefiniteness. Moreover Danti makes Serlio steal from Peruzzi of Sienna, whom he makes to take his methods fairly from Pietro di Borgo. That this Serlio was a thief is repeated by a score; everything is settled except whether he robbed Peruzzi or Da Vinci. In "The School for Scandal" Sir Peter walks in, a sound man, at the very moment when the whole difficulty is reduced to whether he had just been wounded by sword or by pistol: and further examination may possibly give a similiar ending in the present case. Some make him rob both, for safety. At the very time of writing I chance to light upon one instance of the growth of a story. Bayle has it that Budæus stole three hours for study on his wedding day; Dibdin has got it up to his complaining that he could not get more than six. What I have to do with the accusation is to remark that these and various other charges of appropriation show that there was a strong—and most likely a just—impression of the existence of a great deal of unpublished knowledge. I believe that there is not in existence any proof of Da Vinci's skill over and above what be showed in his paintings and remaining drawings, except the geometrical plates which he drew for the "Divina Proportione" of his friend Lucas Pacioli, published in 1509 These are fifty-nine perspective drawings of solid, both *solida* and *vacua*; the second term means drawn with solid bar-edges instead of closed faces. Throughout the sixteenth century it seems to have been considered a triumph of art to represent complicated solids, with a pyramid on each face. Thus Da Vinci gives an icosahedron, a figure inclosed by twenty triangles, in which each triangle is then made the base of an outlying pyramid: and he gives a number of prickly polyhedrons of this kind. Nothing harder could well be proposed to be accurately represented; especially when the solid was to be formed of bar edges, so that the back is partially visible through the front. Barbaro, to whom we shall come, also delights in this kind of exhibition, which shows how much beyond their neighbours the Italians carried actual performance. I further notice that the word *perspective* does not yet appear in its modern sense: when Paciola mentions Da Vinci's plates he says that his purpose in publishing them is "quod *opticen* instructiorem reddere possent." *Optics*, then, is his technical word for what we call perspective. *Scenography* was a common name; it is derived from the first book of Vitruvius, who describes it as "frontis et laterum abscedentium adumbrario, ad circinique centrum omnium linearum responsus." The word *adumbration* also became common enough, in the sense of a perspective drawing: this is a word attributed to Samuel Johnson, who always got credit for invention when, as not seldom happened, he produced something out of the limbo of oblivion.—*Athenæum*.

GAS OR WATER.—The consumption of Gas now is at least double what it was ten years ago; and the annual quantity manufactured in London is about 8,000 millions cubic feet. One fourth of this quantity, according to reliable estimates, is lost by leakage, condensation, dishonesty, and bad debts; and at least one-half of this fourth—or 1,000 millions of cubic feet—escapes every year into the London street earth. Mr Spenser, as analytical chemist to the New River Company, has traced this escaped gas in its destructive action upon the 4,700 miles of metropolitan gas and water mains, until underground London appears to be one vast grave of iron rotting into plumbage. The twelve gas mains, with their eighty joints, which lie side by side with water mains and telegraphic-wire pipes over the sewers in Cockspur-street, Charing-cross, are not such a happy family as their appearance would lead us to suppose. They are crowded together like tramps in a threepenny bed, and there does not seem to be room for a rat to run between them; but there is no real friendship for all this shaking of hands. The defective joints of the gas mains lead to the enormous leakage just described, and the escaped gas, by its action on the street earth, destroys water pipes in a few years that ought to last for a century. Apart from the foul condition of the London street earth, we are all interested in saving this escaped gas and this destroyed pipeage, for our gas bills include the cost of the one, and our waterbills the cost of the other, While the water pipes are softened. and the gas penetrates the tubes, the water is also adulterated with an undrinkable mixture. I have heard of a letter addressed to a leading water company, which ran somewhat in this form:—"Mr. Blank presents his compliments to the Blank Company, and wishes to know whether they supply gas or water. Mr. Blank is led to make this inquiry, because one of his servants went to the cistern with a pitcher and a candle, and instead of procuring water she blew up the roof of a wash-house."—*Dickens's "All the Year Round."*

UNDEVELOPED TALENT.—There have been very popular writers who were brought out by mere accident. They did not know what precious vein of thought they had at command, till they stumbled upon it as if by chance, like the Indian at the mines of Potosi. It is not much that we know of Shakspeare, but it seems certain that it was in patching up old plays for acting that he discovered within himself a capacity for producing that which men will not easily let die. When a young military man, disheartened with the service, sought for an appointment as an Irish Commissioner of Excise, and was sadly disappointed because he did not get it, it is probable that he had as little idea as any one else had that he possessed that aptitude for the conduct of war which was to make him the Duke of Wellington. And when a young mathematician, entirely devoid of ambition, desired to settle quietly down, and devote all his life to that unexciting study, he was not aware that he was a person of whom more was to be made—who was to grow into the great Emperor Napoleon. I had other instances in my mind, but after these last it is needless to mention them. But such cases suggest to us that there may have been many Folletts who never held a brief many Keans who never acted but in barns, many Vandykes who never earned more than sixpence a-day, many Goldsmiths who never were better than penny-a-liners, many Michaels who never built their St. Peters; and perhaps a Shakspeare who held horses at the theatre door for pence, as the Shakspeare we know of did, and who stopped there.—*Fraser's Magazine*.

A NEW APPLICATION OF PHOTOGRAPHY.—A novel and interesting application of the science of photography is now in daily use at the famous Mettray colony, near Tours, which is a reformatory for young convicts. Every urchin brought to this house of correction has his portrait taken the moment he sets foot in it, and another is made on the day of his leaving. The first portrait represents the rags, dirt, and misery, the physical and moral degradation, the prematurely careworn features, the scowling, cowering, timid, uneasy, and withal ferocious look of the born thief. The second shows the same individual transformed by the magic of judicious discipline, which includes physical comfort and kind treatment—his dress is now clean and neat, and his countenance is redolent of health, contentment, self-confidence, benevolence, and energy. Philosophy had never in any age a grander subject for contemplation than two such pictures.

WATCHES AS A BRANCH OF FINE ART MANUFACTURES.—"Having extended our search through the West-end and the city, after an ordinary good English watch, possessing an artistic design, we have come to the conclusion that but very few of our English watch manufacturers have yet properly appreciated the advance of the public taste for a higher order of ornamentation from improved designs. Small though the watch is, it yet affords ample scope for the display of the genius of an artist. It is, therefore, with much pleasure that we can mention one manufacturer who has given special attention to the artistic ornamentation of watches, and whose productions manifest a decided advance in regard to rules of art and the requirements of an educated taste. The manufacturer here alluded to is Mr. J. W. Benson, whose recenly enlarged show-rooms, at 33 and 34, Ludgate-hill, and 46 and 47, Cornhill, from one of the conspicuous features of this great city thoroughfare. The display of gold and silver watches, together with ormolu clocks of rare designs, is quite imposing to the passer-by. Here the purchaser of a watch is afforded every facility of choosing one suited to his purpose and means, and possessing at the same time all that can be desired in finish, taste, and design."—*Globe*.

Dundalk and Carrickmacross Junction Railway.—This railway is intended to connect the town of Carrickmacross, in the county of Monaghan, and the rich agricultural district surrounding it, with Dundalk, an important sea-port town, having regular steam communication with Liverpool four times in the week. This proposed line will also complete the railway communication between Dublin and Belfast, so that farmers in this district can send their stock to the markets in Belfast, Dundalk, Dublin, Drogheda, Newry, or Liverpool, at a comparatively small cost. It is proposed to make use of the Dundalk and Enniskillen Railway, as far as Innishkeen, distant from Dundalk about eight and three quarters statute miles—at this point the proposed line will branch off to the southwest, until it reaches the town of Carrickmacross, distant from Innishkeen Junction six and a-half miles, making the total distance from Dundalk to Carrickmacross, by rail, fifteen and a-quarter statute miles. The engineering character of the proposed line is most favourable, being better and easier than most Irish lines. There will be no tunnelling, no viaducts, no deep cuttings, or high embankments. Estimated cost per mile, including land works, permanent way and stations, £5,800. Mr. James Dillon is engineer in chief.

The Exhibition of 1862 Catalogue.—The Railway Passengers' Assurance Company claim the honour of giving £600 for the last page but *one* of the advertising wrapper of the two shilling Catalogues of the Exhibition of 1862. It is said that Mr. Benson, the eminent watch manufacturer and jeweller, of Ludgate Hill, secured the back page for £1,000, and was subsequently offered £,1000 for his bargain,

Constabulary Buildings, Phœnix Park.—Extensive additions being about to be made by the Board of Public Works at this depot, the contractors desirous of tendering meet at the Custom house this day to decide on a measurer.

London and Paris Squares and Gardens.—A London correspondent of the *Opinion Nationale* says:—"In our new and delicious gardens at Paris the delighted child of some poor persons plays and gives itself up to the transports of joy natural to infancy when placed in such a surrounding, while, seated in the midst of verdant foliage and of flowers, the mother mends the clothes of the family. What would you Parisians say were these little elysiums closed to all but a couple of dozen children of the quarter, and their noble and wealthy parents? Think, then, of the immense and numerous squares of London that are rigorously shut against the working classes, and that the rich and aristocratic alone have access to them, for they are cultivated exclusively for them. When these gardens are kept for the happy and privileged few, there is much loss of health, morality, and recreation to the people. The square of Lincoln's Inn-fields, six times larger than your Square du Temple, is fresh, blooming, and deserted. The rich, however, disdain it, and the poor can only look into it. Some benevolent person demanded of the parochial authorities that this unfrequented square should be thrown open to the public, but obtained only a peremptory refusal. A people thus treated is not free. No, a thousand times! although from time to time they throw potato peels at the heads of lords who displease them, although the Radical press says what it pleases of the aristocracy and caricatures of them are engraved, and although Mr. Bright is indefatigable in pronouncing privilege as a national leprosy—and it is a leprosy that engenders many others."

Monument to the late Earl of Aberdeen.—The tenantry on the Aberdeen estates in the vicinity of Haddo House having a wish to erect some memorial to the memory of their late distinguished landlord, held a meeting recently to consider the subject. The wishes of the present earl were previously consulted as to what the memorial should be, and it appeared that he had expressed his preference for a square tower, to be erected at the hill of Thrie. This was accordingly agreed to by the meeting. The amount already subscribed is £500.

Fifty Years Since.—Half-a-century ago all the great capitals of Europe, although then not half their present size, were dangerous residences to their honest inhabitants, and unmanageable in regard to police supervision, owing to the difficulty of obtaining sufficient artificial light during the long dark nights of winter. The growth of population that has since taken place, and the development of the resources of our own and other countries, would probably have been impossible without the discovery and rapid introduction of some means of economically and effectually lighting the streets and alleys, which had long served as the haunts of thieves and dangerous characters of all kinds. It is not too much to say that in this matter alone the introduction of artificial light has been the main agent employed in effecting a social improvement, compared with which all others are secondary. The millions of cubic feet of gas now burned nightly in our streets are beyond comparison, the best, the most permanent, and the least expensive source of security that could have been introduced, and have served, more than anything else, to check those deeds of wrong and violence that darkness cannot fail to shelter, and invariably fosters.—*Popular Science Review.*

Lifeboat Services.—During the last twenty-one months the lifeboats of the National Lifeboat Institution have providentially been instrumental in rescuing *four hundred and ten* lives from shipwrecks on the coasts of the United Kingdom. For these and other services. either in saving or in attempting to save life the Society has voted £2,133 as Rewards. Who that has seen some of these lifeboats put off in the very fury of the storm, has watched their successful fight with the elements, and has seen the same boats return, laden with human life, that has not felt a deep emotion, such as one cannot but experience when witnessing some heroic and self-denying act! The Institution has already paid this year £8,420 on various lifeboat stations;—since 1850 it has expended altogether, £50,730 on similar establishments. The demands on the Lifeboat Society continue to be very heavy for payments on lifeboat establishments which have just been completed. It is therefore earnestly hoped that the public at large will continue to strengthen the hands of its committee in carrying out the great and national objects of the Lifeboat Institution; and that many persons may be found, from a feeling of gratitude for the services performed by its life-boats to suffering humanity, to respond to the Institution's appeal. Contributions are received by all the bankers in the United Kingdom, to the credit of the Society, and by its Secretary, at the office, John Street, Adelphi, London.

Death of Sir William Cubitt.—Sir William Cubitt, F.R.S, the eminent engineer, died on Sunday last, after an illness which for some years had prevented him from following his profession. He was in the 77th year of his age, having been born in 1785, at Dilham, in Norfolk. In early life he assisted his father, who carried on the business of a miller; but quitting this occupation, he was apprenticed to a joiner. In his new employment he soon acquired the character of a first-class workman, and became especially skilled in making agricultural implements. Not long afterwards he adopted the trade of a millwright, and obtained ample employment in the erection of machinery. In 1807 he promulgated his invention—which has since been so commonly adopted—of the self-regulating windmill sails. Shortly afterwards he became connected with Messrs. Ransome and Son, the celebrated agricultural implement makers of Ipswich. Messrs. Ransome's business extended beyond the mere manufacture of agricultural instruments, and, accordingly, Mr Cubitt was extensively engaged in the construction of gas-works. In connection with prison discipline his name will ever be remembered as the inventor of the treadmill, which has since been introduced into nearly all her Majesty's gaols. The innovation, however, did not take its place amongst the institutions of the country without being subjected to a large amount of ridicule and opposition. The first treadmill was erected at Brixto gaol in 1817. In 1826 Mr. Cubitt settled in London as a civil engineer, and immediately was engaged in works of the most important character. In 1827 an act was passed for the improvement of the Norwich and Lowestoft navigation, and Mr. Cubitt was appointed engineer. The object was to open a navigation for sea-going vessels from Yarmouth or Lowestoft to Norwich. To effect this Mr. Cubitt united the river Ware with the Waveney, thence to the small lake of Oulton Broad, through Lake Lothing, with a passage onward to the sea, 700 yards long and 40 wide—Lake Lothing being thus formed into an artificial harbour, the tide-lock of which will admit vessels 84 feet long and 21 feet in beam. This undertaking was completed in 1829. Among his subsequent employments he designed the South Eastern Railway, including the removal of the South Cliff by blasting, which feat was accomplished under his superintendence. He was officially appointed, being then President of the Society of Civil Engineers, to exercise a superintending watchfulness over the construction of the building for the great Exhibition of 1851, in Hyde Park. He received the honour of knighthood for thus contributing his scientific experience in carrying out this national undertaking. The last great works upon which Sir William Cubitt was engaged were the two large floating stages in the Mersey at Liverpool, and the new iron bridge across the Medway at Rochester.

Fatal Fascination.—A remarkable circumstance has tended to interfere considerably with the brilliancy and steadiness of the magneto-electric light with which some of the squares of Paris are illuminated. The attraction which any bright light at night exercises upon insects is notorious, and every evening—especially after a very warm day—clouds of insects collect around the intensely brilliant points of light, each being irresistibly drawn towards the bright poles of ignited carbon, where they are of course instantly broiled to death. The numbers that crowd to it are so enormous that the light appears at times to be almost extinguished by burning insects, and every morning the bodies of these unfortunate suicides are found heaped up by tens of thousands at the bottom of the Lantern. For this reason it has been found necessary to encase the lamp in glass, instead of having the carbon poles exposed to the air. This is, however, attended with considerable loss of light, as even the most transparent glass has been found to obstruct upwards of ten per cent of the incident rays.

The Dublin Builder.

Vol. III.—No. 46.

THE GRANITIC ROCKS OF DONEGAL.

MR. R. H. Scott, accompanied by the eminent Professor Haughton, made in the course of last summer a "mineralogical tour" of the county Donegal, and the results of their explorations are set forth in an interesting and comprehensive paper read by the former—as elsewhere noticed—at a meeting of the geological society on the evening of the 13th inst. One fact worth specially recording, is an exception found by them in the constituent elements of the granite of this district as compared with that of the counties Dublin, Wicklow, and others throughout the province of Leinster, which almost everybody knows is composed of the ordinary quartz, feldspar and mica in proportions, varying with certain veins; such variability affecting the quality of the materials respectively produced. Of the former the authors say "it is of a peculiar composition, as it contains two feldspars. one of which is orthose, or common feldspar, while the other is not albite, as in the granite of the Mourne mountains, but oligoclase, a mineral which contains less silica than albite does. it is so common in the granites of the Continent of Europe that, according to Professor G. Rose, of Berlin, it is an essential constituent of all granites. This point Irish geologists will be hardly willing to concede, as the Leinster granite does not contain oligoclase—at least it has not yet been discovered in that district.

Another important fact is also elicited—

"That wherever the crystalline limestone was seen in the granite or close to it, there was found in contact with the limestone a bed of a peculiar rock to which Mr. Scott gave the name 'sphene rock;' it contains sphene in great abundance with white, orthose feldspar and green epidote, and is hardly to be distinguished from the sphene rock of Norway. From all these facts the authors of the paper were disposed to form some conjectures as to the origin of granite, or rather as to the origin of the Donegal granite. The character of the rock is essentially gneissose, it lies in beds corresponding to the general lie of the strata of the country."

The tourists then proceed to detail more particularly, and in the following terms, the results of their mission:—

"The tour commenced at Castle Caldwell, in the County Fermanagh, where the oligoclase granite is found in veins in the gneiss of the district. In this locality it contains copper pyrites and molybdenite both of which substances are rare constituents of granite. At times veins are found from which the oligoclase has entirely disappeared, and the granite of these veins consists of pink orthose with quartz and black and white mica. When this is the case, schorl appears to be very abundant. These veins of pink orthose are the source of the china clay which is abundant there, and for which a factory has been erected at Belleek. The main granite axis of the country extends from Ardara along the valleys of Gweebana and Glenveagh up to Glen, and prolongations of the axis were to be found at Unismenagh, near Dunaff Head, and at Ardmalin. This granite contains generally the two feldspars with black mica, and is also remarkable for containing sphene, a rare mineral, also found at Newry, and in great abundance in Norway. In fact the whole of the rocks seemed to be very similar to the granites of the Scandinavian peninsula, which are so common, as boulders, over the whole of the north of Europe."

Again, referring to the igneous qualities of the granite as affected by the presence of oligoclase and quartz in the same rock, the authors of the paper state that such "has been supposed by Professor H. Rose to be fatal to the purely igneous theory; however this is disputed by M. C. St. Claire Deville, one of the honorary members of the society, the papers are to be found in the *Philosophical Magazine*. The grounds of M. Rose's statement are that oligoclase and quartz if melted together would form common feldspar, and he supports his view by certain facts relative to the density of quartz. Mr. Scott expressed his opinion that the fact of the sphene rock and crystalline limestone occurring together support M. Rose's view. The presence of the garnets in the limestone makes that rock run to a glass when burnt. It does not, therefore, appear likely that it can ever have been in contact with a rock which was actually in a state of fusion. If this had been the case it would be probable that the feldspar of the sphene rock, which is orthose, would have been converted to oligoclase by the action of the limestone, as is the case at Carlingford, where, however, anorthite, a more basic mineral than oligoclase, has been produced by the addition of limestone to granite. It appears that granite might be produced by other means than simple heat, as each of its constituents may be found in positions into which they were never introduced in a state of fusion—a fact which is proved by the occurrence of feldspar in quartz veins near Lough Mourne. It appeared, therefore, that the whole of the rocks had been originally stratified, and had been subjected to certain actions, which are usually termed metamorphic, and in which very considerable heat, together with liquids of strong solvent powers, seem to have been employed. The result of this action had been to convert some into granite, some into gneiss, and some into crystalline limestone and mica-schist. Among the rocks found in Donegal was a syenite which resembled the syenite of Carlingford, described by Professor Haughton, but differed from it in containing oligoclase instead of anorthite, as above stated. The district examined was very rich in minerals, and there is no doubt that a careful examination will greatly increase their number."

After some acknowledgments of the valuable assistance rendered by local parties during the explorations, especially by Mr. Harte, the County Surveyor, Mr. Blake proceeded to read a paper on "The Primary Rocks of Donegal;" in which he described the structure of the rocks of the primitive series and their continued vertical structure all through from Sleiveleagne to Horn Head on both flanks of the granite range, consisting of alternate bands of slate gneiss, limestone, and on the northern portions of bands of syenite, porphyry, and limestone. He referred to the difficulty of reconciling the vertical structure with the horizontal deposition of the primitive rocks, noticing the discovery by the Mineral Exploring Company of the Heatite at Croby Head now being applied by English capitalists to manufacturing purposes. He also referred to the causes of the formation of the bog iron ore found at Carrick.

The President said he did not agree with Mr. Blake's views relative to the impossibility of the horizontal deposition of the primary rocks. He most fully acquiesced in the accuracy of Mr. Blake's observations of the directions of the joints, &c., and therefore he regretted that Mr. Blake should have departed from the region of facts and gone into theory. At all points where he and Mr. Scott had been able to check his observations, he had found them very correct. The only point where they might be doubted was at Armagarry, where the limestone beds did not appear to be vertical. After offering some remarks derived from his own observations in confirmation of Mr. Scott's paper, the president in conclusion said that some of the specimens of beryl granite resembled specimens which had been given to him many years ago by Dr. Croker, which had been found in South Australia.

Professor Jukes said he was glad to see that geologists were beginning to examine the mineralogical construction of rocks. He was disposed to think that there might be two origins of granite.

Dr. Sidney also alluded to the kind facilities afforded by Mr. Harte, who was in the highest degree entitled to their thanks. The papers were amongst the most important that had ever come before them.

ARCHITECTURE UNDER THE DYNASTY OF NAPOLEON III.

Reviewing the probable effects on the architecture of the age of the great works for some time being carried on in Paris under the auspices of the present occupant of the imperial throne, the *Building News* has the following:—

Notwithstanding many faults, they mark an important epoch in architectural history. Foreign visitors are naturally struck with their magnificence, and carry home favorable impressions of the transformation which has taken place within the last dozen years in the appearance of Paris. Foreign architects may not be of one mind as to the faultless character of the work; but, in order to satisfy their employers, they are bound to study them, so that when an opportunity occurs they may have a fair prospect of rivalling or excelling them. If, as unquestionably they do, they excite the admiration of the wealthy and the educated classes—the employers of architects—architects must work in the same style, or produce something better. The rigid Gothicists naturally look coldly on the façades of Lesoufacher, Cendrier, Davioud, Ruprick-Robert, Labrouste, and other famous men whose genius has planted the borders of the new thoroughfares. They lament, perhaps, the opportunity which has been disregarded of reviving the glories of Mediæval art, by rearing pinnacles and gables, turrets and oriels, and other forms of pure art such as, five centuries ago, encircled liked a jewelled belt the lovely towers of Notre Dame. They connect the prevailing taste for Italian art in the French schools with the wanton destruction and scalpings which Gothic monuments have endured in France. They are equally grieved to see the so-called "restorations," the indifference to architectural traditions, and the sacrifice of venerable work in the rampant desire to have something striking, and to make memorable the reign of Napoleon III. A revival of ancient art, or a due respect for old monuments was, however, simply impossible in a revolutionary age. There is nothing in anterior French history which would lead us to expect such a thing. A nation's art and literatnre must take its form and color from its politics, and from the spirit which it kindles in the people. The active, restless spirit, which changes periodically its form of government, and dashes mercilessly down all objects of political reverence, will not bend the knee to any style of art which is historically associated with the unpopular times. Napoleon seeks, perhaps, to settle the disordered elements and reconsolidate the scattered fragments of French thought. He wishes to identify himself with the new system. By forming squares and gardens, building barracks, asylums, workmen's quarters and museums, increasing the supply of water and the facilities for drainage, he sets men thinking upon practical questions and enlists the aid of science to the detriment of abstract theories of art. The present buildings in Paris may not be all that we could have wished, but they are what we ought to have expected, and they are better, perhaps, than could have been erected under similar political disadvantages by any other nation. All special theories of architecture and studies of different styles have given place to the absolute necessity for building extensively and rapidly. The shops and hotels of twenty years ago were inconsistent with the new public buildings. The new thoroughfares will really be the channels through which the policy of the French Emperor will flow, whilst the buildings which line them will be the foundation upon which the future architecture of France will be established. An improved character, more than sufficient to justify our faith in the ultimate beneficial effects of the new streets upon architectural taste, may even now be seen in the French capital, more especially in that portion which lies to the north. beyond the Rue du Faubourg Poissonière, in what is called the artists' quarter of Paris. Here we may see the earliest blossoms of the future French architecture, and if its summer's ripening fulfil the promise of its spring, it will assume one of the loveliest forms which Italian art has for centuries planted either on its own or any other congenial soil. The "painter's house" in the Place Ventimile, and the "house of an architect" in the Cité Malesherbes, by M. Amoudru, should be visited and especially studied by every architect staying in Paris. There is a freshness about the design of them, and an elegance and purity in every line of detail which is not always seen in the Boulevard houses. When, however, so many minds have been set at work on the reconstruction of Paris, there must, as a consequence, be an infinity of materials for the English architect's study. There is sufficient similarity of climate to render the same forms and the same materials, with more or less modification, available in both countries. An increased intercourse between the two peoples, must, in some measure, assimilate our habits, and lead each to take advantage of what the other has done. Some of our buildings are no doubt fully equal to, if they do not surpass, any of the modern French architecture, and some of theirs is as bad as any that we have perpetrated, but there is this remarkable difference—a difference seen also in the works of French painters—their architects seem to work within certain well known and recognised rules, ours to wanton in unbridled liberty. They could not build in such dissimilar styles as we do. We could not produce miles of new streets, from the hands of many different architects, bearing so striking a family likeness, and of such uniform excellence. They have, for the time, a national style; we have not.

ON THE RELATION BETWEEN THE POWER AND SPEED OF STEAM-VESSELS.[*]

When the relation between the pitch of the screw and the speed of the vessel is considered, and also that the pitch must be determined and the screw made before the vessel is tried, it must be obvious how important it is that marine engineers should clearly understand the laws affecting the motion of solid bodies in fluids. A few words will not, therefore, be out of place on this important subject.

When a steam-boat makes a voyage between port and port, she, in effect, excavates a canal between those ports, the transverse section of which corresponds with the immersed midship section of the vessel.[†] It is true this canal is immediately filled up again, but yet this canal is really cut, and the work of the engine is expended in cutting it.

After uniform motion has been attained by the vessel, the work of the engine is transferred to the water pushed out of the canal. Now, for similar speeds the work per mile, or per hour, must be as the immersed midship section of the vessel. The work given out by the engine multiplied by a constant co-efficient will therefore equal the midship section, and we shall have $C\ W = M$, where C is put for the constant, W for the work done by the engine in foot-pounds, and M for the midship section of the vessel in square feet. This of course only holds good for vessels of similar form. But it may happen that although we have several particulars of two vessels, one of which has been tried and the other not, we may not have their midship sections. In such case we may still effect our object provided the immersed portions of the vessels are similar, and we have one of the linear dimensions of each, because "all homologous sides of similar figures, whether curvilinear or rectilinear, are proportional; and the areas are in the duplicate ratio of their homologous sides." If, therefore, we have the length L, or depth D, or breadth B, of each of the vessels, we may use L^2, D^2 or B^2, instead of M. Where neither L, D, B, nor M, can be got we may still compare the two vessels if we have only their displacements, because the volumes of similar solids are as the cubes of their homologous sides. So that the cube roots of their displacements will be to each other as are their lengths, breadths, or depths; and as the midship sections of two similar vessels are to each other as the squares of their lengths, breadths, or depths, so also will their midship sections be to each other, as the squares of the cube roots of their displacements, or in other words, we may use $D^{\frac{2}{3}}$ instead of M, where D is put for displacement. To make this more clear, let us take two vessels of the simplest form, that of a parallelopipedon; the small one, eight feet long, one foot broad, and one deep; the large one, sixteen feet long, two broad, and two deep. Here the midship section of the large one is four times the size of the small one; so also is the square of the length of the large one four times that of the small one; the same with respect to the squares of their breadths and depths. Now, the displacement of the small one will be 8 cubic feet, and of the large, 64 cubic feet; the cube roots of these numbers are two and four respectively, and the squares of these cube roots are four and sixteen, the large one being four times that of the small one, the ratio of their midship sections. So that with vessels of similar forms of displacement, we may use either the midship section, the squares of any one of the linear dimensions, or the squares of the cube roots of their displacements, or, in other words, their displacement raised to the two-thirds power.

Hitherto we have taken no account of the speed of the vessels. For similar speeds the work of removing the water from the canal will be as the quantity; but for different speeds the work will be as the quantity, and also as the square of the velocity given to the water. Every body offers a resistance to being put in motion in proportion to the square of the velocity of that motion. This is clearly exemplified in the case of falling bodies. So that the work, and therefore the fuel necessary to generate the power to perform that work, will be as the midship section, and as the square of the velocity. Again, reverting to our canal. If a vessel go from port to port at twice the velocity, she will go in half the time; there will be four times the work to be done in half the time, therefore there must be eight times the power. If she go with three times the velocity, the work will be nine times, and the time to do it in will be one-third; the power must therefore be twenty-seven times. The work, and therefore the fuel between port and port, must be as the square of the velocity, and the power must be as the cube.

DISCOVERIES IN THE TEMPLE.

The *Critic* gives the following particulars of recent operations on a site replete with hallowed associations, the results of which, as may be seen, are, in one sense, to be deplored as partaking of vandalism, while in the other they must be regarded with interest as revealing a very important archæological discovery:—The demolition of Dr. Johnson's house and the adjacent houses on the west side of narrow Inner Temple-lane, and the erection in their place of a row of well-arranged suites of chambers, in external appearance bald and repulsive-looking, has lately been followed by similar demolition (sweeping away Goldsmith's house, No. 5), and new buildings on the eastern side, on the part of the Middle Temple, whose property they are. The houses now removed, completely concealed the north-west of the Temple Church, and some, in fact, actually abutted on it, one being built over the porch, and the way-farers had to go through an archway under it to pass from the lane into the Inner Temple. The demolition has revealed a portion of the church which had not seen the light of day for two or three centuries, and which had escaped the destructive hand of the restorer, viz., the western wheel-window of plate-tracery over the porch, three of the long, narrow, round-headed windows of the round, with the capitals remaining, but attached shafts gone; the original corbel-stones (at a lower level than in the restored portion of the church), and the original masonry of the whole of the north-west wall of the Round in a perfectly fresh state, though rough and seamy from the usage received by the builders of the now demolished adjacent houses. Striking and suggestive is the contrast presented by this solitary genuine fragment of the church with the spurious work of the restorers of 1827, who refaced the whole exterior then accessible to them with large blocks of Portland stone, and made the whole look as little like an Early English, or ancient church, as might be. This stone, by the way, is already, in parts, decayed, while the Godstone firestone of the twelfth century builders still remains—mutilated, but not decayed. Besides revealing an authentic buried portion of the original church in all the eloquence of its picturesque effect and honest construction, the demolition has thrown open to view, in all its naked deformitiy, what was built not to be seen of man—the paltry and abortive quasi-transept, and excrescence dating from the grand restoration of 1841, when it was built to receive the organ, &c. A side view of the master's house (a seventeenth-century building), to the east of the church, is also opened up. Much of the exterior of the porch is of brick, of the same date as the demolished houses; as also is the brick parapet at the lower part of the roof of the Round. The houses in Inner Temple-lane, next the church, and those forming the south side of what was Church-court, are not to be replaced. Those on the north side of Church-court (facing the church), and at the corner of Inner Temple-lane, are being replaced by a row of brick houses with stone dressings, in a kind of sublimated gin-palace style—that showy, bullying, vulgarly-pretentious one, essentially marked by brutal emptiness of all art and all feeling, which may rank as one of the styles of the day, the one that addresses itself to "practical men." The open space between the houses and the church is being lowered by the removal of accumulated earth, and will remain an open flagged terrace, borne on arches, as a safeguard against damp. The exposed roof of the porch has been protected by a temporary pent-house roof. We believe the benchers of the two inns have still to decide what to do with the newly-discovered exterior portion of the Round. Would that it could remain as it is! Every restoring touch will rob us of something of the real work of the twelfth century masons. But above all things, let the benchers beware of imitating the example set by their predecessors and Sir Robert Smirke in 1825-27, and substituting a casing of smooth stone for the mixed surface of rough wall-work and finished ashlar-work, which forms so great a charm in this fragment of the original structure.

[*] The Office and Cabin Companion. By J. Simon Holland, Assoc. I.N.A.

[†] This was written before the delivery of Mr. Scott Russell's recent lecture at the Institution of Naval Architects.—J. S. H.

THE NEW WATER PURIFIER.

Our attention has recently been called to a new water purifier manufactured by the Silicated Carbon Filter Company, Battersea, and as it comes before us with the recommendations of such men as Drs. Letheby, Lancaster, and others of high repute, and having been adopted by Government, and by the Metropolitan Free Drinking Fountains Association, we consider it deserving of notice at our hands. The invention is that of Mr. Dahlke, a German chemist, and consists of an intimate combination of carbon in its most effective form with silica in a highly comminuted state, as they exist in the celebrated Torbane Hill mineral. The compound is formed into blocks of any required size, through which the water percolates, and in so doing becomes purified. This purification is not merely mechanical, like that which is produced by the ordinary water-filters, but it is also chemical, for we have it in the evidence of undoubted authorities that water containing lead in solution is entirely deprived of any traces of that deleterious body when passed through this filter. The advantage of the new filter in this respect cannot well be overated. Upon the various organic impurities contained in water the filter also acts with an equally effective purifying power. Thus, we are told, that the nitrogeneous products, as ammonia, which is a sure indication of organic matter in a state of poisonous decomposition, becomes changed and rendered harmless by the oxidation which the filter induces. The quantity of organic matter with which the water supplied by town pumps is impregnated has been estimated to range from 1·5 grains per gallon to 8·8; the common salt from 2·7 to 25; the sulphate of lime from 2 to 29; the alkaline nitrates from 2·1 to 24·6; and the combined ammonia from 0·5 to 2 grains per gallon. "These results," as we read in Dr. Letheby's report in the *Times* of Friday, August 2nd, 1861, "shows that town pumps are not only charged with decaying organic matter, but also with the saline products of its oxidation: the ammonia, for instance being a sign of present putrefaction, and the alkaline nitrates of a past, besides which, the existence of so large a quantity of common salt is suggestive of the filthiest impurities, as, for example, the fluid matter discharged from the human body, and the percolations from cesspools and sewers. Most of such waters are bright and sparkling, and they have a cool and agreeable taste. They are therefore much sought after for drinking purposes; but the coolness of the beverage and the briskness of its appearance are dangerous facinations, for they are both derived from organic decay, the water being liable at any moment to become charged with the active agents of disease." The chemical influences of Mr. Dahlke's filters upon all these impurities being most decisive and certain, the extreme value of the invention, both in a sanitary and economical point of view will be at once apparent. By the prices at which the articles are sold, it is obvious that they are suited to the requirements of every portion of the community, and we believe they are already largely sought after.—*The Building News.*

Mr. D. K. Clarke, the author of the ablest and most comprehensive work on railway machinery yet published, has been appointed superintendent of fixed machinery in the building of the World's Fair, to be held in London in 1862.

MICHEL ANGELO'S MANUSCRIPTS.

We (*Athenæum*) hear from Florence that the sifting, arranging, and copying of Michel Angelo's manuscripts is nearly completed, and that their publication is near at hand. We speak of those manuscripts left three years ago to the town of Florence by Casimo Buonarotti, the Turean Minister, in which legacy was comprised the old family house of the Buonarroti, with all the objects of Art it contained, and a sum of money destined to keep a conservator of the Buonarroti Museum. The manuscript collection proved to be far more important and comprehensive than was at first anticipated; and with the help of it, the life of Michel Angelo will have to be written anew Since July, 1859, the Signor J. C. Casalucci, D. Gaetano Milanesi, director of the State archives, and Carlo Pini, inspector of the Museum, have been engaged in the arrangement, and are preparing for print, a selection of the papers. The number of Michel Angelo's letters is about 300; but far greater is that of the letters addressed to him, among which are found the names of many of the greatest artists and other celebrities of the time. Of the artists, we may name Bartolommeo Ammannati, Baccio d'Agnolo, Valerio Vicentino, Angelo Bronzino, Giuliano Bugiardini, Baccio da Montelupo, Sebastiano del Piombo, Il Rosse, Andrea and Jacopo Sansovino, Tribolo, Giovanni da Udine, Vasari and Francesco d'Olanda, the Portuguese miniature painter, whose interesting Memoirs on Art and artist life in Rome at the time of Paul III. were published by the Count Athanasius Raczynski, in his book, 'Les Arts en Portugal.' Among other celebrities of whom we find letters in the collection, are Francis the First, Cosimo I. de' Medici, Piero Sederini, Benedetto Varchi, Vittoria Colonna, Catherine of Medici and others. These documents throw light on many an unknown or half-known fact, on many a circumstance which neither Condivi nor Vasari could sufficiently explain; they help us to understand why some of Michel Angelo's grand projects were not, and some only partly, executed, as the Façade of San Lorenzo, the row of statues for the Chapel of Piccolomini at Siena, the sepulchre of Julius II., &c.; and they show the great artist, as man and citizen, in the brightest light. Moreover, they allow us a fair insight into the history of the art and artists of which Michel Angelo formed the centre, and to whom he was the readily-acknowledged and much-honoured oracle. No wonder that the publication of these documents should be eagerly expected. An obstacle to the printing lies in a condition of the testament, according to which neither manuscripts nor sketches were to be made public—a condition which will be submitted to the decision of the magistrates.

ROCKVILLE, COUNTY DUBLIN.

The *Agricultural Review* in a series of "horticultural sketches," notices this mansion, the seat of Thomas Bewley, Esq., and thus describes the minor orchard houses. The dimensions are as follows:—length, 60 feet; breadth, the same; height, 22 feet; the sides, roof, and one end are glazed; the roof is a ridge and furrow in three spans, double glazed, with an interspace of four inches, with Hartley's rough plate muffed to produce the necessary shade. We are under the impression that Mr. Bewley originally intended it to be a tropical orchard-house, the gutter beams of the valleys at first being simply supported by metal pillars, now by ingeniously-devised and admirably-constructed buttresses, with pointed arches springing from them, which serve to divide it into centre and side aisles, and give it the appearance of the interior of some crumbling fane, or "minister of old time;" an impression further conveyed by the vegetation which appears to grow so naturally from the apparently mouldering joints of the stonework. The subdued light, the agreeable and soothing temperature, and an atmosphere peculiarly quiet and still, produce a calm quite in keeping with the idea. The entire breadth at the extreme end is taken up by an ingeniously constructed mass or curtain of rockwork, which, besides its speciality, serves to conceal numerous caves, crannies, and passes, well adapted for the growth of plants that affect such habitats. Advantage is also taken of it to form an easy ascent, quite in character, by which the visitor can obtain an elevation from which a charming *coup d'œil* of the whole is obtained. In the construction of the stone and rockwork, the following materials are used:—For the first, Ballycorus clay slate; for the second, coarse red granite, quartz, sandstone, conglomerate, and tufa. There is no jumbling of these; each is kept separate, and due regard taken to adapt the plants selected so as to suit their growth, and produce the most pleasing effect. A broad shelf at present runs round the sides and one end, which, as well as the color with which it and the interior are picked out, were done when the house was destined for another purpose. Being rathe incongruous, and not in keeping with its present character, M Bewley purposes removing the former, replacing it with rockwor and coloring the roof with more sombre and suitable tints, w h will add greatly to the effect.

WHAT AMERICAN MACHINERY HAS DONE FOR ENGLAND.

THE Hoe printing press, the machinery for making Enfield rifles, sewing machines, Colt's revolvers, Silver's marine governor, reaping machines, and now Thompson's boat machinery, are American inventions. Lynn now undertakes to supply England with boots and shoes at about half English prices, all made by machinery. Clocks are turned out at the rate of thousands a day, and for sale at half a crown or less, and no mean piece of household furniture at that, are all done by machinery. Chairs, and all kinds of cabinet furniture, which are wrought out by the daily toil of the hand, are turned out in the States with the whiz of the sawing, boring, planing, and shaping machinery; a large variety of iron wares, such as locks, &c.—formerly bought of England at hand labor prices—are now made by machinery infinitely superior for the purposes intended, and at much lower prices. Pianos, by far the most elegant and best in the world, are made wholly, from the elaborate carving outside to the completion of the musical arrangements within, by machinery, and for comparative qualities at about one-half of the prices in England, where nearly all portions, even in the largest establishments, are made by hand, with old fashioned legs, and cup castors, too, that look in modern times as if trousers were needed to cover their naked feet; in short, machinery for an endless variety of manufacturing purposes abounds in the United States to an extent not suspected in England.

STREET ARCHITECTURE, AND ITS PROPER TREATMENT.[*]

AMONG the distinguishing features of our age, none more plainly marks the progress of that phase of civilization which has respect to mental accomplishment rather than physical utilities, than the increased appreciation of art which is spreading among all classes of our countrymen. It is now perceived, not by select artistic circles alone, but by the great mass of those who represent the opinions of the nation, that while art yields enjoyment pure and holy, eminently fitted for the relaxation of our minds, it has further power to civilize, elevate, and, in a high sense, educate mankind. Hence, within the last few years many museums and schools for its study have been formed, and so much encouragement has been given to it in various ways, that few need be entirely ignorant of its history or unconscious of its more subtile beauties. What a subject of joy ought this to be to those directly concerned in the work of the fine arts; how necessarily must the interest of a nation impart to them renewed vigor, and cause them earnestly to strive and satisfy its artistic demands. And, as of the three sisters, architecture feels most plainly the effects of this revival, and the course of a few years having so changed the estimation in which she is held, that while formerly she was thought of but by few, now but few are willing to be ignorant of her doings, so architects are particularly called on to preserve and encourage this interest, and to be ever forward to use their utmost abilities for the advancement of their noble art.

Actuated by some such motive as this, and perceiving the desire deeply felt and strongly expressed by all who value art for an improvement in the architecture of our streets, the Architectural Association has offered a prize for an essay to be composed by its members, and has fixed the subject as "Street Architecture and its Proper Treatment." In reply to this offer I beg to submit the following, hardly so much with the idea of saying that which shall be new and original, as of setting forth in order some of those opinions which are more or less prevalent in the profession; and while the faint hope that the prize may fall to my lot is doubtless the motive power which causes the making of this attempt, it is rather to the mental culture obtainable from the study and thought requisite for the production of such an essay that I look for the reward of my labour.

Necessity of Improvement in our Street Architecture.—That there is need of improvement in street architecture requires no proof to any who look on the but slightly relieved ugliness of our towns; nor is the reasonableness of the demand less apparent, when we consider how few have time to spend in galleries of art, or in seeking out the renowned works of architecture. Surely it is a duty to bring beauty into contact with man's daily toil, that his mind may experience and be relieved by its mollifying influence.

Deficiencies of Former Art.—To trace out the steps whereby architecture lost the universal sway it once possessed, would introduce us to many variations in the national mind, and would require an historical treatise. One consideration, however, presses itself forward in our endeavour to account for the fact, that so many of our domestic buildings exhibit a total absence of art—Architecture became impliable, and refused to bend itself to the ordinary requirements of common life, chiefly owing to the curbing of originality by a system of copyism, which sought more to introduce certain acknowledged forms, than to erect noble and consistent structures, suited for and expressive of the ends for which they were intended. Architecture was too academical, and was considered too much the property of the initiated few; it was a thing to be learned, and the points dwelt most upon by its professors could not be appreciated without a minute knowledge of its fixed proportions, for which the mass of Englishmen cared nothing; who having therefore no sympathy with architecture, gave a careless and apathetic consent to its introduction into public buildings, but were willing to spend neither money nor attention that it might adorn their private structures.

Some may still possibly imagine art to be too high and too grand a thing to be found in the common-place houses of our streets; or that if high art were widely diffused over all buildings, we should be without foils to show off in favorable light our more pretending edifices; but a consideration of the universal care which nature has betowed on all her works, will answer both these objections. The lofty mountain, grand by its very barrenness, has charms no less real than the apparently more favored valley at its foot; however minute and comparatively insignificant her work, it loses not its elaborate finish; and she obtains her foils, by changing one kind of beauty for another, not by giving over everything to neglect or contempt. Let architects now, therefore, strive to make their art capable of ennobling the smallest matters as well as the most sublime, that it may everywhere be present, and be felt and appreciated by all; for only such art as this can rise to true and venerated greatness; and that experience which is obtainable in common things, will alone enable us to use with telling effect those magnificent opportunities which are but seldom presented to us. Let the rules which our art acknowledges, be those of reason and artistic morality, and its aim be after appropriateness, expression, and beauty, and ere long it will succeed in still more arousing the love and interest of the community. It is true all buildings cannot be equally elaborate or beautiful, but every building may be so suited to its purpose in reality and appearance, and may embrace so much of beauty, to be incapable of being surpassed in the proportion of art which it embodies.

Artistic Improvements of Towns possible.—Lest the present lamentable state of our towns should discourage us, or lead us to imagine that beauty can never reign in them, we may remember how, when we are wandering through a lovely country, the discovery of a quiet village heightens much the pleasure which we feel. The contemplation of man lends a fresh charm to the beauties which surround us; why, then, should not those spots where men most congregate have a power over us peculiarly their own? True, the direct work of the Almighty is less visible in our towns, but there, man His noblest work, is largely seen in all his strange developments, which, if our towns did but contain more that is lovely or beautiful, might be found to compensate us for the fact that it was produced by human agents, not by the Great Architect himself.

Position of Architects.—By the general consent of all, architects are naturally expected to be the principals in forwarding the reforms which are so eminently needed in our street architecture, and on them the duty necessarily devolves; but before they can possibly carry into effect any modes of treatment they may deem advisable, it is positively requisite that they should regain the position which at the present time they most assuredly do not occupy, of being the chief directors in the erection of the mass of the buildings which line our streets. How comparatively few of the newly built houses in the old parts of our cities tell of the artist's labor, while whole acres of land around our growing towns are yearly covered without any arcihtect being consulted. If this continues, architects are manifestly powerless. Their prime duty, therefore, is to regain their proper position by all the fair means within their power, particularly by rendering plainly superior those works with which they are connected, and by endeavouring to educate the public mind that it may be sensible of the absence of art and appreciation of its beauties when presented to it.

Characteristics of Buildings in Towns.—Whatever may be the character of its architecture, there is never any room to doubt when we are in a town; the bustle of people and vehicles, and the continuous rows of shops and houses give at once a distinctive appearance to the scene. But architecture does very much towards the division of towns into lively or dull, noble or despicable, clean or dirty, interesting or the contrary. While, therefore, it is needless to take any steps to mark towns as such, it is very necessary that our erections in them may help to place them on the desirable side in these comparisons.

The different circumstances in which they are placed, and particularly the necessity of using the least possible space of ground, will, of course, render very different the treatment of civic and rural buildings.

(To be continued.)

COMPETITION.—Plans are required for altering the first Presbyterian Church, Derry, and a premium of £20 is offered. Time limited to 14th December.

---

[*] Prize Essay, by Mr. Lacy W. Ridge. Read before the Architectural Association, London.

MR. TITE'S PRESIDENTIAL ADDRESS ON CURRENT TOPICS.*

On a similar occasion to the present, two years ago, you did me the honour to invite me to read an opening address, on the occasion of the inauguration of these apartments as our resting-place. On that occasion I endeavoured to bring before you a general review of the state of architecture at that time in Europe, and of its probable future prospects. The interval is not long, but it is marked with important incidents, whether relating to ourselves or the world of art in general. We have lost a noble and beneficent patron and president; and, on the other hand, some of the incidents and considerations which have occurred relating to art in general, and architecture in particular, are most important. These considerations induce me to believe that in my character as president you will allow me this opportunity of suggesting to you such views as occur to me having reference to the past, and such notice of the circumstances which are now occurring as I trust may be interesting and useful to us in our profession.

As to the first, one's mind naturally recurs to the personal or professional losses we have to record. At the close of this paper I propose to refer to the deaths more specifically; and therefore at present I proceed to notice topics of immediate interest; and first, that which assumes the greatest importance at the present moment—THE GREAT EXPOSITION OF 1862. In some concluding remarks I made towards the close of last session, I referred to the position allotted in our modern society to our profession; and this appears to be marked, even in reference to the Exposition of 1862. On the occasion of the first Exposition, as you may remember, the design proposed by a committee of architects for the building was set aside, and a design happily suggested by Sir Joseph Paxton was adopted in its stead. The services of the members of this institute were, however, but slightly resorted to; and the superintendence of the working details of the building was entrusted to a member of the newly recognized branch of our profession, a civil engineer. On the present occasion, also, the claims of British architects, to co-operate in the design of a building which ought essentially to represent the state of the art amongst us at the present day, have been ignored; and foreigners are thus likely to form their opinions as to the merits of English architects from the production of a military engineer. I do not propose to criticise the designs of either of the Exposition buildings, notwithstanding the numerous lessons of "what to avoid" they both furnish. But, in the name of this institute, I think it my duty to protest against the OFFICIAL EXCLUSION OF ARCHITECTS from the councils of those who assume to represent the taste of the nation in the various branches of art.

Unfortunately it would seem that the public in general participates in the species of disfavour which this exclusion of recognized architects from the councils of the past and future Expositions may be considered to indicate; and the cheers with which vulgar unreasoning abuse of our profession is almost always received, ought to inspire us with serious anxiety. I believe, from the bottom of my heart, that the accusations brought against us as a body are essentially false,—that architects generally are honourable, conscientious men; hard students, earnest thinkers, and bringing to bear upon their professional duties such an amount of varied information, practised skill, educated talent, and high-minded integrity, as would in any other profession ensure a far greater share of wealth and distinction than we usually attain. Feeling very strongly as I do on this question, it is to me the more painful to observe the existence of an opinion precisely opposed to my own, in those who might be supposed to have known us intimately; as when such men as the Under Secretary of State for Foreign Affairs did not hesitate to state in Parliament, in the debate on the British Museum, that he advocated the plan proposed by Mr. Oldfield, because it was not prepared by a professional architect, and that the great success of the great reading-room was due to the fact that in that case "the trustees were not trammelled by an architect; and, further, when in a crowded House these opinions met with considerable applause. Again, look at Mr. Layard's remarks in the debate on the Foreign Office, in which we are spoken of most disparagingly. And this being so, I am forced to ask myself whether these things can be true. They say that "there can be no smoke without fire;" and it behoves us therefore to see that whatever fire may exist to cause the smoke now obscuring our fame, it is our duty to trample it out.

DISTINCTION BETWEEN ENGINEERING AND ARCHITECTURAL PURSUITS.

Again, I cannot but regret to observe the almost unanimous recognition of the distinction lately established between the pursuits of engineering and of architecture; because I am convinced that both of them would gain by being studied and practised simultaneously. In former time, and, indeed, until the establishment of the "Corps Royal des Ingénieurs des Ponts et Chaussées," in the middle of last century, no such distinction was admitted. Sir C. Wren and Mansard were both architects and engineers. Perronet called himself "Architecte du Roi." Robert Mylne called himself architect and engineer. Telford began his public career by building a church. It was the development of the canal system which first led to the separation of engineers and architects amongst ourselves; and to some extent this may be explained; for the pursuits of the architect lead his studies rather towards the condition of statical than of dynamical forces, whilst the canal and dock engineer has to deal very frequently with the latter. But in the execution of roads, railways, and such works, there are no conditions which ought to be beyond the sphere of an architect's knowledge; and I very strongly suspect that, if architects had been more frequently employed on railway works, our marvellous net-work of rails would have been constructed at less cost than it actually has involved, and that we should not have heard of so many accidents from "striking centres too soon," or from "the rain washing the mortar out of the arches." It is true that the construction of railways does not afford many opportunities for the exercise of the artistic faculty, the noblest one the architect is called upon to employ. It is a kind of work which requires more of science than of art. But our profession ought above all others to present the union of the art and science; and he is a bad architect, in the true sense of the word, who is incapable of becoming "the best workman" in any of the branches of what I may be allowed to call *statical* construction. I dwell upon this subject because it seems to me that much of the favour with which civil and military engineers are now regarded, and that their employment to the exclusion of architects, in the cases of the Exposition buildings, may be explained by the mistaken opinions which prevail with respect to the pursuits and the abilities of the latter. Not to travel beyond the names I have before noticed, I may be allowed to observe that the engineering works of Mr. Hosking upon the West London Railway may well compare with the architectural achievements of Sir William Cubitt in the first Crystal Palace. Be this as it may, it behoves us at least to render ourselves capable of discharging the ordinary duties of engineers and architects. Hydraulic engineering may require a different mental training, and a course of study of a different character, to that required for building in the open air; but it is absurd to suppose that the man who can build a church could not build a bridge or a viaduct, or that he should be unable to conduct great earth-works or tunnels.

THE FLORENCE EXPOSITION BUILDING.

Before leaving the subject of the Exposition buildings, I cannot refrain from saying that the design, given in the *Builder*, of the Florence Exposition, strikes me as containing far more artistic merit, and as presenting a more satisfactory architectural character than the published design of the proposed building of South Kensington; no doubt because in this instance, as in the instance of the construction of the Palais de l'Industrie of Paris, educated architects were consulted. Passing over this part of the subject, however, I am sure that all my hearers will agree with me in the expression of the deep sympathy excited by the first Italian Exposition. These industrial gatherings have assumed, of late years, a deeper moral significance than could possibly have entered into the philosophy of their founders; and they have become the occasions for eliciting the expression of the most recondite forms of national thought and feeling. An Italian Exposition, held in the city of Giotto, Dante, Michel Angelo, and the Medici, becomes, therefore, the matter for serious reflection to those who wish that in truth Italy should cease to be "a geographical expression" And we, whether admirers of the Broletti and of the town-halls of the Mediæval republics, or of the palazzi, cassine, or churches of the *risorgimento*, must turn an anxious gaze on the first steps of the noble Italian race, in the political risorgimento which is at present taking place in that land, so long cursed with what all considered "the fatal gift of beauty." Our sympathies may be of small import to the Italians in the struggle they have still to go through before they can establish a strong nationality, such as the "advanced civilization" of the age requires; but I am sure that an assembly of architects will unanimously join in the expression of good will towords the Italian cause. May the Exposition of Florence prove the harbinger of the full glory of bright days for Italy.

THE ANTWERP CONGRESS.

The artistic Congress of Antwerp, too fussy and unpractical though it may seem to have been, contains the germs of an organization which may, perhaps, produce for art consequences as important as those produced by our "Association for the Advancement of Science" in its particular sphere. In these days of architectural and artistic eclectism, it would manifestly be advantageous for the student to be able to study, with his own eyes, every local manifestation of æsthetical feeling; for the subtle influences of climate, and political and municipal organization, can never be appreciated unless we have the means of watching their daily operation; and few learned treatises on the art-history of nations enable us to appreciate the nature and extent of the action and re-action of building, or of plastic materials on the visible expression of art. The amount of good to be effected by these gatherings must depend on the manner in which they are conducted. As an isolated experiment, the Antwerp Congress was very successful. It were a marvellous pity that it should remain an isolated experiment.

PARIS.

Whilst thus alluding to foreign operations, it may be as well to continue our attempts to derive lessons from them, before turning to more decidedly local considerations; and I would therefore strive to point the moral of some other tales to be read in the proceedings of our immediate neighbours. Thus, all travellers who return from Paris are, upon a superficial view of what is taking place there, and it must be added in almost every important town of France, disposed to find fault with the comparatively slow rate at which improvements are effected in London. Within ten years Paris has been, in fact, remodelled throughout; and broad streets, open squares, and fine houses, have replaced the ancient, narrow, tortuous assemblages of dens of filth and impurity. It is to be feared, however, that the real sanitary improvement of Paris has gained little by these changes; and, indeed, so long as the water-supply and the sewerage of that town are conducted on the present systems, little effect can be produced on that infallible test of the value of the sanitary arrangements of a town—*the average death-rate.* I advise those who believe that "they manage all these things better in France" than we do here, to visit the "Intake" of the Chaillot Water-works; or, to ponder over the charge he will have to pay, even in a private lodging for that necessity of an Englishman's life, the daily hip-bath. Nor is this all: for they who knew much of Paris life in former times, must be painfully convinced that the embellishments of the town have resolved themselves into heavy charges on its inhabitants; whilst the utility of many of the costly works now in hand must seem more than questionable. House-rents have risen to fabulous heights in Paris: the poor are driven from their old haunts, and no refuge is provided for them; whilst, unfortunately, the sanitary defects of the old houses are servilely reproduced in the new ones. But, however painfully these defects may strike us on second and calmer thoughts, it cannot be denied that there is something fairy-like in the rapidity and the brilliance of the change actually produced; and we naturally inquire by what financial agency it has been produced. My friend Mr. G. R. Burnell has made some inquiries into this matter, which I hope that he will be able to communicate to you in the course of the session; but, in the mean time, I may say that the impression I have derived from what he has told me is, that the improvements of Paris have been effected upon principles of political economy, and by dint of an abuse of public credit, which would never be tolerated in this country. We hold that local improvements should be paid for by local contributions, and that building speculations should not be assisted by financial corporations, patronized, if not directly managed, by the Government. The opposite principles prevail amongst our neighbours; and, sooner or later, it is to be feared, that they must produce, even if they are not now producing, sad confusion in the finances of the State.

One matter of detail may be worth especial notice from us—viz, the conditions under which the municipality is now able to obtain land for the purpose of effecting any new works declared to be "*d'utilité publique.*" Until 1852 the municipality, under the old law of expropriation, could only take compulsorily the land absolutely required for the establishment of the streets; and the proprietors of the land partially affected were entitled to retain the remainders of their property, with all the increased value conferred by the new frontages. At the very close of the dictatorial power assumed by the Emperor in 1851, a decree "having force of law," was issued however, by which municipal bodies charged with the execution of works of public utility were empowered to take an additional width of land beyond the lines of the intended streets, sufficient to allow the construction of good houses. The effect of this law has been that the municipalities of France have lately been enabled to sell the frontages on the new leading thoroughfares they open at advantageous terms; and thus, at the expense of the landed proprietors disturbed, materially to diminish the cost of the works. If the latter had been discussed by a really representative body, there could be little reason to regard the advantages thus given with jealousy; but, when the works to be executed are simply prescribed by the Central Government, it is to be feared that great abuses may arise from the interference with the rights of private property it may be made to cover.

THE ARTESIAN WELL OF PASSY.

The success of this experiment is a subject of great interest to all who are called upon to deal with the supply of water to detached mansions, or even to small towns; and to us Englishmen it is the more interesting on account of the recent failures to establish similar wells at Highgate, Harwich, as well as at Calais and at Ostend. The boring at Passy, after passing through the same beds as had previously been traversed at Grenelle, reached the water-bearing stratum at a depth of 1,797 feet 6 inches from the surface, and the water rose to a height of 18 feet from the ground. The lower diameter of the well is about 2 feet 4 inches; and the quantity of water it delivers has, after some oscillations, settled to about 3,791,000 gallons per twenty-four hours. At present, the sand and clay brought up by the water are in such proportions that the water is not fit for use,—a fact which was also observed at Grenelle during the first year after the completion of the boring: the water rises at about 82 degs. Fahren. One effect of this well has been to diminish notably the yield of the Grenelle well; and it must, therefore, for some time to come remain an open question, as to whether or not the water-bearing stratum under Paris will be able permanently to maintain these two springs. The discussion of the failure of the attempts to obtain water in a similar manner, to which I have above referred, would extend to so great a length, that I must pass it over slightly at present; but the great lesson to be learned from it seems to me to be, that at the present day our acquaintance with the laws of geology is only sufficiently advanced to enable us to say with certainty what we shall *not* find beneath the surface, in districts which have not been exposed to violent subterranean disturbances: they are utterly incapable of telling us what we *shall* find. At London, Harwich, Calais, and Ostend, the lowest member of the subcretaceous formations, from which the wells of Passy and Grenelle derive their supply, is entirely wanting.

THE LAWS OF METALLURGY.

A very warm and rather acrimonious discussion is now being waged amongst chemists and experimental observers on this subject with respect to the differences between iron and steel; and the names of Binks, Mushet, Bessemer, Frémy, and Caron, add weight and authority to the various opinions propounded thereon. "*Non nostrum inter eos tantas componere lites;*" and Messrs Frémy and Caron may well be left to settle the precise amount of influence exercised by the nitrogen, cyanogen, and carbon, present during the cementation of steel upon the resulting product. The influence these researches may exercise upon the building arts may, however, be very great; and the production of steel by the new methods suggested by an improvement in the theory of the production of steel may possibly place within our reach a material possessed of far more elastic properties than either cast or wrought iron. We must therefore follow with interest the steps of this inquiry, and hold ourselves ready to adopt any improvement it may place at our command. I would make the same remark with respect to the recent applications of electricity to the ordinary purposes of life; and I would urge the members of our Institution to avail themselves, whenever it is possible, of the great domestic conveniences that wonderful agent is able to supply. We in England are behind our French neighbours in this respect.

FIRES.

In domestic matters the most important lesson to be derived from the events of the last twelve months is, perhaps, the one connected with the terrible fires in the river side warehouses. In a city so essentially commercial as London, it must always be desirable to interfere as little as possible with the arrangements or the operations of trade; and we must always bear in mind the fact that every interference of this kind resolves itself ultimately into a tax upon the articles affected. But the terrible effects of a fire when it once bursts out in large stores of merchandise of certain descriptions are such, and are likely to reach so many persons, that it would almost seem necessary to impose some rigorous limitations to the quantity of these goods, or some stringent regulations as to the construction and management of the warehouses wherein they are stored, if these warehouses are to remain in the centre of the town. All systems of so-called fire-proof construction are useless to resist the effects of the heat evolved during the combustion of large masses of certain kinds of goods; and it even seems that the very precautions taken to ensure the non-combustion of walls, floors, and ceilings, only adds to the intensity of fires in such cases, by turning the buildings as it were into species of closed retorts, able to produce a destructive distillation. The only efficient protections against the spread of large warehouse fires seem to me to consist, first, in limiting the size of the warehouses themselves; and, secondly, in isolating them effectually if the goods they are to hold should be susceptible of easy combustion. Whatever sacrifices these precautions may entail, they ought to be borne for the sake of the public in general.

It may be as well here to mention, that in the course of the spring (9th of April last) the theatre of Barcelona was burnt to the ground; so that warehouses are far from being the only structures exposed to this terrible scourge.

RESTORATION OF CATHEDRALS AND CHURCHES.

There is reason to congratulate the country at large, as well as the lovers of our national archæology, on the zeal with which the good work of preserving and restoring our cathedrals has been lately carried on. In the metropolis, the Temple Church is again undergoing repairs under the directions of our excellent member, Professor Sydney Smirke; and Westminster Abbey is in the eminently judicious care of our friend Mr. G. G. Scott. In the provinces, the cathedrals of Ely, Lichfield, Ripon, Chichester, the churches of Waltham Cross, Islip, Taunton, and numerous other relics of former times are being restored; and though, in the case of Chichester, a lamentable accident has occurred, I hope that the efforts to ensure the re-edification of the spire will be successful.

IMPROVEMENT OF THE PUBLIC TASTE.

In more modern constructions I think we may congratulate oursaves as a body on the improvement which is manifestly taking place in public taste, and on the skill with which the members of our profession have availed themselves of the opportunities afforded them of displaying their knowledge and talent. Art questions are now fortunately discussed on all sides; and a truer, sounder tone of criticism prevails amongst us as a nation than at any former period; and from the fact of our enjoying true liberty of thought and action, I suspect that I may add, than can prevail amongst the despotically administered nations of the Continent. It is our special duty, as architects, to avail ourselves to the utmost of these advantages; and to devote our best energies to the advancement of our noble art. This can only be done by earnest, conscientious study, by devotion to our pursuit, and by an enlightened investigation of the various physical and moral laws it brings into play. Architecture is, as I have said before, an art as well as a science. Excellence in it cannot be obtained without labour, or without the sacrifice of ease. We must resolve, if we would attain in its ranks to that "Fame," the last infirmity of noble minds, "to scorn delights and live laborious days;" but the "fair guerdon" we hope to find will amply repay us; for art is its own reward, and its cultivation will at all times compensate for the toil and time expended in its pursuit.

DEATH IN THE RANKS.

In the course of the twelve months which have elapsed since the last annual inauguration of our meetings, death has by no means spared the ranks of those who have been interested in, or who have indirectly assisted, our pursuits. A short notice of the more distinguished of those persons may, perhaps, suggest to many lessons of deep significance, both morally and artistically, and I hope, therefore, you will bear with me whilst I pay the following short tribute to the memories of our late fellow workers.

The losses of our profession, this year, have been of a threefold character; we have lost coadjutors in the more recondite branches of archæology, in the more abstruse branches of mechanical, chemical, and physical sciences, and from amongst our own immediate ranks. Amongst the former may be cited the names of Baron Bunsen, of the Earl of Aberdeen, and of Sir Francis Palgrave; in the ranks of scientific men connected directly or indirectly with our studies we miss such men as Wertheim, Vicat, Sir William Pasley, Eaton, Hodgkinson, Berthier, and Sir William Cubitt; whilst, amongst our own colleagues, we have to regret the loss of Professor Hosking, Mr. John Clayton, Mr. Henry Austin, our late esteemed solicitor and valued friend, Mr. W. L. Donaldson, Mr. George Bailey, and Mr. Robert Grainger, of Newcastle.

After giving a short biographical sketch of each of the above named, the president concluded by stating of the late Mr. Donaldson, Honorary Solicitor to the Institute, that he had at all times so identified himself with the interests of the Institute, and had displayed so much talent, energy, and disinterestedness in advancing its prosperity in all matters which entered into his province, he feared they shall never be able to supply his loss. The tribute of respect that can be offered to his memory, is feared but a feeble consolation to those who mourn his loss, but in the sincerest and most earnest manner did he beg to express, in the name of the whole body of the Institute, the feelings of grief and of sympathy for the loss sustained.

"All heads must come
To the cold tomb;
But still the actions of the just
Smell sweet, and blossom in the dust."

The president, having resumed his seat, again rose, and said there were two or three other cases worthy of notice, one was the death of Mr. Thomas Finden, who died at the age of 77, was a partner of Mr. Lewis, and surveyor of Hoare's brewery; the death of Mr. Woodward, the architect of the Oxford Museum, of the firm of Dean and Woodward, and who died of consumption; and the death of Zwirner, the architect for the restoration of Cologne Cathedral.

RINGING BELLS BY ELECTRICITY.

The chairman proceeded to observe that there was a mode of ringing bells by electricity, so that in a short time a gentleman having an office in the city could carry on communications between his office and his residence, even if some miles distant. There were in the room bells to explain the system, which would probably be referred to more at length before the meeting broke up.

ART SCHOOLS, ROYAL HIBERNIAN ACADEMY.

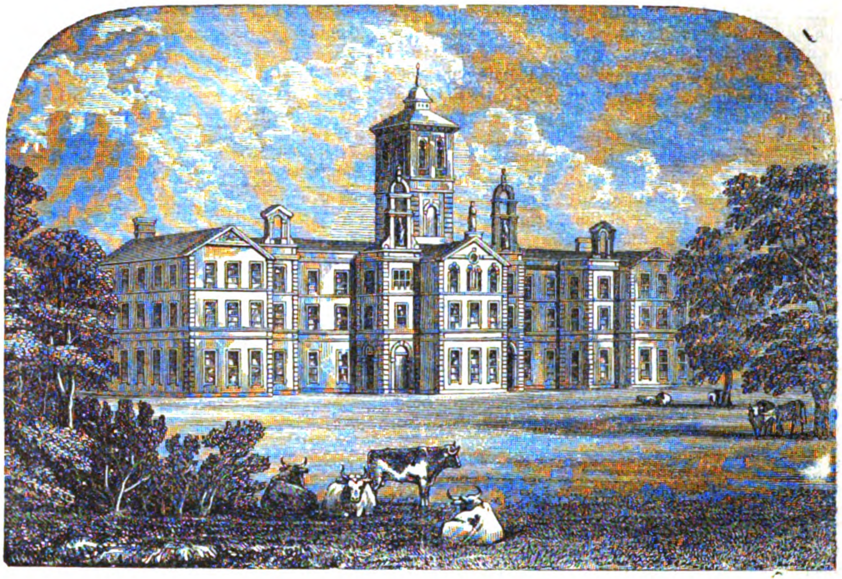
ONE of the changes consequent on the recent enquiry by Mr. M'Leod, Royal Commissioner, into the general state and management of this Institution, was the total reconstruction of the system of admission into its schools of art; and on Monday evening last the winter session opened under the new auspices which we may briefly describe thus in the words of the professor of painting, Mr. H. M'Manus, who delivered the opening lecture:—"Students, to qualify for admission to the schools must in future graduate in the drawing schools of the Royal Dublin Society; they must have passed in the four papers of free-hand, geometry, perspective, and object drawing of the second grade, and produce the certificate from the department of science and art." The lecturer remarked that "this new career of art education was more in accordance with the time;" that "the questions are few, and the papers to be filled by no means difficult, but are yet sufficient to show if the student understands the matter." Adding that "many persons go through this course of primary art instruction without having the least idea of becoming artists, and, therefore, to require those who intend to practise art as a profession to go through a similar course of study cannot be objected to; but the presenting of a drawing by the student to show qualification for entrance to the academy's schools, is not in any way superseded by this requirement, and remains as before."

The following is the programme for the session:—"The hours of attendance will be for study from the living model from seven to nine o'clock every evening in the week, except Saturday. One of the academicans appointed to act as visitors will attend each evening to superintend the studies of the students. The attendance in the school of painting will be from twelve to three o'clock daily, except Saturdays, and the appointed visitors will attend from time to time during the week. The school of the antique, under the superintendence of the keeper, will be open each day, except Saturday, from eleven to three o'clock. In October there will be an exhibition of the works of the students in their various schools, and inspectors from the Department of Science and Art will examine the works, and in conjunction with the president and keeper, will award medals. Lectures will be delivered by the professors—as the council shall require—and for the most part will be delivered upon Saturday evenings, and on those evenings in which there shall not be lectures the library of the academy, under the supervision of the keeper, will be open, which contains many valuable works upon art."

When Mr. M'Manus had concluded his valuable address, in the course of which "he dwelt at much length upon the various branches and modes of study, the necessity of a knowledge of anatomy, and, above all, of a careful study of the antique, the proportion and balance of the figures delineated, and the practice of drawing, instead of painting, from the living model, and from the round; also pointed out the absolute necessity of regular attendance, the observing of order and gentlemanly bearing both in and out of the academy, and concluded by announcing that he intended shortly to deliver lectures upon the true proportions of the human form, and the proper balance of figures," Mr. Sharpe remarked that "he thought the necessity of primary education had been overlooked, and that the academy could not be considered a complete or effective institution unless elementary instruction in art was given inside the academy, instead of trusting to another society to afford it, and that nothing in their character prevented it."

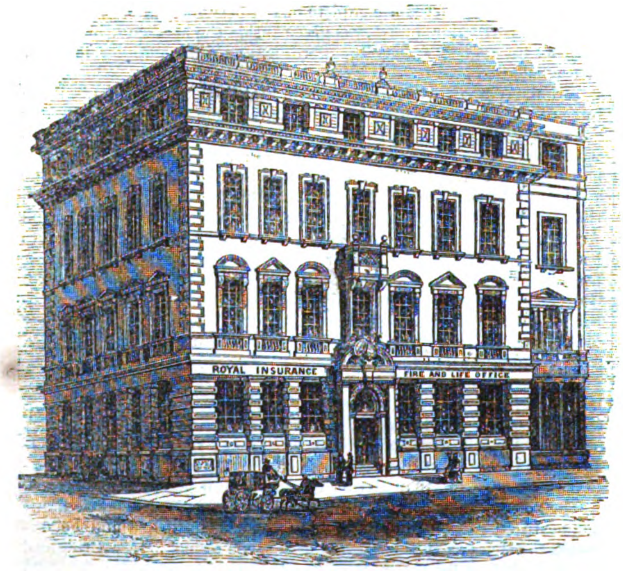
Mr. M. Angelo Hayes, in reply, said that their bye-laws had all the force of the charter—that the same source from which their charter emanated, viz., the government, had also given them their laws which had been most carefully revised; and these laws expressly laid it down that students only be admitted to the schools of the academy who had already passed through the preliminary course in the drawing schools connected with the Department of Science and Art; that it was obvious the government intended the academy to become, so to say, an Art University for those who purposed studying fine art, in contradistinction to the schools of the Royal Dublin Society, which were for the study of ornamental art. It appeared to the academy that those gentlemen who had been up to this new arrangement of studying in their schools, ought not to be precluded from competition for the medals to be awarded. Mr. Crowe, the government inspector, during his late visit to the academy, had led them to expect that the Department of Science and Art would give this matter due consideration, and the matter was being negociated. Mr. Hayes said he had no doubt so reasonable a request would be conceded, for the greatest anxiety was evinced to give every help and facility to the academy in rendering their school efficient and prosperous.

The keeper (and chairman of the evening) Mr. Kendrick, announced that the students in the living model school would be expected to attend on the next evening at seven o'clock. Mr. Bridgford being the visitor for the week—the other visitors were Mr. Thomas Farrell, Mr. Edward Hayes, and Mr. George Sharpe, who would attend in succession. The visitors to the Painting School were Mr. Brocas, Mr. Duffy, Mr. MacManus, and himself (Mr. Kendrick). In the Painting School the draped model and the copying of works would be on alternate weeks, copying of works would be on alternate weeks, commencing with the draped model. Mr. Brocas visitor. Amongst the members present were—Thomas Bridgeford, George Sharpe, Edward Hayes, M. H. Stapleton, the professor of anatomy; P. V. Duffy, Wm. Brocas, B. Mulrenin, M. Kendrick, keeper; J. Falkner, M. Angelo Hayes, secretary; Terence Farrell, J. J. M'Carthy, J. R. Marquis, General Colomb, H.R.H.A.; Thomas Farrell, professor of sculpture; H. MacManus, professor of painting; Patrick Byrne, B. Watkins, W. Osborne, Charles Nicholls, Esqrs., &c.

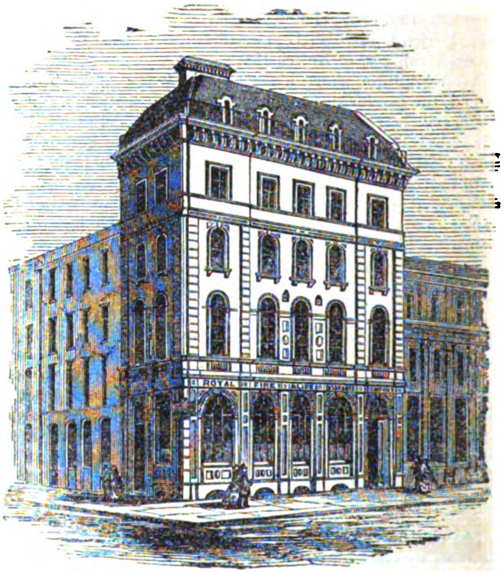


SAINT VINCENT DE PAUL MALE ORPHANAGE, GLASNEVIN.—MR. J. S. BUTLER, ARCHITECT.

WE are enabled to include herein a small view of the buildings—portion of which have been recently constructed—at Glasnevin for the Society of St. Vincent de Paul, and designed, when completed, to accommodate some 120 boys. The style of the exterior, though of plain character, and presenting a calp stone body with granite dressings, displays some novel features, and is effective and appropriate. The internal arrangements are comprehensive, and adapted to their intended purposes, the whole reflecting credit on the architect, Mr. J. S. Butler. Without sectarian identification, which it is always our especial care to avoid, we may observe, that the mission of this society is pre-eminently laudable, and moreover appreciated by the members of all persuasions; and uniting in same, we desire, by insertion of the illustration and this notice, to contribute to its service. A more precise description of the building appeared in a former No.



(LIVERPOOL OFFICE.)



(LONDON OFFICE.)

THE ROYAL INSURANCE COMPANY'S OFFICES, LIVERPOOL AND LONDON.

WE give two minor illustrations of the buildings in which the Royal Insurance Company have their respective offices in Liverpool and London—the former of which we understand is the "head" establishment. Although the scale of the illustrations is smaller than might be desirable to develop their features—a circumstance over which we had no control, as the blocks were supplied—it will be observed that each is distinguished for imposing appearance and architectural excellence, and we heartily wish that the directors of this most successful, liberal, and enterprising company would be induced to establish their Dublin branch agency—which is now twofold, viz., for the north of Ireland, at 49, Dame-street, J. Gore Shields, Esq., local manager; and for the south, at 45, Dame-street, J. R. Curry, Esq., local manager—in as pretentious a structure as either. Just at present insurance companies generally are bestirring themselves to the pursuit of business in Ireland very much more than heretofore—a palpable evidence both of growing appreciation of the system and of international intercourse—and very recently we announced the commencement of some important buildings by a certain few for their local establishments; it may not be unreasonable, therefore, to assume that sooner or later, and in proportion to the ratio of encouragement afforded, "THE ROYAL" will follow in their wake.

LORD TALBOT DE MALAHIDE.

LORD TALBOT DE MALAHIDE.

We deviate somewhat from our previous course in presenting "a portrait" illustration, but feel justified in making an exception to "the general rule" in the case of the distinguished nobleman and art votary, the subject of the accompanying sketch; and we may also remark, that such deviation is not without precedent in metropolitan periodicals of kindred character. It has often been our pleasing duty to record the name of Lord Talbot De Malahide in connection with the scientific and artistic institutions of Ireland, and we confidently assume that we but speak a very general sentiment when we say, that the extent of practical aid afforded by the noble lord to the advancement of art and archæology in this kingdom, but more especially in that portion of it we inhabit, has not been superseded—if equalled—by any other individual in the community. Himself an artist—*con amore*—we find the noble peer almost ubiquitous, where pilgrims at the shrine of art are assembled; encouraging by his example others to "do likewise," and lending his eminently practical mind to their councils.

THE ARTS OF WAR AND PEACE.

Do we live in an age of *war* or *peace?* may we naturally ask when reviewing the chief topics of the day, those in which—seemingly at least—most interest is centred, and to which man's inventive faculties are just now most applied. We are entertained with a perpetual history of "volunteer demonstrations," exuberant professions of "loyal and national attachment," and are told that the *toute ensemble* of civilian avocations—the *pencil* and the *pen*—are comparatively consigned to oblivion, while the *rifle*, the *musket*, or the *revolver* hold pre-eminent sway; drilling becomes "the national system of education," and the merchant's counting-house and professor's studio are alike deserted for a display of semi-military, semi-civilian manœuvres at Wimbledon Common or on Aldershot plains. As *yet*, fortunately, this martial epidemic has not in its integrity commenced to rage in our island—though premonitory symptoms are occasionally apparent in certain quarters—but its ill effects *have;* and here, as well as in "the epitome of the world"—London—the daily press is pregnant with laudations of "the recent successful trial trip" of some "iron plated" naval monster of death, or of some skilfully conceived projectile for the more effectual and wholesale annihilation of fellow-man. Amidst all this bustle to meet "grim-visaged war," the social condition of the inhabitants of our cities and towns, with which the arts of *peace* are so intimately identified, are comparatively neglected; sanitary principles are notoriously disregarded, and all that relates to the preservation of life is treated as little better than *nought.* Perhaps the most palpable and unpardonable defect of the many is the present most unsuitable provision against the ill effects of that ravaging element, *fire.* Our buildings are generally constructed as if more to favour its propensities than to curb them, and—even admitting, under certain circumstances, the reasonableness of the casualty — the absence of precautionary measures against *fatal* results is painfully apparent. Though somewhat late in the field—yet "better late than never"—the attention of our townspeople was, by the recent sad catastrophe in Kildare-street, awakened to the necessity of providing public fire-escapes—our city, with shame be it admitted, being previously without *one*—and with some creditable earnestness the project was consummated. But the apparatuses in vogue being clumsy and defective, a philanthropic and ingenious spirit sought a remedy, and successfully produced an escape on a totally different principle, and at once, simple, facile of application, cheap, and affording perfect safety in ascending and descending. This we had a recent opportunity of seeing practised in the courtyard of the Commercial Buildings, and in briefly describing its features and just claims for general adoption, we note that the patentee is a mere lad, by name William Clayton, of 40, Waterloo-road. The telescopic principle is adopted, and double ladders, which when elongated attain a height of 55 feet, slide within wide ones, and are balustraded at the sides for protection; whereas the present escapes necessitate the objectionable use of a single swivel ladder *without* protection, revolving at the top of the framework, where a height greater than 30 feet has to be reached. The motive power is by means of pulleys and ropes, the latter passing round a drum, worked by a windlass on the axle of the carriage-wheels, which therefore serves a double purpose. When desirable, a cradle of light iron, covered with *wire* netting, and scarcely 20 lbs. weight, is applied to the *uppermost* side of the ladders, and slides up and down on a rail having corresponding groove with marvellous rapidity. This escape can with ease be conveyed to its destination, and worked by *one* man—a fact which speaks volumes in its favour, independent of the other meritorious features above enumerated. None of the numerous descriptions of fire-escapes employed in London and elsewhere can at all compare with this in the various important regards already mentioned, and the brigade authorities are bound, in justice to the public, at least to test its merits by a trial.

THE DUBLIN QUEEN'S COLLEGE.

It is stated that the Museum of Irish Industry, Stephen's-green, has been fixed upon by Sir Robert Peel, Bart., for the location of the proposed Queen's College in this city. If the statement have any foundation, it would seem strange, first, that so excellent a national institution as the Museum should be disturbed, and secondly, that the metropolis should not be deemed as worthy by Government of an independent structure for a Queen's College, as was Belfast, Cork, and Galway, where buildings of importance were specially provided for the purpose.

MORE AMATEUR ECCLESIASTICAL ARCHITECTS.

We find the following significant paragraph—to which our previous strictures on a corresponding subject are applicable—in the *Limerick Reporter*:—

"The new church of the Convent of St. Ursula, at Thurles, was solemnly dedicated upon Monday by his Grace the Lord Archbishop (Roman Catholic) of Cashel, attended by a numerous body of clergy, in the presence of very many respectable Catholics invited by the community to witness the ceremonial. The first stone of this sacred edifice was laid on the 12th July, 1859, by the Most Rev. Dr. Leahy, *to whose taste religion owes so much, and this little church owes all—for he was the designer.*"

"*Dignissimus Leahy architectus erat,*" would be a suitable inscription on an outward tablet.

IMPROVEMENT OF SLIGO.

In the address presented by the Mayor of this town to Sir Robert Peel, Chief Secretary for Ireland, on the occasion of his recent visit, we find the following:—

"The trade of Sligo is daily increasing. There is full employment for all classes of our town population, at our own expense, without ever receiving one farthing of public money. We have made great improvement in our harbour, so that vessels drawing 15 feet of water can reach our quays, and ships of the largest tonnage, and greatest draught of water, can safely anchor at the entrance of our pier. The mercantile interest ask nothing but to be left alone. In 1847, while, no doubt, much relief was given, there were many great abuses in the expenditure of public money; the commissariat had refused to sell or part with any portion of its food stores, although called on by public bodies here, while provisions were scarce and prices high. When the famine had done its work and ample supplies had been imported, they entered into competition with the merchants, shut the markets, reduced prices of food to one-third of the cost, and ruined the enterprising importers. While we can most truly assure you that in this town and neighbourhood we do not apprehend any severe pressure of want, we know that in the backward parts of this county, and along the mountain ranges where the farms are small and the land poor, there must be great distress."

CROZIER TESTIMONIAL, BANBRIDGE.

INSTRUCTIONS TO COMPETITORS.

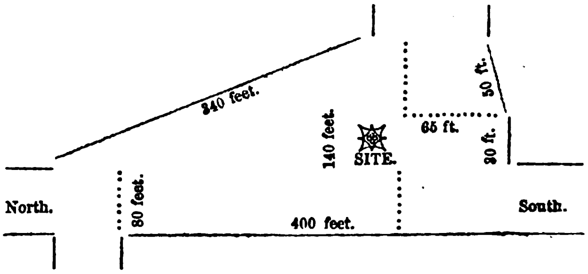
For the information of architects desirous of competing for the premium of £20, proposed to be given to the author of what may be deemed the most suitable design for a pedestal to the statue of Captain Crozier, R.N., we give the following particulars from the official circular:—

Extension of Time.—The time for sending in plans is extended to the 14th of December next.

Figure—Seven feet six inches high. Material, Portland stone.

Site.—The lamp (shown in the photographs which will be forwarded on application to the secretary) is the centre of the triangle, denotes the locality of the proposed statue. The space is 400 feet from north to south, and 140 from east to west at the widest. The ground is triangular—the street narrowing to 60 feet at the north extreme end. Dungannon freestone, at 12s. per ton, can be delivered on the ground.

The committee leave to the taste and discretion of the competitors whether they furnish a base and column of such height as they may deem expedient, or a base and pedestal of a height not to exceed 20 feet, exclusive of figure; as well as size of base, for which there is ample space. They decline also to say of what order of architecture it is to be, but without railing or steps. A bas-relief to be provided for on one side of the pedestal. The inscription will be pretty elaborate. The statue to be seen at Mr. Kirk's, sculptor, in Jervis-street.



PLAN OF SITE.

MORE COBBLING AT THE MANSION HOUSE.

On the 8th inst., at a special meeting of the Town Council, a report recommending certain repairs to be made in the Mansion House was brought up for confirmation.

Mr. French very properly remarked, that during the last ten or twelve years the Council had spent £13,000 in the repairs of the Mansion House, and that for that sum the old building could have been knocked down, and a new one, more spacious and comfortable, erected. The best thing that could be done would be to stop these perpetual repairs and build a new Mansion House.

Alderman Reynolds said it was quite true, though almost incredible, that £13,000 had been spent as Mr. French stated. He would move for the abolition of the present out-offices, &c., attached to the Mansion House.

Mr. Martin said that every facility would, of course, be given for the execution of the repairs and improvements suggested before the incoming Lord Mayor entered on his office. He was of opinion that the improvement suggested by Alderman Reynolds would be very beneficial, as well as the taking down of *the ugly garden wall fronting the street.*

Other members having expressed their opinion as to the necessity of having the proposed repairs immediately executed, the report was confirmed.

What the nature of these repairs may be we are unable to say at present, but of our own knowledge we can advise that the condition of the "Oak-room" needs looking after.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The opening meeting for the session—as announced to be in our last impression—took place on the 4th inst., Mr. Tite, president, occupied the chair, and his inaugural address will be read with much interest on another page. Various donations were announced, including the original painting, by Pannini, of "the Ruins of the Colosseum," the bequest of the late Mr. W. L. Donaldson, honorary solicitor. Professor Donaldson was as usual at his post, vigorous as ever, and reviewed comprehensively the presidential address, with the following remarks in addition:—

With respect to the improvements being carried out in France, he considered that the French Government was entitled to credit for them, because they were calculated to benefit not only the metropolis, but the cities of Lyons, Marseilles, Bordeaux, and, in fact, all the great centres of industry and population in the north, east, south, and west. To the sanitary part of the question he had devoted some attention. The subways in the boulevards were intended to convey the sewage and the gas-pipes in a manner described in a recent number of the *Builder*.* The energy of the French Government contrasted most favourably with the apathy and inertness of our own authorities. Look, for instance, at the block of houses standing in the narrowest part of Holborn, and the entrance to Chancery-lane, in the same neighbourhood. There was no thoroughfare from Holborn into Lincoln's-Inn Fields and the Strand, and in many other parts of the metropolis there was no adequate accommodation for the constantly increasing traffic of the metropolis. In fact, the population of London had outgrown its dimensions; and so blocked up were the streets, that every man of business knew that in making his way through the City he could do so quicker on foot than by cab or omnibus. He thought that it was their duty to urge improvements somewhat similar to those now being carried on in Paris on our own Government. Then, again, look at the chief seaports of the kingdom—Dover, Portsmouth, Plymouth, and others. Why, they were the dullest and least picturesque places that one could live in; without public monuments, fine highways, or any of the improvements which characterized continental cities. Antwerp, Havre, Marseilles, were all beautiful cities, embellished with fine architectural monuments; and although the latter was somewhat deficient in salubrity, the Emperor had lately given instructions for the construction of large works; for his imperial majesty could not allow local bodies to interfere in such a case. Bordeaux was a very fine city, perhaps as fine as either Edinburgh or Dublin. However, it could not be denied but that much had been done at home in the way of improvement within the last twenty or thirty years; and that a sounder public taste was growing up, not only in London, but in Manchester, Birmingham, Liverpool, and Glasgow; which latter city was emulating in its great squares the metropolis itself.

The President said that Mr. George Gilbert Scott was prevented from reading a promised paper "On Ancient Architectural Monuments and Remains," by reason of the illness of one of his children, and it was considered by the council that it should be postponed until a future evening.

Mr. P. Prud'homme then explained the nature of his system of electric bell telegraphs, as supplied to the Imperial Palace, and several public and private institutions in Paris, intended to take the place of ordinary bells. He stated that they could reach any distance, could be fixed without injury to walls or ornaments, and might be relied upon as to accuracy. They also had the advantage of being simple in their mode of working, and inexpensive in construction.

The President announced that the consideration of the subject of Architectural Examination would be resumed on Monday, and that on the succeeding Monday (the 18th inst.) Mr. James Fergusson would read a paper "On the Mode in which Light was introduced into Greek Temples."

ROYAL IRISH ACADEMY.

The first general meeting of the members for the session 1861–62 was held on the 11th instant, the Very Rev. Dean Graves, President, in the chair.

The Rev. Dr. Lloyd read a paper "On Earth Currents, and their connexion with the Phenomena of Terrestrial Magnetism."

Professor Sullivan read a paper "On the Hydro-carbonate of Zinc and Silicates of Zinc, of the province of Santander, Spain."

Professor Haughton, in moving that the paper be referred to Council for publication, paid a high compliment to the talent and accuracy of research of which it gave evidence.

Professor Haughton then read a paper "On a graphic method of computing the drift of a vessel in a tide way between two given hours, with its application to the Kingstown and Holyhead passage." He described an ingenious method given by Mr. Airey, the Astronomer Royal, for calculating the rise and fall of the tide in a harbour within any two given hours. A circle was painted upon the harbour wall, with diameter whose extreme points were the points of high and low water on the spring tide. Upon the circumference were painted the different hours, and when the rise and fall of the tide between any two hours was to be calculated, perpendiculars were let fall from those hours upon the diameter, and the intersept gave the true result. His method for computing drift was somewhat similar. He drew upon a sheet of paper a circle, whose radius was double the tidal rate; upon the circumference he printed the different hours, and when it was required to know the amount of drift between any two hours, he let fall upon the diameter two perpendiculars, and the intersept, as in Mr. Airey's method of computing the rise and fall of the tide, gave the true result. He believed it was most important for sea captains to be able to ascertain the amount of drift, particularly in foggy or stormy weather, for, by not knowing it, vessels from Liverpool had often gone far out of their course and been lost upon the Arklow Banks. The Holyhead steamers had on one or two occasions been found at Bray and Dalkey when it was thought that they were off Kingstown harbour. Mariners ought to be compelled to carry chronometers set to the tidal hours, and by the aid of these and the chart which he had constructed, he believed they would be able to compute accurately the amount of drift, and that many accidents might be averted.

ART UNION OF IRELAND.

The managing committee met on the 12th instant, in the offices, No. 118, Grafton-street, the Lord Chancellor, V.P., in the chair. After the minutes of the last meeting had been read and confirmed, the committee was engaged for some time in consultation as to whether any alteration should be made in the arrangements of the association for the current year. On the whole, it was determined that, having due regard to the original objects of the Art Union of Ireland, and the cultivation of a high order of taste, no change could with advantage be made. It was resolved, however, to draw up for extensive circulation a brief address embodying the actual facts of the society's operations since its formation, and calling upon its subscribers for renewed support. The meeting was then adjourned to Friday following.

GEOLOGICAL SOCIETY.

A general meeting of this society was held on the evening of the 13th inst., in the Museum Building, Trinity College, Rev. Professor Haughton, President of the society, in the chair.

Mr. R. H. Scott read a paper on the granite rocks of Donegal, and the minerals associated with them. Mr. Ethelstane H. Blake read a paper on the primary rocks of Donegal.

A discussion ensued on both papers, in which the president and Mr. Jukes took part, and the latter gentleman referred to the very great value and importance of Mr. Scott's paper.

A large number of gentlemen were admitted associate members, and the society adjourned to the second Wednesday in the ensuing year.

ROYAL DUBLIN SOCIETY.

The first evening scientific meeting for the session of 1861–62 will be held on Monday evening, 18th inst. The chair will be taken at 8 o'clock in Board-room. 1. Andrew Keith Adams, M.D.—Observations on the fossiliferous caves of Malta. 2. Rev. Samuel Haughton—To present, on the part of Lieutenant J. Haughton, R.A., specimens of rocks, shells, &c., from St. Helena. 3. William Barker, M.D.—To exhibit and explain a new fire-escape, invented by Mr. Clayton (elsewhere noticed).

REPORT OF THE IRISH LUNATIC ASYLUM COMMISSIONERS.

From this document recently issued we collect the following, viz:—

"The old buildings, erected thirty years ago, are gradually losing much of their original gloominess and prison-like appearance; while modern improvements, tending to the comfort, well-being, and efficient treatment of the patients in them, have been introduced, or are in process of being so.

"Orders in Council have been issued for the erection of an asylum in Wexford County, detached from the Carlow district; for the erection of an asylum in Clare, for that county alone, detached from Limerick; for the erection of an asylum in Mayo, separated from Galway and Roscommon; for the erection of an asylum at Letterkenny for the County of Donegal, separated from Londonderry; and for the erection of an asylum at Monaghan for that county, separated from the Armagh district. The Grand Jury of the adjoining County of Cavan, detached also from Armagh, wishes to unite with Monaghan and to build in common an institution of suitable dimensions.

"The asylum at Maryboro' for the King's and Queen's Counties is obviously too small; while that at Cork, built for 500 inmates, is now occupied by patients principally from the City and the East Riding, in which it is situated. Increased provision is required for these two districts; and we feel that at no distant period, fresh arrangements must be made in regard to the Mullingar district, the asylum belonging to which, erected for the three counties of Meath, Westmeath, and Longford, is all but fully occupied.

---

* As also in a former number of the Dublin Builder—see page 81 *ante*.

"We may observe that in the beginning of the past year a Turkish bath was erected at the Cork asylum, by way of experiment, at the suggestion of the resident physician, and on our recommendation. The cost was about £180, including fitments, by which a portion of the heat generated in it, and which otherwise would be wasted, is rendered available for drying closets and other domestic purposes.

"As a general rule, the patients in district asylums are industriously employed both in and out of doors; and while their comforts and sanitary condition are carefully attended to, means of amusement are not neglected. At the Richmond, Sligo, Belfast, and some other institutions, there are regularly trained bands of music, with apartments specially allocated for the purposes of recreation; while in the first-named, or metropolitan, besides those females who are engaged in industrial pursuits, there is a class of from fifty to sixty who are instructed by competent teachers in reading, writing, figures, singing, &c.; and so satisfied are we from the result, that a continued system of tuition must prove beneficial to the insane, by giving a fixity to their thoughts, and diverting them from the subject of their delusions, and that in those institutions where the number of patients will justify the application we intend seeking assistance through a grant of books and other requsites from the Board of National Education.

"The most marked deficiency which we notice in poorhouses is the utter want of means of classification and facilities for out-door exercise and employment, or for suitable in-door occupation, the same crowded apartments being indiscriminately used for patients under every type of disease; and being occupied also both as day and sleeping rooms, are necessarily ill-ventilated. In fact we cannot imagine a more melancholy existence than a prolonged confinement within the dark and narrow precincts allotted in some unions to lunatics, who, under more favourable circumstances, might be restored to society.

"As yet we have endeavoured to make the Dundrum Asylum, built for 120 inmates, meet the wants of the country; the infirmary, a small detached building, owing to the absence up to the present of any epidemic disease, being converted to the purposes of general accommodation; thus, its twelve beds have been allocated to some of the quiet and more aged patients.

"Within the last twelve months, however, we thought it advisable to apply for the construction of some additional single rooms, to meet emergencies in regard to violent and refractory patients, as well as for a refectory and a reading or recreation hall for the quiet, better educated, and convalescent.

"The sanitary state of this institution within the past two years has been as usual remarkably good, the deaths being under three per cent., and no epidemic nor accident.

"We have, on several occasions, remarked upon the want of an asylum for a class of patients who, unable to pay the ordinary stipend in a private institution, and not being paupers, are ineligible for admission into public asylums, and cannot therefore but regard an establishment of an intermediate character most advisable in every point of view. The first private or mixed establishment—indeed the first asylum of any kind erected in Ireland—was in the year 1745, that by the celebrated Dean Swift. Though subject to our inspection it is not a regularly licensed asylum, being on a charitable foundation. We believe the sphere of its utility could be very extensively increased. It is unfortunately situated in a most inappropriate locality, and very deficient, from its original construction, in many necessaries. The hospital is under the control and management of a Board of Governors of the highest social position and most benevolently disposed, and at the same time, while having a resident medical superintendent, visited by two physicians of great eminence. We are satisfied that were the site changed to a more rural position, and a new and perfect edifice erected, replete with modern improvements, as recommended in a letter addressed to a Governor of the asylum by one of the inspectors, the change would prove a great boon to the public, while patients who are now detained in one or two private licensed houses, that could well be spared, might be transferred to it, even on the small terms they can afford to pay.

The guardians of the Skull and Skibbereen Unions have made an application to Government for a loan of £70,000 for the purpose of commencing the West Cork Railway, chiefly with a view of alleviating the impending distress amongst the local labouring classes, with whom it is thought "there is a good deal of misery pending."

Mr. William Dargan, D.L. (the eminent railway and other works contractor), has been selected to fill the office of high sheriff to the City of Dublin for the ensuing year.

SHAM ADVERTISEMENTS.

Having practically experienced, despite the utmost care, some "sells" in the matter of advertisement *favours*, we may contribute a little additional cautionary information to our readers and fellow-journalists. We have neither been duped ourselves—nor innocently contributed by our journal the medium for duping others—into the belief that "*a sure fortune could be commanded for a few postage stamps*," nor again, that for a similar douceur "*a truthful peep into futurity*" was obtainable; the very simple indeed could only be gulled thus—and after all a few postage stamps are not a very important consideration in purchasing experience of folly—but we have encountered a few instances where systematic scheming out-generalled our circumspection, and to these we refer. One party advertised in some of our back numbers that he would post from London, on the *days of publication* and *at half price*, numerous metropolitan political and professional journals, and as a case in point—out of too many similar we fear—one gentleman in this city came forward to say that having fulfilled the requirement of remittance in advance for a certain periodical, he received one number and *no more*, the trusty agent not even condescending an answer to applications on the subject. Our enquiry in "the little village" brought to light the fact, that "the house of correction" had but recently allowed at large one of its previous inmates—the individual alluded to—after sojourning a term, during which we sincerely hope that he resolved "to cease to do evil" and "learned to do well." In promised "*money to lend on personal security*"—mere matter of form of course—the readers of public journals should not always place reliance without previous enquiry as to the respectability and *bona fide* character of the source. Penniless adventurers (located in London chiefly) cause flourishing advertisements to this purport to be inserted, directing reference to ——, *Esquire*, —— Chambers, such and such address, with of course a high sounding title, the object being to induce needy parties into a correspondence—sure to be most courteously conducted at first—and after a couple of interchanges politely intimating, that "no further trouble can be taken without a remittance of an *enquiry fee*." This done (perhaps), the prospects of the loan get "small by degrees and beautifully less," and the cessation of the correspondence reveals the sad truth, in vain sought to be remedied by inquiry, as the ——, *Esquire*, is not to be found at his *Chambers*, which are *nowhere*. Profiting by the adage, "*Experientia docet*," we recently declined two such advertisements, worded as follows, which are forcible illustrations:—

[No. 1.]

"—— Chambers, London, W.C.

"Sir,—Give one insertion to my advertisement, and I will send *a sufficient number of stamps* to pay for the same.

"Yours obediently, —— "

[Advertisement.]

"Money, £150,000, at 3 and 5 per cent., according to the sum required. Apply to ——, Esq.

"N.B.—None but *principals* or their *solicitors* treated with."

Manuscript of the above in handwriting of which a schoolboy would be ashamed.

[No. 2.]

"The Agent to the —— Life Office would thank you to insert advertisement, and your account *will be discharged*."

[Advertisement.]

"*Money upon Personal Security only.*—Sums varying from £100 to £500 can be advanced, at 5 per cent. interest, in connection with Life Policies. Apply ——."

The name of *the* agent not attached to *either* document.

To the many deceptions practised respecting "situations" for considerations we need not allude, but that which indisputably attains the climax for effrontery is the profession of an imaginary London watchmaker to furnish a "*perfect silver watch for* 30s.," with various other articles of jewellery at proportionate prices. This party has become so notorious through the exposition of the press, that we need only remark, that the London detective system is still sadly at fault, in not bringing more of these offenders to justice; for it is evident that the letters containing remittances could be traced to *some* person by the district postman—if not himself an accomplice—and that the cash for orders is paid to *somebody*.

Dronet, the famous French sculptor, intends to hew the colossal bust of Victor Hugo out of one of the rocks which surround the Isle of Guernsey—Lorely fashion.

Mr. Cope's fresco painting representing "Charles the First erecting his Standard at Nottingham," has been placed in its proper situation in the Peers' corridor of the Houses of Parliament.

The death of Mr. John Hay, of the architectural firm of J. W. and J. Hay, of Liverpool, on the 3rd inst., was announced.

It appears from some recent statistical returns that the average of the duration of human life in France, which from 1825 to 1850 was 40 years, has gone on decreasing ever since, and is now scarcely more than 37.

COURT OF BANKRUPTCY AND INSOLVENCY.

In re M. Joyce.—The insolvent was a builder and contractor in Fermoy. The meeting was for choice of assignee, in the room of Mr. Thomas Mills, deceased. Mr. Michael Mills, of Fermoy, was appointed as trade assignee, and Mr. James as official assignee.

In re P. G. Dunne.—The bankrupt in this case was a glass, oil, and colour merchant in Abbey-street, in this city. The meeting was for proof of debts, choice of assignee, and surrender. The bankrupt surrendered; and on the motion of Mr. Neilson, Mr. Walter Bourke was appointed assignee. The Court postponed the consideration of an application for an allowance to the bankrupt until further inquiry should be made.

The recently erected church of St. Michael's, Tipperary, has been consecrated. The style of architecture is Gothic. Internally the building measures 140 feet by 65 feet, and has nave separated from aisles by seven lofty arches at either side; tower and steeple at western end reaching an elevation of 165 feet, sacristy, vestibules, &c. The high altar presents a fine piece of carved work in Caen stone, and with various sculptured representations thereon is (we believe) by Messrs. Hardman. The great eastern and western windows consists of five lights each, and are filled in with stained glass. Tiles are extensively employed throughout the building, encaustics being used for chancel and side chapels. The general fittings throughout are said to be of a superior character.

The first stone of a new church has been laid at Bessborough Demesne, Piltown.

The workmen in the employment of Mr. M. Meade, builder, Dublin, commenced pulling down the house at Castleview, Cahir, on the site of which, for the Countess of Glengall, a noble residence, from the plans and designs of Messrs. Lanyon, Lynn, and Lanyon, architects, Upper Sackville-street, is to be forthwith built.

Sundry works are to be executed at the church of Killoe (Templemichael), Co. Longford.

Two dwelling houses are to be erected at Rathgar, Mr. Joseph Maguire, architect.

It has been resolved to enlarge St. John's Church, Monkstown, by the addition of a large transept and gallery, for which provision was made in the plan on which the church was built. The estimated cost will not exceed £1,000. The Venerable Archdeacon Gregg has contributed £500 to this important work out of the funds at his disposal for church building purposes.

Additions and alterations are to be made to the Limerick District Model School, according to the plans furnished by the architect to Board of Public Works.

The monument to be erected on the East Pier, Kingstown, to the memory of Captain Boyd and his brave comrades is now being erected. The work has been entrusted to Mr. Patrick M'Donough.

A line of railway is proposed to be constructed between Carlow and Newtownbarry. Mr. Lewis, C.E., is the engineer, and reports that the works will be easy of construction, and is satisfied that the whole line can be executed, including land and stations, within £5,000 per mile, and at this sum contractors have offered him to execute the works. It is proposed to use the present Carlow station, at Carlow, and to erect a platform and shed at the Junction at Castlemore Cross-roads, and a station and goods store, with turn table, at Tullow, a station at Aghade-road, and one at either Kilcarrig-bridge or Kildarin-road, as may be decided on; and a station, goods store and carriage shed at Carrigduff.

The large viaduct over the Pultanto, on the Portpatrick line, is now fast approaching completion. The arches (thirteen in number) are all finished, and the spaces between them all but filled in.

A trial has been made on the Sligo Extension line as far as Boyle, and it is said the works were considered satisfactory. The through railway route from Dublin to Sligo will soon be complete.

It is proposed to construct a line of railway commencing at the termination of the authorised line of the Parsonstown and Portumna Bridge Railway, on the East Bank of the River Shannon, and terminating at Vinegar Hill, in the townland of Portumna.

Paternoster-row is about to possess its architectural feature, like some other of our streets. On the buildings lately occupied by Messrs. Longman & Co., and their neighbours, the Messrs. Blackwood, a new and spacious edifice is to be erected for the former firm, which will combine beauty with convenience. In the meantime, the Messrs. Longman occupy the building on Ludgate-hill, formerly known as the Milton Club.

The Taylor Scholarship of £20 or upwards, which may be held for a second and third year, provided the student shall produce in each year a work of sufficient merit, has just been awarded by the Royal Dublin Society, after competition, to Mr. Henry Crowley, nephew of the late N. J. Crowley, Esq., R.H.A. The scholarship is the chief of several prizes left by the late G. A. Taylor, Esq., of Dublin, for the encouragement of Art in Ireland; and, by the terms of the bequest, can only be awarded "when high artistic talent shall be manifested."

It is a long time ago since King Francis stood by the easel of Titian and picked up the painter's fallen pencil; and some years have elapsed since Northcote told his royal visitor, the Duke of Clarence, that if George the Fourth had said to the Duke that he, the King, knew Northcote, it was only His Majesty's "brag." On Monday last, however, we had another instance of prince and painter being together on equal terms. The Grand Duke Constantine, with his Grand Duchess and suite, crossed from Westminster Abbey to the Palace, and there inspected, among other worthy sights, the fresco by Mr. E. M. Ward, R.A., which was described in our last number. The Grand Duke conversed with the artist, examined the picture critically, and had much to say touching the history of the stirring times of which the fresco exhibits one of the most romantic incidents.

An interesting paper has recently been read by M. Dumas, before the Paris Academy of Sciences, "On the New Artesian Well at Passy." After a series of difficulties, unparalleled in the history of artesian wells, water was struck at the great depth of 577½ metres, but it did not rise to the surface. Further borings increased the flow, and eventually, on the 2nd of October last, the well discharged 20,000 cubic metres of water in twenty-four hours. The well has cost nearly 1,000.000 francs; and, it is calculated, will yield water for the use of 500,000 inhabitants.

A very ingenious process has recently been perfected by M. Faye, by which he is enabled to pierce thick pieces of glass by means of an electric spark. That glass can be perforated by an electric spark has long been known, but M. Faye has now succeeded in piercing extremely thick plates. The results were laid before the last meeting of the Paris Academy of Sciences. No traces of fusion were discernible.

The stoppage of Messrs. Kelly and Co., the well-known extensive printers and publishers, and proprietors of the *Building News*, Old Boswell-court, London, is announced, to the (we believe) great general surprise of the public, as the firm was believed to be one of uncommon stability. The amount of the liabilities has not transpired. We sincerely trust that the circumstance will not affect the excellent publication named.

The Waterford and Limerick Railway Company find that their present locomotives and waggons are insufficient to do the business which is offering on their line, and at the last meeting of the board the traffic superintendent was sent to England to order two new locomotives. The company have ordered a number of waggons and trucks in Dublin, and they also are endeavouring temporarily to hire two locomotives until their own are ready.

Miscellaneous.

A STAINED GLASS WINDOW FOR INDIA.—A magnificent oriel window, designed and manufactured by Mr. Blashfield, of the Terracotta Works, Stamford, for a new palace that is being built for his Highness the Nawab of Nazim of Bengal, has just been completed. The work is remarkably true in all its details. On reaching its destination the lights will be filled with stained glass now being manufactured by Messrs. Powell and Son, of the Whitefriars Glass Works, London; it will exhibit the arms and badges of the Nawab, surrounded by ornamental borders composed of Arabic inscriptions, consisting chiefly of passages from the Koran. The terra-cotta tiles for the new Westminster-bridge footways are being manufactured by Mr. Blashfield, who is also executing several other important works.—*Building News.*

IRISH TALENT ABROAD.—It is extremely gratifying to learn from the following paragraph, taken from the *Cork Constitution*, that in a work of art an Irishman has won distinguished honours in India, excelling the extraordinary number of 180 competitors:—"Designs having been called for in India for a monument to those who fell at the seige of Delhi during the late mutiny in India, 180 were sent in. The successful one was by E. G. Martin, Esq., Assistant Executive Engineer, Delhi. Mr. Martin is son to Mr. E. C. Martin, builder, of this city."

BOOK RECEIVED.—"Manual of Illumination," by J. W. Bradley, M.A., and T. G. Goodwin, B.A., revised and enlarged by J. J. Laing. London: Winsor and Newton. This work shall receive consideration in next No., having arrived too late for this.

THE BUYER'S DESIDERATUM.—"The buyer's *desideratum* is to find an establishment where will be presented to him ample choice of artistic designs, without having forced upon his attention a host of mere ingenious ones, and destitute of any other merit, with a tariff of prices adapted to the means of the economic or those to whom price is no object. Such an establishment is that of Mr. J. W. Benson, situate at 33 and 34, Ludgate-hill, and 46 and 47, Cornhill, whose recent enlargement of his premises has made his show-rooms more conspicuous than any other in the neighbourhood of St. Paul's. His four windows contain such a variety of gold and silver watches as to leave nothing to be desired but the money to buy them with. The high standing of Mr. Benson as a London manufacturer must secure him a large amount of public patronage."—*Standard.*

Benson's Illustrated Pamphlet, post free for two stamps, is descriptive of every construction of watch now made. Watches safe by post to all parts of the globe.

American Stoves.—In the matter of producing the greatest amount of heat with the most economical disposition of fuel, or in securing the most effectual cooking arrangements with a like concomitant, our inventive transatlantic friends are not behind in presenting "a means." A variety of stoves, ranges, boilers, &c., after American fashion, and manufactured by Messrs. Smith and Wellstood, of Glasgow, may be seen at the local depot of that firm, No. 7, Capel-street; and for those who require to invest in any of the articles above enumerated, the stock is worthy of an inspection.

"**In Garrick's Time.**—The highest weekly salary was then twelve pounds, which was the sum that Garrick received from the treasury. Actors and singers at that period, instead of riding in their own carriages, walked on foot, and many of them followed trades and professions. Packer was a saddler in Vigo-lane, near Burlington-gardens; Parsons and Burton, landscape painters; Aicken kept a hosier's shop in York-street, Covent-garden; Davis, a bookseller, in Great Russell-street, Bloomsbury; Bransley, a hatter, in Shire-lane; Mrs. Pritchard (the Mrs. Siddons of her day) kept a masquerade shop; John and Robert Palmer, in the early part of their lives, were printers, and went round the town to paste up the posting bills—the former was in the evening a favorite performer, and so general an actor that he is said to have studied more parts during his theatrical life than would have loaded a cart drawn by two horses. Dibdin was one of the carpenters of the house; and the laugh-provoking Tom Weston was, to the day of his death, one of the turnspits in the royal kitchen at St. James'. The theatre at the avowed period was so moderate in size that in every part the audience could hear and see. Mr. Garrick frequently asked his treasurer (Johnson) if the receipts of the house amounted to sure figures, meaning expenses. Yet with such moderate returns will the house flourish, and the proprietors realize their fortunes.

Safety Brake for Steering Gear.—A Mr. Meriton has taken out a patent for this purpose, and which consists in the application of a brake to the various description of steering apparatus, and in the construction of the brake itself, so as to admit of its being worked from both sides of the barrel or steering apparatus by means of levers, so that when a heavy sea strikes the rudder the helmsman can apply the brake—or if two be steering both can do so,—and thereby secure firm footing and perfect security from accident. The brake consists of a drum, round which passes a strap or band, having upon its under surface, where it comes into contact with the drum, stops of wood or other suitable substance, for the purpose of causing great friction, and thereby effect the braking of the barrel which contains the chain working the rudder.

Worthy of Example.—Some time since Mr. W. Bateman Byng, cashier of Messrs. Ransomes and Sims, of Ipswich, set a project on foot for raising funds in that town, to purchase a lifeboat, to be presented to the National Lifeboat Institution, and to be called *The Ipswich*. Simultaneous collections were made in the various churches and chapels of Ipswich, and a meeting was held in the town-hall on following day. The mayor presided, and the secretary attended as a deputation from the society, and addressed the meeting, pointing out the value of the lifeboats, the many lives which had been saved through their instrumentality, the necessity there was for the institution being supported and expressing the hope that the noble example set by Ipswich might be followed by other cities and towns of the country. The secretary of the institution showed that the cost of a lifeboat station was from £400 to £500, and that the expense of keeping it up in a state of efficiency averaged £40 a-year, independently of rewards to the crew of the lifeboat. The following resolution amongst others was passed:—"That the meeting recognising the philanthropic character of the operations of the Royal National Lifeboat Institution, whose lifeboats have within the last twenty-two months been the means of rescuing 457 of our fellow-creatures from a watery grave, resolves to purchase a lifeboat, and present the cost of the same to this benevolent institution, as a practical demonstration of the sincere and deep sympathy of the town of Ipswich and the county of Suffolk in its meritorious exertions." We trust that this very laudable example of the town of Ipswich, on behalf of so truly benevolent and national a cause as that of the lifeboat institution, will be followed by many other towns in the United Kingdom.

Collieries.—The total number of collieries in Great Britain at present is estimated at 2,654; of these 1,943 are in England, 235 in Wales, 405 in Scotland, and 71 in Ireland. In 1857 the coal produce of the United Kingdom exceeded 65,000,000 tons. The value at the pit's mouth of the quantity annually raised is estimated at £16,700,000, and its mean annual value when consumed, at about £20,000,000. Besides this sum, it is estimated that the iron extracted yearly from the coals is worth, at the mouth of the furnace, 14½ millions sterling The total capital invested in the trade is supposed to exceed 18½ millions sterling. In 1851 the number of persons employed in our coal mines was 219,000; at present there are at least a quarter of a million.—*Mechanics' Magazine.*

Iron Wire Partitions.—A patent has been completed for the substitution of iron wires—stretched and crossed—for the ordinary laths used in ceilings and partitions; the wires to be placed some four inches apart. The inventor maintains that the rust caused by the humidity of the fresh plaster on the surface of the wires, will furnish sufficient key.

Belfast Imports and Stocks of Timber, 1861.—There were landed at this port, from the 1st January to the 31st October of the present year, from Quebec, 5,461 pieces timber, being a decrease of 2,665 pieces as compared with the corresponding period of last year; and 38,366 deals, &c.—a decrease of 23,131. From St. John's and other British colonial ports, 567 pieces of timber—a decrease of 1,280; 469,416 deals, &c.—an increase of 73,090. From the Baltic, 7,931 pieces timber—an increase of 1,617; 1,685 deals—a decrease of 696. The stocks of timber, deals, &c., on the 31st October were as follows:—Quebec timber, 2,328 pieces—a decrease of 173 as compared with last year; deals, 4.825—a decrease of 714; St. John's and other colonial timber, 110 pieces—a decrease of 205; deals, &c., 204,841—an increase of 108.230; Baltic timber, 1,356 pieces—an increase of 1,189; deals, &c., 6,670—an increase of 2,439. Total increase in stocks this year, up to specified date—timber, 811 pieces; deals, &c., 109,895. (A considerable addition was made during the past month, but the returns are not yet available.) Total decrease in imports of timber up to 31st October, 3,328 pieces; total increase of imports of deals, &c., 49,363.—*Northern Whig.*

New Burning-Glass.—An ingenious artizan, residing in Islington, has fabricated a burning-glass of most extraordinary powers. Its diameter is three feet; its powers are astonishing; the most hard and solid substances of the mineral world, such as platina, iron, steel, flint, &c., are melted in a few seconds on being exposed to its intense focus. A diamond, weighing ten grains, exposed to this extraordinary lens for half an hour, was reduced to six grains, during which operation it opened and foliated like the leaves of a flower, and emitted whitish fumes, and when closed again, it bore a polish and retained its form.

Opening of the National Gallery.—The National Gallery, Trafalgar-square, which has been closed some time for alterations, has been re-opened to the public. During the recess the collection of paintings bequeathed to the nation by the late W. Turner (125 in number) have been removed from the South Kensington Museum to the National Gallery, and are arranged in the great Western room, which is now named the Turner Gallery. The National Gallery will now be opened to the public four days in the week, viz., Mondays, Tuesdays, Wednesdays and Saturdays, Thursdays and Fridays being set apart for students.

Farm Buildings and Labourers' Cottages.—The following have applied for loans to erect buildings under the Landed Property Improvement Act:—Mr. Thos. S. Irwin, Dungannon, Tyrone, for £200; the Earl of Howth, Howth, Co. Dublin, for £1,000; and Sir George C. Colthurst, Duhallow, Cork, for £400.

Catalogues of the Library of the British Museum.—An important improvement, which has been long under consideration, consisting of a re-arrangement and transcription of the catalogues of the library of the British Museum, is, it is said, to be commenced forthwith. The catalogues now comprise—1. The King's Catalogue, in five volumes. 2. The Grenville Catalogue, in seven volumes. 3. The old interleaved catalogue, in 82 volumes, partly printed and partly in manuscript. 4. Mr. Panizzi's Catalogue, in 300 volumes. A staff of clerks has been appointed to transcribe the contents of the four catalogues into one general catalogue, alphabetically arranged. The transcript to be made at once in triplicate, and be placed in the library from time to time as completed.

Encouragement of Irish Art.—Mr. J. Richard Marquis, R.H.A., the recently elected member of the Royal Hibernian Academy, under its new constitution, whose varied sketches by sea and land, in Norway, have elicited such general admiration, has been honoured with a commission to paint for her Majesty Queen Victoria, the "Hut," and adjacent picturesque scenery, lately occupied by the Prince of Wales, on the Curragh Camp, for presentation to his Royal Highness.

NOTICE.

Post-office Orders and Remittances should be made payable to Mr. Peter Roe, *Printer and Publisher*, 42, Mabbot-street, Dublin.

The Dublin Builder.

Vol. III.—No. 47.

REFLECTIONS ON THE LATE TRIAL.

"BEARING a character such as any one in Court might be proud of"—to quote the words of the learned Judge who presided—John M'Ilwaine of Naas, War Department Contractor, has, in conjunction with Hamilton Connolly, Chief Clerk in the office of the District Commanding Royal Engineer, been criminally arraigned in the Court of Queen's Bench, for conspiracy to defraud the Government, and for forgery committed to attain that end. A host of legal talent on both sides was employed, and an intelligent and impartial jury, during several days, carefully weighed the case in all its bearings, and after a comprehensive charge from Mr. Justice Hayes, found M'Ilwaine guilty of conspiracy—which but amounts to *misdemeanour*; and Connolly of conspiracy and forgery—the latter a capital offence—adding a recommendation to mercy for M'Ilwaine, "*as they believed he was led into the business by the other prisoner.*" "From him to whom much has been given, much will be expected," and the jury, by their verdict, would seem to be fully sensible of the immensely increased culpability of Connolly's acts, as a man of education, of independence, and of "gentle blood," beyond those of M'Ilwaine, who is conceded by all to have originally risen from the ranks by honest industry, and to have been so ignorant, even of the rudimentary branches of education, as to be obliged to confide the greater part of his business to others more favourably circumstanced. Now, a great deal did come out on this trial of the way matters are managed, or rather *mis*managed, in public departments; and one fact was glaringly proved, that had there been less circumlocution and red-tapism, this conspiracy or forgery could never have been committed; but a great deal also lay unrevealed, which, if brought to light, would, at least, have increased the public and private sympathy so universally felt for M'Ilwaine. We can perfectly understand how this unfortunate, ignorant, but good-natured and well-meaning man was "led into the business by the other prisoner." From his earliest career, he was associated in daily intercourse with Connolly, who, no doubt—as public officials *can* or *cannot* do as they please—occasionally placed M'Ilwaine under compliment to him for facilitating the passing of his accounts, and whether, for such services, any "considerations" were or were *not* given by M'Ilwaine to Connolly, does not appear. That it was so, however, is a reasonable assumption; and that the compliments and understandings in connection therewith, became so frequent and of such magnitude, that the terms of familiarity so engendered, encouraged Connolly even in going farther, and suggesting "an easier method" of mutually arranging matters. Once the *ignis fatuus* was presented to the weak-minded M'Ilwaine, he, unfortunately, succumbed to the fatal temptations of its influences, until retreat became impossible, though it is evident he remonstrated with Connolly on the impropriety of the pursuit, as the latter, in a letter dated 18th July last, says—"*I promise you there will be no more transactions of this nature*," and about this time, too late to mend, the fraud was discovered. With what systematic and accomplished villainy the *confidential* clerk managed, for a period, to cause M'Ilwaine's accounts to be duly *audited*, *certified*, *passed*, and exaggerated amounts *paid* thereon, is fully explained in the statement of the prosecuting counsel. He had succeeded in making "a tool," a "cat's-paw,"—or whatever other vulgar but truthful appellation one pleases—of the unfortunate M'Ilwaine, and for what? was it to minister to his (Connolly's) necessities? or, like a drowning man "catching at a straw," was it as a last alternative to save him and his family from ruin, which, from circumstances over which he had no control, was approaching? Not a bit of it. Connolly's appointment produced him an income of some £500 per annum, which all must admit was amply sufficient to maintain both him and his family in a highly respectable position—an income, moreover, not dependent on commercial fluctuations, on any uncertain source whatever, but definitely secured to him in sickness or in health by the best of all securities, the government of the kingdom. But, not appreciating the true happiness of a position—for which many an honester and better soul vainly sighs—nor observing the frugal principle "of living within his means," he pursued a career of extravagance, and to maintain same, funds should be forthcoming *somewhere*. On a certain day, he had a payment of £300 to provide for, but the means derivable from his salary were quite inadequate to meet this and numerous other demands; therefore, M'Ilwaine was the only resource in this difficulty, as it his believed he had also been in many others previously. We have often heard a popular insinuation, when self-interest would seem to creep unduly into friendly transactions—viz., "one for you and two for myself"—and how cleverly Connolly had illustrated that principle, may be seen by reference to the proportions of "the spoils" to be divided between himself and M'Ilwaine. He dragged the latter into complicity in his guilt and frauds, and made the most use of him possible for that purpose; and knowingly, at the smallest possible cost to himself.

Altogether there could hardly be a more palpable case presented of a polished rogue, by cunning device, winning over an honest, plain, but respectable member of society, from the path of honour to that of crime, than is this of the Government official—Connolly—inducing the unfortunate building contractor, M'Ilwaine, to implicate himself in his malpractices; and we sincerely trust that the fullest consideration and clemency of the Queen's Bench will be given to the recommendation of the jury. We should not justify fraud, nevertheless, the offence varies many degrees in magnitude, and when only in the positive, may nearly amount to a palliation; but, when in the superlative, as it unquestionably is with Connolly, who, to aggravate its diabolical character, brought ruin on an ignorant accomplice, it ought to be as severely dealt with as it should be leniently in the former regard.

ROAD COVERINGS.

Treating this subject with especial reference to the system most suitable for the traffic of London thoroughfares, and equally applicable to that of other cities and towns, the London *Review* says:—

"Undoubtedly, Macadam went nearest to a right principle of any man in road making, but it may be questioned if Macadam reached the summit of his art, and London has set Macadam at nought; for the wear and tear of his roads is considered too great for their general adoption in this enormous city, where the traffic is incessant and immense. Besides, there is an annoyance in hot weather from dust, and in wet weather from mud.

"The macadamized roadways, too, when under repair, which is very frequent, are so rough and intractable for the passage of carriages while the newly-spread layer of broken stones remains unground together, that pavement has generally been selected for at least the chief arteries of horse and carriage traffic, to the almost entire exclusion of wood and every other material, which have at various times been tried with a view to diminish the noise and clatter that in those districts are so deafening and presistent. But not content with paving our level ways with the hardest stone, and shoeing our horses with the hardest metal, we construct inclined planes in our side streets, or for the discharging roadway of our railways, at gradients which not only raise to its highest pitch the difficulties of the poor horse's maintenance of its equilibrium, but which, in the event of an accident, imparts such an impetus to the vehicle as to cause serious danger to those passing by in the direction of its course. The poor horses do our work, drag our burthens, go our journeys; surely we should use them kindly in return, and not unnessarily subject them to miseries which practically diminish their powers to serve us.

"The highways are common to us all; we pay rates for their maintenance, surveyors for keeping them in good order, and inspectors to see them kept free from nuisances. They ought to be safe. If a door step projects beyond the house or the owner's land, if a cellar trap be loose, or a coal-hole grating unfastened, the negligent offender may be summoned before a magistrate and fined; but a railway company may discharge its torrent of traffic many times a day, with a dangerous momentum, across a foot-path used by thousands in their daily walks with impunity. The incline of the South-Western road at the Waterloo station is not less than one in fourteen, and for the danger they thus launch several times an hour at the passers by, the directors have, at best, no other excuse than economy. It is no uncommon thing to see omnibus and cab horses down on the ground at the station gates, and their vehicles broken and injured—the more surprising thing is that the horses slide down so commonly in erect attitudes, seeing that the poor animals have the worst possible chance of doing so with their iron shoes over a *smooth* granite incline, so steep as to place their hind feet pretty nearly level with the knees of their fore legs.

"What is wanted for the London streets is a firm hard road, with a *rough surface*, which would always afford a good foothold for horses, and for passengers crossing over. The question practically is whether this can be got? Persons holding parish offices have generally very little practical perception, and what they have is very often obscured by individual interests. People, therefore, not parish officers, nor road surveyors, nor contractors, but who form their daily habits are nevertheless much interested in the safety and proper condition of the streets, will see the defects, will think about them, and, thinking about them, are very likely to suggest a remedy. To the naturalist the structure of the molar teeth of any herb-eating animal naturally suggests the way to make a good pavement.

"The elephant's tooth, for example, is constantly used in grinding coarse food. It has always a flat, *rough*, grinding surface, more powerful than a mill-stone, and how is this obtained? The tooth has always a fresh and proper face, and yet nothing is ever done to its surface in the way of manipulation or repair; the very action to which it is constantly subjected keeps it in perfect order. And thus: the elephant's tooth consists of layers or plates of three different substances,—enamel, as hard as flint, surrounded on either side by bony matter, comparatively soft, and dentine, comparatively hard, but not nearly so much so as the enamel. In grinding the food these substances all wear away equally, the bony matter more readily than the dentine; the dentine than the enamel, which latter, therefore, stands out as ridges between shallow cavities which, protected by the adamantine enamel, never get deep. So by this uneven wearing, a rough, effective grinding surface, fit for its work, is constantly maintained.

"Could not this principle be applied to our London streets? Could we not use thin slabs of granite or other very hard rock upended between other thin slabs of sandstone, wood, or limestone, ragstone, brick, or any other material that in practice might prove best? Upon the ridges of the harder stones the carriage-wheels would rest and run smoothly along, for the easy roll of the wheel would depend on the bearing surface of its circumference, and not be affected by the small hollow spaces of the roadway, while the ridges and rough sandstone surface between them would afford as firm points of leverage for the horses' feet, both in running and pulling. We cannot lay down as a rule what should be the proportions of the materials employed, nor what materials would be best. Actual experiment in some well-trodden roadway alone could give those data. But alike for the safety of passengers, economy of expense, efficiency of roadway, and humanity for horses, we think the experiment might be tried—the expense of the trial would be very little, the benefits of success immense.

DISCOVERY OF A CINERARY URN.

On Tuesday, 19th ult. (says the *Carlow Sentinel*), while Thomas Eddy, known in this country as "the Cornish Miner," was engaged by Mr. Joseph F. Lynch, builder, cleaving stones at Ballybit, on the estate of Colonel Bunbury, he discovered, under a granite boulder, weighing nearly two tons, a Cinerary Urn, in a state of perfect preservation, about four feet from the surface. It resembles in shape the frustrum of a cone; accurate in its proportion. It stands on a flat stern, or base, two inches in width, presenting the appearance of an elegantly-formed bowl, with three projecting ribs upon the extreme surface. It is covered with curvineal and vertical scorings, displaying as a whole, a curious and elaborate specimen of ancient Celtic pottery —older, if not cotemporaneous with the earliest discovered remains of Etruscan Art. It has no flange, like those discovered in 1853 at Ballon Hill,—engravings of which may be seen on reference to the Kilkenny Archæological Society. It stands six inches in height; its circumference at the top is 15 inches, but we have no evidence to show, when discovered, that its contents indicated the result of a process of cremation, although when the interior was examined with a microscope, it appears that some fine ashes were encrusted on the bottom of the Urn. It was formed of the best brick clay, moulded by the hand, and then properly baked; and it is now as sound and fresh in its appearance (without a flaw) as it was when it left the hands of the ancient Celtic potter—possibly two thousand years ago. It is intended by Mr. Lynch to present it to the landlord, Cononel Bunbury. In the neighbourhood of Ballybit—and on the same estate—may be seen a Cromlech, of hexagonal form, rudely carved at the top. It was noticed, together with the Cromlech at Browne's Hill, some sixty years since, by the celebrated Captain Grose, in the Antiquities, and is worthy of a visit. We cannot avoid stating that the students of primæval antiquity should be thankful to such men as Eddy, for the careful preservation of such ancient remains of Celtic Art, as they tend to throw a light on the domestic history of the ancient inhabitants of Ireland.

THE NEW KILDARE-STREET CLUB-HOUSE.

On the 25th ult. the members of the Kildare-street Club were installed into their new abode, which as our readers have been already apprised, was for the last eighteen months or so in course of erection at the corner of Kildare-street, at Nassau-street end. Although we have given frequent detailed notices of the progress and features of this building, accompanied by an illustration of its internal arrangements,* we may not inaptly refer to it in its completed state, and add, that for architectural excellence, it must command a certain degree of admiration both from Classicists and Ruskinites, though of course the latter are loudest in their laudations of its merits, *their* sympathies being more in unison with the style adopted by the architects than the former. In point of situation, the new Club-house is somewhat happily circumstanced, its flank abutting on a leading and fashionable thoroughfare, with the magnificent area of the College Park behind, and its principal front returning at right angles down another street, more private no doubt, but affording an admirable point of sight from which the general contour of the building may be advantageously judged. Excepting the entrance porch in Kildare-steet, and the oriel window carried up three storeys high in Nassau-street, there is no break in either façade, but those projections serve materially to relieve the flatness which would otherwise be apparent. Indeed the design of the features in question, even judged apart from the rest of the building, is in itself a study, and although the oriel does interfere with the general street ontline, and at first presented some cause for objection by the city officials, nevertheless, we are pleased in viewing it in connection with the whole. The elaborately ornamented main stone cornice, whence springs a medium pitched cantilever roof, the polished string-courses, the columnared window opens with polished marble shafts and carved caps and bases, and the perforated area balustrade, presents an effective contrast to the red brick facing of the general exterior. We are not quite sure, however, that the introduction of tall chimney shafts at the eaves—an undoubted hobby of the firm—is judicious. The internal ornamentations and fittings in the principal apartments, are of the most *recherché* character, and the arrangements of the *cuisine*, perhaps the most perfect of any establishment of the kind in or out of London. This latter department was entrusted to the eminent firm of Hodges and Sons of Westmoreland-street, who have supplied and fixed all necessary ranges—boilers, hot metal chambers, &c.—of the most approved patent principles. To Messrs. Sibthorpe and Son is due the merit for most of the decorative works—excepting the external and internal stone carvings which were executed by Mr. Purdy, sculptor, with Irish workmen chiefly; a branch of art we should desire to see more general here. Messrs. Kerr of Stafford-street supplied the furniture, Millar and Beattie the carpets, and Fry and Co. the draperies, all of which are in strict keeping with the character of the building, and subject to the architects' selection.

The original contract for this building was about £23,000, but as it now stands, irrespective of fittings, it represents more than treble that amount, and as a total some *hundred thousand* pounds. We should be gratified to see many clubs equally independent and equally willing to spend such an important sum amongst our local tradesmen, and trust that the example of "the Kildare" may induce others to outvie them. For aught we know, Nassau-street may yet become a Pall Mall, and the building under notice prove insignificant compared with subsequent erections. There is certainly no position in Dublin better suited for club structures. The names of Sir T. Deane, Son, and Woodward, as architects, and Messrs. Cockburn and Son as builders, are most honourably associated with our first palatial club-house.

Tipbradden House, Whitechurch, Co. Dublin, is being rebuilt for Thomas H. Guinness, Esq, at a cost of £1,400, and will contain drawing and dining-rooms, study, five bed-rooms, and extensive basement stores, with all modern improvements. Mr. Joseph Maguire, architect; Mr. Gahan, contractor.

The foundation stone of the St. Johnston Church, Derry, was laid on April 4th, 1857, and was dedicated December 9, 1860. It is built in the mediæval style of architecture, and comprises nave, transepts, chancel, porch, and bell tower. It stands on a fine commanding site, on an acre of ground, west of the town of St. Johnston. The high altar and reredos is of Caen stone, enriched with Mosaic and enamel decorations. The chancel floor is laid with Minton's best encaustic tiles; the passages in the nave and transepts with red and blue quarries from his works in Stoke-upon-Trent, Staffordshire. The windows are all filled in with tinted cathedral and stained glass, containing beautiful symbolic and Scriptural illustrations. The benches are open, stained and varnished, and free to the congregation.

The Boyd Testimonial, on the east pier at Kingstown, is in process of completion.

T. N. Deane, Esq., son of Sir T. Deane, has been appointed architect by the Dean and Chapter of Christ Church, Oxford, to carry out extensive additions and alterations in that college.

STREET ARCHITECTURE AND ITS PROPER TREATMENT.*

(Continued from page 680.)

Uniformity.—In the old parts of our towns each house which is rebuilt requires individual treatment by the architect, and some variation, even where a long row of new houses is erected at once, has the advantage of preserving that individuality in his abode, which is precious in the eyes of an Englishman, and gives a more poetic way of distinguishing one's house than the essentially practical number on the door. Nor have the spasmodic efforts, which from time to time have been made, by grouping houses into blocks as though they were but one building, with centre and wings complete, led to such successes, or met with such general approbation as would encourage us to pursue the same path; so that we may safely conclude, that it is at least unnecessary to strive in any way after uniformity.

Attention not to be confined to the Fronts.—While undoubtedly the front forms the important part, which we have to deal with in streets, we must consider that most houses display in the upper portions more or less of the construction of the sides, which are deserving of more attention than is now paid to them—in fact, so far has the elevational principle of designing prevailed, that when called upon to build at the corner of two streets, we usually do nothing more inventive than return the features of the front at the side, only substituting blanks for windows, thus making a frightful deformity, and sacrificing that which by nature is a strong position for obtaining architectural results.

Materials.—The choice of the materials to be used in our buildings is of the utmost importance; natural limits and economical considerations, however, too frequently bind our free-will, and it then behoves us to use to the best advantage any material necessity presses upon us. In London and a very large proportion of other places, brick is principally employed in structures of an ordinary kind, and its cheapness, and even its durability, compared with stone, will probably cause this state of things to continue; consequently our treatment of this material must affect more largely than anything else the appearance of these towns. The treatment of brickwork has been so long neglected, that bricks and mortar have come to represent all that is unartistic, dull, and unpleasant; and no wonder, when we look at the black rows of gloomy brick-houses which are so numerous in London. We may however rejoice that much alteration has taken place in this respect. Feeling the necessity of using brick, architects have been striving to ennoble it as a building material, and the introduction of different species of ornamental brickwork bids fair to be one of the principal architectural characteristics of the present age. Bricks of a light colour are particularly valuable for imparting a more cheerful aspect to our streets, and the divers colors in which this and its relative manufacture, tiles, are capable of being produced, give peculiar advantages for the introduction of polychromy, structurally in the building; thus encouraging that love of color, which, after so long and so sound a slumber, is reviving among us. The great difficulty with external colored decoration, is the evil effect of a smoky atmosphere, whereby colors are often soon dimmed or altered, and occasionally hid altogether beneath a coat of brown dirt; this has led to an almost universal feeling, that our efforts should be limited to constructive polychromy, in which the effect shall be produced by the native colours of the materials employed, and it would indeed be incautious to expose unprotected to the influence of our climate the work of the painter.

Modern instances are not wanting, in which the contrasts of colors are most unpleasantly strong and ill-chosen—in fact, it requires some care so to adjust the colors that they shall be neither painfully exaggerated at first, nor lost altogether after a year or two of exposure. As we can hardly, with our present means for coloring, calculate on the appearance which time will produce, we must beware that it do not in any way divert our attention from the more essential and lasting features of form, outline, and symmetry. Color is far from being the only way in which brickwork is capable of being made ornamental; the attentive arrangement of those bricks, which can now be obtained, moulded in the forms which most frequently occur, may, with but little cutting, be made to produce very good results.

If the manufacture of some slightly glazed facing brick (for which architects have for some time been seeking) could be accomplished, without a disproportionate increase in the cost, such that the rain would remove the deposits from the smoke, which attach themselves to our buildings, we should have a material, which, for variety of effect, cheapness, and durability, both as to substance and appearance, might be fairly esteemed very nearly perfection for all general purposes.

Tiles.—Encaustic tiles are useful for producing brighter effects of color, as well as more varied shapes, than we can easily obtain from brick alone; the quantity of them, however, which we introduce should be limited, owing to their being merely a facing, and adding nothing to the stability of the building.

Stone.—When we have stone at our disposal, it scarcely seems to be used to the best advantage, unless it be made expressive in a way which brick cannot be, by sculpture or carving, that it may appeal directly to our intellect, or our sense of the beautiful.

The facing walls with hewn stone, however desirable in buildings of a high class, should certainly not take precedence of these methods of expending the means at our disposal.

Style.—This is not the opportunity, nor would it be in any way desirable, to reiterate the arguments on the subject of the architectural style, which is best suited for our street architecture, though it is of that importance that it cannot be altogether omitted, and a few considerations press themselves forward. Firstly, gratitude would almost constrain us to the use of the Gothic, for the present interest which is felt for our art can hardly be disconnected from the study of our national Mediæval monuments, and buildings in other styles do not excite much general interest or pleasure.

Again, we often hear it claimed as an acknowledged fact that Classic architecture, as now practised, adapts itself to our modern requirements. Now, as to stone buildings of some pretension, I am not here prepared to deny the truth of this proposition; but with respect to the common-place brick houses which form the mass of our towns, we shall find that this art either enters not, or is represented by certain compo imitations, which, while they pretend to cover openings by pieces of stone, really disguise flat arches, often of the very worst workmanship, and as this can hardly be accounted art, I certainly consider we have no proof of the power of this style to bend itself to the wants of these buildings, which must ever occupy the largest proportion of our towns; and as bricks can only cover openings by means of arches, that style, which so largely includes arches of all kinds, seems, at least, in this particular, to deserve the preference. It is true the adaptation of Gothic windows to modern ideas requires some little contrivance, but this will more properly be considered hereafter, when we are speaking of windows; the difficulties which this presents, however, must be much less than was experienced in making Classic suitable, which naturally shunned the window, whereas Gothic glories in it; and it is not servile copies of the old buildings which it is desirable we should produce, but free renderings of it, fitted for our own times, that our very stones may proclaim that we have no wish to reproduce an old style, the laws of which we intend should be observed unaltered by ourselves and our successors, for then we could expect for the next three centuries no art more original or more noble than that which, with the exception of a few brighter periods, has characterised the three last; and we should, moreover, have neglected to learn the greatest lesson which this period is calculated to teach us.

We cannot overvalue the position in which domestic architecture stands with respect to the revival of the present day. While there remain so many old churches absolutely in use and suitable to a very high degree for our mode of worship, it is not surprising that study should have enabled us to reproduce good samples, correct in every detail, of the old styles, and thus but slight encouragement is given to impart to churches characteristics of our own. On the other hand, the Domestic Mediæval buildings which remain to us are so few, and our manner of life is so changed, that the adaptation of Gothic to modern wants opens out quite a new field for ingenuity, and here we may expect to invent new features which may be engrafted into our art and distinguish the architecture of our day. Again, while we hesitate to try experiments with modern materials within the sacred walls of our churches, which we build as it were for all time, we have in domestic work the means of gaining experience in their use, and afterwards we may adopt them in religious structures. Thus we are but now beginning to build churches of brick, not as a disagreeable thing which we would avoid if pecuniary considerations restrained us not, but as a material from which we mean to obtain an effect peculiar to and suitable for itself.

Whatever different opinions the subject of style has engendered, it need by no means hinder all those who wish to see our streets adorned with more noble structures than they now display, and who acknowledge those principles which govern all good art, from energetically working together; and we may trust ere long that our efforts will be united into a style which shall be more thoroughly and truly our own than anything likely to be hatched by the professed striving after novelty; and we may also well leave the question as to whether it is likely most to resemble Gothic and Classic to the individual opinion of each.

It may now be well, in acknowledgment of the principle, that our ornament is to be deduced out of the various external features of our buildings, in contradistinction from being superadded afterwards, to review the most prominent of these in order, and then to further examine the details of our subject by glancing at the treatment required by the different species of buildings, which are included under the term of "Street Architecture."

Chimneys.—Chimneys will, in most cases, form prominent objects in the external appearance of our buildings, whether we like it or no, which renders it extremely difficult to carry out the ideas of those who try to conceal them, under the impression that the office they perform is of that nature that they ought to be kept out of sight; but though the carrying of smoke may not in itself be a dignified duty, yet chimneys are the external signs of so much which we associate with the comfort and pleasure of home, and the effects they are capable of producing by giving variety to the skyline are so great, that they amply deserve to be boldly shown, and to be the objects of our care. It is necessary for our own peace of mind, that we should carefully provide for our flues properly performing their functions, that our eyes may not afterwards be shocked by all kinds of execrescences added to their tops to aid them in doing so.

---

* Prize Essay, by Mr. Lacy W. Ridge. Read before the Architectural Association, London.

Roofs.—Roofs are to be found either concealed behind a parapet or boldly shown and made to have a pleasing appearance, which may be enhanced by ornamental ridges and metal-work, as well as by distributing our slates or tiles in ornamental patterns and colors, a practice often very useful for relieving what might otherwise be an over large expanse of roof. It is quite remarkable to observe the trouble which has been taken, first to hide roofs, and then to supply the want of proper finish, which the eye at once detects, by placing rows of vases or other meaningless ornaments along the top of the parapets; whereas visible roofs give at once the natural termination to a design, and their picturesque shapes would yield far better skylines to the tops of our streets than the series of horizontal lines, jumping up and down, which they now present.

The view of any of our towns, as seen from an adjoining eminence, is rendered quite frightful by the neglect with which our roofs are treated.

Cornices.—Cornices of some kind appear by the concurrent testimony of all styles, to be necessary for the expression of dignity, and they well repay the care bestowed upon them, both by the influence they exercise over the entire design, and by the opportunities they offer in themselves for the display of invention. Even simple arrangements of bricks are so often satisfactory, that we need never be deprived of a cornice when we desire to introduce it.

Openings.—The openings in our buildings are of great importance, from their usual number, from the conspicuous effect they produce, from the proximity to the spectator in which many of them are placed, and probably still more from their being the connecting link between the interior and exterior, as they thus become the readiest means of expressing the uses to which the building is dedicated, and impart any information we wish to give as to the internal arrangement.

Windows.—Windows in those rooms which are occupied by day, are not only required to admit light, but also to give a good view from the interior; for this larger windows are required than in other rooms, and, where possible, projecting and bay windows are very advantageous. We certainly lose a means of expression by making all windows so similar, although the rooms they light are used for such widely different purposes; they might well vary in character as well as size. The glazing may be arranged in a variety of ways, each suitable for particular positions, but the majority of our domestic windows are provided with double hung sashes, which are so much associated with our notions of convenience, as not to be likely to be superseded. Now the readiest form of making these sashes is with a flat head, and when we desire to use them, and can have a block of stone to cover the opening, no difficulty occurs; for even in Gothic, the use of a stone lintel is inconsistent neither with the principles nor practice (in domestic work) of mediæval builders; but when brick only is used, the only straight covering is a flat arch, the constructional badness of which must be apparent to any perambulator of our streets; where the number of such arches that have failed ought to be enough to banish them, except on a very small scale, from any improved form of street architecture. We may combine the square sashes with those arches of slight rise which we now find in back positions (where it has not been considered necessary to give the appearance of trabeation to an arched construction), increasing, if we wish it, the rise of the arch for greater security to any height, and making the tympanum a vehicle for ornament, or even piercing it, where we have a high arch. Certainly the defects of flat arches justify us in exerting our ingenuity to dispense with their use, and they have further no beauty to recommend them.

The breadth of our modern windows is often said to be inconsistent with the forms of Gothic; but why may not any form of opening of a shape not in itself ugly be made to accord with the spirit of that style, although architects may surely reserve the right of putting two narrower lights instead of one very broad one, the single sash of which is almost invariably difficult to manage?

It may fairly be doubted whether we are right in desiring to have very narrow lights for domestic purposes. They often give an effect of meaness and discomfort, whereas broad ones may, by proper treatment, be made thoroughly Gothic.

Where any species of balcony or verandah is used, we must remember that they very prominently display themselves, and consequently claim to be designed with the same care as other features. We must not trust to buying them ready cast at a foundry.

The interior of our windows, and, indeed of the whole house, must be cared for, for it is within the house that we can most easily appeal to the affections of our clients on behalf of our art.

It behoves us to examine into the traditional treatment of every part of our present manner of building, to see whether it is reasonable and, so far as may be, artistic. Even in the matter of expense, which builders have so thoroughly studied, though it is hardly possible to reduce the outlay, we may make a more judicious distribution of it.

Doors.—Doorways admit of great variety in their treatment, nor do they present any particular difficulties. From the nearness with which they are approached, and the consequent criticism they attract, they impart much character to the building, and are worthy vehicles of decoration; in fact, when there is but a small quantity of decoration to be disposed of, this, perhaps, is the most advantageous position for it. A generous breadth and size give an hospitable appearance to an entrance, which we do unwisely to counteract by hideous grotesques, such as we sometimes meet with in such positions. It seems preferable to give an inviting aspect to any heads or figures we may introduce, although we may fairly retain the watch-dog as the guardian of our safety.

The convenience of some species of porch is great, and their deep shadows, and the pleasant effects they may produce, render them features of much value.

The apertures are so numerous and important in almost all kinds of street architecture that our wall decoration will generally be governed by them, both in character and position. Horizontal string-courses are very useful for marking the storeys of our buildings.

Rain-water pipes are necessaries, to which we need not be ashamed to give honest treatment, though I hardly like making them prominent by decoration; it is but a sorry boast that we have made our buildings water-tight.

As our domestic comforts advance, the offices required increase both in number and completeness, and, where ground is valuable, the basements furnish the convenient situation for them, so that it is now desirable that they should rise some feet out of the ground for the sake of light and air, and their treatment must preserve that idea, combined with an expression of strength sufficient for supporting the superstructure.

Iron railings are certainly not pleasing as now usually arranged; they have the appearance of selfish exclusion, without really affording more protection than a much lighter railing might do, and we are now more than satiated by the recurrence of the same types. The daily development of the uses of metal in building makes this, and all other positions where it is introduced, of great importance; so that we must give the requisite study to this branch of manufacture, that our designs may be truly fitted for the material in which they are to be executed.

We have thus reviewed those elements which, in conjunction with the mass of the wall, we have to combine into beautifully-shaped, well-proportioned and expressive architecture, over which we have to distribute our ornament, and by which we must render our streets more noble and interesting, and more worthy of that greatness to which our nation has arrived.

We will next imagine ourselves penetrating into the heart of London or any other large city from the fields beyond its suburbs, that we may gather some ideas as to the treatment appropriate to each of the principal classes of buildings that we meet with. Would that it were not at each stage, as now it but too frequently is, an advance from bad to worse; the beauties of nature vanish only too quickly, and we far too seldom find those counteracting beauties, which man has been empowered to make; so that, we not only wish to breathe the purer air and hear the warbling of the birds, but we also long to return to the varied scenes, the pleasant forms, the romantic outlines and the harmonious colors of the country.

In the border habitations, which foreshadow the commencement of a town, the work of the architect is comparatively easy; he has nature to help him, and it is strange if some pleasantness cannot be instilled into them. Leaving these, therefore, to the general principles of architectural treatment, we may pass to Building Estates.

(To be continued.)

THE ORIGIN, RELATIONS, AND CHARACTERISTICS OF THE VARIOUS STYLES OF ARCHITECTURE, AND THEIR CONNECTION WITH HISTORY, RACE, AND RELIGION.

On this subject, Mr. Huggins, architect, recently delivered a lecture before the Chester Architectural and Archæological Society, and had arranged round the room a great number of illustrations, examples of the various styles of architecture referred to in his lecture, and these he first of all proceeded to explain in their chronological order, assisted by a most curious chart prepared by himself, and which we believe he is about shortly to publish.

According to the *Chester Courant*, the lecturer, in commencing, asserted the unity of art, and maintained that though the several arts differed from each other in their language and mode of use, yet the soul of those arts was the same in all; each was but a different incarnation of the same vital spirit. Poetry was the first and chief of the arts, because its language was the natural language—the mother tongue of the arts. The architect and the painter appealed first to the eye, then to the mind; the poet, first to the mind, then to the soul. The ultimate of the two former was the proximate of the latter. Architecture was pervaded by a similar law of unity; it was not a multitude of dissimilar arts, but one connected and comprehensive whole. It was one spirit working in different ways, and showing itself under various similitudes. The styles of architecture were but different external phases of one soul. And this view was borne out by their history; they were all historically related, and there was reason to believe they all derived their origin from one fountain head in antiquity. Here he entered into an explanation of his "Chart of the History of Architecture" which represented, under the similitude of streams, the rise, chronological sequence, relations, &c., of the various styles which have been practised in the world. The most prominent distinction between styles of architecture was into beamed and arched. All ancient styles—all before the Christian era—were beamed or trabeated; that is, their columns or pillars supported an horizontal lintel, or architrave. All modern ones, on the contrary—all subsequent to the Christian epoch—were arcuated, the columns immediately supported arches springing from column to column. The Egyptian, the Assyrian, the Pelasgic, the Etruscan, and Greek, were all trabeated styles. The Roman architecture, in the time of Augustus, was pure trabeation; but it gradually gave way, during the period of the empire, to the inroads of the arch. The Pagan Romanesque, which immediately preceded the Christian Romanesque, was the first arcuated style, and all its numerous descendants, down to the present day, were on the same principle. Of the arcuated style, two were pointed arched, namely, pointed Gothic and Saracenic. The rest were *round* arched. This division into beamed and arched styles applied to all of the great connected classic family of Europe and Western Asia; but all the systems detached from these, all the outlying styles—the Buddist, the Hindu, the Chinese, the Peruvian, and Mexican—were all beamed, whether ancient or modern. There were what are called Astylar styles, in which columns do not enter into the artistic designs Such was that known as the Sassanian, being that of the Middle Persian Empire; and the Modern Florentine, which had been called a Fenestral style, from the decorative elements being chiefly employed in the adornment of the windows. The Travellers' Club House, Pall Mall, based on the Pandolphini Palace at Rome, by the celebrated Raphael, is a noted example. Two of the arcuated styles—the Byzantine and the Saracenic—were remarkable for the use they made of the dome, which in these styles was the chief constructive feature. Others occasionally employed the dome, but in these two it was an essential feature. There was another great formative principle which Mr. Huggins pointed out. He remarked that two of the arched styles were pointed, viz., the Gothic and the Saracenic. The Gothicists, however, made a very different use of the pointed arch to that made by the Saracens. While in the Saracenic, the pointed arch was barren of effect beyond that communicated directly by its own form, its tendency in the Gothic was to increase the new-born principle of verticality, already shown in the Round Gothic to a most wonderful pitch. Spires and pinnacles seemed literally to emulate the aspiring tendency and principles of nature's vertical structures. They were nature's organic productions geometrized, as it were—modified by ideas of utility, and the precision and symmetry of human design. It was the possession and command of this aspiring principle—this faculty of looking heavenward, so appropriate to a religious edifice —which was the true glory of the Gothic—which distinguished it from all the styles of the world, and rendered it by far the most important issue of the great architectural fountains of antiquity. The lecturer went on to trace the various births, changes, and ramifications of architecture, from the Egyptian and Greek, through the Roman Byzantine, Gothic, and Saracenic, to the present time. The history of architecture showed that the most potent influences that had been brought to bear upon its career, were those of religion and race. The distinctions of religion distributed the styles of the world, as they existed in the middle ages, into four groups or species, viz., the Gothics and Romanesques; the systems of the western or Latin Church; the Byzantines, the Eastern or Greek Church; the Saracenics, the styles of Mahommedanism; the Indian and Chinese, the Pagan. Difference of race had also divided the styles of the world into groups, and given them a general ethnographic arrangement, as well as a theological, which might be expressed thus—from West to East—Teutonic, Celtic, Sclavonic, Arabian, Tartar. If either the fate of religions, or the migration of races and tribes had been different, it was plain that the career of architecture had been different also. We were indebted to an outburst of barbarism in the fifth century, which destroyed the civilization of the ancient world for the greatest system of architecture that had arisen since the Greek, and to the rise of an illiterate Arab in the seventh, calling himself a prophet, for another, which beautified and gave additional charms to the fairest countries of the globe. He pointed to several of the styles individually in illustration of what he had advanced with respect to the influence of religion and race upon architecture. The religion of the Pelasgi was hero, or ancestral worship; and we found their architecture developing itself chiefly in tombs. The religion of the Persians was the Magian, or fire-worship, which required no temples, its rites being chiefly exercised in the open air. Accordingly, no temples were built by them; and we found this style chiefly developing itself in palaces. Mr. Huggins entered at length into the characteristics of the ancient styles, through which it would be impossible for us to follow him in the space at our command.

The Rev. Canon Hillyard moved a vote of thanks to the lecturer for the ability and zeal he had displayed in the preparation of his subject, and for the novel and interesting chart which accompanied it.

ONE OF THE LIONS OF CHESTER DOOMED.

MR. T. HUGHES at same meeting took occasion to elicit the sincere regrets of the society, that the city was about to lose one of its most interesting antiquarian remains, and one which had long been looked upon by the intelligent stranger as one of the "lions of Chester." He alluded to the house known as "God's Providence," from its bearing on one of its beams the inscription in curious old letters, "God's Providence is mine inheritance." The ancient timber houses of Chester were now few and far between; and it was a melancholy reflection to feel, that one of the most characteristic yet remaining, was about, within, perhaps, a few weeks, to vanish from the scene, in order to satisfy the necessitous demands for commerce. Mr. Gregg, the present owner, he knew to be a man of considerable public spirit; and, unfortunately, it could not be expected that he would altogether sacrifice his business views to either the views of the general public, or the gratification of the antiquary—still it was much to be hoped that at least the carved timbers of the old house, and as far as possible, its external character also should be in some measure preserved in the new erection. This course would certainly serve to identify the spot, about which clung, like ivy, many an old and loved tradition, sacred alike to both citizen and stranger.

THE SHANNON.

THE recent and previously frequent inundations of this noble artery and its tributaries, have caused considerable damage to the adjacent districts, and consequent alarm to the numerous inhabitants along its banks, who in considerable force mustered at a public meeting in Athlone, on the 27th ult., to consider the best means to be adopted to remedy in future, and also to effect improvements in the navigable capacity of the river. The chairman (Lord Clanricarde,) amongst other remarks, observed, that "no landlord or proprietor in person can abstract from this great stream as much as one cup of water without leave of Government;" also that it depended on his hearers "to obtain justice for themselves and improve the country to which they belonged." Various resolutions were proposed and adopted, and some practical steps are likely to follow.

Touching same subject, an important meeting was held in Banagher, and in the course of the proceedings Mr. Lynan, C.E., entered into a lengthened statement respecting the works on the Shannon. He attributed the losses sustained to the inefficient works constructed at Meelick and elsewhere, and these obstructions could be removed or modified. The dams erected impeded the flow of the water and caused the floods; but if the dams were removed the navigation would be destroyed. The Commissioners were losing by the navigation. According to the printed returns, the expenditure of the board, for the last eleven years, amounted to £31,485; receipts from rents, tolls, &c., £20,186, leaving a loss of £11,292. To remedy the defects, he would suggest the erection of a number of self-acting sluices to let off the water. He then explained the principle of these sluices, and stated where he would have them erected. He contended that the dams erected by the Commissioners were not of the slightest utility to the navigation. He stated, in conclusion, that nearly all the entire flooding could be obviated by less interruption to the stream at all times and by a deeper outlet, since the overflow in nearly all the districts did not exceed a depth of much more than eighteen inches. All the facilities for the discharge of the Shannon waters must be commenced near Limerick, and thence continued up the river to Athlone; and he stated several facts confirmatory of these opinions.

A MORE EFFICIENT FIRE BRIGADE.—Our municipal body are about applying, next session, to Parliament for more definite power to maintain an efficient fire-brigade and fire escapes, in connection with "the Dublin Corporation Water Works Act, 1861." The defective construction of the present fire-escapes, as already largely treated of in this journal, should receive immediate attention.

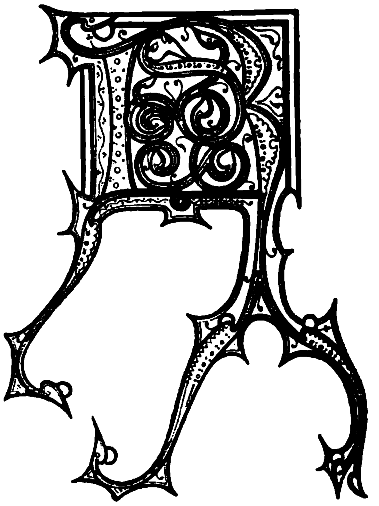
ILLUMINATED ART.

LETTER I FROM MS. GOSPELS, XII. CENTURY, BRITISH MUSEUM.

ILLUMINATION has of late become a revived and pleasing study for artist and amateur, and is justly regarded as a branch of polite education. Several works bearing thereon—some of uncommon excellence, others less pretentious—have recently issued from the press, and our readers will remember our notices thereof, as they reached us from the publisher's hands. We have now before us one* which, if in part not the *most* recent, combining as it does a previously published "manual," and a subsequently added "companion," is at least so in the revised and improved form now presented, and must be judged in that light in its integrity. The purpose of the book in question is essentially practical, but, like most others of kindred character, it opens with an instructive historical sketch of the art in bygone ages, in which is introduced a glance at the characteristics of the various styles of illumination. Amongst these notices the handiwork of our Celtic ancestors has not escaped mention, and the following paragraphs may be appropriately quoted in illustration:—"In very ancient times the Greeks are said to have learned many things of the Celts who possessed curious arts, together with the most extensive knowledge of natural science. Those very remarkable knotted and intricate traceries of twigs and stems, met with so often on Celtic monuments and in old MSS., are of their invention and among their significant secrets. The Celtic style, distinguished by its interlacing bands and inextricable coils of lizards, birds, and twigs, was carried from Ireland by St. Columba to Iona, and thence to Lindisfarne by Ædan, when made bishop of that see in 735. From this time it is called Hiberno-Saxon, or Anglo-Saxon." One noted example of Celtic work exists in the great "Book of Kells" at Dublin, in which the peculiar niceties of the art are so elaborate as to make them the *wonder* and *despair* of copyists. "Of this book," says Mr. Wyatt, in his recent valuable essay, "Mr. Westwood examined the pages, as I did, for hours together, without ever detecting a false line or an irregular interlacement." Adding, in a note, that "it would scarcely be possible or advisable for the most skilled draughtsman in *modern* days to copy some parts of such a book. The manner of life in the middle ages (ignored as *dark* ages), mainly contributed to the production of such *unrivalled*, *marvellous* works of art. Many people very ignorantly condemn the revival of illumination as needless, now that printing exists; but they may rest assured, that its practice is—especially for young people—most disciplinary and delightful, and tends, even as an accomplishment, to strengthen those qualities of *patience*, *thoughtfulness*, *and delicacy*, which shed so salutary an influence upon our daily life. The schoolboy or girl might very profitably and pleasantly acquire their first knowledge in free-hand drawing and colouring, by heading their copy-book pages with an occasional simple capital at first, to relieve the tedium of the repeated text or small-hand."

With part ii. commences the practical department of this excellent *multum in parvo* work, and it is so comprehensively rendered that we have no doubt but that the most uninitiated would attain, after careful study and without the aid of an instructor, a perfect knowledge of "the mysteries of illumination;" though a regret and surprise are suggested, that like some other works with similar purpose, the treatise on colouring is unaccompanied by illustration of the effects produced, though in this portion, as throughout, numerous beautifully-executed outline woodcuts of initials pervade the letterpress. Some of these we are enabled to reproduce from "the Companion," and though not the most important of the selections, they will serve to convey more forcibly the character of the work under notice. The border and figure drawings collected from MSS. in the British Museum, are especially remarkable for excellence, as also are some borderings and letters from MS. Bible, Advocates' Library, Edinburgh.

The *Manual* and the *Companion* must both be appreciated as forming a most instructive and entertaining book, and an authoritative guide to those pursuing the study of illumination, either as a pleasure or an occupation. The publishing department is likewise entitled to commendation, for the very presentable form and style of the exterior.



LETTER R AFTER MS. BIBLE, ADVOCATES' LIBRARY, EDINBURGH.

LETTER O, FROM MS. BIBLE, ADVOCATES' LIBRARY, EDINBURGH.

DROGHEDA.

The *statu quo* condition of this town is a matter of great surprise, considering the facilities afforded for interchange of communication by rail with the metropolis on the one side, and with the commercial capital of the north and adjacent towns at the other; besides its proximity to Liverpool, with which it holds daily passenger and goods intercourse by a fleet of swift and powerful steamers. During the last ten years any improvement that has taken place in the general aspect of the streets, has been comparatively unimportant; most of the business houses presenting a very antiquated character, and in the principal street—West-street—there being but two, viz., Davis, Son and Latimers, and Parsons and Co.'s, of any architectural pretensions. Publicans and pawnbrokers are in the ascendant, and in more than one respect, too, as being among the fortunates in acquiring worldly stores; the streets are filthy to a vengeance, a fact perhaps chiefly attributable to the nature of the local paving and flagging stones employed, but which consequently would demand more looking after; in sanitary regards, the back streets, where the labouring and manufacturing classes inhabit, are palpably defective, indeed as much so as those of any town in the West of Ireland, and especially for a town so disadvantageously placed as Drogheda notoriously is in this regard, their condition is a gross stigma on the authorities. At last, steps are being taken to substitute a suitable structure over the Boyne for that which was condemned fifty years ago, but still spans it and serves as the chief thoroughfare; and we hear that it will be a spacious structure, with double foot-paths. This will, admittedly, be a desideratum, and we hope that other contemplated improvements will soon follow. The railway viaduct over the Boyne has been strengthened in accordance with the recommendations of Mr. Hawkshaw, C.E., and apprehensions as to its security are thereby reasonably set at rest.

---

* Manual of Illumination on Paper and Vellum. By J. W. Bradley, B.A., and T. G. Goodwin, B.A. With practical notes and new illustrations on wood, by J. J. Laing; together with "A Companion," by same artist. *Ninth Edition.* London: Winsor and Newton, Artists' Colormen, &c.

CENTRAL RAILWAY STATION.

It is proposed to form a Company with capital sufficient to unite, by branches, the several railways, having termini in this city, viz., the Great Southern and Western, the Midland Great Western, the Dublin and Drogheda, the Dublin and Wicklow (Kingstown branch), and to form a central station at the western side of Carlisle bridge, and 150 yards west of the Metal bridge, also lines of tramways along the quays, and to widen and improve Carlisle bridge. The mode of connection proposed is briefly,—to construct a line commencing 150 yards distant from Great Southern and Western Railway bridge at Long lane, passing thence through the parishes of Sts. James, Paul, Audoen, Michael, Michan, Mary, John, Werburgh, Andrew, Thomas, and Mark, and terminating by a junction with the Dublin and Wicklow Railway, at western extremity of Westland Row station; a junction with the latter at a point near centre of river Liffey, and 66 yards west of Carlisle bridge, thence to Amiens-street station of Dublin and Drogheda Railway, 56 yards from lower Sheriff street bridge; also by a Junction with latter, 240 yards north east of Lattice Canal bridge, and uniting 220 yards from said bridge with Liffey branch line.

The scheme, however desirable, would seem to be far too comprehensive to justify a hope of speedy accomplishment.

METROPOLITAN CATTLE MARKET.

We perceive that it has been re-notified that application will be made to Parliament in the ensuing session, for leave to bring in a bill "To incorporate a company for the purpose of establishing, erecting, and maintaining a new Market, to be called the Metropolitan Cattle Market, for the sale of cattle, horses, sheep, pigs, hides, skins, and other marketable commodities; such proposed market being situate in the North Lotts, immediately adjoining the Liffey branch of the Midland Great Western Railway, and extending from the Dublin and Drogheda Railway to East-road and Sheriff-street, all in the townland of North Lotts, in the parish of Saint Thomas, and county of the city of Dublin. And power will be taken to erect suitable offices, counting-houses, sheds, stores for the sale of provender, dwelling-houses, shops, weighing machines, water tanks, stalls, pens, slaughter-houses, with all other necessary buildings suitable for the purposes of such proposed Market, &c., &c." The desirability of improved market accommodation has been frequently urged in these pages, and some portions of Mr. Hemans' (C.E.) report, with accompanying maps on the project in question, appeared in previous numbers.

A NEW ARCHITECTURAL PHOTOGRAPHIC ASSOCIATION.

With experience based on the misfortunes or the mismanagement, or whatever it may be, of a former project which has become "a thing of the past," a few gentlemen have united to mature and maintain *an* association for the advancement of Photography as applying to the art of Architecture, and amongst such we notice the names of Messrs. Tite, M.P., Beresford Hope, Sidney Smirke, Cockrell, Digby Wyatt, &c.

A professional contemporary says the modus operandi of the new association will be to procure negatives of fine architectural works, both abroad and in this country, not otherwise obtainable, and to issue proofs to annual guinea subscribers. The exhibition will be abandoned, and subscribers are invited to propose subjects. If "caution marks the guarded way," we see no reason why the new association should despair of success.

AN ARCHITECT MAYOR OF BELFAST.

It seldom happens that an architect succeds to the dignity of "Mayor," the character of his occupation naturally precluding him from the probability of selection for an office admittedly more suitable for a commercial, than a professional, man; nevertheless, precedents for such an event in England are not wanting, though, as *yet* Ireland cannot furnish any. The first exception, therefore as regards the latter, will be the Mayoralty of Belfast for 1862—which in more regards than one, promises to be an eventful year—the result of the nomination being in favour of Mr. Charles Lanyon, an eminent architect and C.E., with whose name much of the modern improvements of the important town of Belfast, especially, are associated.

It is somewhat of a coincidence, too, that an Englishman should be the *first* exception; however, we have no sympathy with those who would suggest that fact as an obstacle to the occupancy of the office, where both merit and position entitle to the distinction, as in this instance, undoubtedly they do. The following brief sketch of Mr. Lanyon's career may prove interesting.—After concluding his articles with the then architect of the Board of Public Works, Mr. Jacob Owen, Mr. Lanyon was appointed to the county surveyorship of Antrim, an office which he still holds, and established himself as a practising architect in Belfast, where his business increased in proportion to the growing prosperity of the town, which everybody knows has been in a ratio considerably beyond that of any other in Ireland. Most of the public buildings in Belfast and neighbourhood, and very many of the private and commercial likewise, have been designed by and completed under Mr. Lanyon's directions, amongst which we may enumerate the combined Custom House, Law Courts and Post Office, the Queen's and Presbyterian Colleges, various ecclesiastical edifices, Banks, and the Sailors' home, &c., &c. In the engineering branch, Mr. Lanyon also enjoys the patronage of several Railway Companies, and had important lines completed under his supervision. Recently, in conjunction with his partners, Mr. Lanyon, jun., and Mr. Lynn, Mr. Lanyon opened a branch office in Dublin, and additional evidences of the ability of the firm have been presented in their designs for the new St. Andrew's* and Unitarian Churches in this city, the latter about to be commenced. With such extensive practice it may not be unreasonable to assume, that a fair acquisition to the worldly store has resulted, and we believe we are correct in stating that Mr. Lanyon possesses *considerable* property in the town of Belfast, a fact which at once establishes a just claim to the civic honour about to be conferred. But we may go farther and say, that in all the relations of life, by his courtesy, amiable disposition, and demeanour, which is that of a polished gentleman, Mr. Lanyon has won the highest and unanimous esteem not only of his (adopted) fellow-citizens, but of all members of society with whom he has at any time come in contact. Joining in the general surmise—whether it may prove only an idle one or not we cannot say—that on the attainment of majority next year by the heir to the British throne, the Mayors of the principal towns in the kingdom will be dubbed "Knights" in honour of the event, we hope we may be enabled to present our congratulations thereon to the *third* "Knight Architect" in Ireland, as we now do for his attainment of the worthily earned distinction, "Mayor of Belfast."

PROPOSED CATHEDRAL FOR BELFAST.

For some time past a project has been on foot for the establishment of a Cathedral in Belfast, for the see of Down and Connor; and we learn, from recent accounts, that the preliminary arrangements of the committee appointed to secure that object, are progressing successfully. Amongst the donors are the Lord Lieutenant, the Lord Bishop of the diocese, Mr. Guinness, and numerous others of the nobility and gentry.

As regards the intended building, we have no doubt that the proverbial enterprise and good taste of the Belfast people in matters architectural, assisted by eminent local professional talent, will secure a suitable and handsome work of ecclesiastical art.

WINTER SHOW, ROYAL DUBLIN SOCIETY.

Scarcely were the doors of the Agricultural hall finally barred to admission of the public to the "Art Treasures" collection deposited therein, than a legion of hands, under direction of the Society's energetic officials, might be seen undoing that which cost them so much previous labour to arrange and classify, paving the way for some *new* event. The Winter Show of Cattle, farm and dairy produce, implements, &c., is announced to take place on the 17th inst., and following day; and, though it is by no means so important an exhibition as the corresponding one in Spring, it nevertheless, by those whose pursuits are allied to agriculture, is looked forward to with some interest. We presume that no substantial cause at present exists to justify an assumption of its being this year, either of more or less than average excellence.

THE FALL OF HOUSES IN EDINBURGH.

A warning to the corporate officials in cities and towns, where ancient and insecure structures exist, has been issued from "the modern Athens," and we hope that the proverb, "out of evil cometh good," may be speedily illustrated, both as regards our *own* city and others, before a similar calamity takes place. A house, six stories high in front, seven at rere, and 300 years old, suddenly fell last week in the High street of Edinburgh, burying under tons of debris, some eighty or ninety inmates, the majority of whom were enjoying rest—that image of death, soon to become a reality.

The descriptive particulars are most harrowing, and we will not relate them; the extrication of lifeless, semi-lifeless, maimed, and mutilated bodies respectively, was vigorously proceeded with after the crash, and miraculous to relate, some escaped comparatively uninjured, while those in juxta-position were instantaneously hurried into eternity.

The number of deaths announced as having taken place, is twenty-eight. The cause assigned is the rottenness of the timber supports, a cause which, under proper inspection of dilapidated structures, ought not to have been developed at a cost of human life, and the existence of which it was not unreasonable to assume, after a lapse of three centuries. The blame for this sad occurrence can and ought to be brought home to *somebody*.

---

* Illustrated in the Dublin Builder for September 1860.

ARTIFICIAL FLOWERS' MANUFACTURE.

We have recently heard and read very much of the fatal results arising from the employment of arsenic in the manufacture of green paper hangings, but this deleterious ingredient is not confined to this branch of trade, being extensively employed in various others, of which perhaps the manufacture of "artificial flowers" is the most important. Parties, generally youths of the fair sex, so engaged, adopt some precautions against the inhalation of the pigments—such as wearing masks, or pieces of muslin across their mouths—sometimes with partial success, but sometimes not so. This week we read in the columns of our London contemporaries of the death of an artificial florist, a young girl, nineteen years of age, owing to the effects of poison imbibed into the system during the pursuits of her occupation. The premonitory symptoms consisted of pain in the side and intense thirst, accompanied by retching—it being the fourth attack from same cause—and the existence of the sufferer was speedily terminated in great agony. It seems that the leaves were made of wax, and while wet, emerald green powder was sprinkled over them; and in the post-mortem examination, the lungs were found to give presence of arsenite of copper, and the bronchial tubes to be affected.

The surgeon who had been called in to attend the deceased, demonstrated to the coroner's jury, by means of a glass tube in which some grains of the powder had been placed, that one end contained a deposit of metallic arsenic, and the other arsenious acid, an incontestible evidence of the presence of poison—and recommended in future cases as an antidote the administration of the hydrate peroxide of iron. *We* would, however, urge in this as in numerous other occupations wherein human life is made subservient to the wants, the luxuries, or the vanities respectively of man, that *prevention* is better than *cure*, and that those invested with authority should prohibit, under severe penalties, the employment of such elementary materials in manufactures as are detrimental to health and longevity.

HIGH ALTAR AND REREDOS, ST. MICHAEL'S, TIPPERARY.

Passing notices of this important—perhaps indeed the *most* so of any of similar character in the kingdom—work of ecclesiastical art have appeared in this journal, but we should involuntary and tacitly perpetrate an act of injustice towards the artists engaged thereon, were we not to award space for more *special* description of its features and composition.

The general dimensions of the altar, which stands on a richly moulded plinth, are 11 feet 6 inches in length, and 3 feet 4 inches in height, to a massive table, ornamented with ball flowers and pateræ formed on hollow mouldings, and supported by four marble columns with carved caps and moulded bases.

On the front in three quatrefoil medallions are beautifully sculptured subjects illustrating, respectively, "The Paschal Supper, and the sprinkling of the door-jambs with the blood of the Paschal lamb; the gathering of the manna in the desert; and the spies bringing branches of grapes from Hebron."

The tabernacle is of the finest alabaster, and elaborately carved, having on each side in an angle niche, a solid gilt figure of an adoring angel; and central, a large wrought safe lined with richest materials, the door being of massive gilt plate beaten, engraved and picked in with richest colours.

The reredos is 27 feet 6 inches wide, and covers the entire end of the chancel from floor to sill of east window—a height of 17 feet 6 inches—flanked by gorgeous niches and a canopy 2½ feet high. The canopy is supported by four marble columns resting upon a base exquisitely wrought. In one niche is a statue of the Blessed Virgin, 5 feet 6 inches in height, and over her head rises a groined ceiling and four richly carved and pierced gablets, from the centre of which rises a handsome crocketed pinnacle, with finial termination; and in the other a figure of St. Michael the Archangel, patron of the Church.

The basement rises seven feet from floor, and is rich in diaper, terminating with a carved string course, and surmounted by six elaborate canopies sustained by marble columns with richly carved crocketed gablet over each, the spaces between gablets being filled in with angels bearing musical instruments.

Immediately under the canopies above named are sculptured, three fourths life size, the following subjects, viz., "the sacrifice of *Abel*—representing, respectively, the offering of the lamb, and the acceptance thereof of our Blessed Lord; the sacrifice of *Noah*, wherein the prophet, surrounded by his sons and daughters, is seen in the act of offering; the sacrifice of *Melchisidech*, King of Salem, bringing forth bread and wine; the sacrifice of *Abraham*, who, with uplifted hands, immolates to the Most High his son Isaac, bound upon the altar; the sacrifice of King *Solomon*, in presence of the people of Israel, on the completion and dedication of the temple; the sacrifice of *Elias*, who prayed, and fire descended from Heaven and consumed the sacrifice." (The composition of this group is very effective, and tells its story.) Central in the reredos rises a richly wrought canopy 26 feet high, surmounted with a figure of a pelican feeding her young, and supported by four marble columns. Underneath the canopy is a colossal figure of our Blessed Lord, as King of Heaven and Earth, holding the globe in the left hand, the right being raised to bless the people.

The Artists of the above named work, as also of the side altars in same structure, are the eminent firm of Hardman and Co., Birmingham and Dublin, to whom much of the revival, in Ireland, of mediæval art is mainly attributable.*

THE ORDNANCE FRAUDS.

COURT OF QUEEN'S BENCH.

The trial of Hamilton Connolly, clerk in the Ordnance Office, and John M'Ilwaine, builder and contractor, for frauds jointly committed by conspiracy and forgery on the Ordnance Department, amounting, it is said, to several thousand pounds, was commenced on the 28th ult.

The prisoners had pleaded not guilty.

The Attorney-General then stated the case. The offences charged were conspiracy and forgery. The prisoners were persons of consideration in the city and its neighbourhood; both held respectable positions. Hamilton Connolly for many years was chief clerk in the office of the District Commanding Engineer in Dublin. John M'Ilwaine was for a great number of years a contractor. He did an extensive business. He had triennial contract for certain barracks in Ireland, amongst them Island-bridge and Richmond-barracks. During periods of three years he had to execute necessary works in the barracks, according to certain schedule prices which he had contracted for. The amount of work which the contractor executed at any barrack during a period of three months, was examined by the local clerk of works, then certified by the district commanding engineer, and the claim of the contractor for the work done being checked off by the schedule prices; it was then returned to the office in which Hamilton Connolly was chief clerk, to be transmitted by him to the accountant-general's office, in London, who thereupon sent back an authority to Connolly to draw bills for the payment of the amount. A duplicate of the contractor's claim, and of the certificates of the proper officers was presented. It was impossible to imagine any machinery more perfect than this to prevent fraud upon the part of the contractor, When he furnished his claim for work done, he should have that claim examined by the local clerk, again by the district commanding engineer, then by the persons in London—all this was done before the order for payment was made. Only in one way was it possible to defeat that machinery—by complicity between some trusted servants of the crown and the contractor. Up to the time the district commanding engineer signed the certificate, it was impossible to attempt a fraud. But when the certificate was sent back to the office, the opportunity for fraud was given. Before it went into the office, the claim was perfectly true and good—it represented work actually done, and bore the genuine signatures of the officials certifying it. In Mr. Connolly's office, however, the claim of the contractor was altered—the columns were altered—in some instances by interpolating items that were never there before; in others, by changing the figures that were in the columns to represent larger amounts. In this way extensive frauds were carried on by the prisoners, the changing of the claims being done in every case by the prisoner Connolly. The Accountant-General in London, when he received the fraudulent claim which never had been certified, although it purported to be, sent a letter of advice of M'Ilwaine, who resided in Naas, telling him to draw a bill for the amount. It appeared that M'Ilwaine communicated with Connolly in Dublin, that the latter drew the bills for the fraudulent amounts, which being accepted by the paymaster-general, were paid in due time, and the fruits of the frauds were thus realised by the parties. The first fraud, which would be brought under the notice of the jury, was in reference to the claim of M'Ilwaine for the quarter, ending 31st December, 1860, for work done at Richmond Barracks. The amount certified for the Local Clerk of Works and the District Commanding Engineer, was £323 17s. 2¾d.; that claim was fraudulently altered by Connolly to £628 7s. 2¾d.—the difference was made up by inserting an item in the claim for "Bangor slates with nails dipped in boiled oil, £406," instead of a small amount under that head. It would be found that those slates were never furnished to the barrack—that the whole thing was a deliberate fraud. The second fraud was in the claim of M'Ilwain, for Island-Bridge Barrack, for the same quarter, ending 31st December, 1860. The true claim was £277 11s. 5¾d., it was fraudulently altered to a claim for £576 1s. 5¾d. by erasing the true figures and substituting the false ones. The third fraud was carried out on a claim of M'Ilwaine for Richmond Barracks, for the quarter ending 31st March, 1861, the true amount was £361 14s. 7d., it was fraudulently altered to £706 17s. 0¾d.; by inserting, instead of a small amount for slates, an item of £460 3s. 4d., for 251 squares of Bangor slates with nails dipped in boiled oil—those slates, it was unnecessary to say, had never been supplied. The fourth fraud was on the claim of M'Ilwaine for Island-Bridge Barracks, for the quarter ending the 30th June, 1861. The genuine claim was for £221 10s. 2¾d., it was fraudulently changed into a claim for £445 18s. 5d. The fifth fraud was on a claim of M'Ilwaine for the same period, for work done at the Richmond Barracks. The true sum was £269 9s. 3d., it was fraudulently altered to £501 6s. 9d. These were the cases that would be proved to the jury. During six months M'Ilwaine's true claim for work done at the barracks was £1,447. That was the amount of the claim examined and certified by the clerk of works and the district commanding engineer. The sum fraudulently claimed and received was £2,858, leaving a profit to those concerned in the frauds, of £1,411 during the six months. Evidence of the most conclusive character, under the hands of the parties themselves, would be given to prove that Connolly altered the claims, and that M'Ilwaine conspired with him in the frauds. When Connolly was arrested in his office, the police took possession of his papers before he had any opportunity of meddling with them. Documents were found having entries on them which were, in fact, a history of the frauds already disclosed, with a division of the spoil, all in the handwriting of Connolly himself. He (the Attorney-General) would read from a book of Connolly's, the following entries:—Under the head "Rich," were, in one column, the figures "311260;" in another, "323172;" in another, "628172." "Rich" meant "Richmond Barracks;" "311260" stood for the 31st December, 1860; "323172" represented the first genuine claim of £323 17s. 2d., and "628172" meant the sum it was fraudulently altered to, £628 17s. 2d. The other claims, their dates, original genuine sums, and what they were fraudulently altered to, were represented in the book in the same way by columns of figures. Under the figures which represented the history of one claim, upon which there was a gain of £304 10s, there was a balance struck in this way—Under 304, which represented the sum, was put 200, and the balance was brought out 1041, or £104 10s. That was the division of the profits on that transaction. Upon another of the transactions, which gave a profit of £224 16s. 2d., the balance was struck by the figures 224162, under which were put 150, the balance then brought 74162, or £74 16s. 2d. There, again, was the division of the spoil in Connolly's handwriting. The claim of £271 11s. 5¾d. was altered, as and been stated, to £576 1s. 5¾d., by erasing the true figures, and substituting false figures. The true figures, £271 11s. 5¾d., were signed "Edw. William Dunford," the name of the district commanding engineer. The substituted figures, £576 1s. 5¾d., bore the initials, "E. W. D.," and, of course, being thus apparently certified by the officer whose genuinely written name appeared where the other figures were, passed at the office in London as all right. The letters, "E. W. D.," were forgeries, as the crown alleged, by Connolly. Amongst other matters belonging to that prisoner, which were found by the police, was a scrap of paper on which the letters "E. W. D." were several times written. The jury would, perhaps, conclude that the writer was practising the writing of the initials "E. W. D," for the purpose of forging them. They were forged to the claim above mentioned. Amongst the papers of M'Ilwaine were found some bearing calculations of the kind found in Connolly's book, and this was evidence of the conspiracy between the prisoners. Three documents found in M'Ilwaine's desk should be read. Two were letters from Connolly. The first, dated from the War Office, Dublin, Thursday, 18th July, 1861, was in these terms: "My dear Sir, the bills for the undermentioned places were forwarded for payment yesterday, for the June quarter, 1861—Island Bridge, £221 16s. 2d.; Richmond Barrack, £268 9s. 3d. Your's truly, Hamilton Connolly. P. S.—You ought to see Scott about the contract for the drainage and water supply of the Island Bridge Barrack." That was a real, true, and proper letter, stating that bills had been sent for sums honestly due and properly certified. But there was another document—a private letter from Connolly to M'Ilwaine, of the same date, the 18th July, 1861, in these words—"My dear M., I have to pay £300 in three weeks from this date; there is no escape from it. As you cannot help me without I assist you to do so, I have arranged matters according to the enclosed dockets. When you get the amout of those bills you can pay me £300. You also owe me a balance of £277, which I hope you will soon be able to clear off, and then I promise you there will be no more transactions of this nature." Inclosed in that letter was a slip of paper having, in Connolly's handwriting, the following calculations:—"I. B., £221 16s. 2d., £445 16s. 8d., £224 0s. 6." "I. B." stood for Island Bridge, and the figures represented the true claim, the fraudulent claim, and the profit realised. Then under £224 0s. 6d. was put £150, with the words "for me," and the balance was brought out £74 6s., with the words "for you." A second calculation was this—"Rich," £268 9s. 3d., £501 6s. 9d., £232 17s. 6d. "Rich," meant Richmond Barracks, and the figures, the true, the false claims, and the gain. Those under the £232 17s. 6d. were put "£150," with the words "for me," and the balance was brought out £82 13s. 6d., with the words "for you." There was the division of the spoil under the hand of Connolly himself, who realised on the two transactions the £300 which, in his letter, he said he required. It would be proved, too, that on the 30th July, M'Ilwaine drew a cheque for £150 in favour of Connolly. This was the outline of the case of the prosecution. It would be sustained in every part by documentary evidence, about which there could be no mistake. If there was any doubt on the minds of the jury as to the conclusive nature of evidence adduced to bring home guilt to the prisoners, of course, they would return a verdict of acquittal. But if, on the other hand, the jury were satisfied that the evidence did sustain the indictment, however painful it might be to them, seeing the respectability of the prisoners, it was, nevertheless, their bounden duty, and, assuredly, they would discharge it, to find a verdict of guilty against the prisoners.

---

* It is not a trifling coincidence, that *such* a work should find its destination in "*Tipperary*," but is a happy illustration of progress.

After several witnesses—chiefly Castle officials—had been examined by the Crown, and cross-examined by the prisoners' counsel,

Mr. Macdonogh, Q.C., addressed the jury on the part of the prisoner, M'Ilwaine. The case of his client was no way connected with that of Hamilton Connolly; he did not intend to say one word, in defending M'Ilwaine, either in exculpation or condemnation of Connolly. The Attorney-General, in this important case, did not tell the jury how, in point of law, he hoped to sustain against M'Ilwaine the indictment for conspiracy and forgery. Where was there the slightest piece of evidence to show that M'Ilwaine ever committed forgery in any of the mass of papers that filled the table? There was none. Neither was there evidence to prove that M'Ilwaine conspired with Connolly to commit the frauds charged. The charge was that M'Ilwaine, a man who had passed a long life bearing the highest affirmative character for honesty and sincerity—a man of means, too—conspired and forged to commit frauds; but the jury would be satisfied before the trial was over that, however he may have been connected with irregularities, he certainly did not stain his hitherto high character, with the crimes charged against him. There was a wide line of demarcation between irregularity and crime, and the jury should bear that in mind. It should be stated who John M'Ilwaine was. For thirty years he had pursued a laborious and industrious career. He had necessarily to depend much on others in respect to his accounts and claims. Gradually M'Ilwaine raised himself in life. He was well known and highly respected in his business—he was respected, too, in Naas, his native place, and his acquittal was there anxiously awaited, not only by the peasant, but by people of every class, who firmly believed that, however confiding and incautious he may have been, he certainly was not guilty. He had triennial contracts with the government for several barracks. He built largely for himself, and held the position of chairman of the Town Commissioners of Newbridge, and was a guardian of the poor. The want of education was his great defect; his knowledge of arithmetic was imperfect, and he had to confide, almost entirely, to others in reference to his accounts. His military contracts brought him into contact with government officials, and one could well understand how a man in M'Ilwaine's position, regarding officials almost as his superiors, would be desirous to stand well with them, even to the length of negotiating their bills of exchange. Having so many contracts on hand, M'Ilwaine was obliged to give over the management of the greater part of his business to a very correct person, his foreman, named Foley. According as the work was done it was measured by the government officer, in order to be certified for the quarterly accounts. The measurement took place in the presence of the foreman; there was no pretence that the works in the accounts were not done, and the proper sums claimed. And here it should be remarked that had M'Ilwaine's claims been at once put into an envelope and sent across to London, there was no possibility of fraud been committed by any one. There was no allegation that any fraud was committed in respect to any of the bills sent into the War-office by M'Ilwaine, they were all most carefully and honestly detailed accounts. His first account was £323 17s. 2d, that was in every part of it correct, but a monstrous item of £400 was put in for Bangor slates—enough to have covered the whole of the Four Courts. So it was in all five accounts; but what evidence was there that M'Ilwaine had anything to say to the putting in of that item? None. It was attempted to fix M'Ilwaine with the frauds by showing that he received letters of advice from the War Office in payment of his bills. But it turned out that these letters of advice came not at regular intervals, and that these letters of advice often were in reference to more than one claim, and without specifying for what claims they were sent. How did this bear upon the case of M'Ilwaine? He was a man of extensive business—he had, of course, enough to do with his money—when he got letters of advice desiring him to draw for certain amounts, was he to stop to inquire for what particular works the payments were made. But what guilty knowledge could be imputed to M'Ilwaine, that he was aware, in his total ignorance of what his accounts were with the government, that those accounts were fradulently increased? It was the state of M'Iwaine's mind the jury had to try—if he had no guilty knowledge, then he should be acquitted. It was alleged that the papers found in Connolly's office proved the case of conspiracy. Now, papers that were evidence against one person might not be evidence against another, and the papers relied on by the crown proved no conspiracy. There was no evidence whatever given to show that Connolly and M'Ilwaine ever met—that they were associates in private life, or were acquainted with each other at all, except by their correspondence. M'Ilwaine, when under arrest, at once told the police inspector where he would find the key of the office in which were found the letters of Connolly of the 18th July, which were said to establish his guilt. Was the conduct of M'Ilwaine like that of a guilty man? No, it was proof of innocence. The documents found in M'Ilwaine's drawer were said to be evidence of his guilt. On the contrary, they were evidence of his innocence. If they were proofs of guilt, would not M'Ilwaine have destroyed them?—would he have at once given up the key of the office where they were found? Two letters of Connolly's and a piece of paper were found in an envelope. What else was the one dated 18th July but a statement that M'Ilwaine's bills—his true and honest bills—certified by the government officer, checked and rechecked, the proper amounts set out, were sent by the government official to London for payment? Was not that letter powerful evidence of the absence of conspiracy on the part of M'Ilwaine—of his entire freedom from fraud? But the crown relied on the second letter of the same date, 18th July, and what was that letter but a request for accommodation to the extent of £800. Was it proof of conspiracy? Who ever heard of conspiracy couched in such terms? The jury could well understand that M'Ilwaine, believing that the government officer was all powerful, and that in dealing with his numerous claims for work done could procure him payment in advance, would be anxious to accommodate him, and did so, that government officer getting him an advance on account of his claims due and current. That supposition was entirely reconcileable with the notion of M'Ilwaine's innocence—it was entirely opposed to the notion of his guilt. On the document found with those letters were figures in which that £300 required by Connolly, and with which he said he should assist M'Ilwaine, were totted off. That was the whole case, and it entirely failed to support the charges against M'Ilwaine. Witnesses of high rank would depose to the excellence of M'Ilwaine's character—would depose to their belief that he was utterly incapable of doing what was alleged against him. If they had the smallest doubt of the conclusiveness of the case they should acquit; and the case was now left to their impartial and merciful consideration.

Mr. Dowse, in addressing the jury for the prisoner, Hamilton Connolly, reminded them that they were trying a criminal case, in which they should not convict upon probabilities, but upon the conclusive evidence of the prisoner's guilt. The history of the bills alleged to have been altered by Connolly was really instructive. M'Ilwaine, having contracted for works to be carried on in various barracks in Ireland, was obliged to communicate with the War-office in London. According to the blessed system of centralization that was being carried out, the head of every thing—the place containing all the brains (it was supposed) was fixed in Pall Mall, through which the pecuniary blood circulated to the extremities—one of the extremities being in the Lower Castle yard (a laugh). Had the business of the head in Pall Mall being carefully transacted, what happened in the Castle-yard could never have taken place. He ventured to say that a more complicated and absurd machinery, or one tending more to inconvenience and mistake in the transaction of public business, was never exhibited than that, the screws, pistons, and rods of which were laid before the jury during the last two days. It appeared that M'Ilwaine intrusted the works at the various barracks to his foreman, a steady, honest man. The foreman with the aid of his own information, and the assistance of the government official who was to measure the work, made out the quarterly claims. Now, Mr. G. W. S. Scott was the gentleman to measure the work. In all public offices it was the rule to have somebody under somebody else; and, accordingly, Mr. Scott had persons under him who measured some of the works, and he of course adopted their measurements. Now the allegation was that the slator's work, for which the increase was charged in the claims, had not been done at all, but the jury were left without evidence by the crown on that point, and if the jury believed the work charged for had been done, however irregular the practice complained of may have been—however improper or opposed to red tape it may have been, they could never convict the prisoners of conspiracy to defraud. The account for the work certified being sent into the office in the Lower Castle-yard, a "duplicate" of it, as it was called, simply because it was not a duplicate, was then made. One document was retained, the other sent to London, which, as he observed, absorbed everything valuable in Ireland, and could not even leave them Mr. Macdonogh. With the regularity that marked all public departments, Mr. Scott checked only the quantities in the claims. The clerks in the Castle-yard checked only the money calculations, and so on. This double check, which was not a check at all, the Ordinance Office, by a process of reasoning, it was to be hoped, peculiar to itself, arrived at the conclusion that the account was correct. In the process of making each claim of the contractor all right it was first checked by one clerk, then by another, then by another, each clerk checking it by a private mark known to every other clerk, and, finally, it went before the head of the department, Colonel Durnford. That gentleman, like all the other witnesses produced, gave his evidence fairly, candidly, and truthfully. Colonel Durnford certified each account after it had passed through the hands of the previous officials, taking it for granted that it was all right, and the money total of the account, not a copy of the whole account, was then entered into what was called the expense book. After they were certified by Colonel Durnford, they found their way to the office in Pall Mall of the Assistant Accountant-General in the War Office. There is no evidence whatever that after the five claims which were the subject of investigation had been certified by Colonel Durnford, they ever went back to Connolly, the chief clerk—that he ever saw them, or posted them to London. It was alleged that the alteration in the claims were in Connolly's handwriting, but the jury would remember that no evidence was more fallacious than that of handwriting. Colonel Durnford, out of all the files of documents produced to him, only deposed to one line of writing being that of Connolly. For the first time in his (Mr. Dowse's) experience was evidence given of figure writing. And what sort of evidence was that? One official gentleman who was put up to prove that the figures 468 were in the handwriting of Connolly said he believed the 4 and the 8 were, but that the 6 was not in that party's writing (a laugh). Why were not all the clerks engaged in the process of checking those claims produced? They should not, upon light grounds, believe that Hamilton Connolly forfeited his character for honesty and honour—a character of many years standing—because there happened to be accommodation tranactions between himself and M'Ilwaine. If they felt that the indictment was not sustained satisfactorily—if in considering the motives capable of two interpretations, they adopted the more humane, the more merciful interpretation, they would, by doing so, temper justice with mercy—they would, in this criminal case, be acting on the old and honoured canon of the law—that the prisoner should have the benefit of the doubt, and he could only hope that justice would be done by returning a verdict of acquittal.

Numerous witnesses were produced to testify to the high character previously borne both by Mr. Connolly and Mr. M'Ilwaine, and amongst those for the latter were—Alderman and Mr. Richard Martin, Maurice Brooks, William Kelly, Mr. La Touche, D.L., Baron DeRoebeck, Major Borroghs, Rev. James Hughes, P.P., Rev. Mr. DeBurgh (Incumbent of Naas), &c., &c., after which

Mr Justice Hayes charged the jury. He said that everything capable of being said in the case—all that skill and ability could achieve for the elucidation of the case, according to the view which was respectively taken of it by counsel for the crown and counsel for the prisoner, had been done by those learned gentlemen, and, if he could, he very gladly would now leave the case in the hands of the jury. He had, however, a certain duty to discharge, and he would endeavour to do it briefly. In the first place he should state that the jury might find either of the prisoners guilty of forgery, but they should either convict both or acquit both on the indictment for conspiracy. There could be no conspiracy without two or more persons being concerned in it; therefore, if they held one of the prisoners not guilty of that part of the indictment, they should acquit the other also. His lordship then stated in detail to the jury the history of the case, the evidence adduced by the crown to sustain the charges against the prisoners, and the arguments relied on by their counsel in defending them. There really seemed to be no evidence whatever on the part of the accused, whose case resolved itself into one of a consideration of their characters. The character given to M'Ilwaine with such heartiness and good-will by the gentlemen produced was such as any one in court might be proud of; and the same observation applied, although to a smaller extent, to the character given to Connolly. But that evidence of character could only be legitimately used in this way—it should make the jury more vigilantly scrutinise the evidence by which the case against the prisoners was sustained—but it should not induce them to reject the case. If they believed that the evidence in the case proved satisfactorily a concert between the prisoners to commit the frauds which certainly had been committed, the good character of the prisoners should not avail—a verdict of conviction ought to be returned; if, on the other hand, they had any reasonable doubt of the prisoners' guilt—such a doubt as honest, clear-headed, intelligent men, acquainted with the way the affairs were carried on, would entertain on the case—the benefit of that doubt ought to be given to the prisoners by a verdict of acquittal. But, he repeated, if the case of the crown satisfied them that it was complete, they should convict the prisoners.

VERDICT.

After about an hour's deliberation, the jury re-assembled in their box, and the foreman (Mr. Whyte) in reply to the Registrar, stated that they had agreed to their verdict. The prisoner, John M'Ilwaine, was found guilty of conspiracy to defraud; the prisoner, Hamilton Connolly, was found guilty of conspiracy to defraud, and also forgery.

The Foreman—We wish the court to give a merciful consideration to the case of M'Ilwaine, as we believe he was led into this business by the other prisoner.

Mr. Justice Hayes said when the case came before the Court of Queen's Bench, he would take care to inform their lordships of the recommendation of the jury.

Mr. Curran said the offence of which the prisoners were convicted, was a bailable misdemeanour. He now applied that they should be allowed to stand out till next term, when the points saved would come on for argument. Substantial bail would be given. M'Ilwaine could procure bail for almost any amount.

The Attorney-General said the application to bail should be formally made at the proper time. If such were done, the matter would receive every attention. At present he could not consent to Mr. Curran's application.

Mr. Justice Hayes said as a judge at Nisi Prius he did not think he had power to bail the prisoners; as a judge of the Queen's Bench, he could not grant the application without the consent of the Attorney-General.

Carpenter v. *Scott.*—Demurrer taken by plaintiff to defence, also a new trial motion. It appeared that this case was tried before Chief Justice Monahan and a special jury of the City of Dublin, at the last after sittings, when the jury found a verdict for the plaintiffs on one of the issues, and for the defendant on all the others, which in effect amounted to a verdict for the defendants. The facts of the case were these:—It appeared that the plaintiffs were Messrs. Thomas A. Carpenter and John H. Carpenter, of Dame-street, in this city, commission agents; and the defendants Sir Claude Scott, Bart., and other persons, who are the owners of certain slate quarries in Wales; and the action was brought to recover damages for an alleged breach of contract in not delivering slates and slabs. The defendants denied the alleged breach, and pleaded that the plaintiffs had violated the contract in not paying for certain slates which were delivored. The case of the plaintiffs was, that in the month of November, 1860, they entered into an agreement with the defendants to deliver to them 100,000 slates—one half at £9 and the other half at £8 a thousand, as they might require them—and that the defendants neglected to deliver them as they were bound to do. It was also alleged by the plaintiffs that the defendants contracted to deliver to them all the slates raised from a certain quarry between November, 1860, and November, 1861, at the price of £2 3s. per ton; and further, that they contracted to deliver 200 tons of slates called "slabs" at £2 6s. per ton, but only partly carried out that contract, and after delivering about eighty tons, refused to complete it. The case of the defendants was, a traverse or denial of the contracts as put forward by the plaintiffs, that they were always most ready and willing to carry out the real agreement, and that they had in point of fact delivered a portion of the goods in relation to each contract, and only discontinued to do so when the plaintiffs violated the agreement by not paying for the slates and slabs which were so delivered. The plaintiffs obtained a conditional order for a new trial during the present term, and also brought forward the case on demurrer. The demurrers were taken to the defences put in to the fourth and sixth counts of the summons and pliant. The defence to both counts referred to, stated that the plaintiffs did not perform what they undertook of their contract, and that upwards of £408 worth of slates were delivered, and they did not pay for them within the specified time, viz., twenty-four days after delivery, although requested to do so. The plaintiffs demurrers to the two defences in question were similar, and to the effect that the payment of £408 mentioned did not appear by the terms of the contract to be a condition precedent to the right of delivery, and that therefore the plaintiff was entitled to recover in the action.

Butler v. *Cunningham.*—An action by a carpenter, named John Butler, against defendant, Mr. John Cunningham, to recover balance of about £20, alleged to be due on foot of a contract in writing, to complete the woodwork of two small houses, and also to recover damages for the alleged breach of contract. Plaintiff stated that he commenced the work in June last, and was turned out of it before it was completed in the month of September, and he only received £32 on foot of the contract, and there was a balance due to him of upwards of £20, even for the value of the work actually done. The original contract, it appeared, was for a sum of £71 16s. The plaintiff alleged that he did the work well and expeditiously, and that there was nothing to justify the conduct of the defendant; while the case of the defendant, on the other hand, was, that the plaintiff did not attend to the work as he ought, but remained away from it and got drunk, and that he was, under the circumstances, fully justified in putting an end to the contract. It was also alleged for the defendant that he offered the sum of £18 over and above the amount of the contract if he completed the work, and that the plaintiff proposed to accept it, or to finish the work. Verdict for defendant, with costs.

In re G. Robinson, a bankrupt, builder (Ardglass).—The assignees objected that schedule was not properly vouched, and Judge Berwick, after examination of bankrupt, who stated that he lost £500 by one contract, and kept no books, expressed dissatisfaction and contemplation of adjoining the case *sine die*, but subsequently ordered adjournment for a fortnight.

TIMBER SALES.

At Messrs. Martin and Son's sale of wood goods on Thursday last, owing to the inclemency of the weather the attendance was not as numerous as had been expected. All the lots put up were sold without reserve, although they realized much under the rates obtained at previous sales. In consequence of the continued severity of the day, the sale had to be finally adjourned to next Thursday, when it is expected there will be a large attendance of buyers, as the goods which remain are to be sold unreservedly. The following is a note of the sale:—

21 hundred bright Quebec spruce deals, second quality, at £13 12s. 6d. to £13 17s. 6d. per stand hundred.

119 hundred St. John and Lower Port spruce deals, principally long lengths, at £13 to £14; average £13 7s. 6d.

8 hundred bright Quebec pine deals, second quality, at £19 to £19 15s.

16 hundred red deals, long lengths, £18 15s. to £19 10s.

119 tons red pine timber, at £3 to £3 2s. 6d. per ton.

10 tons old red pine, at £2 12s. 6d. per ton.

18 tons yellow pine, at £2 2s. 6d to £2 5s. per ton.

20 tons Sundswall timber, at £2 7s. 6d.

From Commercial article in *Freeman*, we quote that John Martin and Son having been compelled to adjourn their periodical auction of wood goods from the 21st instant, the adjourned sale took place on Thursday, 28th. The attendance of the trade was large and respectable, and the bidding much more active, with an advance on late sales. The following is a summary of the goods sold:—

71 hundred St. John spruce deals, planks, &c., £13 2s. 6d. to £14 12s. 6d.; average, £13 18s.

5 hundred Quebec spruce deals, first quality, £16 5s. to £16 7s. 6d.; average, £16 6s.

28 hundred Quebec spruce deals, second quality, £13 2s. 6d. to £13 7s. 6d.; average £13 5s. 6d.

81 hundred Pugwash deals, £12 10s. to £13 10s.; average, £13 4s.

3 hundred St. John pine deals, £14 to £14 2s. 6d.; average, £14 1s. 8d.

8 hundred Quebec pine deals, second quality, £17 17s. 6d. to £19; average, £18 3s.

10 hundred Norway red deals and battens, £15 15s. to £19 10s.; average, £18 11s.

89 pieces yellow pine, 42s. 6d. to 47s. 6d.; average, 45s. 6d.

4 pieces board pine, 80s.

110 pieces crown Memel timber, 62s. 6d. to 70s.; average, 67s. 8d.

29 pieces crown Dantzic timber, 62s. 6d. to 67s. 6d.; average, 65s.

160 pieces Sundswall timber, 47s. 6d. to 55s.; average, 52s.

9 fathoms Dantzic lathwood, £6 10s.

1 fathom American lathwood, £3 5s.

At Messrs. William Kelly and Co.'s sale on Thursday, the 7th, there was a numerous and highly respectable attendance, and a fair amount of business was done.

15,697 St John's and lower port spruce deals were sold at prices ranging from £14 5s. to £15 7s. 6d. per 120 of 12 feet 9 x 3; 1,000 Quebec spruce deals at £17 5s; 3,916 pine deals, 10 to 12 feet, 7 x 3, 8 x 3, 9 x 3, and 11 x 3, from £18 7s. 6d. to £26 per 120 of 12 feet 9 x 3; 1,564 red deals, long lengths, from £21 2s. 6d. to £25, and 294 pieces of ends at £19 10; 50 tons Quebec oak from £4 7s. 6d. to £4 12s. 6d; 236 tons yellow pine from £2 5s. to £3 15s.; 64 tons small red pine at £3 2s. 6d. The sale of Memel and Sundswall timber was not proceeded with at the rates offered.

Fatal Accident.—A carpenter, named Thomas Cahill, recently engaged fastening a sash in first-floor window of house 12, South Anne-street, fell from some outward scaffolding on the area railings, and met with a fearful death. The deceased left a wife and family.

Incombustible Wood.—Wood may be rendered incombustible by impregnating it with a solution of silicate of potash, commonly called liquor of flint. The liquor is first laid on with a brush in a highly diluted state; this being repeated two or three times, letting the wood get dry each time, common whitewash is applied, and this again, when dry, is fixed by the concentrated solution.

To Prevent Boiler Explosions.—Boiler explosions are generally caused by the water in the pipes or cisterns becoming frozen, under which circumstances, if heat be applied to the boiler, (which is usually unprovided with a safety valve), an explosion will ensue from over-pressure. The best preventive is to keep on a good fire during the frost, and if the supply of water to the cistern be stopped, unless other means be adopted for filling it, no water should be drawn from the boiler.

THE DUBLIN MADRIGAL SOCIETY.

The first concert for the season of this society, took place at the Antient Concert Rooms on the evening of the 29th ulto., and was as usual fashionably and numerously attended. Although the term "Madrigal" is adopted in its nomenclature, the committee very properly have not exclusively observed it in practice, which would simply constitute the presentation at their periodical concerts of nothing but "*Madrigals*," which are vocal glee performances of peculiar character, and however excellent in their way, would without being varied, prove monotonous, at least to the taste of the general public. The selections usually comprise as well as "Madrigals"—which are in the minority—vocal solos, duets, &c., by the best available local artists, amongst whom on Friday evening were the Misses Julia and Frances Cruise (soprani), Messrs. Tracy, Topham, and Fanning (tenori), and Richard Smith (basso), with occasional instrumental performances likewise. Mr. Levey acted as conductor with his wonted ability, to which is due no small proportion of the success of the Society; and Mr. O'Rourke efficiently accompanied the vocalists on the piano.

As the season is now in its infancy, we would urge on such of our readers as appreciate a musical evening in company with a goodly gathering of "Erin's fairest daughters," and can spare a short hour from the matter of fact things of life in rational and instructive recreation, the desirability of joining the ranks of this most excellently conducted and select Society, which for a trifling annual subscription of one guinea, confers many advantages not otherwise obtainable.

THEATRE ROYAL.

An engagement more successful in point of appreciation by the *few* than in financial results arising from the patronage of the multitude, has just been completed here by Mr. and Mrs. Florence, American comedians. Versatile as Mrs. Florence's talents undoubtedly are, whether as actress, songstress, or danseuse—a rare combination—the culminating point of excellence is in her Yankee delineations, though we should also add that the others—viz., the Spanish, the French, and the German are likewise distinguished by uncommon fidelity of portraiture. Mr. Florence as *Captain Cuttle*, in the somewhat dry and uninteresting dramatised version of *Dombey and Son*, is entitled to unqualified praise, but mistakes his *forte* in attempting Irish characters.

Madame Grisi (with a troupe of artistes familiar to the Dublin public, as also Miss Conran) is, we understand, to commence a *real* farewell engagement on the 3rd instant. Signor Mario does not accompany as *primo tenore*, that position being alotted to Signor Galvani, a very mediocre actor and singer, who appeared recently in same capacity with Mdlle. Patti. We presume, however, that the last appearance in the operatic hemisphere of the bright luminary, in her zenith for nearly a quarter of a century, is deemed alone a sufficient attraction to secure overflowing benches.

The works on the extension line between the Kells terminus and the town of Oldcastle—a distance of twelve statue miles—are progressing most favourably, under the superintendence of the contractor, Mr. Burke.

The extension of Cork and Youghal Railway, from Tivoli to the temporary terminus situate a little to the eastward of St. Patrick's Chapel, Lower Glanmire-road, is nearly completed, and the trains may be expected shortly to run on it.

Notices are published to connect the city and county of Cork with some of the richest districts in the county of Waterford. One is a railway between the Cork and Youghal line at Middleton and Fermoy, and the other, a continuation of the proposed Middleton and Fermoy line, to Lismore and Dungarvan. The plans which were deposited in previous years for a connection between the Cork and Youghal Railway and Fermoy, ignored the important town and district of Middleton as the point of junction.

Preparations are being made for the immediate commencement of the railway from Castlebar to Claremorris, and it is believed that the line will be completed by next August. Mr. E. Harrison, C. E.; Messrs. Smith and Knight, contractors.

A sum of £387 has been expended on works at Passage, a terminus of the Cork, Blackrock, and Passage Railway.

The construction of the Tralee and Tarbert line has for the present been abandoned.

A line of railway from Carlow to Tullow and Newtownbarry, is contemplated.

The photographic art in Paris, including all classes of photographic workmen, employs no less than 10,000 persons. The portrait card is the most profitable branch, in which an ever-augmenting trade is carried on. The sporting world, too, of Paris has now its photographic establishment in the Champs Elysee, it being the fashion amongst a certain class to have the portraits of their horses and dogs hung up in their apartments.

Origin of the Word "Tramway."—The *Newcastle Chronicle* denies the accuracy of the derivation of "tramway," which a newspaper paragraph assigns to the father of Sir James Outram, whose iron road at the Butterly Iron Works, of which he was the founder, took the latter half of his name, and was known as *tram*way? Mr. Smiles, in his life of Stephenson, gives a somewhat similar derivation, and says that Mr. Outram's roads were laid down in the year 1800. The writer in the *Chronicle*, however, asserts that "tram" was an old word in the mining districts long before the year 1800. "Follow the tram" occurs in local song; and the word is repeatedly used in "The Pitman's Pay" of the late Mr. Wilson. When, for example, two "drouthy cronies," on "pay night," are talking over old times in the alehouse, one of these veterans says:—

> "But heavy puttin' 's now forgetten,
> Sic as we had i' former days,
> Ower holey thrill and dye's a' spletten:—
> *Trams* now a' run on metal ways."

And in his glossary the author has this definition:—"*Tram*, a small carriage, upon which a corf or basket is placed; or it sometimes means two boys who have the charge of the carriage, the one drawing and the other pushing it;" to which may be added, from the famous glossary of the late Mr. Trotter Brockett:—"*Tram*, a small carriage on four wheels; so distinguished from a sledge. It is used in coal mines to bring the coals from the hewers to the crane. The word is Gothic, and is fully explained in Callander's notes on the old poem of 'Christ's Kirk on the Green,' p. 174." The verse of James I. of Scotland, here referred to, in which the word occurs, runs thus:—

> "Twa that were herdsmen of the herd,
> Ran upon udderis lyk rammis;
> Then followit feymen richt unaffeird,
> But on with *burrow-trammis*.

Here we have the word "tram" in use by a royal poet who died upwards of four centuries ago; and Mr. Wilson, in a note to his verse about quoted, gives us some account of the translation of the vehicle from an earthen and wooden to a metal way. "Previous to this," says he, "bringing out the coals to the crane or shaft, or what is called 'putting,' was the most distressing slavery. It was generally performed by boys, in nine cases out of ten too weak for the purpose—if even the materials had been better than they were over which the trams then passed. What, then, must it have been when a beech board was a godsend? And, more frequently, they had to drag their load over a fir deal or the bare 'thill' [surface]—the former too often split from constant wear, and the latter too soft to bear the load passing over. Now the whole way is laid with plates, even up to the face of the workings, so that a man or lad may run the tram before him both out and in, the plates being so formed as to keep the tram in a right direction. This important improvement made quite a revolution in 'putting,' and enabled *one* to effect with comparative ease what formerly required the most intense labour of *two*—a headsman and a lad." The plates or rails referred to by Mr. Wilson took the name of "tram-plates" from the carriage which ran along them; and have we not here the origin, also, of the word "tramway?" We think so. Its derivation is similar to that of "foot-path," "horse-road," "cart-road," "coach-road," &c., and its date is long anterior to the time Mr. Benjamin Outram.

The Last Patent.—We have been told of a curious invention which will be shown at the Great Exhibition of 1862. By its means a man may turn himself inside out, and a woman too—not exactly in the full meaning the words would convey, but partially. The inventor is Garcia, not the Spaniard who turns the tables against Homburg and Baden proprietors, but a scientific Frenchman, who has been practising the simple performance in which many ladies spend much time without equally valuable results—namely, standing before a mirror for a considerable portion of the day. When he had done that to his satisfaction, and knew every pimple and hair to his heart's content, he wanted to look inside, or, as we say, turn himself inside out; so, being of a highly inventive character, he got the looking-glass down his throat a considerable distance, and then, by means of a light, in a way which will be easily understood by all our readers, of course, he cast a reflection inside himself so powerful, that it was sent back to an outer reflector showing the whole of the high-pressure machinery of man—the wheels, cranks, cogs, and so forth, going on. He fainted from pleasure and astonishment at the discovery on the first application thereof, and declares to the world that this invention, so costly to science in one sense, he will produce at the most nominal figure, so that it will be within the reach of all. Where will this discovery stop? Of course every lady will possess one, and the first response to her lover when he pops the question will not be, as we are told is the case in high life at present, "How much hast thou, Alonzo, per annum?" but, "Alonzo, open thy mouth that I may insert the *mirror Garcia* and look down into thy heart to see if it is black or spotless." Here are discoveries, indeed, awaiting us. How many will freely submit to the inspection.—*Court Journal.*

Constabulary Buildings Surveyorship.—Mr. William Doolin has been appointed surveyor on behalf of the builders who propose tendering for the new Constabulary buildings to be erected in the Phœnix Park, by the Board of Public Works.

The Dublin Builder.

Vol. III.—No. 48.

OUR FOURTH YEAR.

CONCLUDING our *third*, and prior to commencing our *fourth* year, we must, as usual, address a few words to our readers. The same kind spirit that cherished and sustained us during the two first years of our infancy has not deserted us in that of which we are now about to take leave, but on the contrary materially increased. It must however be borne in mind that our responsibilities and duties have also proportionately enlarged with a bi-monthly illustrated journal as compared with a *monthly non*-illustrated, involving double time, trouble, and expense. With any of those we would not find fault, but rather embrace them cheerfully; there is however one point of difficulty to which we must specially allude, and that is the want of promptitude on the part of some—doubtless of our best wishers and patrons—either as advertisers or subscribers, in settling their accounts. We are most willing to suit ourselves, as far as practicable and as courtesy will suggest, to the convenience of parties who so favour us; but while we are met either by indifference, by apologies, by promises (not fulfilled), &c., our responsibilities become more serious with our *employées*, and rapidly tend towards an elucidation of the axiom that, "*while the grass is growing the steed may starve.* In the organization, the maturity, and the conducting of this journal to its present position—conceded by all to be one now of *some* importance—the proprietor has had to work earnestly and *single-handed* in a *double* capacity. Those who know anything even of "editorial labours" must admit that they are quite sufficient tax on one brain without the additional duty of *financier*, and we are quite sure that it only requires us to direct consideration to this point to ensure it, and to lessen considerably, henceforward, the labours in the *other* regard. We harbour no false pride to induce us in concealing the fact, that whereas some speculators project journals with ample capital at back to maintain them for a time, whether the result be successful or not, the proprietor of this had but the good wishes and substantial assistance of an extensive number of friends to rely upon, who, as before conveyed, have generally realized his expectation. It is obvious, however, that where, in a multitude of items, varying from insignificant figure—though the Scotch principle that "every mickle makes a muckle" is not to be disregarded—to important amounts, a large sum to the *credit* of an undertaking is represented, there must, under the circumstances above enumerated, be a corresponding *debit* which will fetter independent action, produce irregularities, cast a damper on the general management, and probably terminate disastrously, while all the elements of success are to be found in its constitution. We, therefore, earnestly impress, not only on the debtors of the journal, but on those who purpose extending a helping hand during 1862, forthwith, on receipt of accounts now being furnished, to remit to the authorized party. The introduction of *new* subscribers will also be appreciated an additional favour.

The course we propose to pursue during the ensuing year will be substantially similar to that hitherto adopted, with the exception that though we shall use every exertion to *maintain as far as possible* the "illustrated" character of the journal, we are precluded from *undertaking as a condition* the presentation of illustrations with *each* number.

Various circumstances justify this deviation, and we hope to be excused for adopting a necessary alternative. In the *first* place, the pecuniary responsibility is too great for our present strength; in the *second*, there is an extreme difficulty in procuring subjects of interest; and in the *third*, in getting them suitably executed. We desire not to reflect in the least on the general competency of our wood engravers and lithographers—and some of our published illustrations will prove their ability to produce most excellent specimens of the respective arts—but the services of those capable of dealing with an architectural subject, which requires "a professional hand," are not always available, and we have on more than one occasion been obliged to delay or disappoint our readers in consequence. We have sometimes found—and doubtless will many more equally liberal hereafter—parties personally interested in certain works who allowed us the use of wood blocks, or of lithographic stones, on which subjects were drawn, for reproduction in this journal, and by this means, or with the addition of small expense, we hope to present frequent illustrations.

In answer to suggestions respecting a reduction in price, in consequence of the abolition of the paper duty, we cannot accede to them, as the Dublin Builder is most expensively produced, and in typographical regard will stand comparison with any periodical in the kingdom; besides, the fractional advantage acquired on each copy since that event would not justify a substantial reduction; therefore, following the course of our contemporaries, we purpose continuing as before.

Whatever may be the intrinsic merit of our journal, we have no desire to act as our own "trumpeter," but must remark that it has at least acquired popularity, and its contents have been constantly quoted—and with much kindness—into the columns of our leading contemporaries. To ensure an acquisition in this regard, to aid in the great cause of progress, local and general, to minister to the relaxation and instruction of our readers—among whom are comprehended various classes besides professionals—shall be our constant endeavour, and pointing with some confidence to past proceedings, we look for a renewal thereof during the year on whose threshold we now stand.

THE RECENT SUNDAY-OPENING OF THE BOTANIC GARDENS.

We are much gratified to hear, by the report of the curator, that "the results of this movement have proved of a very satisfactory nature," and that "with the exception of boys occasionally running through the plants, and leaping over the beds, no further wanton mischief has been done." It is suggested that the conservatories be widened to admit of free access, and prevent the throng not damaging the plants, but a practical difficulty intervenes here, the solution of which devolves on the committee of this section and its officers.

THE TAYLOR PRIZES AND SCHOLARSHIP.

The works submitted in competition for the prizes are reported to be not so numerous as last year, though in the figure department there is some improvement. The scholarship is awarded to Mr. Crowley, and the prize of £10 to Mr. Perry for his picture of "The Baptism of Arthur, King of Munster, by St. Patrick." In the landscape and architectural department, the works of Miss White and Miss Alment are recommended for the consideration of the trustees. The committee suggest that the prize offered for Historical Composition should be at least £50; believing that such a reward would draw forth the best efforts of the young artist, and enable him to throw into his work all the power of his genius.

CONG CHURCH, TUAM.

Mr. Benjamin Lee Guinness is erecting, at his own expense, a tower and spire to this church, according to drawings furnished by Messrs. Welland and Gillespie, architects. The tower communicates with a lateral porch near south-west angle, and though of square form externally with buttresses on each face, is circular internally, 8 feet in diameter below, and reduced to 7 feet in upper stage for belfry. The first stage rises from a battered plinth, and is perforated on two sides by a small narrow open for light, a doorway leading to porch occupying a third. At belfry level double light lancet and louvred opens, with columnard jambs and moulded head, are introduced; and immediately above, at a height of 36 feet 6 inches above level of ground, rises a broach spire, 42 feet 6 inches in height, terminated by a vane; total, 79 feet. Messrs. Murphy and Son are the builders.

ROYAL IRISH ACADEMY.

At a stated meeting of the Academy, on 9th inst., the Rev. Dean Graves, President, in the chair. Mr. W. H. Hardinge read a paper on "The Origin and Continuance of Townland MS. Mapped Surveys of a public character in Ireland," which elicted much discussion. Professor Sullivan also read a communication "On a new Hydrated Silicate of Potash, and on some of the conditions necessary to develope the reniform structure of minerals."

EMPLOYMENT OF FEMALES.

That "woman" has not yet fulfilled her destiny in the social scale, that her capabilities of contributing practical aid in the every day pursuits of life, are not yet fully developed, we are impressed with the deep conviction. However, we may desire strongly to uphold the dignity of that position to which, in the domestic circle, she is so pre-eminently entitled, and with which no undue interference should be had; however, we may advocate the maintenance of her freedom from those occupations for which the physical strength of the "lords of the creation" better suit them, we still believe, that "the customs of our country" have curtailed her sphere of usefulness, and that there are very many occupations in which, both with advantage to herself and the community generally, she might participate. Our continental neighbours seem more alive to this belief than are the inhabitants of this kingdom, as in France, for instance, female clerks are employed at the booking offices of the different railways, as flag-bearers in characteristic uniform at the level crossings, and as "points-women" at the switches. In Paris, manageresses of business establishments, lady cashiers and bookkeepers are most numerous, and for these and other capacities females must graduate similarly to those of the other sex so employed in this kingdom. If "idleness," as is stated, be "the mother of all vices," would there not seem therefore a greater guarantee of absence therefrom amongst females so employed compared with those elsewhere, who, from necessity and want of some occupation whereby to secure a livelihood, are driven to unfortunate pursuits, and if so, ought not agitation to that end be heartily joined in by all philanthropists? The first step would, of course, be to institute a suitable educational training; the second to secure employment in various departments for those on examination found to be competent.

The education of young females of the present day is thought to have attained its maximum; if a lady can skilfully execute crochet work, or ornamental figures and patterns in wool, speak and read a foreign language, play the piano and sing for the edification of "a host of admirers," and perchance write a little poetry too; but though all these are very well for polite society—when circumstances change, when reverse of fortune or other causes cast on the inhospitable world to earn her bread, the fair one who hitherto never knew a wish ungratified, how much more advantageous would prove an education of more practical tendency? In London females have recently been admitted to employment as electricians, as printers, and as sewing machine workers, and are distinguished for their skill in each of those occupations; might they not likewise prove excellent lithographers, engineering and architectural drawers, wood engravers (there is one in Dublin and of extensive practice too), writing clerks, bookkeepers, &c.? We understand that under the auspices of "the Irish branch of the Society for Promoting the Employment of Educated Women," a female class of lithographers has been formed at the Royal Dublin Society School of Art, and we doubt not that some artists of first-rate ability will be the result. If this society extends its operations with the same earnestness with which it has commenced, an important and universal benefit will be conferred.

ASSYRIAN ARCHITECTURE.

This style differs essentially from any other with which we have hitherto been acquainted. Its main characteristics are enormously thich mud-brick walls, covered with painted bas-reliefs, and roofs supported internally by slight but elegant wooden columns, ornamented with volutes, and the elegant honeysuckle, which was afterwards introduced through Ionia into Greece—this Assyrian style being, according to some, the parent of the Ionic order, as the Egyptian was of the Doric order of Greece. The very greatest interest attaches to these architectural remains, and to the records cut in enduring stone which they have handed down to us, inasmuch as they corroborate, in a most remarkable manner, certain statements in the Bible connected with Jewish history. There can be little doubt that the Assyrians and Jews sprang from the same stock; and no one can fail to remark that the physiognomy of the Assyrian, as pourtrayed in their sculptures, bears a strong resemblance to the Israelitish visage. As far as we can judge from description, the architecture of ancient Jerusalem was almost identical with that of Assyria.

STATE OF THE BUILDING TRADE.

Accounts reach us from all quarters of Ireland far from satisfactory. The past season was dull enough—much duller than the preceding—and the approach of winter is never calculated to compensate for an indifferent spring and summer, much less so at a time when "war," with all its horrors and depreciating influences on the money market, stares us in the face. Masters experience difficulty in procuring business, and where same is to be had competition is brisk, perhaps ruinously so, to the successful party. The artizan, consequently, feels the sting more keenly, and we learn with great regret that very many of that class are unable to obtain employment.

Societies should relax the stringency of their conditions, and meet the spirit of the times equitably, or the result may prove more disastrous even than anticipated. Building materials (especially timber) may reasonably be expected—judging from present prices and probable circumstances—to be soon at their highest figure; and the absence of speculation, or even of necessary works, will be proportionate. We should willingly not portend the worst, but *our duty* compels us to present the worst side of the picture, that error may be avoided.

PURE WATER IN THE OLDEN TIME.

The *London Medical Review* says "the importance of a supply of pure water for domestic use appears to have been thoroughly recognised by the Romans. For although the river Tiber flowed through the city of Rome, and the Romans at a very early period had made use of its waters and likewise that of wells, it is now two thousand one hundred and seventy-three years since they discovered the unwholesome characters of such waters, yellow with mud and mingled with sewage as they were. These ancient people were aware of the importance of collecting the waters of rivers near their source, before they had been contaminated with drainage, and hence they brought the supplies to their fountains from the sources of the Anio and Tiber by twenty different aqueducts, at various distances up to sixty-two miles, at an enormous expense. Nothing is more surprising than that, although moderns have devoted so much time to the study of the Roman classics, they should have entirely lost sight of the sanitary knowledge acquired above two thousand years ago, and that we should find ourselves in the middle of the nineteenth century persisting in the metropolis of England in perpetrating experiments upon human health and life, which a little knowledge of history would have served to obviate.

A CONNEMARA DWELLING.

Amongst other pictures of Irish misery in the western districts, graphically painted by a special correspondent of "old *Saunders*," we reproduce the following, relative to some of the inhabitants of Clifden, in Connemara district:—Clifden contains hovels which are a disgrace to any civilised community. I examined one of these the other day and left it with a feeling of amazement as to how it was possible for any man to exist in such a wretched place. There were only two rooms; the rotten thatch admitted the rain, which was falling in torrents and streamed down the walls, rendering the clay floor a mass of greasy mud; in the back-yard there was a great pool of water which, from the want of drainage, trickled under the door and formed small pools on the floor of the bedroom; a spark of fire glimmered only on the hearth. The occupants of this dwelling are an old man seventy-six years of age and his wife. The man is a tinker by trade and a very sharp intelligent person. He complained bitterly of the state of his cabin and said he had repeatedly urged the middleman, to whom he had paid 1s. 6d. a week, to repair the thatch and make some other improvements which were requisite to render the place habitable. I asked him why he continued to live there, and he replied that it was impossible for him to obtain any other lodging in the town unless he paid a much higher rent, which he was unable to do. There are other cabins in Clifden of a similar description, though perhaps not just so bad as the one referred to, and there will be much destitution amongst their occupants in consequence of the failure of their potato (con-acre) crop, and the absence of employment.

Amœna et Utilia.—"Amongst those visited we found none more deserving a special mention than the products of Mr. J. W. Benson, of 33 and 34, Ludgate-hill, and 46 and 47, Cornhill. The beauty and novelty of his designs, engraved on the cases of his watches, which he now appears to give especial attention to, certainly surpass anything of the kind which has heretofore come under our inspection. The variety of his stock is something enormous. Not only may the connoisseur here meet with the most exquisite design, but the utilitarian will find an ample choice of plain watches; while each will find, in the high standing of Mr. Benson as a city manufacturer, ample guarantee of the intrinsic value of the mechanism. Here, indeed, may be found the buyer's desideratum—excellence of design and perfection in workmanship."—*Chronicle*.

Benson's Illustrated Pamphlet, post free for two stamps, is descriptive of every construction of watch now made. Watches safe by post to all parts of the globe.

STREET ARCHITECTURE AND ITS PROPER TREATMENT.*

(Continued from page 694.)

Building Estates.—Year by year whole tracts of land are given up for building purposes; the usual process being, to let them out to be covered by different individuals, who, amongst other conditions, are bound to build houses of a certain class; which may be well, but unfortunately they are frequently further compelled to adopt a certain design, under the impression that uniformity ought to be preserved throughout; and this design almost invariably is of the poorest description, that it may not surpass the ordinary capabilities of field builders; so that, even if so disposed (which there is reason to fear is not very often the case), it is frequently impossible for a person building to make any artistic advance. How preferable would it be to allow each to follow his own design, and even to encourage them in doing so, for then, as the sale of the superior houses must necessarily be more speedy than that of the inferior, a wholesome rivalry would be excited, which eventually would cause competent persons to be applied to for the preparation of the designs, and we might hope for some improvement on the despicable, mediocre buildings, of a vile school, which now disfigure miles of our new streets.

Residences.—Suburban residences require a neat and gentlemanly appearance, not ostentatious even in their art and much less in anything else; and as the object of those who travel some distance from their place of business (a class by whom this style of house is chiefly occupied) is to enjoy something like country after their daily fatigues, we ought to cherish everything which would preserve this effect, both in the architecture and arrangement of the houses and in laying out the estates, when as much as possible of the original beauty of the site should be retained. The system of erecting detached houses is very valuable in this respect, and it is further desirable, as it permits a healthy circulation of air. To all houses which are intended for residences, it is appropriate to give a quiet cheerfulness, both by picturesque treatment and by color, and to render the whole as expressive as possible of that respectability which Englishmen so much value, varying, however, the pretensions of the houses in proportion to the social positions of the inhabitants.

Shops.—Associated with residences we find shops, a class of building in which all architects feel the necessity of improvement. The great complaint against the prevalent mode of shop-building is, that the very large opening demanded by tradesmen for the display of their goods, gives the upper part of the premises the appearance of being either very feebly supported, or else of having no connection whatever with the ground. We should, doubtless, like to persuade such clients that quality and beauty in the space for the display of goods would give a better effect than quantity, which now alone they value; and should wish to introduce an arcade of sufficient strength, both in reality and appearance, to support the superstructure. Stone we should probably prefer, though iron, if made to have a proper connection with the part above, would satisfy us. If, however, the gap must be retained, the honest display of the brestsummer of wood or iron, or of any other means employed to span the opening, would convince the understanding as to the safety of the fabric, and then the work of pleasing the eye is comparatively easy. Our brestsummer must be well supported at the ends, and the piers on which it rests must be very fully pronounced, or the idea of safety will not be imparted to the beholder. This leaves us at liberty to gaze any way we please; if, however, additional supports are used, we may as well show them, as they will thus occupy no more room than when cased in looking-glass. Directly we give to brestsummers the outward appearance and details of classic entablatures, they demand that amount of support which entablatures by rule require, and, failing to receive it, they look weak and insufficient. Instances very frequently occur in which the actual shop fronts project some inches from the face of the wall above, so that the brestsummer itself is necessarily hid; we must then endeavour to suggest through the visible parts that it duly exists in its proper place and is properly supported. In all cases we should preserve the piers in brick or stone, and keep the party piers (so to speak) in one mass, instead of breaking them up by placing imaginary wooden pilasters in front, which are the chief agents in giving the superstructure that appearance of disconnection from the ground of which we have spoken.

Large arches would be satisfactory in shops, but there is so seldom sufficient height, without discomposing the arrangements of the floor above, and the necessary abutments are so rarely to be secured, that practically they can be but seldom introduced.

The old fashion of giving signs to shops is pleasingly quaint, and the symbols of the different trades are not quite extinct, though usually they are but vulgarly expressed. We might refine these, and use them for giving a distinctive character to our decoration. Even where a shop has passed to some other trade, such memorials would be interesting, as telling something of its past history.

Manufactories and Warehouses.—In manufactories and warehouses for the stowing of goods, those buildings appear most characteristic which go directly forward to their object, and which value more the stern requirements of utility than the embellishments of art, though art must be so represented that no doubt should exist in the mind that this is the feeling imparted by the architect, not the chance result of the work of the utilitarian. One not unfrequently meets with absolutely plain erections, thrown by chance into some pleasing form, which one small sign, to assure us of the artist's hand, would transform into noble and grand works. It is, therefore, from the masses and outlines of such buildings that we must chiefly gain an effect. By diversifying the plans of the different departments in those large manufactories which are not included under a single roof, instead of necessarily enclosing everything in a parallelogram, we should attain to very great varieties of form. The mediæval kitchens at Glastonbury and elsewhere suggest this treatment, which we might do well to adopt. We ought particularly to avoid carving or decoration of a trifling or small character. Where carving is introduced, it should be bold, and might, perhaps, be chiefly concentrated at the door or other marked spots, rather than dispersed over the whole building.

As the heart and life of manufactories are generally to be found in the engine-house and its chimney-shaft, these parts claim to be distinguished, and, if possible, to be placed in a position to show their importance. The chimney-shaft becomes so prominent an object that it well repays us and gives us a noble opportunity for displaying our design; and we may remember that none will look with less forgiving eyes on the smoke issuing from its mouth because the shaft itself is beautiful.

Dwellings of the Laboring Classes.—In connexion with the houses of the artizans and others which are usually found in such thick numbers at this stage in our towns, it would be feelingless to speak of artistic requirements until we have bespoken for them the attention of the philanthropist, and acknowledged that architects are pre-eminently called on to aid in this work; but when provision has been made for the healthy circulation and freshness of air, and the decent accommodation of the inhabitants, we may strive to gain that amount of effect which is attainable with a small outlay, or may sometimes be secured without extra expense at all, by bestowing attention on the arrangement and form of the roofs, openings, and all those necessary things which are to be found in all buildings, and our minds quickly perceive and venerate that disposition, which, in spite of difficulties and limitations, still exerts itself to gain any results that may be within its reach, and this thought gives a charm and a nobility to any beauty we may in such cases recognise.

Mercantile Premises.—Passing on, we arrive at mercantile premises and business offices, which should have somewhat of the matter-of-fact appearance of the manufacturing class, though less severely expressed, and modified much more by ornamental features, until, in superior specimens, the dignity itself is expressed by the ornament of an elaborate though grand and costly character. Inlaid marbles and shafts, or other judicious introductions of such expensive materials very appropriately express that wealth which we connect with mercantile pursuits, and a fair proportion of which, we may rejoice to say, is very frequently not denied to the architecture of these buildings at the present day. If the money which year by year is being spent within the City of London be but laid out to the best advantage, at least our principal streets will ere long present a creditable appearance, and render our city much more what we could desire to see it.

Statues.—First among public erections may be mentioned those statues, which we use great efforts to place in our streets and squares, with the two-fold object of commemorating the glory of an individual and of adorning our public thoroughfares, but by the well-nigh universal consent of all they nearly always fail in the latter of these objects, and many diversities of treatment with respect to the pedestal, &c., are recommended to counteract this unhappy result, but, at present, it seems without success.

Now, it appears to me that no individual, though chosen from among our bravest generals, could stand on an exalted pedestal, exposed to the gaze of all beholders, and feel perfectly composed, and, therefore, it may reasonably be doubted whether such a position is not too painfully trying for his effigy; and may not this be the real defect in our statues? The matter can in no way be improved when the figure is placed on the top of a lofty column, for there never was but one man who had any partiality for that exalted and giddy position. The inference, therefore, that I would draw is, that our street monuments should be architectural compositions, governed by the commemorative figure, which surely would be more honored in being reverenced and protected by architectural accompaniments than by being exposed to assert its own dignity before a staring multitude, or amidst the driving snow and pelting rain of our climate.

Public Buildings.—Of whatever kind and wherever they occur, those buildings which are used by large numbers of persons, or for the public service, justly claim to be marked as more important than those dedicated to the uses of individuals, and we naturally expect them to assume a more pretending and ornate character.

---

* Prize Essay, by Mr. Lacy W. Ridge. Read before the Architectural Association, London.

Their public buildings form the most tangible elements by which the traveller judges of the relative nobility of cities, and they, longest of all that he may observe, retain their hold on his memory; and more especially do our large national edifices form an important part of that scale whereby we are estimated by foreigners and ourselves, and they will further have a powerful influence over the Fine Art history of our age; so that we cannot overrate the attention they deserve, or use too great efforts, lest any which it may be the work of the present generation to erect, should but inadequately express the real state and the characteristic peculiarities of the architecture of our age.

Further remarks upon our national public buildings are beyond the scope of this essay, and therefore we will proceed to a few thoughts on that particular class of buildings, which represent our religious faith, and a liberal proportion of which, we will trust, will never be wanting to adorn our streets.

Churches.—In town churches we of course pursue somewhat different aims from those we seek for in a country district. Dignity and grace take precedence of that picturesqueness which so well harmonizes with rural scenery; and a certain appearance of size seems almost necessary for the assertion of sufficient importance; even though to obtain it, we are compelled to forego some ornament, or to substitute brick for a more costly facing.

In many of the recently built suburbs of London, the churches present a great sameness of treatment, and this seems to have especially centred itself in the spires, so much so that when we have an extended view over these parts, they all appear so similar, and to be built so much after one type, that there is danger of our tiring through repetition of that beautiful object. When, therefore, a spire is introduced in such neighbourhoods, it may be well to suggest, that more originality should be infused into the composition; but let us not suppose that a spire is an absolute necessity, many towers have more novelty and dignity, and are therefore well suited for town architecture. We may remark, that it would not have occurred to us to leave a larger proportion of church towers without their visible roofs of due pitch, than of other portions of our building, had it not been for the example of the architects of the fifteenth century, and the prevalence, since that time, of the custom of removing such roofs from towers of older date. As in churches architecture has its noblest work, so do we expect to find its noblest achievements, and that not in a style peculiar to themselves, or shared in only by schools and parsonage houses, as though our religion were a thing separate from and having no influence over our daily pursuits. Rather should we combine all the buildings of every class which our streets contain into an harmonious and consonant whole, which shall lead us, through the various scenes of social life, up to those higher things of which our churches are the symbols, and then, like as the mighty dome of the cathedral of St. Paul broods over the dark mass of buildings, which is the City of London, so should all our churches tower above and consecrate the districts that surround them.

The length to which it is desirable this essay should extend being now nearly arrived at, it may be well to observe that our subject has, it is hoped, been treated, as the second part of its title implies, with respect to the practical duties required from architects. We have opened with general remarks on several points connected with street architecture, on the desirable characteristics and wide diffusion of our art, on the materials to be employed, on the question of style, &c. Next, we passed to a consideration of the details of our buildings, endeavouring, with a true economy, to make each subservient to our artistic ends; and finally, we have reviewed the different species of buildings which compose our towns. Much, doubtless, has been omitted, and, indeed, the subject is but opened; the next steps, however, if it is to be continued in the same practical direction, require more the use of the pencil than of words, for it is with pencil and paper that such subjects as this must most fully be studied. It has been considered unnecessary to indulge in speculations as to the results of vast reformations in our towns, as both the character of the English people and the results (or, rather, in many cases absence of results), which have attended former efforts in this direction, lead us to look to the individual exertions of many, combined by their love for their art, for the architectural improvements of our towns. This consideration, as well as the majority of the systems of treatment which are herein recommended, or are being gradually introduced among us, lead us to expect that variety and picturesqueness and a general freedom of treatment will prevail in our future street architecture, and I cannot but suppose that in general points it will incline towards Gothic, although many details, and foremost among them windows, will probably vary considerably from old forms.

I have not thought it requisite to allude to any new buildings which display the desired advances in street architecture, or which illustrate anything of which we have spoken, believing that those to whom this is addressed watch with the same interest as myself the progress of their art, and can, consequently, furnish these examples for themselves. It must be manifest to any who do thus watch, that architecture is undergoing a transition of no ordinary character, but it is beyond our power to discern whether the activity which now prevails will expire as the sharp flash of the lightning, or whether it is the dawning of another day—a day which the scientific discoveries, the wide-spread learning, the historical experience, the ceaseless energy, and the purer religion than any under which art has yet flourished, which adorn our age, may render far brighter, far more glorious than any which has preceded it in the vicissitudes of art. If these our hopes are to be realised, it must be by our exciting a true love for architecture in the hearts of our countrymen, and where shall we find a school so fitted to instruct them—where a rostrum whence we may so readily address them—as the streets of our cities?

THE SUPERINTENDENTS OF ENGLISH BUILDINGS IN THE MIDDLE AGES.

An elaborate paper on this subject, and by way of supplement to a previous one published in the London professional periodicals, was read by Mr. Wyatt Papworth, on the 2nd instant, at a meeting of Royal Institute of British Architects.

The author enumerated the names of masons, the places at which they worked, their customs, wages, workshops, company and guild, constitutions, trade designations, confraternities, and lodges of the seventeenth and eighteenth centuries, and referred to the earliest notice of masons, which was in the eleventh century, when they were engaged at St. Albans, to their employment at Canterbury in the twelfth century, and to works executed by them in the thirteenth, fourteenth, fifteenth, and sixteenth centuries. The paper also embraced a great many extracts from ancient documents relating to the masons, their wages, conditions of engagement, &c. The term master mason was now nearly obsolete, though it was still employed by the Corporation of London. Mr. Papworth remarked that the term freemason was used in Scotland at the period referred to in the paper, and after referring particularly and at some length to the wages paid to masons in various parts of the country in the middle ages, he directed the attention of his audience to the workshop, residence or lodge, &c., also to the subject of companies and guilds, showing there were guilds of masons existing before the fourteenth century. He next brought under review the privileges of the guilds, in the course of which he made numerous quotations from old documents, and referred at some length to the marks of masons, carpenters, &c. He proceeded to give a description of the designations of the masons in the middle ages, which included ingeniator, latomus, cementarius, marmorarius, &c. The first use of the term freemason in England was made in 1396, and was derived (as the lecturer contended) from the mason working in freestone. He next alluded to what were called the travelling masons, who were supposed to have erected the principal buildings of Europe, but he did not believe that any such body ever existed in England. On resuming his seat Mr. Papworth was much applauded.

The following discussion, therefore, was then elicited:—

Mr. Mylne thought the master masons had a great deal more to do with architecture than they generally got credit for. As to ecclesiastical buildings, it was more likely the master mason would have such buildings handed over to him than a royal building. In several towns of Scotland in the fifteenth century, as for instance Dundee, a contract would be made between the ecclesiastics and the municipality to appoint the master mason upon certain conditions. One was led to believe that more than one master mason had been known to work at the building. There was a great distinction in Scotland with regard to the principal master mason and the master mason. The master mason was elected for a time, but he suspected that the principal master mason had more to do with the architecture of the work than the master mason, the principal master mason being appointed for life. And in reference to the works performed, great care should be taken to ascertain whether there was not a principal master mason over the master mason. In 1630, a certain house was built in Scotland, the master mason being John Ritchie, but at the same time he found there was a master of works, who had great taste and a liking for architecture, and he found that to him, whose name was James Murray, a payment of a thousand pounds Scots was made for drawing the model of the fabric and other services. So that they should not at once put down the words master mason and attribute works to him without further inquiry. In 1617, William Wallace, who was employed to build Heriot's Hospital, Edinburgh, was called a carver. He had not found the word freemasons used in Scotland as indicating a company or guild at the period referred to. As to Scotland, where our best masons come from, it was curious to notice that all the principal master masons were originally Frenchmen.

Mr. Street thought that what was true of Spanish buildings might be true also with reference to architects in England as well as in France. Mr. Papworth appeared to prove that the master mason was not the architect, while on the same stone were found the marks of the superior and of the inferior mason. In England our architects were always as much architects as masons.

Mr. W. White said that in several of the conclusions which Mr. Papworth had arrived at he must profess himself to be at variance. One of them had reference to a point mentioned by Mr. Street—namely, the difference of order between the superior mason and the subordinate mason, and there were no less than four or five terms which came into general use, though in different countries different terms had been used, and even in England the same term did not always apply to the same man. For instance, the word "builder" meant in some places "plasterer," and in other parts they called a "plasterer" the "masoner." But what he wished to make special observation upon was the difference between the higher and the lower order of masons, although the body might be in some way connected; but in the present system of freemasonry there was the term "free and accepted mason," which applies, and which he conceived did apply, to the artificers employed in carrying out works in different parts of the country, and the "arch mason," of which none of the lower order had any knowledge, and which was prosecuting the science of freemasonry, brought down from the earliest days to the present time. It would be absurd to suppose the lower order of masons had the same sort of knowledge as the arch mason, but it would be equally absurd to say they had not some common knowledge to enable them to carry out the directions of the superior or arch masons. And more especially because he believed, and he had been able to gain specific evidence of this fact—which he hoped to be able some day to state more definitely and more systematically—that the guild of arch masons carried out the work from the first until the decline of art, upon a systematic, geometrical principle, which enabled them by secret signs to communicate to those under them—the supervisors and the stonecutters—how to carry out the work, without a system of elaborate drawings now indispensable. We had the ancient plan of Strasburg, but he had never heard of the drawings of any detailed works whatever, which he thought was a corroboration of the supposition he had made. With regard to the difference of the terms employed, might he ask what the interpretation of *cementarius* was?

Mr. Robert Kerr proposed a vote of thanks to Mr. Papworth. Who was the architect of the middle ages? On this point there seemed to be several theories advanced. One was that the principal architect of the middle ages was a monk; another was that these were the master masons; and a third was that there was an architect, properly so called, between the two. As to the freemasons as they now existed, he did not suppose any person in his senses imagined they so existed in the middle ages. As to the Scotch masons, the working masons of Scotland of the present day had a sort of freemasonry amongst themselves almost identical, he was told, with the freemasonry of the English society. They had the signs, symbols, and ceremonies of a very elaborate description, and they were "free and accepted masons" amongst themselves as working men, and the consequence was that the Scotch trades' union was in a manner more formidable, except as to numbers, than those in England. He was of opinion that it was clear the ecclesiastics of the middle ages must have had a great deal to do with buildings, there was at that period so great a gulf as to learning between the clergy and the laity. There was much in the theory that the clergy must have had a great deal to do with the architecture of buildings in the middle ages, though they must have had assistants. There might have existed in the middle ages a confederation of masons, which might have served important objects.

Mr. Papworth, in answer to Mr. Morris, said he had found the word "controller" as early as the reign of Edward III. The controller kept the accounts, and clearly had nothing to do but to look after them.

Mr. E. Roberts, in seconding the vote of thanks to Mr. Papworth, observed that he thought there were lodges of freemasons in the middle ages, and also lodges of labourers, and the livery then worn, he apprehended, would be used in the same sense as the livery of the City now, indicating that those who wore the livery were a superior class in the guild. He would ask Mr. Papworth to consider what the word "tile" meant—not that the roof was covered with tiles, as distinguished from slates, but that the roof was tiled, so that no one could get to it and see what was going on within the building. As to working drawings, those who had turned over the stones of mediæval buildings would find the lines cut in the stone. There were lines from which the mouldings were afterwards cut; these, he apprehended, were the production of the master masons, and that the work was the design of a superior mind.

The Chairman (Mr. Digby Wyatt, V.P.), in putting the vote of thanks to the meeting, remarked that Mr. Papworth had collected a great deal of interesting information, but the great difficulty remained unsolved, and further investigation would be required before it was proved who designed the buildings of the middle ages. From what Mr. Street had said, he thought it was clear that it could scarcely fall to the mason only to make such a combination of materials in the buildings of that period. Any information connected with the actual existence of the working classes of those ages was of great importance, and referred to some Florentine papers on the subject, which referred to the conditions on which the men worked, and it would appear that some of those referred to were really architects, as those of the present day. He believed that there were at the time referred to both architects and artists, and he hoped that Mr. Papworth or some other gentleman would dig up further information on this matter.

The vote of thanks was passed by acclamation.

SOCIETY OF ARTS.

At the first ordinary meeting of the 108th Session of this Society, recently held in the Society's rooms, Adelphi, Sir Thomas Phillips, F.G.S., chairman, in the course of his inaugural address touched upon the losses which the society has sustained during the past year by the deaths of Mr. Joseph Maudsley and Sir William Cubitt; secondly, the prospects of the Great Exhibition of 1862; and, thirdly, the examinations conducted by the society. Of the Great Exhibition building itself, he said, that should the Exhibition prove a great success, the charter would secure to the society the possession of the centre of the picture galleries to the extent of an acre; and the Commissioners were required to expend out of the surplus funds so much money (not exceeding, with the original cost of works, £50,000) as, in the judgment of the Commissioners of 1851 and 1862, should be required to render the architectural character of the building suitable for the objects for which it was to be employed by the society. As the buildings were susceptible of much decoration, it was thought desirable to originate a subscription for the purpose of making experiments in the employment of mosaics on the external walls of the front in Cromwell-road. The subscription was begun by Earl Granville; and, should the mosaics be successful, they would give to the buildings a character new in this country, especially suitable to the climate, and hardly to be found on any building north of the Alps.

At the conclusion of the address the society's medals were awarded. About 300 candidates had been proposed for election as members.

THE ARCHITECTURAL UNION COMPANY.

The following is a copy substantially of the report of the directors, read at annual meeting on 4th inst.:—

"The directors are enabled to congratulate the shareholders on the continued success of the undertaking; all the tenants named in the last report, except the Architectural Photographic Association, still occupy their holdings, and since then lettings have been effected to the Motett Choir of the Ecclesiological Society, and Mr. Alfred Gilbert. The capital account is now closed, and a new lease has been granted to the company by the Corporation of the City of London. There are now 1,037 shares on the register, upon which £10,370 has been paid. The following directors retire by rotation, viz.:—David Brandon, James Edmeston, Owen Jones, M. Digby Wyatt, John Whichcord, and J. M. Lockyer, Esqrs., of whom the first five, being eligible, offer themselves for re-election. James Lockyer and Frederick P. Cockerell, Esqrs., retire from the office of auditors, but being eligible, offer themselves for re-election. The revenue account is made up to the 29th day of September last, and the directors propose forthwith to pay a dividend of 8s. per share, free of income-tax, which will amount to £414 16s., leaving a balance in hand of £69 1s. 9d., and £12 1s. on the capital account. The directors beg to point out that one and a-half year's interest on the mortgage has been paid, during the last financial year—and that legal and some other exceptional liabilities have been discharged, which have alone interfered to prevent the payment of the full dividend of 5 per cent. Some expense has recently been incurred in making a separate entrance to the east gallery, which is already let for some evenings of the week, and which, if let as the directors expect for the remainder, will return at once the outlay thus incurred, and will prove a permanent source of addition to the revenue of the company. The directors would remind shareholders that they should make known as much as possible that spacious accommodation in the eastern gallery is to be had, with use of a committee-room, with lighting, warming, and attendance for any one night in each week all the year round, at the moderate rent of £85 per annum. The directors further report that the dividends arising from the Auxiliary Donation Fund of last year amounted to £16, of which, by the express wish of the donors, £5 has been paid to the Committee of the Architectural Exhibition, and the balance of £10 remains to be applied for the encouragement of architectural art or science, as the directors may determine."

Colors to imitate Portland Stone.—Lime whitewash, yellow ochre, and lampblack, mixed up to please the eye; this is for outside work. For inside work, whiting is used instead of lime.

THE "GUINNESS RESTORATION" OF ST. PATRICK'S CATHEDRAL.

Our previous notices of the important restorative works in progress at St. Patrick's Cathedral, through the munificence of Mr. Guinness, fully detailed the character of such portions comprehended in the general task (so nobly volunteered) as had been accomplished to the date thereof; but as eight months have elapsed since our last visit —and designedly so to admit of better judgment being formed from perfect development, and to present some new intelligence to our readers—it must be expected that very much more relative thereto can now be recorded. We left the cathedral in May last, noting that the massive south wall of the nave had been just rebuilt, and the internal stonework of same partially completed; that portions also of the external stonework of the former and of the north wall of nave, including the flying buttresses of choir—which afforded such subject for criticism—were restored, and various repairs throughout effected. But then the work of groining the nave ceiling—rendered more difficult owing to its trefoil outline, and the irregularity of the opens in the opposite walls—or the restoration of the south transept had not been commenced, and the rebuilding of the south aisle was only being partially proceeded with. All these, however, are now in a forward state, and in addition a south porch, 25 by 15 ft., has been built. The ribs for the ceiling of nave and their battened spandrils and soffets are all nearly ready for lathing, except at the western end where an impediment to uniformity of the whole may be presented, owing to the great perpendicular traceried west window rising several feet above the soffet of the ceiling, and which may possibly necessitate the removal of this window, and the substitution of one of lesser height. A question, we learn, has been raised respecting the trefoil outline having existed in the original ceiling which was destroyed by fire, but on what grounds we are at a loss to divine, as there exist on the north wall of nave, next the choir, distinct traces of same, and as a matter of course they were continued throughout that portion (at least) of the building. So far as this section of the work had proceeded, it is to our mind an unexceptionable evidence of skill, judgment, and fidelity; but we must await the completion of the plastering to realise our conception of the general effect. Touching this, we must digress somewhat to mention, that a correspondent (more presumptuous than learned in architecture) of the *Athenæum*, in a recent fugitive sketch of this important national work, is pleased to conclude, first that he cannot "say *anything* in favour of the *new* work, the buttresses and general details being very poor; but is gratified at the evident care which has been taken to *reproduce the old detail* wherever it exists." Again, the same sage authority informs us, that "few architects of the present day understand how to execute vaulting, having learnt certain false rules as to its construction given in text books." With reference to the first, we assume with some confidence, judging from the manifestation of spirit that prompted this restoration, that Mr. Guinness will be satisfied to consign to oblivion the memory of the slight so attempted to be conveyed, and to stand by the admission in qualification thereof, which must attest to his utmost wish "the fact, that he has not sought to be the innovator (as alleged), but simply the restorator," as professed; and in the second, we rather prefer to hand the disclaimer over—for what it is worth—to the *many* architects here and elsewhere "of the *present* day" who build Gothic churches, and are enabled "to lay the flattering unction to their souls" that they *do* "understand how to execute vaulting."

Viewing the south elevation generally, it—as do also the north, east, and west—admittedly presents some incongruous features, owing, as stated in a former article, to various innovations from time to time, and among the principal may be noted the difference in character of the aisle and clerestory windows respectively, the former being lancets with plain splayed jambs and hood mouldings, and the latter—of similar form, though not so tall—with columnared and splayed jambs and ornamental heads. The parapet of the one also presents the discrepancy of triple embrasures to the single of the other. In both instances, however, Mr. Guinness faithfully reproduced the features from models and photographs of the old work, and the only perceptible deviation or addition is the south porch above referred to, on the flanks of which the original form of aisle windows has been continued, and niched buttresses—proportionate facsimiles of those at south side of choir—introduced at the quoins. The south elevation of this porch presents a moulded and columnared doorway, 7 ft. in width, 8 ft. to springing, and about 13 feet in height, and immediately above is a triple trefoil-headed window, the whole surmounted by a gable of lofty pitch, with trefoiled opening in spandril near apex. The doorway is of suitable character, bold and effective, from whatever source the design may have proceeded; but the window above seems too short—a fault, perhaps, attributable to the level of the groined ceiling. The vaulting of the south aisle is being erected, also other works in connection therewith. The rebuilding of the south and part of the west walls of south transept is next in importance to the south wall of the nave, so skilfully completed; and from the *modus operandi* adopted, we have confidence in a satisfactory result. Already the external work of the adjoining aisles, and that portion of the west wall of transept taken down to level of triforium, has been perfectly restored, and the mullions and jambs of the great triplet window are fixed to the springing of the arches. Between this window and the buttress projections at either side, which contain stone staircases to the triforium, are two tiers of niches, and these likewise are completed. There can be no question of the fidelity here observed in this great restorative work, though we may assume that even *it* will not escape the acrimony of captious critics. In the south transept are some remarkable monuments, and the original ball finial of the spire, as likewise its equally unlucky successor, together with portion of the original pulpit, here find a repository, more objects of observation, however, than of care apparently.

On a pier we note a tablet with the following inscription, no less remarkable as a specimen of the orthography of the age, than characteristic of the memorable divine at whose instance it was erected:—

HERE LIETH THE
BODY OF ALEXDR.
McGEE, SERVANT
TO DR. SWIFT, DEAN OF
ST. PATRICK'S.
HIS GRATEFULL
MASTER CAUSED
THIS MONUMENT
TO BE ERECTED IN
MEMORY OF HIS DIS-
CRETION, FIDELITY,
AND DILIGENCE
IN THAT HUMBLE
STATION.
OB MAR. 24, $172\frac{2}{1}$
ÆTAT 29.

The fractional part of the year thus introduced would suggest a conjecture, either of an error of the sculptor or that the dean was uncertain as to whether the event recorded took place in the year 1721 or 1722. In recent excavations, close to this spot, some mortal remains have turned up—and are still to view—which, though possibly erroneously, it may not be altogether unreasonable to assume were those of the person referred to.

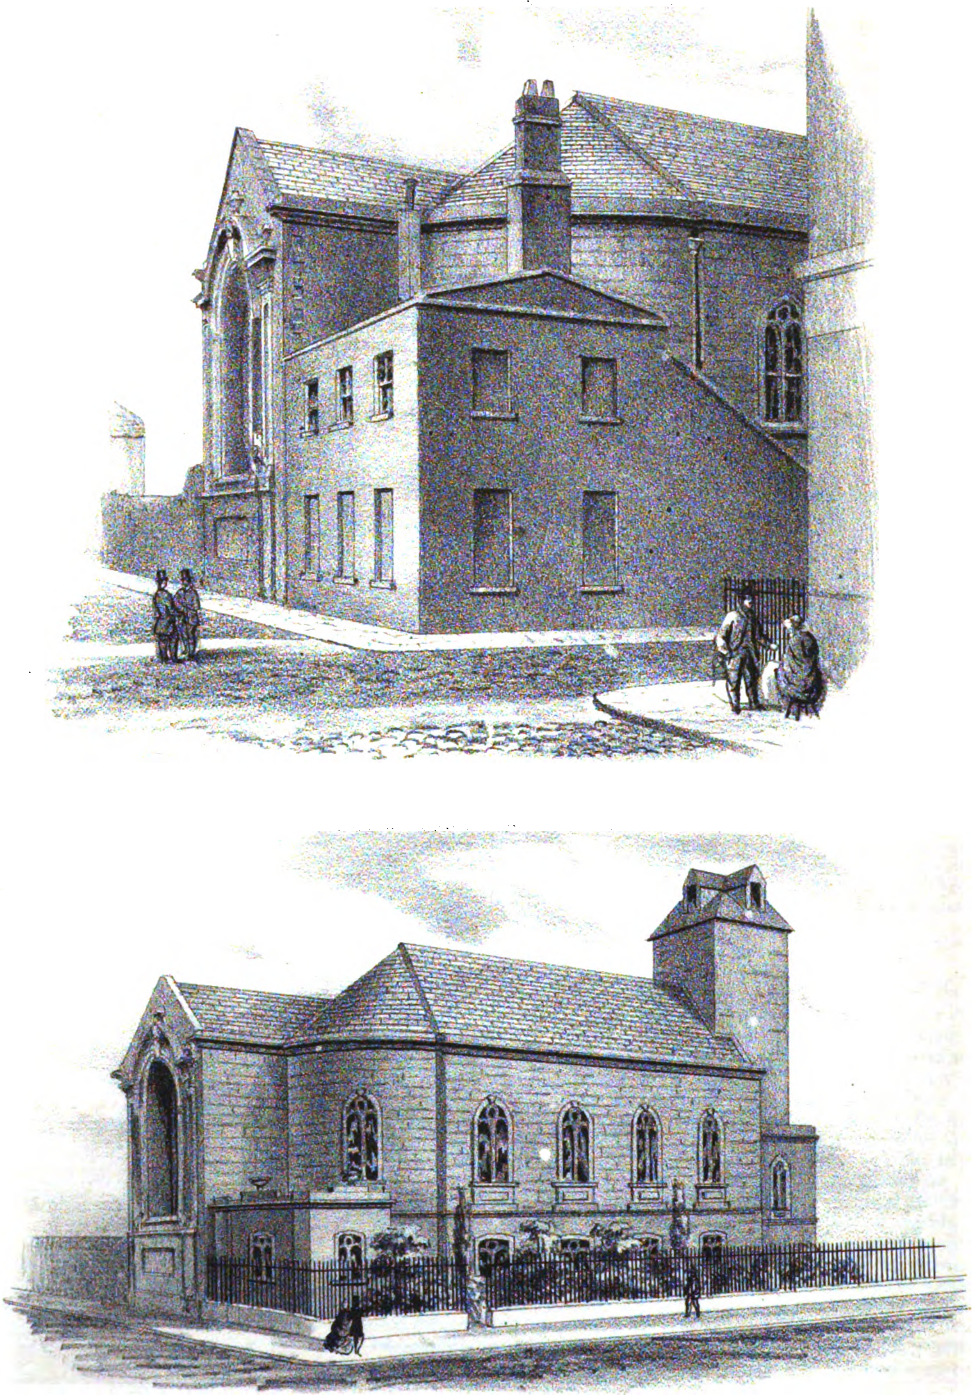
We now conclude this notice, maintaining the conviction originally expressed, that taking in its integrity the great philanthropic work undertaken by Mr. Guinness, it is being performed in a manner as worthy of the beneficent intention, as it is creditable to the judgment, discretion, and fidelity of purpose with which the princely donor directs it, and is rapidly approaching a successful consummation, aided by the intelligence and constructional skill of his builders—the Messrs. Murphy—which does honour to the firm.

We shall complete our survey when "the Guinness restoration" shall have terminated, but the difficulty of defining that period may readily be inferred from the fact, that although the estimated value of the work to present time is some £30,000, it will most probably require a like amount to be withdrawn from the inexhaustible coffers of the most estimable ex-alderman, before the contemplated work shall approach its finale.

ANOTHER SUBMARINE PROJECT.

Engineering skill seems just now to be specially directed to the contrivance of submarine communication between countries separated from each other by narrow channels, and as a subject for experiment the English and French coasts have been selected to establish the practicability of principles which have, as yet, found but little encouragement from the general public. We recently directed attention to two projects for submarine tube, and tube and tunnel respectively, by Mr. James Chalmers, C.E., and Mr. Richard Turner, there being a slight similarity both in the *modus operandi*, the general design, and the selection of the terminal stations. We have now "another" before us, of which Mr. F. Smith, of Leicester, architect and C.E., is the author, who proposes to carry a railway through a wrought-iron tube of vesica form in section, and laid on its side, at a level of about six fathoms below the surface of the sea. The length of the tube would be about 23 miles, kept level throughout by a sufficient quantity of ballast, and with Lewises in the rocky bed of the sea. Chain weights, 50 feet apart, would also be employed, and masonry piers constructed every mile apart. At either shore towers 100 feet high, to mark the whereabouts of the tube, also tunnels, with easy gradients for egress and ingress, are comprehended by this plan. Provision for ventilation is effected, or rather *proposed* to be, by passing currents through the tube, or by floating ventilators, at intervals. The total cost of the tube and appendages is estimated at *ten and a half millions sterling.*

The Dublin Builder, Decr. 15th. 1861.



PROPOSED IMPROVEMENT IN MARY ST.

MORISON LITH DUBLIN

PROPOSED IMPROVEMENT IN MARY-STREET.

DESIRING that at all times any matter appertaining to local improvements should find fitting publicity in our columns, we herewith include a separate sketch of a projected work in connection with St. Mary's Parochial Church; and by presenting both sides of the picture, we hope more clearly to illustrate the desirability thereof. The point of view is taken at corner of Jervis-street, next Messrs. Todd, Burns, and Co.'s monster establishment, and, contrasting the upper and lower figures, it will be seen that the contemplated improvement comprises the removal of an unsightly block at north-east corner of church, where Mary-street and Jervis-street intersect—containing vestry and sexton's rooms—and the substitution of a neat wrought-iron railing, returned on flank and eastern end, with the addition of a neat low building, as shown. The aspect both of the church, which has a fine east window, and of the locality generally, will be materially enhanced by this arrangement. As is usual in such cases, some philanthropic spirits were not slow in coming forward with substantial aid, and we learn that upwards of £100 have been already collected—Messrs. Todd, Burns, and Co. contributing £20; Messrs. Cannock, White, and Co., and Mr. George Tickell, £5 each, &c.; but about £100 more are still required, which doubtless will be forthcoming, and reward the energy of the rector—the Rev. E. S. Abbott—under whose auspices the improvement is proposed to be effected. With reference to this gentleman we may remark, that the citizens are materially indebted to him for an act of self-devotion in assenting to the closing of the church-yard, whereby his income was materially lessened, and personal interest sacrificed at the shrine of the public good. It is not, therefore, unreasonable to assume that in acknowledgment thereof—if from no other reason—he will be enabled to complete his present undertaking, as also the finishing of the tower and spire hereafter, a work very much to be desired.

THE BOYD MEMORIAL.

As announced in recent No., the final completion of this structure—the purpose of which is well known—was an event to be looked for immediately, and we have now to record that the last stone of the obelisk, which forms the crowning feature, was, on the 12th inst., fixed in its position, leaving the architectural *toute ensemble* of the memorial a subject of criticism and regard. We are not much in favour of the *obelisk* form for monuments or memorials generally, preferring those which furnish scope for greater originality and comprehensiveness of treatment, nor do we in this instance deviate from our opinion, yet the design—so far as it may be so termed—is somewhat judiciously and suitably handled. In addition to the particulars already noted, we may remark, that the height of the memorial is about 80 feet above the base, and a panel, on which is an inscription commemorative of the sad calamity and displaying the names of the brave captain and his fellow-sufferers, is introduced. The work was constructed by Mr. Patrick M'Donogh, of Kingstown, under the direction of the architect, Mr. Trevor Owen—the material employed being local granite.

"THE HANDSOMEST STRUCTURE IN EUROPE."

CANOVA, when he visited London, was pleased so to designate Waterloo-bridge, and few will yet be found sufficiently hardy to attempt a controversion of the great sculptor's opinion, though we may anticipate the probability of admiration being in the future diverted therefrom to the magnificent Westminster-bridge, now in course of construction, or to that at Blackfriars, as contemplated. But what would Canova now say if he were capable of learning the monstrosity proposed to be perpetrated on that admired work, in the erection of a combined iron, glass, and slate structure to cover in, as an arcade, the entire structure? One of the most magnificent views of its character in the world is obtained by a spectator standing on one of the many bridges that span the Thames; and placed somewhat central, as "Waterloo" is, perhaps about the most so is afforded therefrom; but the proposed erection will materially impede that hitherto obtainable from the other bridges, and disfigure the structure itself.

Much authority in matters relating to metropolitan improvements is vested in a special Board of Works, and although the bridge in question is private property, we hope that that authority is sufficient to prevent private individuals doing that "with their own" which would prove detrimental to the public interest, and to the degeneration of art.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held on the 2nd inst., Mr. Digby Wyatt, V.P., occupying the chair, in the absence of Mr. Tite, president. Several donations were announced, and some new members elected, after which the attention of the meeting was occupied with Mr. Papworth's paper on the "Superintendents of English Buildings in the Middle Ages," more particularly described in another column.

NEW BRIDGE AT LENDAL, YORK.

A PHOTOGRAPH of a handsome bridge to be erected over the river Ouse at the above town, and somewhat similar to the Victoria-bridge at Windsor, has been kindly forwarded to us, and we acknowledge it with thanks. The Town Council have adopted the design, which is by Mr. Page, C.E.—one of the most eminent bridge builders of the age—in lieu of that which fell a couple of months ago while in course of erection, and which comprehends a cast iron structure in the Tudor style, with graceful elliptical curve, parapets perforated with quatrefoils, and spandrels enriched with the arms of the city and the bishopric. Span 175 feet. Cost, £31,000. It will be lighted in the centre by lamps of graceful design secured to the parapets.

DEATH OF THE PRINCE CONSORT.

THAT man—"the paragon of animals"—be he prince or peasant, must one day make communion with the dust, has been strikingly illustrated by the sad and comparatively unexpected demise of the Prince, who for the last twenty-two years has reigned supreme in conjunction with his royal wife—Great Britain's Queen—in the affections of the people of these realms. Apart from the sympathy—in which all will most heartily unite—to be felt for her Majesty (herself the best of wives and mothers) for that melancholy domestic bereavement which has, in the inscrutable disposition of an all-wise Providence, torn from her by the agency of death the best of husbands and fathers, we must in a general point of view regard the event as a national calamity. On his attainment to the proud position of consort of the greatest monarch in the world, with all its concomitant ease and independence, Prince Albert might have abandoned himself to a listless, idle life—a great personage, no doubt, but a more useless member of society than the humble artizan who lives by the sweat of his brow. But with eyes undazzled by the bright sun that had beamed upon him, with mind of extraordinary capacity, and with heart which knew how "to feel another's woe," the Prince immediately on his marriage earnestly commenced a career of usefulness, and step by step became the champion of scientific and artistic progress, the keystone of a nation's pride. Were the origination and the maturing of the conception of the Great Industrial Exhibition of 1851 the only acts by which the Prince Consort signalized himself, they would have been of themselves sufficient to render his name memorable; but in every movement of progressive tendency originated during his time, we have found him at the helm, not as mere nominal patron, but counselling and aiding by the prestige of his presence, his judgment, and his eminently practical mind. In sanitary and social improvement, the deceased Prince took a lively interest, and his model lodging-house at Kensington was a first illustration in that regard. As an agriculturist, it is well known that Prince Albert acquired considerable skill, and maintained an extensive farm of his own. But in the hallowed sanctuary of domestic life, as a fond husband and an affectionate father, his late Royal Highness shone pre-eminent, and his virtues will be handed down in the pages of history to that generation on whose happiness his good example to England's future rulers exercised such beneficial influence.

INAUGURAL MEETING OF THE INSTITUTE OF CIVIL ENGINEERS IN IRELAND.

THIS event took place on the 11th inst., in the Museum Building, Trinity College, and numerous members and visitors attended.

Sir Richard Griffith, having taken the chair, said—That this was the second session of the first year, that the Institute had become, in a measure, affiliated with Trinity College. He referred to the great and manifold advantages which resulted from this arrangement, as the members had a large and handsome room in which to hold their meetings, also fire and light, without any expense to the association. The annual subscription, which hitherto went to pay for those necessaries, would in future be expended in the publication of the valuable papers which were read from time to time, and thereby the public would have the benefit of them as well as those who might be present. Many thanks were due to the Rev. Professor Haughton for his kindness in giving up his own rooms to their use. Here were deposited their library and all other documents belonging to the institution. It was not expected that the present meeting would be largely attended, as the county surveyors, of whom a great number throughout Ireland are members, are at this time of the year engaged in their professional duties. He was glad to perceive that a large number of civil engineers, particularly those engaged on railways, had joined the society since they became connected with Trinity College. The Earl of Rosse, the Rev. Dr. R. Robinson, and Professor Haughton had been added to the institution as honorary members. Four gentlemen had joined a new class, called student members, which was to be composed exclusively of those belonging to the university. Since the last session there had been, in all, 17 new members added to the association.

Mr. Stoney, secretary, read a short description of photographs which were exhibited by Mr. A. M'Donnell, showing the appearance presented by a locomotive steam-boiler which burst at Newport in April last. The explosion was supposed to have occurred on account of the rivets in the plates being placed too closely together, which, it was said, materially weakened them. Remarks were made by several members on the comparative merits of drilling and punching holes for connecting iron plates by rivets.

Mr. Anderson, a member, communicated a paper by Mr. C. H. Maberly, C.E., on "the conveyance of light draft steamers from England to the Volga." This was a kind of journal kept by the author, who had charge of their transmission, in which were detailed various circumstances and difficulties attendant on the journey, also the constructive arrangements of the vessels, whereby they could be taken asunder, so as to navigate the canal which connects the Lake of Onega with the Volga. Several drawings and a map of a part of Russia were made use of to illustrate the subject. The whole distance of 960 miles was accomplished in 6 weeks, or averaging about 23 miles a day.

Amongst the recent accessions to the ranks of the Institute are Messrs. Price, Devonshire Rowan, James Barton, C. P. Colton, Marcus Harty, J. Smyth, and Thomas Going, C.E's.; W. Anderson and G. S. Strype, M.E's., as members; and as associates, Messrs. Thomas Fitzgerald, B. T. Patterson, Charles Geoghegan, R. J. Boylan, and the Hon. King Harman.

The new members having been confirmed by ballot, the proceedings terminated.

NORTH WALL *V.* SMITHFIELD AS A CATTLE MARKET.

Apropos to a certain project for establishing a great cattle market at the North Wall, and for the consequent removal of that department from Smithfield—particulars of which have already appeared in this journal—a lengthened discussion on the relative merits of the sites took place on the 9th inst., at a general meeting of the Corporation. Mr. O'Brien opened the debate by bringing forward the following resolution referring to the act of parliament sought for —viz., that "it is the opinion of this Council that such an act, if passed into law, would seriously injure that portion of the city in which the present cattle market is situate, and considerably depreciate a large extent of the property of this Corporation, and that it would be prejudicial to the interests af the public at large; therefore, that a special committee of this Council be now appointed to take immediate steps to place the Municipal Council in a position effectively to oppose the passing of such an act, and to protect the rights and interests of the public and of the Corporation, and that such committee be, and is hereby empowered, to do and direct all necessary acts to be done, to effectually carry out the objects of this resolution and reference." The speaker urged that the site being a low swamp, and distant from the Great Southern and Western Railway, was most unsuitable, and believed that the project was got up by interested parties; adding that the only objection to Smithfield was want of space, and additional could be procured.

Alderman Martin, in an able and comprehensive speech, stated that cattle were deteriorated by the unsuitableness of Smithfield, which, according to the report of Mr. Cahill, C.E., it would cost £50,000 to place on a proper footing, that he was in favour of the North Wall as the site, owing to the facilities for ample pasture in the vicinity, and especially for its contiguity to the Liffey branch of the Midland Great Western Railway and to the packets for shipment to England and elsewhere, whence both live and slaughtered cattle, as proposed by Mr. Hemans' plan, could be transported.

Alderman Reynolds said he had heard from Liverpool and London slaughterers that Smithfield was the best cattle market in Europe, and that all it needed was a little enlargement. It had been established more than 150 years, and he hoped that this bill to transfer the market to the North Wall would be strangled. St. Paul's parish contained 15,000 houses, most of which were dependent in some degree or other for their support upon Smithfield. Men had invested tens of thousands of pounds relying on the existence of that market; and if it were abolished the surrounding district would become a second edition of the Liberties. The swamps at the North Wall had no doubt greatly improved of late years, but their progress would not be accelerated by a market. The people of Dublin, let it be observed, did not derive any advantage from the mere transit of cattle through the city to other places of consumption. The conversion of tillage grounds into pasture was ruinous to the country. Smithfield could easily be enlarged by purchasing blocks of buildings at Queen-street and Red Cow-lane. It was time to tell such persons as the originators of this preposterous railway to cover in the Liffey, and other speculators, that henceforward the Corporation were determined to be masters of those matters which were so entirely within their province, and that they would allow no interlopers. They had surmounted all difficulties as regarded the waterworks, and were now not in hot but in cold water, and therefore they would not allow other persons to interfere with the markets. Interference of the kind was a degradation not practised in other cities, and which seemed to be specially reserved for Dublin.

Mr. John Martin then moved, as an amendment—"That the proposed bill for the establishment of a new market, and the subject of the state of Smithfield Market, be referred to No. 2 Committee for their consideration and report, and that the Council do adjourn to the 17th inst. for the special purpose of considering and acting on the report; and in the event of the report of the committee not being ready, that this Council shall, if they think proper, on that day proceed to consider the subject, and to do all the necessary acts in relation to the market bill or bills."

After some discussion this was unanimously agreed to.

CARLISLE BRIDGE.

The project for reconstructing this incommodious structure is again on the *tapis*, not to be consigned, we hope, to the same oblivion as before.

On the 9th instant Alderman Reynolds, according to notice, brought forward a resolution at the Municipal Council to the effect that, "a committee be appointed to enquire and report on the necessity of rebuilding Carlisle-bridge, and the probable expense." In introducing the subject the Alderman proceeded to remark that his proposal was, that the bridge should be built the entire breadth of Sackville-street, measuring from Mr. Law's house at one side of Sackville-street, to Mr. Kelly's at the other. He was informed by Mr. Hammond, who came from London last August to inspect the proposed work, that he could erect a bridge across the river, with one arch, which would be, as near as possible, a copy of the arch of Westminster-bridge. It would cost between forty and fifty thousand pounds. There were some persons who said Carlisle-bridge was a handsome bridge. The man who thought that must know very little of such structures. He did not think there was an uglier bridge in Dublin. It was built at a time when there was not one-tenth of the traffic for it that there is at present, and was certainly not sufficient to meet the requirements of the present generation. What embarrassed Carlisle-bridge so much was, that there were eight distinct approaches to it. The Ballast Board some time ago obtained some interesting statistics through the agency of the police relative to the traffic over Carlisle-bridge. There were direct from streets laden carts and drays on the 7th March, 1,433; on the 8th there were 1,412; on the 9th there were 1,537; on the 10th there were 1,648; of empty carts and drays there were 944 on the 7th; there were 1,321 on the 8th; there were 1,238 on the 9th, and 1,199 on the 10th; of carriages, cars, and cabs, with fares, there were, on the 7th March, 3,567; on the 8th there were 3.680; on the 9th 3,608; on the 10th 3,616; of empty cars, carriages, and cabs, there were on the 7th, 1,514; on the 8th, 1,405; on the 9th, 1,342; and on the 10th, 1,418. These passed directly over the bridge. Of those that came a circuitous course over the bridge, that was from the quays, there were of laden carts and drays, &c., 1,227 on the 10th; of empty drays and carts that came circuitously to cross the bridge, there were 800 on the 10th; of cars, carriages, cabs, &c., with fares, there were 619 on the 10th; of empty cars, carriages, cabs, &c., there were 179 on the 10th. Total over the bridge from streets and quays, on the 7th March, 9,779; on the 8th, 10,426; on the 9th, 10,419, and on the 10th, 10,869. Laden drays and carts across the ends of the bridge, and not passing over the bridge on the 10th of March, there were 821; empty drays and carts on 10th, there were 790. Of carriages, cars, and cabs, with fares, there were on the 10th, 156; of empty ditto, there were on the 10th, 97. Total passing over the bridge or coming circuitously, on the 7th, 1,163; on the 8th, 1,556; on the 9th, 1,707; and on the 10th, 1,864. The total for ten hours crossing the bridge was 9,779. Let him now draw attention to a curious calculation and comparison which had been made as to the traffic over London bridge, across which, every one supposed, there was more traffic than across any other bridge in the world. The average number of vehicles that passed over London-bridge in an hour was 1,091, while the average that passed Carlisle-bridge in an hour was 1,037. If the plan which he (Alderman Reynolds) suggested were carried out, Carlisle-bridge would be the handsomest bridge in Europe. Some were anxious that a bridge should be built at the Custom-house; so was he. He was anxious to open up Luke-street, and also to have the nearest communication between the Dublin and Drogheda and the Dublin and Kingstown Railway Termini. They had plenty of money to build both bridges without calling on the public. If they had a bridge from the Custom-house to Luke-street, that portion of the city would not remain in its present neglected condition. The Ballast Board might say that the river accommodation at this part would be interfered with, but the Ballast Board should not oppose the project on such a ground, for there was plenty of room farther down. How the funds were to be obtained was to be found in a report which had been submitted to the Lord Lieutenant in March last, in which they claimed from the government the restoration of a sum of local revenues, amongst them the carriage rents and fines, amounting in the aggregate to £16,000 a-year. They had determined to send Sir Robert Peel a statement of their claims, to have these revenues given to the city. They felt they had been badly treated by the government here and in England. When the address was presented to the Lord Lieutenant he said their claim was worthy of attention, and that it would be transmitted to the government, and he gave them to understand that everything right and just would be done to restore this income of £16,000 a-year to the citizens, who paid it for the support of the police force, over which they had no control whatever. He would at present merely move the resolution in question as on the paper, for the appointment of a committee to inquire and report upon the necessary and probable expense of rebuilding Carlisle-bridge. He was happy to say that the feeling in the city was so strong in favour of the movement that several influential citizens called on him to remind him that he should bring the question on again, and they told him that they were about to sign a requisition to the Lord Mayor to call a meeting at the Rotundo for the purpose of co-operating with the council in their efforts to rebuild Carlisle-bridge. It was also stated to him that Sir Edward Grogan and Mr. Vance had promised to give all the assistance in their power in the matter.

Captain Knox, T.C., with some apposite observations seconded, and an interesting description followed, after which the resolution was carried.

WHAT IS AN ARCHITECT?

ON the 4th instant a paper descriptive of the building now in progress for 1862 exhibition was read by Capt. Phillpotts, R.E., at a meeting of Society of Arts, after hearing which, and in the course of other remarks, Mr. Ottley enquired if any architect had been consulted? Mr. Henry Cole, C.B., in answer thereto said that he came prepared to hear that question asked; and in return he would ask that gentleman to have the kindness to define what an architect is? He (Mr. Cole) had taken some pains to find out; and confessed himself rather puzzled. He had gone to past times, in order to ascertain who had built some of the most striking buildings in Europe, and to find out whether they were or were not architects in the sense in which the term was understood. In the first place, they had the exquisite belfry of Giotti, at Florence, who was bred a shepherd, and became a painter, and subsequently an architect; but he found no facts to substantiate that he was brought up professionally as an "architect." He next took Brunelleschi, the inventor of domes, who was originally a goldsmith; after that a sculptor; then a painter. He then became enamoured of construction; and as a self-taught architect built the dome of Florence, the constructive principles of which were adopted by Michel Angelo in St. Peter's at Rome. He had never heard that Michel Angelo himself was ever articled in a professional architect's office. He began his career as a sculptor, was eminent as a painter, and subsequently took up with architecture and military engineering. Bramante, he dared say, had been heard of. He began as a painter, and subsequently erected a great part of the Vatican: hence he had been called an "architect." Leonardo da Vinci was in the first instance eminent as a mathematician, then as a modeller, then became a painter: subsequently he wrote some poetry, and afterwards became a water and military engineer, and in the latter capacity defended a number of the strong posts of Italy. Subsequently he erected a number of buildings, and became what was called an "architect." Palladio—a name which he had no doubt heard of—began as a geometrician; he never heard that he served his time to an architect: he had no systematic education in that profession; and yet he erected buildings which made him renowned. San Gallo, another eminent constructor, began as a sculptor, and subsequently became an "architect." He supposed the questioner had also heard the name of Inigo Jones: he began as a carpenter, afterwards he became a landscape painter, and met with patrons who sent him to Italy, where he turned his carpentering to good account, learned to erect buildings, and became "an architect." They had all heard the name of Wren. He (Mr. Cole) should like to challenge anybody to show that he was an architect in the sense in which they understood it. He was very ingenious in making mechanical toys. He was a professor of mathematics at the University of Oxford. He happened to be acquainted with the Crown Surveyor of the time; who, having got into difficulties with a building under his charge, consulted Wren; and Wren, not being a professional architect, gave him sound advice, which led to his stepping into the place of his friend; and he erected St. Paul's Cathedral against much architectural advice: hence posterity called him an "architect," and it was commonly supposed that he was well entitled to that appellation. Then there was another person following him—Vanbrugh. They knew that he covered England with a great number of buildings, but he had no professional education as an architect. However, some people thought that he had a special genius for building. He built Castle Howard, Blenheim, and other mansions. The next most eminent name that occurred to him—coming now to modern times—was that of Sir Charles Barry, for whose talent he had much respect. Now he fancied that Sir Charles was what is called a real, professionally-bred architect. Sir Charles Barry's works they all knew: as to whether or not his Houses of Parliament were a great success, the world was divided in opinion: some thought them all wrong: others thought them approximating to right. But of this point there could be no question: having been deputed to build Houses of Parliament, in which people should be able especially to hear, and talk, or parley, he did not succeed in making rooms in which people could hear fairly well, if at all. Sir Charles Barry was also deputed to make a picture gallery for Lord Ellesmere. He had made a pretty architectural building, but unluckily not a picture gallery, as neither by day nor by night could the pictures in it be well seen. He was, however, an eminent professional architect; and, notwithstanding his great reputation, the military engineer whose construction was now before them had been consulted how to make Sir Charles Barry's picture gallery suitable for the purposes for which it was designed. When it was decided what was an "architect," he (Mr. Cole) would answer the other questions which had been put by the same gentleman, who did not appear to know the difference between a perspective drawing and a geometrical elevation.

The speaker, after detailing some particulars connected with the design for the Crystal Palace of 1851, proceeded to eulogize Captain Fowke, the engineer architect of the building for 1862, in the following terms, viz:—Captain Fowke, who had the highest constructive ability—amounting to genius—had been employed as secretary to the Paris Exhibition. He had built *the National Gallery at Dublin*, and designed the Industrial Museum of Scotland: he had also been employed in laying out the ground plan of the Royal Horticultural Society at Kensington. That ground, almost from its first purchase, was viewed as providing a home for future exhibitions. Nothing, therefore, was more natural than that in laying out the ground he should have made provision for the site of the future Exhibition. Accordingly, when the Royal Commissioners for 1862 entered upon their functions, Capt. Fowke had plans ready. He (Mr. Cole) supposed the most partial advocates of architects and competition would not contend that the process of 1851 ought to have been repeated as regarded the building for 1862.

[Without entering into the other matters referred to, we must observe that it would have been mere prudence for Mr. Cole not to have associated, by way of compliment, Capt. Fowke's name with "the National Gallery at Dublin," which externally is a mere stereotype of a corresponding wing, designed—whatever be its merits or the reverse—by a local Board of Works official; and internally was proceeded with by piecemeal, in the dark, without drawings, and under the directions of another superior official from same establishment, and "a doctor" to boot. The friends of the patient, however, thought at latest moment a consultation desirable, and "*Dr.*" Fowke was called in sufficiently early to prolong an existence, the benefits of which, to art and society generally, time alone must proclaim, though the *nostrums* displayed at recent exhibition here suggest little reason for a favourable opinion.]

COMPETITIONS.

OUR readers are aware that plans had been invited in competition for new buildings for the Londonderry Penitentiary, and several having been submitted and under consideration, the committee have at length decided on adopting those by Messrs. Frazer, Ferguson, and Frazer, local architects.

The 14th instant being the last day for receiving plans for intended pedestal for Captain Crozier's memorial at Banbridge, several drawings were received by the secretary, and we await the result.

About £700 has been subscribed to the Marsh testimonial, and it has been determined to employ the amount in procuring a statue of the deceased baronet and M.D. from the chisel of Mr. Foley, to be placed in the hall of the new College of Physicians. Some of the faculty consider that it would be more desirable to appropriate the fund to the Medical Benevolent Fund Society, or in founding a Marsh Exhibition or Scholarship.

EXCLUSIVENESS OF PATRONAGE.

Sir—You would render an essential service to many who, like myself, contribute to the support of your independent and well-conducted journal, by drawing *special* attention to the fact, that the architects of a certain public department in this city, and having much patronage at command, confine it by their specification in the articles of "*plaster and cements*" to one particular English firm, locally represented, and to the exclusion of *all others*, however excellent their manufacture may be. This is the height of injustice, and is doubly reprehensible in a public department, supported by *public money*, and presumed to be impartial in its dispensation of patronage. I import as good—if *not a better*—article as the firm in question manufactures, yet I am precluded from the slightest business advantage in connection with the numerous buildings erected here and throughout Ireland, from plans and specifications so provided. You will not, I am sure, by refusal to expose this abuse, belie the good opinion already formed of your publication.

A Cement Importer and Manufacturer.

[Several communications of similar purport to the above having been previously received, we commented on them in a previous No., and having done so, conceive that our correspondent's object will be fully achieved by mere insertion of his letter.—Ed.]

LAW NOTES.

COURT OF EXCHEQUER.

Sitting of Nisi Prius, before the Lord Chief Baron and a special jury—5th December, 1861.

Luke Doyle v. W. C. Thompson.—Action brought by a builder and contractor in Temple Bar against a gentleman resident at Glenageary, near Kinstown, to recover £111 3s. 8d. for work, and labour, and materials supplied in the building of two houses at Sunning-hill, Adelaide-road.. The amount claimed was for penalties for eleven weeks beyond the time for completing the contract, also for amount of extra bill furnished, after the award of Mr. Papworth, the architect, and for some lead which defendant refused to give, believing it to be his property. The plaintiff's case was that he was not supplied with the ironmongery, plate glass, and chimney-pieces in time by the defendant, which he was bound by his contract to fix up; and also that extra works were ordered, which were so mixed up with the contract works that it was impossible to complete the contract by the time agreed on, and that therefore the penalties should not be enforced. The defendant's case was, that he supplied the articles required when the plaintiff was ready for them, and that the extra works were not so mixed up with the contract works, which were ordered so early that if he had used proper exertion, and employed a sufficient number of workmen, the contract could have been completed by the time specified. The plaintiff was subjected to a long and enquiring examination, as also was the defendant and the architect, Mr. Papworth, and the case terminated on Saturday by a verdict for the defendant substantially on all counts.

Messrs. Whiteside, Q C., Heron, Q C., and E. Johnson, with Mr. F. Kiernan, attorney, appeared for the plaintiff; and Messrs. Sergeant Armstrong, Chatterton, Q.C., and Exham, with Mr. Henry Reily, attorney, for the defendant.

Sullivan v. O'Rorke.—This was an action brought by a lime manufacturer of Upper Baggot-street, against a hardware merchant in New-row, to recover a sum of about £53, for goods sold and delivered, &c. The summons and plaint stated that the defendant, having employed Mr. George Robinson to erect certain buildings for him, and Mr. Robinson being in want of lime to carry on the works, the defendant undertook, with Mr. Robinson's consent, in consideration of the plaintiff supplying Mr. Robinson with what lime he required, to retain out of certain moneys which would become payable to Mr. Robinson sufficient to pay him for the value of the lime he so supplied; and that after lime to the value of about £53 was supplied by the plaintiff to Mr. Robinson, in pursuance of that agreement, and there was money in the defendant's hands due to Mr. Robinson, he did not pay the plaintiff's demand. The defendant pleaded that he never promised to pay for the lime, as alleged; and also, that after the lime was supplied, and the £53 became due to the plaintiff, there was no money in his hands applicable to pay the amount of the plaintiff's bill. Upon these pleadings the issues raised were—whether there was any such promise made by the defendant as alleged, and whether he had in his hands any money properly applicable to pay the plaintiff's demand. It appeared that the houses in question were erected in or about the year 1859, at Sandycove, near Kingstown, and that the defendant entered into a contract with Mr. Robinson to build them for a specific sum, Mr. Robinson supplying all the necessary materials, and to assist him in doing so advanced him some money for the purpose on the security of his bond.

The jury found a verdict for the plaintiff for £50, and costs.

John M'Elwaine v. the Baron De Robeck.—Mr. Levinge, on the part of defendant, moved for liberty to lodge in court £563, the amount for which the action had been brought, the sum in question not to be drawn out by the plaintiff without notice to the Attorney-General. Counsel stated that the action had been instituted to recover the amount of a building account. The plaintiff was lately convicted of a conspiracy to defraud, and the defendant's object in making the motion was to avoid having to pay twice, as might be the case if the property of the plaintiff was forfeited to the crown.

Mr. Martin, for the plaintiff, resisted the motion. He said that Mr. M'Elwaine had been convicted, not of felony, which would involve a forfeiture, but of a misdemeanour, which did not. The motion, therefore, was untenable.

Baron Fitzgerald refused the motion with costs.

In re J. Lynch, a bankrupt builder.—The meeting was for final examination. Council appeared for the assignees, and examined the bankrupt in reference to some building contracts he had been engaged in, and among others a contract he had with Dr. Kavanagh, of Kingstown, to build four houses at Blackrock. There was a dispute as to the execution of the contracts having been delayed, and ultimately the houses were finished by another contractor. He was also examined on the part of creditors. The case was then adjourned till the second week in term, the schedule to be amended in the meantime.

Notes of New Works.

Mr. Meade, the contractor for the newly erected buildings and other improvements in connection with the Four Courts, is about commencing another large block, 200 feet in length by 75 feet, as a Record Office, much additional accommodation in that regard being needed. The plans have been furnished by the architect to Board of Public Works.

A new Roman Catholic Church is to be built at Butler's-bridge, according to designs by Mr. William Hague, jun., architect, Cavan.

It is expected that the new convent of the Sisters of Mercy at Newry will be completed next spring.

The skeleton of St. Mary's Church, Granard, approaches completion, and the walls will shortly be ready for roofing.

It is proposed to erect a new church in Kingstown for the Rev. Denham Smith.

The newly-erected bridge of St. Patrick at Cork, already described in the Dublin Builder, has been formally handed over by the engineer, Sir John Benson, to the Mayor, and opened for public traffic. The event was attended with the eclat of a procession, christening with a bottle of champagne, and a sumptuous dinner at "the Imperial."

The new graving dock at Derry, which will accommodate vessels of the largest size, will shortly be completed.

The new organ recently erected in St. Patrick's Church, Ballymena, by Messrs. Bevington and Sons of London, was opened on Sunday, the 8th inst. It is fixed in the vestry, the front presenting itself towards the chancel and nearly flush with the chancel arch. The case is in the Gothic style, and constructed of pine, stained and varnished, so as to harmonize with the other wood-work of the building; the front pipes elaborately ornamented in mediæval columns, vermillion, green and gold, oak leaves and acorns being prominent. The tone of this instrument is said to give every satisfaction. Two new benches of memel, stained and varnished, with trefoil pannels in front and elaborate traceried pannels at ends, have likewise been provided and fixed on each side for the choir, according to drawings by Messrs. Welland and Gillespie, architects.

St. Mel's Cathedral, Longford.—The great campanile in progress of erection to this structure has already reached to considerably over 100 feet above the surface of the ground. The massive stone columns which surround the bell chamber are nearly half completed, and the structure already gives promise of the striking and imposing effect it will have when crowned by its graceful dome and decorated cross 166 feet over the entrance steps. The works have been suspended until the return of favourable weather, when it is expected another season will complete this, the most striking feature of the greatest of our modern cathedrals in Ireland. After its completion the great portico will still remain to be erected, but there is little reason to doubt that at no very distant time this great cathedral will possess all the adjuncts requisite to render it complete in all its parts. The new diocesan seminary, it is expected, will be commenced early in spring on a site adjoining the cathedral.—*Freeman.*

The town of Castlederg has been lighted with gas at the cost of Mr. Smyley, Q C., and with apparatus erected by Messrs. Edmundson and Co., of Capel-street, in this city.

Portion of the new railway between Castlebar and Claremorris is being lockspitted by the contractors.

THE CRYSTAL PALACE, SYDENHAM.

Unity in architecture is one of the most requisite and agreeable of its qualities; and certainly no building possesses it in a greater degree than the Crystal Palace. Its design is most simple: one portion corresponds with another; there is no introduction of needless ornament: a simplicity of treatment reigns throughout. Nor is this unity confined to the building. It characterises the contents of the glass structure, and prevails in the grounds. All the component parts of the exhibition blend, yet all are distinct; and the effect of the admirable and harmonious arrangement is, that all confusion in the vast establishment, within and without, is avoided. "The mighty maze" has not only its plan, but a plan of the most lucid and instructive kind, and the visitor is enabled to examine every court, whether artistic or industrial every object, whether of nature or of art, in regular order; so that, as in a well-arranged book, he may proceed from subject to subject at his discretion, and derive useful information without the trouble and vexation of working his way through a labyrinth.

All the materials employed in the Exhibition of 1851, with the exception of the glass on the whole roof, and the framing of the transept-roof, have been used in the construction of the Crystal Palace. The general principle of construction, therefore, is identical in the two buildings. The ground ran rapidly down towards the garden, and Sir Joseph Paxton accordingly constructed a lower or basement storey towards the garden front, by means of which not only increased space was gained, but a higher elevation secured to the whole building, and the noblest possible view. The lower storey is sufficiently large to serve as a department for the exhibition of machinery in motion, and a very interesting exhibition of agricultural implements, which important branches of science and human industry will thus be contemplatad apart from other objects. Behind this space, towards the interior of the building, is a capacious horizontal brick shaft, 24 feet wide, extending the whole length of the building, and denominated "Sir Joseph Paxton's Tunnel." Leading out of this tunnel are the furnaces and boilers connected with the heating apparatus, together with brick recesses for the stowage of coke. The tunnel itself is connected with the railway, and is used as a roadway for bringing into, and taking from, the palace all objects of art and of industry: an arrangement that leaves the main floor of the building independent of all such operations. Behind the tunnel, and towards the west, the declivity of the ground is met by means of brick piers of the heights necessary to raise the foundation pieces of the columns to the level at which they rest on the summit of the hill.

The building consists, above the casement floor, of a grand central nave, two side aisles, two main galleries, three transepts, and two wings. The building above the level of the floor is entirely of iron and glass, with the exception of a portion at the west front, which is panelled with wood. The whole length of the main building is 1,608 feet, and the wings 574 feet each, making a length of 2,756 feet, which with the 720 feet in the colonnade, leading from the railway station to the wings, gives a total length of 3,476 feet; or nearly three-quarters of a mile of ground covered with a transparent roof of glass.

Though not exactly in the direction of the cardiaal points, the two ends of the building are generally called north and south, and the two fronts east and west.

The floor consists of boarding one inch and a half thick, laid as in the old building, with half inch openings between them, and resting on joists, placed two feet apart, seven inches by two and a half inches thick. These joists are carried on sleepers and props eight feet apart. The girders which support the galleries and the roof-work, and carry the brick arches over the basement floor, are of cast-iron, and are 24 feet in length. The connections between the girders and columns are applied in the same manner as in the building of 1851. The principle of connection was originally condemned by some men of standing in the scientific world; but experience has proved it to be sound and admirable in every respect. The mode of connection is not merely that of resting the girders on the columns in order to support the roofs and galleries, but the top and bottom of each girder are firmly secured to each of the columns, so that the girder preserves the perpendicularity of the column, and secures lateral stiffness to the entire edifice. Throughout the building the visitor will notice, at certain intervals, diagonally placed, rods connected at the crossing, and uniting column with column. These are the diagonal bracings, or the rods provided to resist the action of the wind; they are strong enough to resist any strain that can be brought to bear against them, and are fitted with screwed connections and couplings, so that they can be adjusted with the greatest accuracy. The roof, from end to end, is on the Paxton ridge-and-furrow system, and the glass employed in the roof is 1-thirteenth of an inch in thickness (21 oz. per foot). The discharge of the rain-water is effected by gutters, from which the water is conveyed down the inside of the columns, at the base of which are the necessary outlets leading to the main drains of the building. The first gallery is gained from the ground floor by means of flights of stairs about 23 feet high; eight such flights being distributed over the building. This gallery is 24 feet wide, and devoted in a great measure to the exhibition of articles of industry. The upper gallery is 8 feet wide, extending like the other round the building; it is gained from the lower gallery by spiral staircases, of which there are eight. The greater number of these staircases are divided into two flights, each flight being 20 feet high; but in the central transept the two staircases contain four flights of the same altitude. Round this upper gallery, at the very summit of the nave and transepts, as well as round the ground floor of the building, are placed louvres, or ventilators, made of galvanised iron By the opening or closing of these louvres—a service readily performed—the temperature of the Crystal Palace is so regulated that on the hottest day of summer, the dry parching heat mounts to the roof to be dismissed, whilst a pure and invigorating supply is introduced at the floor in its place, giving new life to the thirsty plant and fresh vigour to man. The coolness thus obtained within the Palace will be sought in vain on such a summer's day outside the edifice.

The total length of columns employed in the construction of the main buildings and wings would extend, if laid in a straight line, to a distance of sixteen miles and a quarter. The total weight of iron used in the main building and wings amounts to 9,641 tons, 17 cwt., 1 quarter. The superficial quantity of glass used is 25 acres; and weighs 500 tons: if the panes were laid side by side, they would extend to a distance of 48 miles: if end to end, to the almost incredible length of 242 miles. To complete our statistics, we have further to add that the quantity of bolts and rivets distributed over the main structure and wings weighs 175 tons, 1 cwt., 1 quarter; that the nails hammered into the Palace increase its weight by 103 tons, 6 cwt., and that the amount of brick work in the main building and wings is 15,891 cubic yards.

From the end of the south wing to the Crystal Palace Railway station, as above indicated, is a colonnade 720 feet long, 17 feet wide, and 18 feet high. It possesses a superficial area of 15,500 feet, and the quantity of iron employed in this covered passage is 60 tons; of glass 30,000 superficial feet.

(To be continued.)

TENDERS

For additions and improvements to Armagh Lunatic Asylum. Mr. J. Boyd, architect, Belfast. Quantities taken off by Mr. B. T. Patterson, 206, Great Brunswick-street, Dublin:—

T. H. Carroll, Dublin	£6,900
C. Gregg, Belfast	6,270
T. Ross, Armagh	6,125
F. M'Gaughey, Omagh	5,800
R. Cherry, Loughgall (accepted)	5,663
M'Manus J. Marshall, Caledon	4,416

How the Telescope was Invented.—"We have spoken," says *Macmillan's Magazine*, "of the telescope as an *enfant trouvè*. The matter of its invention is said to have been in this wise: Once upon a time—two hundred and more years ago—the children of a spectacle-maker were playing with some of their father's glasses before his door. They poke them here and there, till—what is it they see? The distant steeple appears to be brought almost into their own street. Paterfamilias is apprised of the phenomenon. He verifies it, but it passes his philosophy to tell the youthful inquisitors 'the reason why.' Like a sensible man, he screws the glasses on to a board, casts a covering about them, and secures the fact. The 'spyglass' played subsequently far too grand a *role* not to attract the envious glance of national rivalry; and we have, in fact, the same legend repeated by more writers than one, always, of course, with a patriotic change of the place. The learned and unfeeling *savans* of the present day declare the stories to be all fudge. 'The number of the competitors for this honor,' observes Sir David Brewster, 'affords the most unequivocal evidence that the telescope was brought into the condition of a portable and efficient instrument by steps so gradual, that no individual had any real claim to be considered as its inventor.' Ugh! for the Herod of our Innocents of Invention! We claim the honor for our little Flemings, and crown Middelbourge as the 'Stammort' of the numerous and refined family of the Dollands of our day."

To Prevent Boiler Explosions.—Boiler explosions are generally caused by the water in the pipes or cisterns becoming frozen, under which circumstances, if heat be applied to the boiler, (which is usually unprovided with a safety valve), an explosion will ensue from over-pressure. The best preventive is to keep on a good fire during the frost, and if the supply of water to the cistern be stopped, unless other means be adopted for filling it, no water should be drawn from the boiler.

PUBLICATIONS.

WE have received a pamphlet by Mr. James Mills respecting alleged delusions in the scheme of Indian Railway and Indus Flotilla Guarantees (London, W. Wilson and Co., Cheapside), on the merits of which, as the subject matter concerns but a comparatively small section of the public, we are not disposed to enter. The bare announcement of its existence may conduce towards the author's purpose.

NEWS AND LITERATURE.

The Dublin Library.—The early advent of a "new year" reminds us that the committee of this library is making strenuous exertions for additional enlistments to its ranks of membership. Professional gentlemen and others extensively frequent its reading-room, which is spacious, centrally situated, and in which may be found all the respectable current periodicals, political or otherwise, and telegrams during the day and evening. The library is one of the most important in Dublin.

The Dublin Mechanics' Institute.—Independent of sect and party this institute now steers a steady, useful course, after being tossed for a lengthened period on the shoals and quicksands of political and party animosity. The olive branch has been securely grasped by the belligerents on both sides, a happy result of better judgment, and long may they retain it! To the general public, but to the artizan especially, facilities are afforded through its medium for perusing the organs of daily and weekly intelligence, the professional and scientific periodicals and magazines; while its capacious library amply satisfies the numerous demands of the members for the wherewith to pass a leisure hour in combining instruction with amusement. Competent masters in music, the languages, drawing, &c., are associated therewith, and the lecture theatre is one of the most spacious and best arranged in the kingdom. Recently the directors have added the inducement of periodical concerts by local artistes, with admission at a low figure, and we hope the result may prove successful. Thanks to the good feeling of the Queen's Theatre lessee, the members are allowed reduced tickets to that popular place of entertainment, and an acknowledgment of the same privilege is due to other public establishments likewise.

The Catholic Young Men's Society.—Since its formation this society has considerably progressed, owing to the energy of its promoters—of whom the zealous Rev. Dr. Spratt was the principal—and its managing committee, which comprises gentlemen of great judgment and intelligence. The reading-room is well supplied with political and non-political journals, serials, &c., and the library is fully stocked with select volumes appertaining to science, art, ancient and modern literature, &c. A trifling annual subscription ensures membership for Roman Catholics. The society has recently taken the old church of St. Saviour in Denmark-street, and converted it into a spacious lecture and class rooms.

The Dublin Athenæum.—This recently formed establishment in Anglesea-street, comprising general reading-room, lending library, class-rooms, &c., offers numerous educational and other advantages and instruction to the classes for whom it is intended, and is exclusively Protestant.

THEATRE ROYAL.

SINCE our last impression Mesdames Grisi and Lemaire, Mdlles. Dario and Ellen Conran (both of Irish birth), and Signor Galvani and Swift (tenori), Cresci (baritone), and Ciampi (basso), have appeared in a succession of Italian operas. In *Norma* Madame Grisi still maintains her supremacy as the greatest delineator and vocalist, and was most admirably supported by Mr. Swift as *Pollio*, and Miss Conran as *Adalgiza*. In the other operas also the veteran prima donna still displays so much vigour, grace, and exquisite vocalism that a sincere regret is experienced at her contemplated secession from the scene of her triumphs; a feeling which we doubt not will be enthusiastically conveyed on the occasion of her farewell benefit next Saturday evening. The mantle of Catherine Hayes has descended on Ellen Conran, who, as an Irish star of the first brilliancy, her countrymen may regard with unqualified admiration. We should prefer, however, witnessing a different mode of expressing that feeling than by uproarious conduct of the gallery occupants, illustrating "bedlam let loose," or "a menagerie in confusion," neither appreciating the performance themselves, nor allowing the remainder of the audience to enjoy it comfortably. The systems of encoring, calling before the curtain, and interrupting the opera to compel an "Irish song," as adopted in this theatre, are outrages on the decencies of modern society. If Mr. Harris would equalise the prices of the galleries with the pit, even for one night of a favourite opera, we apprehend that the experiment would have a salutary effect, and not affect him pecuniarily. Signor Galvani improves with acquaintance; and Signors Cresci and Ciampi are both clever artistes. An engagement with Mr. Drew, Irish comedian, is announced. A Christmas pantomime, of great splendour and merit, is in preparation, and will be entitled, "Aladdin, or the Wonderful Lamp."

QUEEN'S ROYAL THEATRE.

FURTHER than what we note of this place of amusement when we occasionally visit it *and pay*. we are unable to record its proceedings. Why *we* should be selected for exclusion from the ordinary press privileges is somewhat inexplicable, even making due allowance for the many demands of similar character on the lessee, to whose abilities as an actor and manager, and claims for support from the public we were always willing to pay fitting tribute. Our London contemporaries of mission equivalent to *ours* enjoy *all* the privileges in this regard, and to the extent of the *political* organs; and we, though *personally* indifferent to the right of free access to this Theatre, as by favour of Mr. Harris we enjoy at the Royal, as also elsewhere in usual course; must therefore regard, on *principle*, the unjustifiable exclusion in question by Mr. Webb with at least *some* regret.

THE PHILHARMONIC SOCIETY.

ON the 6th instant a charming concert was given by this society at the Antient Concert Rooms; the troupe of Italian artistes at that period under engagement at the Theatre Royal constituting the principal vocalists. Madame Grisi excelled herself in the rendering of "O meo Fernando," by Donizetti; and Miss Ellen Conran in the cavatina "Bel raggio," was rapturously applauded. The singing of Signori Galvani, Cresci, and Ciampi in the trio from "Pappatacci," by Rossini, and of Madame Lemaire in the aria "Nobil Signor," from *Les Huguenots*, were amongst the chief attractions of the evening.

Miscellaneous.

IMPURE WATER AND DISEASE.—So late as even 1851 we find three chemists appointed to analyse the London waters, stating that "the shallow wells of London have never been pronounced unwholesome," yet in 1847 much public discussion resulted from a report which I made to the magistrates of Glasgow, in which it was demonstrated that sewage was present in greater or less quantities in all the wells of that city, and which I, therefore, pronounced to be unwholesome. In 1850, at the request of the magistrates of Liverpool, I reported on the wells of that city, and gave a similar opinion of their unsanitary character. In the case of Glasgow, a proposition had been made to the magistrates to expend a large sum of money in sinking new wells, but the unfavourable report of their impurity led to the project being abandoned. Companies were subsequently formed for the supply of water to Glasgow from streams in the neighbourhood, of which I had the chemical examination, and the result proved that the purest water which could be obtained was that of Loch Katrine, a noble lake, containing the drainage of a mountain range. When the water was first introduced into the main pipes the total impurity amounted to as much as 3·3 grs. or degrees per gallon, although when I first examined the water in the lake the impurity was 2·3 grs. in the gallon. It was obvious that some impurer springs had mingled with it in its passage to the city, which has now been remedied, as in March last the impurity was 2·35 degrees, of which ·605 was organic. The authorities of Glasgow have expended on this scheme somewhere about three-quarters of a million, and, probably, before the plan is complete the expenditure may not be less than nearly a million sterling. Allowing for the difference of population this would be equivalent to between seven and eight millions for the inhabitants of London. For this sum it is believed a pure mountain drainage water might be made to supersede the present supply from the Thames, which acts as a sewer to the whole of the populous country which it traverses. Manchester and Liverpool, which, like Glasgow, suffered intensely from cholera, and where well-water was much used, have now obtained pure supplies of water from mountain or pastoral drainage. The importance of these improvements has been fully borne out by the facts which have come under the cognizance of those who have made sanitary science their peculiar study.—*Dr. Thomson in London Medical Review.*

A WONDERFUL LOCK.—The *Leeds Intelligencer* announces that there is now in course of manufacture at Wolverhampton a new patent keyless lock, having 244,140,625 combinations. This lock is the invention of Count Kersolon, a Frenchman, but is now the property, in this country, of a Mr. Loysell. It has five rollers, and each roller is marked with twenty-five letters of the alphabet. If the letter at which it is set should not be discovered, the exhausting of all the variations necessary in that case to the opening of the lock would require an immense expenditure of time. It is intended to place one of these locks upon some iron safes that are being made for exhibition at the forthcoming World's Fair. In one of the safes it is proposed to place the sum of £500, which is to full to the lot of the person who may be fortunate enough to effect an opening of the safe.
